It is a great deal to decide even upon so much. If parents go into the country for the sake of their children, they will find comparatively little difficulty in deciding as to the "where." It may be the sea-side, or it may be the hill-side, but it will hardly be the hotel, fashionable or unfashionable, where they will be brought into direct contact with so much frivolity and dissipation, and be subjected to all the restraints of nice clothes, and spoiled with luxurious living. The money expended in maintaining such a life would be infinitely better bestowed in compensating some respectable farmer for opening his unoccupied rooms, and spreading in one of them an extra table for your family. We are inclined to think that the perfection of living—if there is any such thing as perfection in this world—would be to remove into some quiet country house during the summer months, with a tutor or governess competent to instruct the young in natural science, and, for some twelve weeks at least, leave the school behind. We are not sure that during the remainder of the year as much book learning would not be acquired as is gained now; at all events, the culture of the young would be much broader than at present. Some of the ablest men now on the stage were once boys who went to school only during the winter, and worked on the farm in the summer. That settled the gymnastic question; and the young men were hoeing the corn and potatoes whilst they were getting up their muscles. But even if the lads should not go to college so early as they go now, and if the girls "come out" a little later, would any one suffer thereby except their foolishly impatient and ambitious parents? If there is no lack of boys and girls, there is an over supply of men and women, in this part of the world at least. If our merchants, physicians, and lawyers, had been kept boys and young men a little longer, if they had entered college two or three years later, there would not be so many grown-up idlers as there are now. If the multitude of young ladies who go about in the forenoons with card-cases to ascertain that nobody is at home, or to pass five minutes at a reception in talking nothings, had remained at school a few years longer, they would be happier and more blooming; for late hours and midnight suppers, rather than studies, are destroying the young people. "Schooling" is greatly overdone, if by schooling is meant, as is the case for the most

part, the study of dead vocables. The structure of a plant, God's wondrous handiwork to-day, is quite as important a matter for a child to master as the structure of a Greek verb, though of Greek verbs, as in duty bound, we would always speak respectfully.

So, we say, take the children into the country, not where you can make new acquaintances, or lose your relish for your old, simple ways; not where you will be compelled to herd with a multitude, and hear and tell gossip; but where you can give yourself to the reading of pleasant books, where you can indulge in long rambles, where the simplest dress will be the only appropriate dress, where the finest turn-out is a good, strong country wagon, or, for the more delicate, a super-annuated carryall.

But what of the poor children who have no parents able to give them pleasant vacations? It is not a pleasant matter to think about. If possible, the poor are worse off in their wretched quarters during the months of summer than during the winter season. The charitable supply them with coal when it is needed, and a bitter cold morning is almost sure to replenish the purse of the almoner; but we believe that as yet no philanthropist has been found to send about a supply of refrigerators and ice-carts during one of those fearfully hot weeks with which we are sometimes visited. The rooms of the poor, so far as we know anything about them, are generally over-heated, summer and winter. How to get fresh air into them, is the question. A comparison of the statistics of mortality in the different wards of the city of Boston during the summer months tells a sad tale of the household fortunes of the poor; and yet Boston is comparatively well drained and well aired, though in the poor's quarters it is over-crowded. What can be done? The relief is distant. Improved houses, tenements a little out of town, with cheap conveyances to and fro, public squares, tea and coffee gardens to take the places of poison saloons,—these we hope will come in time. Meanwhile, if you know of a Patrick in the city whose brother Dennis lives in the country, enable the said Patrick to send the young Michael and the young Bridget to spend the vacation with the said Dennis, and, our word for it, the boy and girl will return in the autumn as much improved in moral tone as in their physical condition,—in the color of the heart as in the color of the face,—with less of that fearful wildness of look and general savagery of bearing which so often mark the child who has spent his days and evenings on wharves and lumber-yards and noisy thoroughfares, with one eye on his booty and the other on the policeman. Let the charitable remember, too, that a picnic can hardly be called a luxury for the poor children of a mission school, and that a few dollars spent in providing entertainment of this kind for those who rarely

see more than a patch of sky at once, may do as much as anything to keep them out of dance-halls and houses of correction when they come to be men and women. But the topics accumulate too rapidly, as we intimated at the outset would be very likely to be the case, and we must stop before we have quite compassed sea and land upon our very humble, yet, we hope, well-ment errand.—*Religious Magazine.* E.

“As long as there is anything to be done in a matter, the time for grieving has not come. But when the subject for grief is fixed and inevitable, sorrow is to be borne like pain. And we may remember that sorrow is at once the lot, the trial, and the privilege of man;” so that it behooves us to bear it patiently, lest we rebel against Him who hath permitted it.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, EIGHTH MONTH 20, 1859.

FEMALE INDUSTRY.

(Concluded from page 347.)

There remain the classes which speak so well for themselves as to leave others little to say;—the artists and authors. Here nature indicates the path of action; and all that we are practically concerned with is that her behests are not disobeyed,—her guidance not perverted,—her elect not oppressed, through our mismanagement. We have adverted to the opposition made to opening Schools of Design to female students. We must permit no more obstruction of that kind, but rather supply the educational links that are wanted, if we would render the powers and the industry of women available to the welfare of society. For one instance;—it is a good thing to admit students freely to Schools of Design and to train them there; and it is a good thing that manufacturers of textile and metal productions employ women at rising wages, in proportion to their qualifications. But there is a chasm between the training and the work which requires bridging. The greater part of the higher order of designs are practically unavailable, for want of knowledge on the part of the designer, of the conditions of the particular manufacture in question. The economic possibility and aptitude are not studied and hence, the manufacturers say, an enormous waste of thought, skill, and industry. This want supplied, a field of industry practically boundless would be opened to female artists, as well as artisans; and it would be an enlightened policy to look to this, while the whole world seems to be opening its ports to our productions.

It seems not very long ago that the occupation of the Taylor family, of Ongar, was regarded as very strange. The delightful Jane Taylor of On-

gar, and her sisters, paid their share of the family expenses by engraving. Steel engravings were not then in very great demand; yet those young women were incessantly at work,—so as to be abundantly weary of it,—as Jane's letters plainly show. For a quarter of a century past, many hundreds of young women, we are assured, have supported themselves by wood engraving, for which there is now a demand which no jealousy in the stronger sex can intercept. The effort to exclude women was made, in this as in other branches of art; but the interests of publishers and the public were more than a match for it. One of the most accomplished 'hands' in this elegant branch of art has built herself a country house with the proceeds of her chisel; and will no doubt furnish it by those of her admirable paintings on glass.

We look to cultivated women also for the improvement of our national character as tasteful manufacturers. It is only the inferiority of our designs which prevents our taking the lead of the world in our silks, ribbons, artificial flowers, paper-hangings, carpets and furniture generally. Our Schools of Design were instituted to meet this deficiency: and they have made a beginning: but the greater part of the work remains to be done; and it is properly women's work. There is no barrier of jealousy in the case, for our manufacturers are eager to secure good designs from any quarter.

For the rest, the female artists can take very good care of themselves. Music will be listened to, if it is good; and sculpture and painting must assert their own merits. Miss Herschel sat unmolested in her brother's observatory, discovering comets; and Mrs. Somerville became a mathematician in a quiet way, and after her own fashion. Our countrywomen have the free command of the press; and they use it abundantly. Every woman who has force of character enough to conceive any rational enterprise of benevolence is sure to carry it through, after encountering more or less opposition. For a Catherine Mompeiron, supported by her husband's companionship in a plague-stricken village two centuries ago we have had a Mary Pickard doing exactly the same work, but alone, within our own century. Mrs. Fry in Newgate, Florence Nightingale and Mrs. Bracebridge at Scutari; Miss Dix reforming lunatic asylums; Sarah Pellatt reclaiming the Californian gold-diggers from drink; Mary Carpenter among her young city Arabs: all these, and several more, are proofs that the field of action is open to women as well as men, when they find something for their hand to do, and do it with all their might.

Out of six millions of women above twenty years of age, in Great Britain, exclusive of Ireland, and of course of the Colonies, no less than half are industrial in their mode of life. More than a third, more than two millions, are indepen-

dent in their industry, are self-supporting, like men. The proceedings in the new Divorce Court, and in matrimonial cases before the police-magistrates, have caused a wide-spread astonishment at the amount of female industry they have disclosed. Almost every aggrieved wife who has sought protection, has proved that she has supported her household, and has acquired property by her effective exertions. It is probable that few of our readers have ever placed this great fact before their minds for contemplation and study: yet it is one which cannot safely be neglected or made light of. The penalty of such neglect or carelessness is an encroachment of pauperism at one end of the scale, and the most poisonous of vices at the other. How do we meet the conditions which stare us in the face? Mr. Norris's Report supplies us with the answer.

'But I much fear the chief reason that more is not done in this direction, is the very general apathy that prevails in the matter of girls' education. Why is it that, where you find three or four good boys' schools, you will find barely one efficient girls' school? Why is it that in pamphlets, and speeches, and schemes of so-called national education, they are almost uniformly ignored? The reasons are twofold; a very large number of the people who are interested in the progress of education think of it only in connexion with our national wealth; they mean by education the extension of skill and knowledge as essential elements of productiveness, and, therefore with them, girls' schooling is a matter of little or no moment. Another still larger class of persons, who, from native illiberality of mind, are opposed to all education, though ashamed to confess this generally, do not blush to own it with respect to girls. So that on either hand the girls' school is neglected. And what is the result? For want of good schools for girls three out of four of the girls in my district are sent to miserable private schools, where they have no religious instruction, no discipline, no industrial training; they are humored in every sort of conceit, are called "Miss Smith" and "Miss Brown," and go into service at fourteen or fifteen, skilled in crochet and worsted work, but unable to darn a hole or cut out a frock, hating household work, and longing to be milliners or ladies' maids. While this is called education, no wonder that people cry out that education is ruining our servants, and doing more harm than good!

'But there are other evil results arising from the neglect of girls' education, far more serious than the want of good servants;—as the girl is, so will the woman be; as the woman is, so will the home be; and as the home is, such, for good or for evil, will be the character of our population. My belief is, that England will never secure the higher benefits expected to result from national education, until more attention is paid to girls' schools. No amount of mere knowledge, religious

or secular, given to boys, will secure them from drunkenness or crime in after life. It may be true that knowledge is power, but knowledge is not virtue. It is in vain for us to multiply the means of instruction, and then sit down and watch the criminal returns in daily expectation of seeing in them the results of our schooling. If we wish to arrest the growth of national vice, we must go to its real seminary, *the home*. Instead of that thriftless untidy woman who presides over it, driving her husband to the gin palace by the discomfort of his own house, and marring for life the temper and health of her own child by her own want of sense, we must train up one who will be a cleanly careful housewife, and a patient skilful mother. Until one or two generations have been improved, we must trust mainly to our schools to effect this change in the daughters of the working classes. We must multiply over the face of the country girls' schools of a sensible and practical sort. The more enlightened women of England must come forward and take the matter into their own hands, and do for our girls what Mrs. Fry did for our prisons, what Miss Carpenter has done for our reformatories, what Miss Nightingale and Miss Stanley are doing for our hospitals.' (*Minutes on Education*, 1855-6, pp. 482, 483.)

Further illustrations may be found in the group of good books with which we have prefaced these remarks. The volume on the Industrial and Social Position of Women, and the Reports of the Census and the School Inspectors, are written by men; and the rest are even more worthy of attention as being by women, who best know their own case, though they must appeal to us to aid them in obtaining free scope for their industry. The tale is plain enough,—from whatever mouth it comes. So far from our countrywomen being all maintained, as a matter of course, by us 'the breadwinners,' three millions out of six of adult Englishwomen work for subsistence; and two out of three in independence. With this new condition of affairs, new duties and new views must be accepted. Old obstructions must be removed; and the aim must be set before us, as a nation as well as in private life, to provide for the free development and full use of the powers of every member of the community. In other words, we must improve and extend education to the utmost; and then open a fair field to the powers and energies we have educated. This will secure our welfare, nationally and in our homes, to which few elements can contribute more vitally and more richly than the independent industry of our countrywomen.

The complete moralist begins with God; he gives him his due, his heart, his love, his service: the bountiful giver of his well being, as well as being.—*Penn.*

ON THE MINISTRY.

In the discharge of the trust reposed in her as an Elder in the Church, Susanna Mason felt herself bound to address a few remarks to a friend respecting the ministry, of which the subjoined is an extract.

"The exercise of thy gift when among us threw me into serious reflections respecting the ministry. I was led, according to my measure, to sympathize in the tried path, which, I believe, often falls to the lot of those who are called into that line of service; and I was ready to query, why, in the wisdom and goodness of Providence, it should be, that the creatures of his forming hand, who have in good measure submitted to his renovating power, are resigned to do his will, and ardently desirous of fulfilling, to the best of their ability, the task assigned them upon earth, should, in the performance of their apprehended duty, mistake, err, and do what at the time is not required of them? But this is the case, I charitably believe, having known something of it in my own experience.

Whether a more consistent reason can be given I cannot say, but to me it appears owing to the natural activity of the creature. This activity may be so refined as scarcely to be distinguished (except by the mystical eye and ear) that it is creaturely. Thus it may be with us, even whilst the six day's creation is spiritually carrying on, and the lights placed in the heavens for ruling the day and night (revelation and enlightened reason) shine with considerable brightness, until we come to the seventh day's experience, wherein we witness a rest from all our own activity and conceivings, and the soul comes to sit empty and motionless before God, having no other consciousness than our own *nothingness* and the *all* of God. This sabbath of rest I believe is highly needful for all who are accounted the salt of the earth to press after, more especially those to whom is committed a dispensation of gospel tidings to declare unto others. From my own experience, I believe, where any undertake to promulgate gospel precepts, or to judge of gospel truths, their suitableness as to time, place, &c., who do not measurably witness from season to season this sabbath of rest, (though ever so filled with zeal and ardor to be doing good) never get further than the chambers of imagery, where every form of creeping things, abominable beasts, and idols of the house of Israel, are portrayed upon the wall. Their understanding and spiritual discernment may be so enlightened as to see the states and vices of the people in their native deformity and ugliness; they may even see what the ancients of the house of Israel do in the dark chambers of imagery. These they may truly perceive and declare; but to apply the gospel remedy, the holy baptism, belongs only to those who, being fitly prepared, have received the divine commission "go teach and baptize."

Unless something of this baptizing power and influence attend preaching, I believe neither preacher nor hearer is much, if any the better.

I have sometimes thought I could perceive lines of agreement between a rightly qualified minister of Christ, in sounding the gospel trumpet, and the golden censor, which, upon the opening of the seventh seal, was said to be in the angel's hand, which is the true incense, the smoke thereof coming with the prayers of the saints, ascend up before God. This censor being filled with fire from off the golden altar which is before God, and cast into the earth, occasions voices, thunderings, lightnings, and earthquakes among the inhabitants of the earth; or great inward stirring and commotion in earthly and carnal minds, to the convincement of many, and the awakening into life and sensibility such as shall be saved; whilst the most refined declamations of man, in which the life and power rise no higher than is consistent with the *number of a man*,* is but as the wind ingeniously played through a polished tube, the melody of which is apt to strike the passions of both preacher and hearers, and occasion a counterfeit of real spiritual fervor in the one, and of conviction in the other; but which is commonly of short duration, comparable to the shadow of a cloud over a field. With such, the old proverb is often verified: "No longer pipe, no longer dance." The state of a preacher, thus animated by his own natural fervor, and speaking in the strength of his own natural powers, appears to me somewhat like a stagnant pool of water, perhaps full to the very brim, but to which the vast ocean has no access, so as to fill and empty, and fill again, according to the fluxion of the Divine Fountain, which (with respect to mortals, and perhaps all finite beings) ebbs and flows.

Now, whether any of these remarks may afford thee the least hint of instruction, I cannot tell; but thus my mind was led to communicate. It may be there is room for both of us to witness further attainments in true Christian experience. The root of that tree which bears twelve manners of fruits, yields her fruit every month, and the leaves thereof are for the healing of the nations lies deep. That thou and I may labor to grow in the root, and find the foundation, rather than to display leaves and branches, or build a superstructure too large for its basis, is the desire of thy well-meaning and sympathizing friend.

SUSANNA MASON."

—*Memoirs of S. Mason.*

It is a severe rebuke upon us, that God makes us so many allowances, and we make so few to our neighbors: as if charity had nothing to do with religion; or love with faith, that ought to work by it.—*Penn.*

THE OFFERING

The proud man says, I nothing offer,
And naught from others do I take;
I slight all gifts that any proffer,
I'd rather have an empty coffer
Than wealth by begging rake:
I my own fortune make.

Blind folly his and senseless bragging;
There is no self-dependant man,
Though many a one has had hard dragging,
Behind frank, mutual helpers lagging,
A foolish, boastful man,
Since this old world began.

Unaided toil is only seeming;
All men are made to help each other,
And he in vanity is dreaming,
Who tries by ineffectual scheming
To live without his brother,
And human feeling smother.

An ostentatious offering making
All to release from debt to him,
He the false liberty is taking
Of all his debts to all forsaking;
His miserable whim
Makes reason's light grow dim.

His offering men will not receive,—
They could not do it if they would;
Such words as his none can believe,
And oh! it makes the world's heart grieve,
That his heart's in the mood
To make such words seem good.

The offering dear to truthful men
Is honest help to one another;
And we all make this offering when,
In life that's plain to common ken,
We prove each man our brother,
By honest help to one another.

HEALTH AND HEALING.

The Machineal is a poisonous tropical tree, whose unhealthy effect is counteracted by the White-wood, which is always to be found near it. The White Ash is the dread of the *Crotolus Horridus*, or Rattlesnake. Being cured by the White-wood, is like being penitent, being protected from harm by the White Ash, is like being held back from sinning.

The Machineal and the White-wood
Are growing side by side;
And the White Ash spreads its guardian shade
Near where venomous serpents glide.
The poison and the antidote,
Grow under the self same sun,
And prevention, a richer boon and cure,
Is given to every one.

If the breath of the deadly Machineal
Has dimmed your health-bright eye,
The White-wood, waving its friendly arms,
Says softly, Thou shalt not die.
Under the boughs of the White Ash keep,
And the rattles you may hear,
And see the gleam of the angry eye,
And never feel a fear.

If you have slipped, recover,—
There is help in power divine;
A blessed gift in repentance,
And the word in every line,

Bids him that strays, back to the way
That he has left return,
And every human soul has need
This lesson of love to learn.

But we must strive that we may not slip,
And to be upheld must pray:
The White-wood helps us when we fail,
The Ash when we steadfast stay;
Both are fair trees in the garden of God,
Both are for human need;
And every lesson our Father writes,
It is good for his children to read.

THE BABY.

Another little wave
Upon the sea of life;
Another soul to save,
Amid its toil and strife

Two more little feet
To walk the dusty road;
To choose where two paths meet,
The narrow and the broad.

Two more little hands
To work for good or ill;
Two more little eyes,
Another little will.

Another heart to love,
Receiving love again;
And so the baby came,
A thing of joy and pain.

From the Quarterly Review.

SHIPWRECKS.

Concluded from page 351.)

Lieutenant Maury, in his Physical Geography of the Sea, has boldly likened the causes at work to produce the celebrated Gulf-stream to the mechanical arrangements by which apartments are heated. The furnace is the torrid zone, the Mexican Gulf and the Caribbean Sea, are the caldrons, and the Gulf-stream is the conducting-pipe by which the warm water and the air above it are dispersed to the banks of Newfoundland and to the north-western shores of the old world.* By this beneficent process the cold of our northern latitudes is greatly ameliorated. The waters sent north and north-east are edged by return currents, one finding its way close to the banks of Newfoundland and along the seaboard of the States, and the other returning by the North Sea, the Bay of Biscay, and the West coast of Africa, until about the latitude of the Cape de Verdes it crosses westward again to fill up the void caused by the waters issuing from the Gulf of Florida. Thus the grand circuit is for ever maintained, not always, however, exactly in the same form, but varying according to the season.

* We may more truly liken the system to the warming apparatus of a hot-house. The hot waters of the Gulf, conducted across the Atlantic, are the forcing power which stimulates the vegetation of Cornwall, whence the London market is supplied with its early vegetables.

In the winter, the cold current coming S. S. W. along the Atlantic Coast of North America is greatly augmented, and pushes the Gulf-stream further to the south-east. With the return of summer this stream, in its turn, thrusts aside the waters coming from the Polar Ocean. Between these two periods the trough of the Gulf-stream, to use Lieutenant Maury's forcible expression, "wavers about in the ocean like a pennon in the breeze." The temperature of the Gulf-stream, even in the winter, is at the summer level as it runs between two walls of nearly ice-cold water. Sir Philip Brooke found the air of either side of it at the freezing point, at the same time that that of the stream was at eighty degrees. The difference in the temperature of air and water is probably the cause of those terrible hurricanes that occur in the Atlantic and among the West Indian Islands, and which make it the most dangerous navigation, during the winter, in the world. The average of wrecks on the Atlantic seaboard of the United States during these rigorous months is not less than three a day. Sailors term the Gulf-stream "The weather breeder," and well they may, considering its frightful effect in producing commotion in sea and air. In Franklin's time it was no uncommon thing for vessels bound in winter for the Capes of Delaware to be blown off land, and forced to go to the West Indies, and there wait for the return of spring before they could attempt to make for this point. The snow-storms and the furious gales which greet the ship as she leaves the warm waters of the Gulf and nears the shores of North America, are quite dramatic in their effect. One day she is sailing through tepid water, and enjoying a summer atmosphere, the next, perhaps, driving before a snow-storm, her rigging a mass of icicles, and her crew frozen by the piercing blast. The Gulf-stream is answerable for another phenomenon—the fogs which invariably shroud the Banks of Newfoundland, and which render the approach to the North American coast in winter so particularly dangerous. The hot water of the Gulf-stream gives up its vapor to the cold air, and hangs about the coasts an impenetrable curtain, which baffles the navigator's skill, renders useless his chronometer, and but too often sends his bark to destruction upon the hidden shore.

Another danger of the stormy Atlantic arises from the flow southward, in the spring and summer months, of icebergs. These stupendous masses have their breeding-place in Davis' Strait, from which they issue in magnificent procession directly the current increases in a southerly direction. Polar navigators have been surprised to find these huge monsters moving against the wind, apparently by some inherent force, and crashing through vast fields of ice, as if impatient to escape from the silence and desolation of the Polar seas. The explanation of this singular occurrence is, that powerful under-currents are acting

upon the submerged portions, which in all cases vastly preponderate over the glittering precipices of crystal that appear above the water-line. As the icebergs advance into the open waters of the Atlantic, they at last come to the edge of the Gulf-stream, where in "the great bend," about latitude forty-three degrees, they harbor in dangerous numbers, and without doubt send many a noble ship headlong to the bottom. In all probability the ill-fated "President" was thus destroyed, and some towering iceberg, that has long since bowed its glittering peaks to the solvent action of the warm water of the Gulf-stream, was perhaps, the only witness of the calamity which placed the noble "Pacific" among the list of ships that have sailed forth into eternity.

If the northern latitudes of the Atlantic have their dangers of ice, the southern latitude, especially the Carribean Sea, in common with all intertropical oceans, have their dangers of fire. The hurricanes of those latitudes are generally accompanied by visitations of fearful thunder-storms, in which many a good ship is enveloped and destroyed. In the midst of a summer sea a clipper ship may be suddenly assailed by one of those tremendous conflicts of the elements, of the approach of which the silver finger of the barometer, unless carefully watched, has scarcely had time to give warning. However prepared by good seamanship and an active crew, there she must lie on the vexed ocean, her tall masts so many suction-tubes to draw down upon her the destructive fire from heaven. In his Report to the Admiralty, laid before Parliament in 1854, entitled "Shipwrecks by lightning," Sir William Snow Harris—whose exertions to find a remedy for this evil are above all praise—states that in six years, between 1809 and 1815, forty sail of the line, twenty frigates, and ten sloops were so crippled by being struck, as in many cases to be placed for a time *hors de combat*. In fifty years there were two hundred and eighty instances of serious damage to ships in the British navy. Of these the "Thisbey" frigate, off Scilly, in Jan., 1786, affords a melancholy example. The log represents her "decks swept by lightning, people struck down in all directions, the sails and gear aloft in one great blaze, and the ship left a complete wreck." In the merchant service the list of disasters is fearful. Since the year 1820 thirty-three ships, varying from three hundred to one thousand tons, have been totally destroyed by lightning, and forty-five greatly damaged.

"A great peculiarity," says Sir William Snow Harris, "may be observed in cases of ships set on fire by lightning, viz. a rapid spreading of the fire in every part of the vessel, as if the electric agency had so permeated the mass as to render the extinction of the fire by artificial means impossible." Take, for instance, the burning of the "Sir Walter Scott," in June, 1855. This fine passenger ship of six hundred and fifty tons

was struck in the Bay of Biscay: the lightning shivered the foremast, completely raked the vessel, and instantly set fire to the cargo. The passengers and crew had scarcely time to jump from their beds and put on their clothes, and leap into the boats, when the masts went over the sides, the flames shot up into the air, and the ship went down like a stone. Such extraordinary catastrophes as these seem to set forth in unmistakable terms the feebleness of man in the presence of the tremendous powers of nature. In reality, they are only forcible instances to call upon him to use the means for dominating the peril. Of all the dangers that beset the mariner at sea, danger by lightning is the only one that he can thoroughly guard against. To Sir William Snow Harris we owe the perfecting of the lightning-conductor for marine purposes, and the power of braving unscathed the direst electric storms. The permanent conductor adopted, in the navy in 1842 is arranged so as to extend along the masts, from the truck to the keelson, and out to sea. In the hull various branches ramify, and admit of free dispersion of the electric fluid in all directions. Thus armed, the ship is impregnable to all the forked lightnings that may dart about her. Since the system of fitting men of war with this apparatus has been adopted no vessel of the Royal Navy has been injured. The log of the frigate "Shannon," commanded by the late gallant Sir W. Peel, on his voyage out to China, affords a striking example of the manner in which the fury of such electric storms as are only to be met with in the Indian Ocean, was baffled by a contrivance which may truly be called, in the words of Dibdin—

"The sweet little cherub that sits up aloft,
And takes care of the life of poor Jack."

"When the ship was about ninety miles south of Java she became enveloped in a terrific thunderstorm, and at five P. M. an immense ball of fire covered the maintopgallant mast; at fifteen minutes past five the ship was struck a second time on the mainmast by apparently an immense mass of lightning; at half-past five another very heavy discharge fell upon the mainmast, and from this time until six P. M. the ship was completely enveloped in sharp forked lightning. On the next day her masts and rigging were carefully overhauled, but, thanks to Sir Snow Harris's system of permanent lightning-conductors, no injury whatever to ship or rigging was discovered."

There is always connected with true refinement of character, the tenderest regard for the feelings of others. Even when benevolence is not the predominating motive, a man of true dignity of character will never wilfully offend. To those socially beneath him, this quality of mind or heart will exhibit itself, with perhaps more marked distinctness.

Correspondence of the N. Y. Tribune.

STEAM CARRIAGES ON A COMMON ROAD.

A SUCCESSFUL EXPERIMENT.

Philadelphia, July 4th, 1859.

The novelty and the success of the recent trips of Lee & Larned's Steam Fire Engine over the public highway to this city by its own locomotive facilities seem to justify a more detailed account of the expedition than that which the telegraph transmitted to The Tribune.

This engine was finished only on Tuesday last, and late the same night was run on a trial trip from the Novelty Works to Burnham's on the Bloomingdale road and back. On Wednesday its powers in throwing water were tested, taking suction from off the dock at the Novelty Works; Thursday was devoted to polishing up the machine and putting it in its best holiday dress; and on Friday it was sent by railroad to Trenton, where it had a successful trial and exhibition. Of course, from so new an engine, its full capacity cannot at once be obtained; yet the impression produced by its performance at Trenton, both in its hydraulic and its locomotive functions, was one of unmixed astonishment and admiration.

It had been the intention to run the engine the whole distance from Trenton to Philadelphia, 30 miles, by the common road, but an examination of the canal bridges a few miles out from Trenton showed that they were unsafe, and it became necessary to send it by railroad ten miles to Bristol, leaving twenty miles to be run by its own steam. At the request of Mayor Mills, and through the kindness of Mr. Fish, the railroad superintendent, a special train was provided, and the Mayor himself accompanied us to Bristol. Our party consisted of Messrs. Lee & Larned, the builders—Mr. Lee being in sole command; Mr. Cary, whose rotary pump is one of the features of the engine; Prof. Phelps, of the State Normal School of New-Jersey—who kept the record of time, distance and stoppages; four gentlemen from Philadelphia, representing the Southwark Hose Co., and an engineer, fireman, and other assistants, to the number of six. Nine persons rode on the engine nearly all the way—the remainder accompanying in a two-horse carriage, and taking "turn's about" between the horse and steam conveyance. The total weight, including the engine, fuel, water in boiler and tanks, and the nine passengers, was about 12,000 pounds, of which about 9,000 pounds was due to the engine itself. We heard at Bristol an ominous report of the condition of the draw in the bridge over Neshaminy Creek, three miles ahead, but it was too late to be scared by any more bug-bears in that shape. The locomotive was sent back, the carriage went on nearly a mile ahead, but still keeping in sight, and then, at exactly 2.62 p. m., steam was let on, and the engine

started. It had been the intention that the carriage should keep ahead, but it soon became manifest that this was out of the question. The horses were strong and willing, but they could hold no contest with the tireless horse-giant that had taken the road with them. In a very few minutes it overhauled them, checked up, and finally stopped for a little while to let them get another start; but it was of no use. Almost immediately it was close on them again, overtook and passed them, and reached the gate near Neshaminy Bridge a good half mile in advance, in 18 minutes from the time of starting, having made the first three miles in 16 minutes running time. Here, while the water tanks were replenished and the journals examined and oiled, the carriage drove up and crossed the bridge, and all joined in a survey of its condition. It is a covered bridge, in two parts, about 250 feet in length, with a draw in the middle of about 40 feet. The main bridge was all right, but the draw was old and shaky, and the loads that ordinarily cross it furnished no test of its sufficiency for our purposes. However, it was short; and even if it should be disposed to give way, by "cracking on steam" the engine could cross it before it would have time to fall *far*. But that was not the only difficulty. On the other side rose a long hill, of high grade throughout, with a sharp pitch one third of the way up much steeper than any ascent the engine had yet encountered, on the Bloomingdale road or elsewhere. The road had a good hard bed, covered, moreover, here and there with loose gravel that promised but a poor footing for the whirling tread of the iron steed. But there was to be no flinching; the ascent *must* be made; the steam must go up, to 180 pounds, if need be, the suspicious bridge be crossed at full speed, and the gradual slope beyond to the sharp pitch, and then the momentum, the lever down in "full gear forward," with throttle valve wide open and all steam on, must do the rest. Every man that could be spared left the engine, we took our positions all along up the hill, the men from the saw-mill below left their work and gathered by the road-side, and all awaited "the charge." It was a moment of intense excitement, but the time-keeper, watch in hand, did not fail to note the exact instant of the start. The word is given; the engine moves deliberately for a few yards, then, as steam is let on, takes the bridge as with a leap, and fairly jumps, as the long timbers vibrate in response to the heavy impulses of the drivers; in another instant it has shot across the quaking draw, and is seen emerging from the dark archway, every man at his post, with energies strung to the utmost tension, while the man of iron and fire on the deck, bending over them with bared head, and begrimed face, and black, streaming beard and hair, and flashing eyes, that take in at once the machinery, the men and the confronting track, shouts to the

engineer, who shrinks from the very furthest thrust, "Down, down, down with your lever," and down it is, and the engine, now with full steam on, impelling the pistons in strokes of furious energy, and, with a speed of full 18 miles per hour, clears the slope, and with a facility that surprises every beholder, mounts the steep and presses on to the level summit, when it is brought to a stand, more than 1,000 feet from the starting point, having made the distance in exactly one minute.

Such was our "passage of the Neshaminy," a scene which no one who witnessed it will ever forget. The power developed in the engine at its highest speed was not less than 60-horse—much more than was needed, as it appeared in the result; but this could not be known in advance of the actual trial, and it was necessary the trial should succeed the very first time.

This experiment settled the question as to what the self-propeller could do in ascending grades. Several others occurred, near or quite as formidable, especially the ascent of the Red Lion hill, two or three miles further on, but all were surmounted without faltering, and with much less expenditure of power, experience having shown how much it was necessary to put in requisition. At Holmesburg a heavy grade continuing for half a mile was taken from a "standing start," without any run to acquire momentum, and was surmounted in exactly three minutes. The running time for the whole trip was but a minute or two over two hours, giving ten miles per hour as the average time. The last three or four miles through the streets of the city were necessarily run at a much lower rate. It was fully proved that with a fair grade twelve miles per hour was a natural and easy rate of movement, and that ten miles could be made even up severe grades. More time was consumed in stopping and waiting than in running. Delays occurred, some vexations, and others not a little amusing. We had, of course, to improvise our stations, and though the fuel first taken in sufficed for a run of twelve miles and upward, the water tanks were of less capacity, and had to be frequently replenished by the pailfull from wayside pumps and wells. The trip ended with our arrival at the Southwark Company's house at exactly 8 o'clock, making the whole time five hours and thirty-four minutes.

L.

ITEMS OF NEWS.

NEW FLOOR-COVERING MATERIAL.—The London Mechanics' Magazine states that an original material for floor-covering has recently been patented by Mr. Dunn, a member of C. Goodyear's India Rubber Company, London, which meets all these conditions. It consists of a composition of cork, flock cotton, wool, and other fine fibrous materials of various colors, mixed with India rubber. These are spread on a canvass back and embossed. The result is a material of great permanence and beauty, having all the softness of a car-

pet, with the elasticity and noiseless tread which constitutes the beauty of a real "velvet pile Brussels."

RISE AND FALL OF THE BAROMETER.—In a paper read to the British Association of Science, by one of its members the author shows that there is a compensation and reciprocation of temperature going on at distant places on the earth at the same time and from time to time; that the direction of the wind is determined by the relative rise and fall of the barometer, the current of air setting from the place where it stands high towards those where it stands low; and that heat and cold are the great moving causes in these changes and not evaporation and condensation. These views were illustrated by several examples of the comparative heat and cold of the same days in polar regions and in London, and the course of the wind in tropical and temperate, arctic and equatorial places.

The town of Racine, Wisconsin, is in danger of being undermined by the action of Lake Michigan. Houses, that only a year since were occupied, are now jutting over the bank.

DEATH OF HORACE MANN.—Horace Mann, died at Yellow Springs, Ohio, on the 1st inst. He was professionally a lawyer, but had for many years devoted his talents to the cause of education, in which he has been known and distinguished. He filled the office of Superintendent of Public Schools in Massachusetts with eminent ability. Upon the death of John Quincy Adams, he resigned his office to accept a seat in Congress, thus made vacant. Recently he has been President of Antioch College, Ohio.

BECOMING AFRICANIZED.—The State of South Carolina is now taking a census, and in seventeen parishes there is a decrease of over 5000 whites since 1855, while the blacks have largely increased. At this rate the Palmeto State will soon be Africanized.

SALT AT TURKS' ISLAND, BAHAMAS.—Late accounts from Turks' Island state that 130,000 bushels of salt have been shipped from the different ports of the colony, since the 1st of July. A large quantity is still on hand, with prices ranging from 7 to 8 cents per bushel.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market continues very inactive. The receipts are small, but the stock is ample. Old stock superfine is held at \$5 a 5 12 per barrel and fresh ground, new, at \$5 50. The sales to the trade range from \$5 25 to \$5 75 for superfine and from \$6 00 up to 7 00 for extras and extra family, according to freshness and quality. Not much doing in Rye Flour or Corn Meal. The former is held at \$3 75 and the latter at \$3 62 per barrel.

GRAIN.—There is a limited supply of Wheat, and with a light demand prices are lower. Small sales of prime new red at \$1 20 per bus. and choice white at \$1 25 a 1 32 per bushel. Rye sells at 70 cents for new and 76 c. for old. Corn is in demand. Sales of yellow at 78 a 79c. Oats are firmer; free sales of new Delaware and Maryland at 34c. Prime old Pennsylvania is wanted at 37 a 38 cts.

CLOVERSEED comes forward slowly. If here fair and good would bring \$5 75 per 64 lbs. Timothy is worth \$2 50 a 2 75. Flaxseed is selling at \$1 66 per bushel.

LAKE SCHOOL FOR BOTH SEXES.—This School has a beautiful and healthy location on Oneida Lake, N. Y. Board, Tuition and use of books and

stationery for twenty weeks, from \$45 to \$50, or from \$90 to \$100 for continuous term of forty weeks, beginning 26th of 9th month. This school is situated 130 miles west of Albany.

Circulars sent on application to either Proprietor.
SIDNEY AVERILL, or
ELMIRA AVERILL,
8 mo. 13.—3t. West Vienna, Oneida co., N.Y.

MOORESTOWN BOARDING SCHOOL FOR FEMALES.—The next session will re-open the 1st Second-day of 10th mo. next. For Circulars apply to
MARY S. LIPPINCOTT, Proprietor,
Moorestown P. O., Burlington Co., N. J.
8th mo. 20—3 t.

GWYNEDD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The next session of this Institution will commence on the 14th of 11th month, 1859, and continue twenty weeks. Terms \$70, and no extras. For further information application can be made to
DANIEL FOULKE, Principal,
HUGH FOULKE, Jr., Teacher,
Spring House P. O.,
Montgomery co., Pa.
8 mo. 13—2 mo.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

GEO. A. NEWBOLD,
Purcellville, Loudon Co., Va.

8th mo. 6, 1859.—6m.

BYBERRY BOARDING SCHOOL, FOR GIRLS. The ninth session of Byberry Boarding School, taught by Jane, Anne and Mary S. Hillborn, will commence on the first Second-day of Tenth month, 1859, and continue forty weeks without intermission, (including two terms of 20 weeks each.) The course of instruction embraces all the branches of a liberal English education.

Terms \$60 per session of 20 weeks, one half payable in advance. For circulars containing further particulars address

JANE HILLBORN,
Byberry P. O., Philada., Pa.

8th mo. 7—3m.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Pencilling, and Pellis work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; Reading Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M.
Principal.

Attleboro', Bucks Co., 5th mo., 28, 1859. 6m.

Morrhew & Thompson, Printers, Lodge st., N. side Penn'a Bank.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, EIGHTH MONTH 27, 1859.

No. 24.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,

No. 324 South Fifth Street,

PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

CONVERSATIONS ON RELIGIOUS SUBJECTS, BETWEEN A FATHER AND HIS SONS.

BY SAMUEL M. JANNEY.

(Continued from page 355.)

Baptism and the Lord's Supper.

James. Since our last conversation, I have been reflecting on the subjects of baptism and the Lord's supper, which appear to have been ceremonies practised in the primitive Christian church, and are said to have been commanded by Christ himself. If they have such high authority for their observance, I do not see how any of the professed followers of Christ in the present day can disregard them.

Father. I am willing to state my views upon these subjects, and give the grounds on which my own convictions are founded; but I have seen so little good resulting from religious controversy that I always abstain from it when possible.— During the progress of an argument on any religious subject, the minds of both parties are generally too much excited to be open to conviction. Changes of sentiments on these subjects are generally the result of deliberation, and communion with the witness for truth in our own consciences, and it often happens that the conclusions formed in this manner, although accompanied with sufficient weight of evidence for the satisfaction of our own minds, cannot be stated to others in such a manner as to satisfy them, until they shall have passed through the same stages of experience.

John. I think I can appreciate the soundness of this sentiment, for I know, by experience, that some religious truths which now appear very clear to my understanding, were at a former period the subjects of much doubt; although I endeavored to become acquainted with the strongest

arguments that had been advanced for them, and felt a sincere desire to weigh them impartially. The subject of baptism is one on which my mind is not satisfied; and being desirous of conforming to all the commands of our Saviour, I have long been anxious for further light upon it.

Father. I have no doubt the Divine Master is now subjecting thee to the purifying process of his own baptism; and if thou art able to "drink of the cup that he drank of, and to be baptized *with his baptism,*" there will be no need of resorting to the outward and elementary type of that cleansing operation which his spirit performs within us.

James. I believe it is now agreed by most of those who administer water-baptism, that it makes no change in the heart, but is an outward and visible sign of an inward and invisible grace. They think it was commanded by Christ, and intended as a badge of our profession, and a seal of the covenant, as circumcision was given to the Israelites.

Father. I think if this were the case, we should find it mentioned in some of the writings of the New Testament; but it is not spoken of as the seal of the new covenant, nor can it be considered as the badge of Christian profession, because it leaves no impression to distinguish those who have received it from the rest of the world. The only seal of the new covenant is "the Holy Spirit, whereby *ye are sealed* unto the day of redemption;" (Eph. iv. 30) and the only badge of discipleship mentioned by the Divine Master, consists of the fruits which are produced by the influence of this spirit. "By this shall all men know that ye are my disciples, if ye have love one to another;"— and "Ye shall know them by their fruits."

John. The command of Christ to his disciples, "Go teach all nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghost," is considered by most persons as still obligatory upon the church.

Father. But in this text, *water-baptism* is not mentioned; and it appears that the writers of the New Testament speak of the baptism of John and that of Christ, as distinct from each other. John said to the Jews, "I indeed baptize you with water unto repentance, but he that cometh after me is mightier than I, whose shoes I am not worthy to bear, he shall baptize you with the *Holy Ghost and with fire*; whose fan is in his hand, and he will thoroughly purge his

floor and gather his wheat into the garner, but he will burn up the chaff with unquenchable fire." Matt. iii. 11, 12. It is also said that when Paul came to Ephesus he found certain disciples, of whom he inquired, "Have ye received the Holy Ghost since ye believed? And they said unto him, We have not so much as heard whether there be any Holy Ghost. And he said unto them, Unto what then were ye baptized? And they said, Unto John's baptism. Then said Paul, John baptized with the baptism of repentance, saying unto the people, That they should believe on him which should come after him, that is, on Christ Jesus. When they heard this, they were baptized in the name of the Lord Jesus. And when Paul had laid his hands upon them, the Holy Ghost came on them; and they spake with tongues, and prophesied. And all the men were about twelve." Acts xix. 2-7.

James. It seems to me that none can baptize with the Holy Ghost but Christ himself: and in the text just quoted, it appears that these new converts had been baptized with John's baptism unto repentance, and Paul had them baptized again in the name of the Lord Jesus; and after that he laid his hands on them, and they received the Holy Ghost. May we not conclude that Paul used water in this instance?

Father. I think not: for there were twelve of these disciples who were men; and Paul says in another place, that Christ had sent him not to baptize, but to preach the gospel; and he thanked God that he baptized none of them but Crispus and Gaius, and the household of Stephanus. (1 Cor. i. 14, 16.) Although it may be said in one sense, that none can baptize with the spirit but Christ himself, the same may be said of preaching the gospel; which no man can do without Divine assistance. When the gospel is preached "in the demonstration of the spirit and of power," it has a baptizing influence; that is to say, it brings the hearers who are willing to receive it, under the influence of Divine love, and they become "baptized by one spirit into one body," and "are all made to drink into one spirit." (1 Cor. xii. 13.) The apostles were not prepared to administer this spiritual baptism, until they had waited at Jerusalem, and were endued with power from on high, by the descending upon them of the Holy Ghost. And notwithstanding the miracles have ceased, which accompanied that baptism at the dawn of the gospel day,—yet the reality of it is as truly experienced now, by those who come under the influence of the spirit of Christ. Although Paul was not sent forth to baptize with water, there is no doubt his commission was as extensive as that of the other disciples; for he was clothed with Divine love, and was made instrumental in bringing others under its baptizing influence. This still continues to be the case with true gospel ministry, in proportion as the instrument is en-

dowed with the ability which God giveth; for such ministry has always had a baptizing power.

John. But although water is not mentioned in these texts, there is another place where it is mentioned by Jesus himself. He said to Nicodemus, "Except a man be borne of water and of the spirit, he cannot enter into the kingdom of God." John iii. 5.

Father. It must be observed, that on this occasion he had not been speaking of baptism, but of the *new birth*; and he goes on to say, "That which is born of the flesh is flesh, and that which is born of the Spirit is spirit." As the expression cannot be taken literally, it must be understood figuratively; that is, water being a purifying element, was coupled with the Spirit to describe its effects, in the same manner that fire was mentioned in conjunction with the Holy Spirit, by John the Baptist, when he said of Christ, "He shall baptize you with the Holy Ghost and with fire." Therefore the water here intended which can give a new birth, must be the water of the river of life, which whosoever drinketh shall never thirst.

James. But water-baptism was frequently, if not always, administered by the disciples, both before and after the crucifixion of Christ: and we know that Jesus himself submitted to the baptism of John.

Father. This argument, if valid in favor of water-baptism, is equally so with regard to circumcision, and other rituals of the Jewish law; to all of which the Messiah submitted.

We find that when Paul went up to Jerusalem, about twenty-seven years after the ascension of Christ, the disciples said to him, "Thou seest, brother, how many thousands of Jews there are which believe, and they are *all zealous of the law*." And Paul condescended to their prejudices so far as to purify himself, and to enter with four others into the temple, "until an offering should be offered for every one of them." It appears further, that Peter was so filled with Jewish prejudices, eight years after the ascension of Christ, that it required a remarkable vision to convince him that he ought to go unto the house of Cornelius to preach the gospel; and after he had done so, "they of the circumcision contended with him, saying, Thou wentest in unto men uncircumcised, and didst eat with them."

I mention these circumstances to show, that even the apostles, as well as the other Jewish converts to Christianity, did not at once come into the spirituality of the gospel dispensation, but retained for a considerable time a number of the Jewish rites and ceremonies; and no doubt they adhered with equal fondness to the water-baptism of John. It is said of Apollos, that being "fervent in the spirit, he taught diligently the things of the Lord, *knowing only the baptism of John*. And he began to speak boldly in the synagogue; whom when Aquila and Priscilla had

heard, they took him unto them, and expounded unto him the way of God more perfectly." Acts xviii. 25, 26.

(To be continued.)

EXTRACTS FROM A MEMOIR OF
ELIZABETH T. KING.

(Continued from page 342.)

The following extracts are from her journal, which, from this time seems to have been kept with much regularity:

"7 mo., 1st, 1845. I am very much tried with my imperious and impatient temper. May I be able to overcome this. Then I have a tendency to self-indulgence. May I be favored to feel that the one thing needful is the only thing desirable.

15th. O Father, feeble and unworthy as I am, Thou knowest the desire of my heart is to serve Thee. It is Thou who hast given this desire; Thou wilt not refuse it. Make, I beseech Thee, the way plain before me, and enable me to tread it in the obedience of faith.

8 mo. 16th. 'I will take heed to my ways, that I sin not with my tongue.' I have been too careless of late in repeating tales to the disadvantage of others. O that I may walk in the fear of the Lord all the day long. I have felt that we were not to ask for temporal blessings, or spiritual comforts, but only that we might be fed with food convenient for us, even though that may be the bread of adversity and the water of affliction. 'Shall we receive good at the hand of the Lord, and shall we not receive evil?'

9 mo. 1st. May I be led and guided in all my steps by Him who is the only Leader, that I may give up every thing which He requires, in little things as well as great. Oh enable me to bear patiently the daily cross, looking for no comfort or pleasure out of the fulfilment of Thy will. Give me to travail availingly for the welfare of Thy Church militant, for those that are dear to me, and for my own advancement in the pathway of holiness. I have only sins and weaknesses to bring to Thee; be pleased to have compassion, and afford a little help to struggle against them, manifold though they be.

10 mo. 15th. Yesterday I had a call from ——. I talked much, and perhaps not unprofitably; but it had an exciting and unfavorable effect, as it tended a little to the exaltation of self. I can not bear to have my quiet disturbed; and those periods when, as it were, I rest under the shadow of His wings, are so precious, that I desire to watch jealously lest any earthly feeling should draw me from this refuge. There is no comfort, no satisfaction, in any thing else. The heart can rest in no earthly home; not too entirely even in that which is provided to cheer it as a brook by the way.

11 mo. 21st. I have continually to struggle against my pride and selfishness. Oh for the

rest of true humility! Could I attain to it, how much should I enjoy. Well, in the beautiful language of one of our early Friends, 'None are so weary but He takes care of them, and none so nigh fainting, but He puts His arm under their heads; nor can any be so beset with enemies on every side, but He will arise and scatter them; and none are so heavy laden, but He takes notice of, and gently leads them—so tender this Good Shepherd over His flock.'

Oh what marvellous loving-kindness! To believe in this constantly would be an abiding comfort; but our own weakness and faithlessness interpose many clouds between us and the Sun of Righteousness."

It is but justice to her character to say, that these complaints of irritability and selfishness arose from her desire to be thoroughly conformed to the perfect Pattern. Her conduct was ever marked by a scrupulous attention to the wishes of others, and a striking forgetfulness of self.

The time was now approaching in which she was to leave the home of her childhood, and assume new duties and responsibilities.

On the last night of the year 1845 the following entry occurs:—

"12 mo. 31st. So it will soon be over—a year which has decided my future life. I began it with anticipations of happiness; they have been realized, for I never before was so happy, though now the future assumes no definite form. But I am almost sorrowful, even heavy-hearted now, as I feel the weight of the step I am about to take. May my love become more and more spiritual, and divested of selfishness; may my faith be strengthened, that I may go on quietly and calmly in the way in which I believe I am called upon to walk, not repining or feeling disappointment if I should find some thorns among the flowers. I must look to Him who is 'strength in weakness,' to be with me now, and desire to resign myself and all I have, unreservedly, into His holy keeping.

On the 8th of 1st month, 1846, she was married to Francis T. King, of Baltimore, and removed to reside in that city. A change of residence brought with it no change in her desires for holiness; but, in the enjoyment of her many blessings, her heart continually turned to her Heavenly Father, and sought to follow Him unreservedly. In reference to her marriage, she says—

"As for me and my house, we will serve the Lord, and serve Him too in the way of His requiremings, as far as strength is given us to do so.

Oh, Father, satisfy, if it please Thee, the desires which we believe Thou hast created in our souls for more holiness and greater usefulness, and grant, if consistent with Thy holy will, that we may go on together in the path of humility and self-denial.

1 mo. 22d, 1846: All must be in subjection to the Father of spirits, and now I renewedly desire to take such portions from His hand as He may see meet to bestow, in thankfulness for what is given and for what is withheld. Oh to be made meet to be a partaker with the heavenly host—to be fitted for usefulness while detained on earth. I long to be dedicated, body, soul and spirit, to the service of the Redeemer, while I feel that flesh shrinks from sacrifice and self-denial.”

To be continued.

The heart of man seeks for sympathy, and each of us craves a recognition of his talents and his labors; but that man has fallen into a pitiable state of moral sickness, in whose eyes the good opinion of his fellow-men is the test of merit; and their applause the principal reward for exertion.

LOVE FOR LOVE;

OR THE DEBTS OF CHILDREN TO PARENTS.

Filial love may be shown by patience and forbearance with parents, when they are descending the vale of years. It is one of the beautiful orders of Divine Providence, that we may pass through successive stages of growth and decline, before we are suffered to complete the pilgrimage of life, and thus the parents who tended us in infancy become dependent on us for the same tenderness when they are feeble by sickness or old age. Sometimes God calls parents out of the world while their children are yet in youth. But he does bless and honor that house in which he spares the aged sire and the venerable mother, to be the glory of their children; to counsel them, to pray with and for them, and to receive their gentle ministries of filial love.

It is a privilege for which we should be unspeakably thankful, to be permitted to smooth the passage to the grave of those who led us by the hand along the path of life in the morning of our days! To shield them from the storms of a pitiless world, by giving them a pleasant resting place by our own fireside, in the midst of our children, in whom they may live over again the scenes of their former days, when we were sporting on their knees! We owe them this retreat—we owe them more than this, and more than all we can ever give. To make them a return in kind or in degree, is beyond our power. If we make it a matter of debt and credit with our parents, we shall be bankrupt always. You may load them with riches, the fruit of your own life's long toil; you may carry them in your arms to their nightly couch, and watch them till the morn returns; you may whisper words of kindness in their ear, and smile lovingly on them as their eyes grow dim with age; you may hold their dying head upon your

breast, and wipe the death sweat from their brows, and kiss away their expiring breath, and lay them softly in the grave—all this is what a parent most desires, when he knows that he is about to die; but all this, and a thousand-fold more, will never repay the debt of gratitude you owe for parental love and care when you were an unconscious infant, wailing in a mother's arms.

While you were in the cradle, you had a fit of sickness. You knew not that one whose heart was almost breaking with anxious fear was hanging over you, watching with intense solicitude your breathing through the long, long night, kissing you to sleep when in feverish dreams you started from your slumbers and screamed in fright; singing through her tears; and soothing you with such tender pressures as only a mother's arms can give, when folding a sick babe to her own sick heart. Had you *died* in her arms, she would have been heard when she found you again an angel among the angels.

“Oh! when a mother meets on high
The babe she lost in infancy,
Hath she not then, for pains and fears,
The day of woe, the watchful night,
For all her sorrows, all her tears,
An over-payment of delight?”

But you lived; and now the debt is upon you, increased by years of such days and nights, through which your parents have followed you with anxious hearts and watchful eyes, to keep you from falling, to help you in trouble, to lead you in the ways of usefulness, and point you to the gates of eternal life.

The strength of a parent's love has been tested in a thousand cases, and it has never failed. The story of Jacob and Joseph is on the great chart of Old Testament history, to be studied, age after age, as one of the most touching and beautiful passages in the annals of human love. Yet every *parent* whose heart has not been hardened by vice, is a *Jacob* in affection for the children that God has given him.

The tie is tender but strong, and often it seems to fasten itself on objects that have no loveliness save in the eyes of parental regard. How frequently do we observe with delight that the least favored child in the group is the favorite in the parental heart. Perhaps it is deformed, or helpless; perhaps deficient in intellect; yet its very infirmities, that make it less attractive to others, secure for it such a place in a fond father or mother's love, that its loss of beauty, or of limbs, or of intellect, is a gain of love to the child. When death has come into the family circle, and taken away this child, the neighbors and friends have said that it was a mercy to have it removed, for they thought it no comfort to its parents; but those parents have grieved more over its death than they would over any other one of their little flock. Its helplessness

won upon their sympathies. Because others cared less for it, they cared more for it. And I have heard such parents say that their little blind daughter was more comfort to them than all the rest of their children. This is no strange thing, that the parents should so cling to their children. The wonder is that in all the world there can be found one son or daughter so ungrateful and cruel as to make a parent feel

"How sharper than a serpent's tooth it is
To have a thankless child."

N. Y. Observer.

It is good and profitable to keep near the Fountain Head, that, if the streams be diverted out of the expected channel, we may not be at a loss, having that to approach to which remains everlastingly fixed.

HUGH MILLER.

In a recent number of the *Living Age* there appeared several very interesting notices from Foreign Reviews, of Hugh Miller, whose name is now associated with those of the great and good who have left their example and labors for our instruction. We have made some selections from these, taking such as possess the greatest interest to the general reader. The following from the *North British Review* was published some years before his death.

Hugh Miller was born at Cromarty, of humble but respectable parents, whose history would have possessed no inconsiderable interest, even if it had not derived one of a higher kind from the genius and fortunes of their child. By the paternal side, he was descended from a race of sea-faring people, whose family burying-ground, if we judge from the past, seems to be the sea. Under its green waves his father sleeps; his grandfather, his two grand-uncles (one of whom sailed round the world with Anson), lie also there; and the same extensive cemetery contains the relics of several of his more distant relatives. His father was but an infant of scarcely a year old at the death of our author's grandfather, and had to commence life as a poor ship-boy; but such was the energy of his mind, that, when little turned of thirty, he had become the master and owner of a fine large sloop, and had built himself a good house, which entitled his son to the franchise on the passing of the Reform Bill. Having unfortunately lost his sloop in a storm, he had to begin the world anew, and he soon became master and owner of another, and would have thriven, had he lived; but when our author was a little boy of five summers, his father's fine new sloop foundered at sea in a terrible tempest, and he and his crew were never more heard of. Hugh Miller had two sisters

younger than himself, both of whom died ere they attained to womanhood. His mother experienced the usual difficulties which a widow has to encounter in the decent education of her family; but she struggled honestly and successfully, and ultimately found her reward in the character and fame of her son. It is from this excellent woman that Hugh Miller has inherited those sentiments and feelings which have given energy to his talents as the defender of revealed truth. She was the great-granddaughter of a venerable man, still known to tradition in the north of Scotland—Donald Roy of Nigg—a sort of northern Peden. Tradition has represented him as a seer of visions, and a prophet of prophecies: but, whatever credit may be given to stories of this kind, which have been told also of Knox, Welsh, and Rutherford, he was a man of genuine piety, and the savor of his ennobling belief and his strict morals has survived in his family for generations. If the child of such parents did not receive the best education which his native town could afford, it was not their fault, nor that of his teacher. The fetters of a gymnasium are not easily worn by the adventurous youth who has sought and found his pleasures among the hills and on the waters. They chafe the young and active limb, that has grown vigorous under the blue sky, and never known repose but at midnight. The young philosopher of Cromarty was a member of this restless community; and he had been the hero of adventures and accidents among rocks and woods, which are still remembered in his native town. The parish school was therefore not the scene of his enjoyments; and, while he was a truant and, with reverence be it spoken, a dunce, when under its jurisdiction, he was busy in the fields and on the sea-shore in collecting those stores of knowledge which he was born to dispense among his fellow-men. He escaped, however, from school with the knowledge of reading, writing, and a little arithmetic, and with the credit of uniting a great memory with a little scholarship. Unlike his illustrious predecessor Cuvier, he had studied natural history in the fields and among the mountains ere he sought for it in books; while the French philosopher had become a learned naturalist before he had even looked upon the world of nature. This singular contrast it is not difficult to explain. With a sickly constitution and a delicate frame, the youthful Cuvier wanted that physical activity which the observation of nature demands. Our Scottish geologist, on the contrary, in vigorous health, and with an iron frame, rushed to the rocks and the sea-shore in search of the instruction which was not provided for him at school, and which he could find no books to supply. After receiving this measure of education, Hugh Miller set out, in February, 1821, with a heavy heart, as he himself confesses, "to make his first acquaintance with a

life of labor and restraint." In the exercise of his profession, which "was a wandering one," our author advanced steadily, though slowly and surely, in his geological acquirements.

After having spent nearly fifteen years in the profession of a stone-mason, Hugh Miller was promoted to a position more suited to his genius. When a bank was established in his native town of Cromarty, he received the appointment of accountant, and he was thus employed, for five years, in keeping ledgers and discounting bills. When the contest in the Church of Scotland had come to a close, by the decision of the House of Lords in the Auchterarder case, Hugh Miller's celebrated letter to Lord Brougham attracted the particular attention of the party which was about to leave the Establishment, and he was selected as the most competent person to conduct the *Witness* newspaper, the principal metropolitan organ of the Free Church. The great success which this journal has met with is owing, doubtless, to the fine articles—political, ecclesiastical, and geological—which Hugh Miller has written for it. In the few leisure hours which so engrossing an occupation has allowed him to enjoy, he has devoted himself to the ardent prosecution of scientific inquiries, and we trust the time is not far distant when the liberality of his country, to which he has done so much honor, will allow him to give his whole time to the prosecution of science.

In the Autumn of 1856, he labored too assiduously in endeavoring to complete the great work upon which he was engaged. This overmuch brain work brought on a temporary fit of insanity, during which, on the night of the 23d of 12th mo., 1856, he died by his own hand. After this sad event, the *Edinburgh News* thus speaks of him :

We cannot well estimate the loss which society sustains in the death of Hugh Miller. He occupied a foremost place among us. In the world of letters his name takes high rank, for undoubtedly he was one of the ablest writers in our literature. Who can have read without delight his manly, vigorous language, soaring sometimes into the highest eloquence, anon plunging into the depths of metaphysical argument, or grappling with the dry technicalities of science, yet ever rolling along with the same easy, onward flow? His style has all the charm of Goldsmith's sweetness, with the infusion of a rich vigor that gives it an air of great originality. He is one of the few writers who have successfully conjoined the graces of literature with the formal details of science, and whose works are perused for their literary excellences, independently altogether of their scientific merit. His writings will ever be regarded among the classics of the English language. For obvious reasons

we pass over his editorial labors. It is on the republic of science that his death will fall most heavily. There can be little doubt that he has done more to popularize his favorite department than any other writer. Of all geological works, his enjoy, perhaps, the widest circulation—not in this country, merely, but all over the world, and especially in the United States. His reputation, however, does not rest solely on his standing as an exponent of science to the people; he was himself an original and accurate observer. When the infant science of geology was battling for existence against the opposing phalanx of united Christendom, Hugh Miller, then a mere lad, was quietly working as a stone-mason in the north of Scotland, and employing his leisure time among the fossil fishes of the Old Red Sandstone, and the ammonites and the belemnites of the Lias, that abound in the neighborhood of Cromarty. As years rolled slowly away, he continued his observations, and when at length, in 1841, the results were given to the world in his well known "Old Red Sandstone," every one was charmed with the novelty and beauty of the style, and his reputation as a writer was at once established. Men of science, however, though acknowledging the graphic and elegant diction of his descriptions, had some doubts as to their truthfulness. Indeed, by some geologists they were cast aside as fanciful, and other restorations of the Old Redfishes were proposed and adopted. Those who are acquainted with the Old Red ichthyolites, or who have had the pleasure of examining the exquisite series in Hugh Miller's collection, may well smile at the absurdity of the restorations that were adopted. Yet some of these found their way into a work of no little popularity,—Mantell's "Medals of Creation." It is sufficient to state that the drawings there given bear no resemblance to any thing in the heavens above or on the earth beneath, or in the waters under the earth, nor to any fossil organism that has ever been discovered. At length the progress of investigation led to the discarding of these monstrosities, and Miller's restorations were returned to, as, after all, the true ones. "The Old Red Sandstone" formed an era in the history of fossil geology. That formation had hitherto been regarded as well nigh barren of organic remains; but Hugh Miller demonstrated that it contains at least three successive stages, each characterized by a suite of uncouth and hitherto unknown fishes. A few years later he published his "Foot-prints of the Creator." This is undoubtedly his *chef d'œuvre*, exhibiting, as it does, the full powers of his massive intellect and his poetic imagination. As a piece of scientific investigation and research, it is of a very high order: as a reply to the crudities of the development theory, it is unanswerable; and as a contribution to our physico-theological literature, it ranks, with Chalmers' "Astronomical

Lectures," among the finest in this or any other language. Some of the ideas are as profound as they are original, opening up a new field of thought, which it was doubtless the intention of the deceased himself to cultivate. His published works, however, contain but a fraction of the labors of his lifetime.

"For many years past he has been one of the most energetic members of the Royal Physical Society, at whose meetings he from time to time made known the progress of his researches. Were these papers collected, they would form several goodly volumes. But their author studiously refrained from publishing them, save occasionally in the columns of the *Witness* newspaper. It was his intention that they should each form a part of the great work of his life, to which for many years his leisure moments had been devoted. His design was to combine the results of all his labors among the different rock formations of Scotland into one grand picture of the geological history of our country. For this end he had explored a large part of the Scottish counties, anxious that his statements should rest as far as possible upon the authority of his own personal investigations. His knowledge of the geology of the country was thus far more extensive than was generally supposed. We may refer particularly to that branch of it on which he bestowed the unremitting attention of his closing years,—the palæontological history of the glacial beds,—that strange and as yet almost unknown period that ushered in the existing creation. He studied it minutely along the shores of the Moray Frith, on the east coast of Scotland, along the shores of Fife and the Lothians, and on the coast of Ayrshire and the Frith of Clyde. This last summer he made a tour through the centre of the island, and obtained boreal shells at Buchlyvie in Stirlingshire,—the *omphalos* of Scotland. The importance of this discovery, in connection with those he had previously made in following out the same chain of evidence, can only be appreciated by those who have paid some attention to geology. We may state briefly that it proves the central area of Scotland to have been submerged beneath an icy sea, and icebergs to have grated along over what is now the busy valley of the Forth and Clyde, while the waters were tenanted by shells at present found only in the Northern Ocean. A large part of his work is written; though it is to be feared that much knowledge amassed in the course of his preparation, has perished with him. In particular, there were whole sections of his Museum understood only by himself. Every little fragment had its story, and contributed its quota of evidence to the truth of his descriptions. There is, perhaps, but another mind in Britain—that of Sir Philip Egerton—that can catch up the thread, and read off, though with difficulty, the meaning of those carefully arranged fragments. Yet,

even with such aid, much must long, if not for ever, remain dark and obscure. The work on which he was more immediately engaged at the time of his death was partly theological, partly scientific. It was to embrace the substance of some lectures lately delivered, and a paper read last year before the British Association at Glasgow on the fossil plants collected by himself from the Oolite and Old Red Sandstone of Scotland. It was likewise to contain the figures of some thirty or forty hitherto undescribed species of vegetables. We hope that, as it was all but ready for publication, it may yet be given to the world.

"The name of Hugh Miller will ever stand forth as synonymous with all that is honest and manly; as the impersonation of moral courage and indomitable energy; as the true ideal of a self-educated man. From the humblest sphere of life, and from the toils of a stone-mason's apprentice, without means, without friends, without other than the most rudimentary education, he rose, by his own unaided and unwearied exertions, to fill one of the brightest pages in the annals of our country. And when, in future years, an example is sought of unconquerable perseverance, of fearless integrity, and of earnest, ceaseless activity, the voice of universal approbation shall proclaim—"the stone-mason of Cromarty." We have spoken of this mournful event only as a public calamity; yet, to those who were personally acquainted with the departed, it is invested with no ordinary sadness. Long, long shall they remember the playful fancy, the rich humor, the warm, genial heart of their friend. His simple, open frankness endeared him to every one, though his retiring disposition prevented him from making many intimate friendships. To those who enjoyed this higher privilege, his death must have caused the most poignant regret. Yet what can even their sorrow be to that of the relatives of the departed? We lament the death of one who was alike an honor to his profession, to literature, to science, and to his country,—and of the most loved and cherished of friends."

OLD BIBLE.

Speaking of old Bibles, there is one now in the city of New London, Connecticut, which is remarkable, not only for its antiquity, but for its early history. It claims to be the identical book that Rev. John Rogers, the martyr, owned; and after the persecution of Mary, concealed in a bed, to keep it from being destroyed by the minions of Gardiner and Bonner. The martyr, who was burned 303 years ago, gave it to his oldest son. The posterity of that son removed to America in 1635, bringing the martyr's Bible with them. In this wilderness it was kept as an amulet to keep off the devil and the Indians.

When its owner, James Rogers, travelled, he wore it in his bosom, and when he slept at night it was his pillow. It was the light of his log cabin and the instructor of his children. It descended from Judith Rogers, who married Thomas Potter of Hopkinton, Rhode Island, and has now been in the possession of the Potter family about 100 years. This family claim also the direct Rogers descent, through Judith Rogers, wife of Thomas. Its present owner lives at Potter Hill, R. I.; but the Bible is for a time in the hands of Daniel Rogers, Esq., of New London. It contains the New Testament, Psalms, and part of the Liturgy of the English Church in the reign of Edward VI. It is not divided into verses, and its division into chapters differs from King James's translation. It is Mathews' or Craumer's Bible.—*Journal of Commerce.*

FRIENDS' INTELLIGENCER.

PHILADELPHIA, EIGHTH MONTH 27, 1859.

Erratum.—In the obituary notice of Mary Eck, No. 22 of the *Intelligencer*, her age should have been stated as 79, instead of 49.

DIED, 7mo. 31st, 1859, at the residence of William Satterthwaite Jr., EDITH PALMER, aged 87 years and 10 months.

—, in Philadelphia on 4th day, the 3d inst, SARAH M. daughter of the late James Widdefield.

Extract from the Moravian.

WORK AND LOVE.

The great secret of success, in any undertaking, is folded up like the fragrance of a flower in the heart that prompts to it. That work which is commenced with enthusiasm, prosecuted with energy, and finished by persevering labor, is almost certain of winning for its author the reward which he covets. They who would live to purpose must live in earnest, fearing no danger, dismayed by no obstacle, and shrinking from no self-denial.

We have not an Aladdin's lamp to charm our wishes into realities, nor a magical wand to bring distant things near. The philosopher's stone, which could convert the dust and rubbish of our minds into ingots of fine gold, still lies undiscovered by the shore of an unknown sea. Effort is a talisman which has power to work wonderful changes of truth and right in this probationary life.

We are all prone to depreciate our opportunities. Had we the wealth which a kind Providence has lavished upon our neighbors, we would be the joyful almoners of the bounty of God. Had we the rich gifts of genius, the profound wisdom of the scholar, or the eloquent tongue of the orator,

we would tell the sweet story of the cross in tones that would melt the hardest heart. And since our Father has given us but one talent, while another has the keeping of ten, we would fain hide it away in darkness, or let it moulder idly in the dust.

Yet the commandment is: "Whatsoever thy hand findeth to do, do it with thy might!" It is binding upon us all, as well upon the lowliest child of want and sorrow as upon the happy one, whose lot lies in a pleasant land; as well upon the youth whose bounding steps tread the "morning street" of life, as upon him whose bronzed forehead wears the noonday crown, or him whose weary feet totter on the slippery steeps of Time's descending vale. Oh! what a world of good lesson home; if every toiler in the vineyard might be done if every Christian heart took the vated his portion of the field with all the strength and skill which he could bring to the task. So thought John Bunyan the Prince of Dreamers, as in the gloom of his prison cell he traced the pilgrim's progress from the city of destruction to the city of life. So thought Mary Lyon; and with no riches but the wealth of an earnest heart and the strength that cometh by prayer, she performed a noble work for her sex and for God.

Work and love should be graven on the tablets of every laborer. How brightly then would the inner lamp burn when the winds were wild and the way long, and the field barren and cheerless. How the feet would linger in the homes of want and sorrow, and the eyes grow dim at the bedside of pain and distress. As our Master did, we would strive to do, shutting out none from the pale of our sympathies, and extending a warm hand to the uttermost of life's weary ones.

Loving hearts make willing hands. Christ should dwell in our hearts, and the reflection of his brightness should illumine and glorify our lives. Toiling for *him* we should seek no rest till the blessed hour when his voice shall bid us "come up higher!"

REMARKABLE VISION OF THOMAS SAY.

Thomas Say was born of religious parents, in Philadelphia, 9th month 16th, 1709, old style. He was educated an Episcopalian: but early in life "he seemed to prefer getting into stillness, and would, in consequence, often attend Friends' meetings, where he said he frequently found spiritual comfort." He was united to the Society of Friends when a young man; and throughout his life was remarkable for the tenderness of his conscience, and the benevolence of his character. He was guardian to a great number of orphan children, and was zealous in supporting schools, for black as well as white. He was a saddler and harness-maker by trade; and was remarkable for industry, as well as for the neatness and facility of his workmanship. His mode of

life was temperate and simple in the extreme; and this may be one reason why his mental faculties continued clear and vigorous to the last, though he lived to an advanced age.

When about sixteen or seventeen years old, he had a dangerous illness, and was supposed for some time to be dead. It was during this trance that he had the vision here recorded in his own words. Numerous cotemporaries, of the highest respectability, were in the habit of testifying to the entire veracity of that part of his statement of which it was possible for them to judge; and many of their descendants have now a clear recollection of such testimony, often repeated.

"I was apprentice to William Robinson. Many were the ways and methods I took to get rid of my evil thoughts and melancholy meditations. I frequently used to stretch myself along upon a bench, viewing and counting the stars; and it often arose in my mind, If there be no Divine Being whence came the stars? and why ranked in such order? These serious meditations caused the tears to flow down my cheeks, while my soul inwardly cried, and said, Oh, if there be a God, let me *know* it, before it be too late. At last I concluded that to believe there was a God and a future state, and to strive to obey him, could not hurt me; but if I should die in a state of unbelief, and find a God, my state would be miserable indeed. Here it pleased the Lord to work upon me according to the richness of his goodness, and under these considerations to beget a desire in me to know him, and a longing to be reconciled to him and he to me. At length he visited me with a sickness called the pleurisy, in which I continued for some time, in extreme anguish both of body and mind. Sometimes a small glimmering hope of mercy seemed to revive me a little; at other times I was almost in despair. Thus I continued for nine days. The fifth and seventh days, being exceedingly thirsty, I cried out to my mother, and said, 'Oh, that I could get my thirst quenched for a moment, before I go hence, that I might enjoy a moment's happiness; for I am afraid that if it is not quenched here, it will not be quenched hereafter.' This made my mother burst into tears; and she said, 'If that is *thy* state, what will become of the world?'

None but God knew the distressed condition of my poor soul at that time. But here the Lord shewed me he 'opens rivers in high places, and fountains in the midst of the valleys; that he makes the wilderness a pool of water, and the dry land springs of water.'

On the ninth day, between the hours of four and five, I fell into a trance, and so continued until about the hour of three or four the next morning. After my departure from the body, (for I left the body,) my father and mother, Susannah Robinson, and others, who watched me, shook my body, felt for my pulse, and tried if

they could discern any remains of life or breath in me, but they found none.

When I opened my eyes, I found myself laid on my bed, as a corpse is on a board. I was told, after I got better, that the reason they did not lay me on a board, was because my mother could not find freedom to have it done. They sent for Dr. Kearsley, who attended me, to have his opinion. When he came, he felt for my pulse, and told them he found no remains of life in me, but as he was going away, he returned again, and said that something came into his mind to try further. He asked for a small looking glass, which Catherine Souder, who lived with my father, procured. The doctor laid it on my mouth for a short time, and when he took it off, a little moisture appeared on it. He then said, 'If he is not quite dead, I think he never will open his eyes again; but I would have you let him be as he is, while he continues warm, and when he begins to grow cold, lay him out.'

This they told me after I returned into the body. At first, I inquired why so many sat up with me; not knowing that they thought me dead. They were very much surprised to hear my voice; the second time I spoke, they all rose from their chairs; and when I spoke the third time, they all came to me. My father and mother inquired how it had been with me? I answered that I thought I had died, and been going into heaven; that after I left the body, I heard, as it were, the voices of men, women, and children, singing songs of praises unto the Lord God and the Lamb, without intermission, which threw me into transports of joy. My soul was also delighted with beautiful verdant groves, which appeared to me on every side, and such as were never seen in this world. Through these I passed, being all clothed in white, and in my full shape, without the least diminution of parts. As I passed along towards a higher state of bliss, I cast my eyes upon the earth, (which I saw plainly,) and beheld three men, whom I knew, die. Two of them were white men; one of whom entered into rest, and the other was cast off. There appeared a beautiful transparent gate opened; and as I and the one that entered into rest, came up to it, he stepped in; but as I was stepping in, I stepped into the body. When I recovered from my trance, I mentioned both their names; at the same time telling in what manner I saw them die, and which of them entered into rest, and which did not. I said to my mother, 'Oh, that I had made one step further! then I should not have come back again.'

After I told them what I had to say, I desired them to talk no more to me; for I still heard the melodious songs of praises; and while I heard them I felt no pain; but when they went from me, the pain in my side returned again. I was glad of this, hoping every stitch would take me off; for I longed for my final change.

After I told them of the death of the three men, they sent to see if it was so, and when the messenger returned, he told them they were all dead, and had died under the circumstances I had mentioned. Upon hearing this, I fell into tears, and said, 'Oh, Lord, I wish thou hadst kept me, and sent back him, who entered into pain.'

Soon after this, I recovered from my sickness.

One of those whom I saw die, was a negro, named Cuffee, who belonged to the widow Kearney. Some time after my recovery, the widow sent for me, and inquired whether I thought departed spirits knew each other. I answered in the affirmative; and told her I saw her negro man die, whilst I myself appeared to be a corpse. She asked me, 'where did he die?' I told her in her back kitchen, between the jamb of the chimney and the wall; and when they took him off the bed to lay him on a board, his head slipped from their hands. She said it was so; and asked me if I could tell her where they laid him. I told her they laid him, at first, between the back door and the street door. She said she did not remember anything of that. I told her he lay there whilst they swept under the window, where he was afterward placed. She then said she remembered it was so, and she was satisfied.

Though the negro's body was black, yet his soul was clothed in white. This filled me with greater joy than I had felt before; as it appeared to me a token of his acceptance. I was not, however, permitted to see him fully enter into rest; for as I was about to enter in myself, I came back into the body again.

Each of these three men appeared to me in a complete body, separated from the sinful, earthly body. They were also clothed. The negro, and the person who entered into rest, were in *white*; the other, who was cast off, had his garment somewhat white, but *spotted*. I saw also the body in which each lived when upon earth, and also how they were laid out, but my own body I did not see. The reason why I neither saw my own body, nor entered fully into rest, I take to be this—that my soul was not quite separated from my body, as the others were; though it was so far separated, as to see those things, and to hear the songs of praises I have mentioned."

Though Thomas Say lived to be an old man, it was universally remarked by those who knew him, that after this vision he walked through life, like a traveller desirous to reach his home. He discharged all domestic and social duties in a manner eminently exemplary; but the other world was to him the *reality*; and this world was the *shadow*.—L. M. C.

The brightest hours of prosperity have their clouds; and the stream of life, if it is not ruffled by obstructions, will grow putrid by stagnation.

THE DAY AFTER THE BATTLE.

Henry J. Raymond, editor of the *N. Y. Times*, was an eye-witness of the battle of Solferino, and was at Montechiaro on the following day when the wounded of both armies were brought in from the field. We copy a part of his description of this heart-rending scene from the *Anti-Slavery Standard*.

Is it not astonishing that any one can reconcile the spirit of war with that of Christianity? This battle has occurred within the last few months, and its horrors are fresh in our memories, but let us bear in mind that every war is followed by similar suffering, and that we cannot be too earnest in advocating the spirit of peace, and in inculcating a horror of all war.

At the entrance of the town stands a large building used as a hospital, fronting upon a small open space, and being placed at the angle of two diverging roads. As the wounded arrived, those of them who could go no farther were taken off the carts and left here, while the rest moved on to Brescia. I never saw so heart-rending a sight as was presented in front of that hospital. The army seems not to be provided with any means of removing the wounded, but relies entirely upon the conveyances they can procure from the surrounding peasantry. Everything for miles around has been called into requisition. For the most part they consisted of the rude, heavy ox carts of the farmers, made to carry stone or other ponderous articles over the fields. Each of them had a flat platform six or eight feet wide and twelve or fifteen long. Some hay was spread upon this, and upon that the wounded soldiers were placed as thickly as they could be laid—without shelter of any kind, or pillows for their heads or blankets for their limbs, except such as they might happen to have upon them. The weather has been excessively warm—the storm on the day of the battle being the last rain that has fallen—and yesterday and to-day the sky has been perfectly clear and the air heated with the warmest rays of an Italian sun. The roads are perfectly hard and very dusty—and it was utterly impossible for well persons to travel along them with any comfort without protection of some kind from the heat. You can judge then of the intense suffering which these thousands of maimed and mutilated creatures must have endured during that fearful journey of ten or fifteen miles—performed at the slowest pace of heavy oxen, and compelled constantly to stop by some interruption of the procession. It was enough to melt the most obdurate heart to see the state in which they arrived. The peasants who drove them seemed not to have the slightest sense of their condition, or to take the least pains

to alleviate their agony. Some of the soldiers themselves—whose wounds were least serious and permitted them to move about—had cut branches from the willows and other trees that border the road, and made of them a slight shade for some of those who could only lie upon their backs, their faces turned to the brazen and the burning sky. As far as eye could see, a dense cloud of white dust marked the approach of the advancing train. As the carts came into the town, many of the poor wretches stretched out their hands, piteously crying for water, or for wine, as they were perishing of thirst. The people of the village had prepared, so far as possible, for their reception. Committees had been appointed, a quantity of soup had been prepared, and the young women and men of the place went to work to supply the most pressing necessities of the poor creatures who were suffering on their behalf. They went about from cart to cart, asking what each needed, and provided for them to the best of their ability. Austrians and French were mingled indiscriminately and were treated with precisely the same kindness and attention. As a general thing the Austrians were very badly wounded, and seemed to suffer terribly. They were, so far as had been convenient, placed upon the same carts—and frequently six or eight carts would arrive with none but Austrians upon them; but still more frequently there would be three to four Austrians upon a cart with twice as many French—and in many cases I have seen a French soldier assisting the Austrian, who lay by his side, into some easier position, or endeavoring to procure for him water or something else of which he seemed to be in need. All differences of nationality were submerged in the intense and over-mastering agonies of their common fate. Upon one cart which came up lay an Austrian who had died on the road—and close by his side was a French soldier just able to raise himself from his place and beg for water. As he raised his head, he looked over at his companion and said, as if envying his lot, “Poor fellow—he needs nothing now.” The Austrian lay at full length upon the cart—his hands crossed upon his breast, and his face, which was turned directly upward to the sun, wearing an expression of intense suffering. Five or six others, less severely wounded, were sitting in front. Upon another cart lay a poor fellow, entirely naked above the waist, except a broad bandage which had been passed around his body to protect a frightful wound received from a musket ball in his side—the ball seemed to have passed entirely through his body—his face was pale and inexpressibly sad—and he had just strength enough left to lift himself up and beg for water. It was immediately brought; and as soon as his condition was perceived, he was lifted off the cart in the blanket on which he was lying and placed in the hall of the hospital—but he lived only a few

minutes longer. As they were lifting him out, the blanket was drawn from under the feet of another poor fellow lying in the same cart, and the motion extorted from him a cry of anguish more intense than I ever heard before.

But it is utterly useless to multiply notices of individual cases of suffering. Indeed it would be impossible to mention a hundredth part of the instances of dreadful agony which attracted my special attention at the time: and if each one of them could be described in writing, not even a faint impression would be given of the fearful horrors of the scene as it met the eye of a spectator. If you can imagine the open area in front of the City Hall filled with carts, upon every one of which lay from five to ten or twelve men in soldiers' uniform, so far as they were dressed at all—nearly all bareheaded, their faces, clothes and hands clotted with blood, groaning and writhing in pain—and then conceive Broadway, as far as the eye can see, to be filled with an unbroken procession of just such carts laden in the same sad style—the cattle bellowing, the drivers shouting, and with the usual accompaniments of a great and half-regulated crowd, you may form some idea of the character and magnitude of this dreadful scene. As a general thing the wounded made but little noise. Many of them were too much exhausted—none of them cried aloud, and comparatively few could be heard to groan. But there was no mistaking the expression of their efforts to suppress and conquer it. As I was riding through the principal street in Castiglione this afternoon, passing the largest hospital, I saw lying in the street, close to the wall, fifty or sixty Austrian wounded who had just been brought in from the field, and for whom no place within the building could yet be found. One of them, a large, powerful man, with an intelligent face, was sitting upright with his back against the wall and uttering with a chattering sound the most intense and heart-rending yells of pain. He looked eagerly into the face of every one who passed, as if he *must* have help—but he could only await his turn. In another part of the town, on a cross-road leading from the hill in front of Solferino, I met twenty-one ox-carts laden with Austrians in every stage of suffering. One of the carts contained but two—and in the extremity of their agony they had half risen to their knees, grappled one another by the shoulder and were gazing into each other's faces with a fixed and stony look of frenzied horror which I shall never forget.

Just before dark on Sunday evening I looked into the large church in Castiglione, to which the greatest number of wounded were taken. It was a Catholic church, of course, as there are no others here. All the furniture of every kind had been taken out from the altar and side chapels, as well as from the nave of the building, and upon rows of mattresses, extending lengthwise

on the stone floor, as closely as they could lie, the wounded were placed. All whose injuries would permit their removal had been taken away and sent on to Montechiaro, Brescia and other towns, and only those were left who seemed very near their end. In one side chapel lay *eight* Austrians—two or three grasping for breath and in the very act of dying—and not one of the whole eight could possibly, as it seemed to me, live an hour. The entire floor was covered with the poor victims of war, nearly all rapidly approaching the same extremity. Men and women, charged with the care of them, were passing to and fro—not to soothe or comfort the dying, for there was no time for that—but looking for those who might still be saved. And over the altar, looking down upon this horrid scene, was an immense, well-painted, life-like picture, illustrating the Sermon on the Mount, and representing the Redeemer saying to those about him, "*Blessed are the peace-makers, for they shall be called the children of God.*" What an awful comment did that scene present upon that sacred text!

For Friends' Intelligencer.

Review of the Weather, &c., for SEVENTH Mo.

	1858.	1859.
Rain, during some portion of the 24 hours,	12 days.	11 days
Rain, all or nearly all day,	0 "	0 "
Cloudy without storms,	2 "	6 "
Ordinary clear,	17 "	14 "
	31	31

TEMPERATURES, &c.

Mean temperature of the month per Pennsylvania Hospital,	75.43 deg.	75. deg.
Highest do. during month do.	94. "	94. "
Lowest do. do. do. do.	60. "	55. "
Rain during the month,	1.34 in.	4.07 in.
Deaths counting five current weeks for each year	1595	1217

The average of the mean temperatures of this month for the past *seventy* years has been 75.55 deg., while the *highest* during that period occurred in 1793, 81 deg.; and the *lowest* in 1816, 68 deg.

Both memorable years, the *first* named so well known as the one during which the Yellow Fever so terribly scourged this city, and the last as the "*cold year*," frost occurring during *every* month thereof.

Again we have occasion to record the abundance of rain, the comparative account for the seven months just closed, for the past three years, being!

1857.	1858.	1859.
29.88 inches	21.90 inches.	35.24 inches.

The uniformity of temperature of the months under review for the past three years, and their close approximation to the average for seventy years, is rather unusual, viz. :

1857, 75 degrees; 1858, 75.43 degrees; and

1859, 75 degrees; while the average before alluded to is 75.55 degrees. J. M. E.

Philadelphia, Eighth Month 19, 1859.

P. S.—Since arranging the above, and glancing again at our record, we find that the month for 1838 also reached 81 degrees, Peirce remarking for that month: "On eighteen days (during mid-day) the mercury rose to 90 and above; on two of these days it rose to 96½ in the shade, but being placed for thirty minutes in the full rays of the sun, at mid-day, it rose to 143 degrees."

HYMN TO THE ASCENDED.

My beautiful, my angel!
I watched thy slumbers sweet,
When in thine infant innocence,
Soft cradled at my feet,
Thy gentle breathing soothed me;
Thy beauty undefiled
Awaked my heart to blissful hope,
My own, my first-born child!

My beautiful, my angel!
I saw the reaper, Death,
With overshadowing wing descend,
And draw away thy breath;
I saw the snowy mantle
Enwrap thy little form:
I bowed in silence, for I knew
Who sent the gathering storm.

My beautiful, my angel!
I laid thee in the dust;
But ever, 'mid the thin, white clouds,
Did He, in whom I trust,
Make me to feel thy presence,
The beauty of thy face,
Looking upon my daily path,
A comfort and a grace.

My beautiful, my angel!
Another precious one
From loving arms did pass away,
My bright, my first-born son.
The joy of life was on his brow,
His movement like a bird:
And where the sports were merriest,
His voice was ever heard.

My beautiful, my angel!
How weary were the nights,
When on the couch of suffering
Thy spirit, in its flights
Of wild and restless wandering,
Lay bound beneath a spell!
And as the hours were passing by
We knew, alas! too well,

My beautiful, my angel!
That thy fair head must lie
With thy sweet angel sister's form,
Beneath the turf hard by.
We bore thee from our dwelling,
We laid thee 'neath the snow;
O, as it were but yesterday,
Comes up that "long ago"!

My beautiful, my angel!
When thy sweet spirit fled,
How many cherished flowers of hope
Faded, since thou wast dead!

But Heaven beamed more fully :
And earth more holy grew ;
And hopes more pure were nurtured there,
But not by earthly dew.

I sat me down contented,
For spirits everywhere
Sang through my lowly dwelling-place,
And waved their wings of air.
I listened to their whispers ;
I felt their peerless gaze :
I knew in full communion now
They pondered o'er my ways.

My beautiful, my angel!
And couldst *thou* leave me too ?
That arm on which I rested, love,
That heart, so nobly true ?
The reaper came and lingered
Above that gentle head ;
And made the room a heaven of peace,
Whence that last breath had fled.

My beautiful, my angel !
O, *grief* I shunned so long,—
So poignant, so resistless,—ay,
So deathless, deep, and strong ;
I met it, I received it ;
And on my aching breast
Bore from the loving Father's hand
The wound his wisdom pressed.

My beautiful, my angel !
God took thee from my side ;
He lent, but claimed his own again ;
His will be glorified !
O earth, thou home of spirits !
Yea, how they gather round,
To raise us, to sustain us still,
To consecrate the ground !

My beautiful, my angel !
Once more the silent air
Is trembling with a presence sent
His message sad to bear.
So meekly lay the sufferer,
As, drooping day by day,
She, long so loved and revered,
Faded from life away.

My beautiful, my angels !
Though now thy last embrace
Meets not my throbbing, yearning heart,
Thy kisses leave no trace,
Yet in the hour of worship,
In the tried hour of care,
In the full heart's clear sunshine, lo !
Thy love unfolds me there.

My beautiful, my angels !
How rich, how hallowed glow
The fresh, bright hours of lifetime, while
We linger here below !
While round us ye are hovering,
While onward ye will lead,
And upward, bearing lightly now
The heart that else would bleed.

O spirits of our loved ones,
Bright messengers of God !
With what fond love ye aid the soul
In seeking His abode.
We would not ye should suffer
With those who linger here,
But we would rise, all purified,
To your serener sphere.

Ye beautiful, sweet angels !
Gather about us still,
Enkindling in our yielding hearts
The flame of that strong will,
Which makes us ever ready
The cross of grief to bear ;
With high resolve, and loving heart,
To live the life of prayer ;—

To live as holy angels,
While treading through the vale ;
With light, and love, and promise true,
Chasing the shadows pale :
Till, at the joyful summons.
We wake in that sweet home,
Where sorrow never entereth,
And Christ says, *Hither come !*

NEATNESS.

In a recent conversation with a wealthy merchant, he remarked that whatever he had acquired was owing in a great measure to the fact that his mother had brought him up to be neat when a boy. His story, as nearly as I can recollect it, was as follows:—"When I was six years old my father died, leaving nothing to my mother but the charge of myself and two younger sisters. After selling the greater portion of the household furniture she had owned, she took two small upper rooms in W—— street; and there, by her needle, contrived in some way to support us in comfort. Frequently, however, I remember that our supper consisted simply of a slice of bread, seasoned by hunger, and rendered inviting by the neat manner in which our repast was served, our table being always spread with a cloth which, like my good mother's heart, seemed ever to preserve a snow-white purity." Wiping his eyes the merchant continued—"Speaking of those days reminds me of the time when we sat down to the table one evening, and my mother having asked the blessing of our heavenly Father on her little defenceless ones, in tones of tender pathos, she divided the little remnant of her only loaf into three pieces, placing one on each of our plates, but reserving none for herself. I stole around to her side, and placed my portion before her, and was about to tell her that I was not hungry, when a flood of tears burst from her eyes, and she clasped me to her bosom. Our meal was left untouched; we sat up late that night; but what we said I cannot tell. I know that my mother talked to me more as a companion than a child, and that when we knelt down to pray, I consecrated myself to be the Lord's and to serve my mother." "But," said he, "this is not telling you how neatness made my fortune. It was some time after this, that my mother found an advertisement in the newspaper for an errand boy in a commission-house in B—— street. Without being necessitated to wait to have my clothes mended, for my mother always kept them in perfect order, and although on minute inspection they bore traces

of more than one patch, yet on the whole, they had a very respectable air; without being obliged to wait even to polish my shoes, for my mother always kept a box of blacking, with which my cowhides must be set off before I took my breakfast; without waiting to arrange my hair, for I was obliged to observe from earliest youth the most perfect neatness in every respect—my mother sent me to see if I could obtain the situation. With a light step I started, as I had a long time wished my mother to allow me to do something to assist her. My heart beat fast, I assure you, as I turned out of W—— into B—— street, and made my way along to the number my mother had given me. I summoned all the courage I could muster, and stepped briskly into the store, found my way to the counting-room, and made known the reason of my calling. The merchant smiled, and told me that there was another boy who had come in a little before me he thought he should hire. However, he asked me some questions, and then went and conversed with the other boy who stood in the back part of the office. The result was, that the lad who had first applied was dismissed, and I entered the merchant's employment, first as an errand-boy, then as a clerk, afterwards as his partner until his decease, when he left me the whole business, stock, &c. After I had been in his service some years, he told me the reason he chose me in preference to the other boy was because of the general neatness of my person. To this simple circumstance has probably been owing the greater part of my success in business." Will not all my young friends who read this narrative of the successful merchant, like him, form in their youths habits of neatness? Remember that if you would secure the respect of your acquaintances, you must be very careful in respect to your personal appearance. Purity and cleanliness of person are indispensable to the highest purity of character.—*Weekly Spectator*.

THE HARMONY OF COLORS.

Raphael was not more choice about his painting than we find the sun to be. As winter departs, the modest violet first blooms beneath a veil of leaves, which radiate back upon the fragrant little flower all the heat that departs from it. As the snows disappear, blossoms of other flowers open, which display themselves more boldly; but they are blanched, or nearly so. In the passage from the last snows of winter to the first blossoms of spring, the harmony of color is preserved—hill-sides and orchards are laden with delicate white, varied rarely by the pink upon the almond-tree. Petals of apple-blossoms floating on the wind mimic the flakes of snow that were so lately seen. As the warm season advances, colors deepen, until we come to the dark crimson of autumn flowers, and the brown of

autumn leaves. This change is meant not only to be beautiful—it has its use. Why are the first spring flowers all white, or nearly white? Because when the winds are still cold, and when the sun is only moderately kind, a flower would be chilled to death if its heat radiated from it rapidly. But radiation takes place most freely from dark colors—from black, from the strongly defined greens, and blues, and reds. In hot weather, flowers and leaves so colored, cool more readily at night, and form upon their surface the healing dew. The delicate spring flowers are, therefore, of a color that is least ready to encourage radiation. For the same reason—because white substances give out least freely the heat that they contain or cover—arctic animals are white as their native snows. For the same reason too, the snow itself is white. When cold becomes severe, snow falls, and hangs like a fur mantle about the soil. If snow were black, or red, or blue, it would still let some of the heat escape which is retained under its whiteness. The colors even of men darken in hot climates; in the hottest they are quite black. Black substances give out their heat more freely.

In regions subject to a cold almost incessant, a short summer produces flowers of extremely vivid coloring. The summer, although short, is fierce, and the plants radiate fast that they may escape destruction. The dark verdure of the Northern pines would cause them to lose heat with great rapidity. For compensation they are made to grow in pyramids that catch a cone of snow so cleverly as to great-coat them during the hard weather. Birch trees that grow in the same forests rise among the pines like silver columns, and they are not shaped to catch the snow because they do not want it. They have their own light clothing of a brilliant whiteness.

We need not examine far into the wealth that is poured out in nature before we discover that

"Such bounty is no gift of chance."

A RIDE ON THE STEAM PLOW.

BY PROFESSOR ALFRED L. KENNEDY, M. D.

Editors Co. Gen.—Yesterday will be ever memorable in a life by no means devoid of incident, for then was realized a long cherished wish to ride on a successful steam plow, of American invention. The day was balmy; fleecy clouds and a slight haze shielded man and nature from the summer sun. The oats, the last of our smaller cereals to yield up their treasures, were ready for the reapers, who were now rejoicing over all the land, because of a superabundant harvest. A fit day for the rendering of a judgment on a new means of agricultural progress—to inaugurate a great agricultural era. The committees of the Pennsylvania Agricultural Society, and of its venerable prototype, the Philadelphia Society for Promoting Agriculture, were in at-

tendance. The extensive grounds of the Oxford Park Association had been thrown open to the committee. And a decision was to be made on the merits of the invention of John W. Fawkes, a Lancaster county mechanic, who, after three years of almost despairing struggle and utter privation, spent in the embodiment of his grand idea, now submitted the product of his genius to the highest tribunals of his native State and her metropolis. As he stood in the garb of a workman trying his gauges, or, in a sharp, quick tone, which told of mingled confidence and anxiety, giving order to the foreman, his rough attire, soiled in such a cause, appeared more honorable than imperial purple. By his permission I stepped upon the engine, and stood by his side, as the shrill whistle gave the signal to start. The gang of eight 14 inch prairie plows, which until now had hung by chains to cranes at the rear of the machine, were quickly lowered until they rested on the hard sod. One movement of the lever, and onward we went, up an ascent of about seven degrees, and with a smooth, uniform motion. As the eight shares entered the soil I apprehended a sudden check and strain, like that felt when a railroad train is partially "braked up," but nothing of the kind was experienced. In the enormous driving wheel, or rather drum, beneath my feet, I could not detect the least sliding on the sod. *The traction was perfect.*

Before us the beautiful green turf swept under the bow of our gallant craft. Behind us lay a wide deep-brown wake, in which scarce a tinge of green was visible. Under the stern the eight broad waves of sod lifted their crests, and rolled over like surges falling upon the beach. "Steady she goes," as our helmsman, with hand upon the tiller, and eye upon the guide-wheels, keeps on his straight course. But we near the edge of our field. Two shrieks of the whistle, and up rise the plows. Starboard your helm! Round sweeps our craft as easily and gratifying as a bird on the wing, and we came again into line. Another whistle, and the plows are lowered, and in less time than that required to follow this sentence, she is off! A flush of triumphant pleasure mantles the face of the inventor. The grade slightly descends. The crowd which has toiled after us up the ascent, quicken their pace. Still we are leaving them. Now only the foremost—then the whole party break into a run, and shouts, like those which followed the triumphal car of a Roman conqueror, rend the air.

Many were the warm grasps of congratulation which greeted the American conqueror as he stepped from his car of triumph, and in modest terms proposed to subject the machine to any test which the committee might suggest. "Can you cross-plow the land you have just turned over?" "Yes sir," was his prompt reply, and wheeling his machine into position, he crossed at right angles the furrows previously thrown up.

Subsequently gulleys were passed over, abrupt elevations surmounted, and finally the plows were detached, and an omnibus hitched to the engine. "Here we are now, right off," cried a facetious passenger, and right off we were, going the trotting course at a good round pace.

Feelings of intense gratification appeared to animate the entire assembly, and I left the grounds with emotions of thankfulness to that great and good Being, who in our own day had enabled a fellow-countryman to make the giant steam tributary to the art of cultivation, and the means of untold blessing to millions.—*Country Gentleman.*

ITEMS OF NEWS.

EUROPE.—By the steamship Asia, at New York, we are in possession of later news from Europe. The Peace Conference at Zurich was to meet on the 8th inst. Count Colleredo, the Austrian; M. De Sambrus, the Sardinian, and De Bourgeney, the French representative to the Peace Conference, had either reached Zurich or were *en route* for the meeting on the 8th. The strikes among the builders of London were becoming more serious every day, and it was feared there would be as many as forty thousand operatives in the trade unemployed. A great meeting of workmen had been in held Hyde Park, and a determination was evinced to abide by the "nine-hours" movement. The employers had likewise had a meeting, and resolved to resist the demands of the men.

WHEAT CROP.—The Milwaukee *Wisconsin* has no doubt that the crop of spring wheat now harvested in that State is larger than in any former year. It estimates the amount at 14,000,000 bushels, and allowing 4,000,000 for consumption, there will be 10,000,000 bushels for export. The *Wisconsin* does not anticipate high prices, but claims that the excellent quality of the wheat will create a demand for it among millers. It urges wheat-raisers to clean their wheat carefully, and advises them to send their crops forward before 12th mo.

AMERICAN INGENUITY ABROAD.—One of Bishop's American floating derricks having been put on the Thames in London, it has furnished a theme of admiration. To test its powers, a Norwegian vessel of 940 tons was recently laid along-side of it, and three chains were rapidly passed under the bottom and connected with the lifts of the derrick. When all was secure the machinery was set in motion, and the vessel was steadily lifted from the water at the rate of about a foot per minute. When raised twenty feet a small steamer of sixty tons was fastened beneath her, and both vessels were raised high into the air, presenting a most singular appearance.

AFRICAN COTTON.—African rivers are at this moment being penetrated to their upper waters by an expedition whose object it is to establish commercial relations with the natives, and to assure them of a market for all the cotton they may produce. Lord Palmerston pronounced these cotton districts of Africa "more extensive than those of India," and declared that their exports of this article would in a few years be far more valuable than that of all the world beside, this country alone excepted. Livingstone says that Angola, if it had been in the hands of Englishmen, would have produced, its size considered, more cotton and sugar than all our Slave States. Field labor there is two pence a day, but if paid for in calico, the usual currency, it would cost but a penny. This cotton is in every respect fully equal to American, and has

been grown by the natives in immense quantities from time immemorial. American seed sent out from England, has produced a staple of the finest quality. Gins have been furnished to the natives at low prices to enable them to clean the staple, purchasing stations have been established at various points, new ones are being located and the growers ask only to be guaranteed a market, and they will raise an almost unlimited supply. The cotton thus produced in Africa has been received in annually increasing quantities in England, at a cost so low as to make it a desirable acquisition, and has been worked into yarns not inferior to the best produced from our own. This cheapness and success are giving a prodigious impulse to British effort, popular and official, to insure a national supply.—*Tribune*.

LATER FROM HAYTI.—By the arrival at this port of the brig Isabel Beurmann, from Port au Prince, we are placed in possession of our Hayti files to 7 mo. 23d. The feature of the news is the proposed change of the presidency to a dictatorship. The Chambers had appointed a committee, who waited on President Geffard, and proposed to him to assume the office and title of Dictator of Hayti, arguing that by the absolute authority thus accruing to him he could proceed better in his great work of the social re-organization of the country. President Geffard had declined the honor. *La Republique*, a journal established under the present regime, has exerted its influence in favor of the proposed dictatorship, which would invest Geffard with almost despotic power. The course of the President in declining to assume dictatorial sway is recorded to his praise, but it is intimated that another application will be more successful.—*Evening Post*.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market is exceedingly dull and inactive. Sales are mostly confined to the wants of the trade at \$5 a \$5 25 per barrel for common and good brands of fresh ground superfine, and \$5 37 to \$6 50 for extra and fancy lots, as in quality. Very little doing in Rye Flour or Corn Meal. We quote the former at \$3 75 and the latter at \$3 62½ per barrel.

GRAIN.—Wheat is decidedly dull. There is more offering and the millers are holding off. Sales of 4,000 bushels of prime red at \$1 18 a 1 20, and good white at \$1 25 a 1 30. New Southern Rye is wanted at 70 cts., and old Pennsylvania at 78 a 80 cts. Corn is scarce; sales of 800 bushels of yellow at 81 cents, afloat. Oats are in fair demand; sales of 1200 bus. new Delaware at 35½ cents. Old Pennsylvania are held at 37 cents.

ELDRIDGES HILL BOARDING SCHOOL FOR YOUTH OF BOTH SEXES, will open its Winter Session 11 mo 1st.

Terms \$70 per session of 20 weeks. For particulars address the Principal for a circular.

ALLEN FLITCRAFT.

Eldridges Hill Salem County, N. J.

8 mo 27 3 m.

THE BANKSDALE BOARDING SCHOOL FOR GIRLS, will be reopened the 14th of 11th month, and be continued twenty weeks. The course of study will comprise the usual English branches and Drawing. Terms \$60.

For further information apply to ELIZA HEACOCK Jenkintown, Montgomery Co. Penn.

8 mo. 27 3 m.

LAKE SCHOOL FOR BOTH SEXES.—This School has a beautiful and healthy location on Oneida

Lake, N. Y. Board, Tuition and use of books and stationery for twenty weeks, from \$45 to \$50, or from \$90 to \$100 for continuous term of forty weeks beginning 26th of 9th month. This school is situated 130 miles west of Albany.

Circulars sent on application to either Proprietor
SIDNEY AVERILL, or
ELMIRA AVERILL,
8 mo. 13.—3t. West Vienna, Oneida co., N. Y.

MOORESTOWN BOARDING SCHOOL FOR FEMALES will re-open the 1st Second-day of 10th mo. next. For Circulars apply to
MARY S. LIPPINCOTT, Proprietor,
Moorestown P. O., Burlington Co., N. J.
8th mo. 20—3 t.

GWYNEDD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The next session of this Institution will commence on the 14th of 11th month, 1859, and continue twenty weeks. Terms \$70, and no extras. For further information application can be made to
DANIEL FOULKE, Principal,
HUGH FOULKE, Jr., Teacher,
Spring House P. O.,
Montgomery co., Pa.
8 mo. 13—2 mo.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

GEO. A. NEWBOLD,
Purcellville, Loudon Co., Va.

8th mo. 6, 1859.—6m.

BYBERRY BOARDING SCHOOL, FOR GIRLS. The ninth session of Byberry Boarding School, taught by Jane, Anne and Mary S. Hillborn, will commence on the first Second-day of Tenth month, 1859, and continue forty weeks without intermission, (including two terms of 20 weeks each.) The course of instruction embraces all the branches of a liberal English education.

Terms \$60 per session of 20 weeks, one half payable in advance. For circulars containing further particulars address

JANE HILLBORN,
Byberry P. O., Philada., Pa.

8th mo. 7—3m.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Penciling and Pellis work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; reading, Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M.

Principal.

Attleboro', Bucks Co., 5th mo., 28, 1859. 6m.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, NINTH MONTH 3, 1859.

No. 25.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

CONVERSATIONS ON RELIGIOUS SUBJECTS, BETWEEN A FATHER AND HIS SONS.

BY SAMUEL M. JANNEY.

(Continued from page 355.)

Baptism and the Lord's Supper.

John. It is said in the scriptures, that the disciples administered water-baptism, while the Master was with them; consequently we may suppose he did not disapprove of it.

Father. In this passage it is stated, "When therefore the Lord knew how the Pharisees had heard that Jesus made and baptized more disciples than John, (though Jesus himself baptized not, but his disciples,) he left Judea, and departed again into Galilee." John iv. 1, &c. John was at that time baptizing in or near *Ænon*, where there was much water; and I have no doubt the disciples were influenced by his example, and by that activity in religious performances which new converts are apt to exhibit; but it appears that Jesus himself did not engage in it, nor would it have been consistent with his mission to have taken up the baptism of John, which was only a type of his own spiritual baptism; therefore, when he knew the report which the Pharisees had heard, he removed into another place.

James. It is, however, asserted, that the practice of the Christian churches, from the time of the apostles down to the present day, has (with the single exception of the Society of Friends,) been all in favor of water-baptism, either by sprinkling or immersion.

Father. John the Baptist said of Christ, "He must increase, but I must decrease;" which no doubt alluded to the two dispensations which they administered; and accordingly it has always been found, that the more completely the mind

is brought under the purifying and baptizing power of Christ, the less dependance is placed upon any outward rite or ceremony. Of this we have a remarkable example in the apostle Paul, who saw beyond the types and shadows of a former dispensation, and perceived that the spiritual kingdom of Christ contained the substance of them all.

The service under the Mosaic law, "stood only in meats and drinks, and divers washings, and carnal ordinances, imposed on them *until the time of reformation.*" Heb. ix. 10. Therefore this experienced apostle says, "Let no man judge you in meat or in drink, or in respect of an holy day, or of the moon, or of the sabbath days, which are a shadow of things to come; but the body is of Christ." Col. ii. 16, 17. "Wherefore, if ye be dead with Christ from the rudiments of the world, why, as though living in the world, are ye *subject to ordinances* (touch not, taste not, handle not, which all are to perish with the using) after the commandments and doctrines of men? Which things have indeed a show of wisdom in will-worship and humility, and neglecting of the body; not in any honor to the satisfying of the flesh," ver. 20-23.

Paul expressed his thankfulness that he had used water-baptism but in a few instances, which he mentioned; because he was not sent forth to administer this ceremony, but to preach the gospel, and to bring men under the baptizing power of the Holy Spirit. He says there is "*One Lord, one faith, one baptism, one God and Father of all, who is above all, and through all, and in you all.*" Eph. iv. 5. 6. Now, if there be but *one baptism* that saves, can we be at any loss which it is?—whether the water-baptism of John, or the spiritual baptism of Christ?

In the infancy of the Christian church, the Jewish converts were nearly all "zealous of the law" of Moses; and we have reason to believe that it had long been the practice under that law, for the converts from heathenism to wash their bodies in water, as a sign of purification; and this ceremony being further confirmed by the dispensation of John the Baptist, it was still retained in the infancy of the Christian church; although there is no doubt that others besides the apostle Paul saw that it was not essential to the Christian dispensation.

After the apostles and elders of the church were removed by death, those who succeeded

them showed a great disposition to multiply rites and ceremonies; some of which (as historians inform us) were adopted from the Mosaic law, and some were copied from the heathen festivals, in order to ingratiate themselves and recommend their religion to the multitude.

During the earlier ages of the church, water-baptism was administered by immersion, and to adults only;— but in after-times, when the doctrine of original sin had been introduced by the vain speculations of philosophers, they began to baptize infants, in order to wash away the sin supposed to be inherited from Adam; and as these infants could not answer for themselves, godfathers and godmothers were introduced to answer for them, and to promise that they should renounce the devil and all his works. The sprinkling of infants and the promises of godfathers and godmothers, are now considered by the reflecting part of the community as mere lifeless ceremonies, having no warrant in the scriptures, nor in the practice of the primitive church.

It must be acknowledged, that the baptism of adults by immersion in water, was practised in the days of the apostles; but it was not administered nor commanded by Jesus Christ, neither is it a part of his spiritual dispensation; although, like circumcision and other Jewish ceremonies, it was permitted to continue for a season, and was known among the disciples by the name of "*John's Baptism*," which was intended to decrease as that of Christ should increase. The *baptism which saves*, is spoken of by the apostles as an inward, spiritual washing; "not the putting away of the filth of the flesh, but the answer of a good conscience towards God, by the resurrection of Jesus Christ." 1 Pet. iii. 21. "Not by works of righteousness which we have done, but according to his mercy he saved us, by the washing of regeneration, and renewing of the Holy Ghost." Titus iii. 5. "Christ also loved the church, and gave himself for it, that he might sanctify and cleanse it with the washing of water by the word." Eph. v. 25, 26. "But ye are washed, but ye are sanctified, but ye are justified in the name of the Lord Jesus, and by the spirit of our God." 1 Cor. vi. 11.

I believe there are few intelligent minds in the present age and in our country, who will contend that any change is produced in the soul by water-baptism, or that the favor of God can be secured by such a ceremony. How can we suppose that a just and merciful Creator would regard with more favor an infant whose parents have subjected it to this process, than one that had died without it? In either case, there can be no merit accruing to the infant; because it exercises no choice in the matter, and incurs no responsibility thereby. If, therefore, it makes no difference in the case of infants, dying without baptism, it can make none with those adults

who believe that water-baptism was not commanded by Jesus Christ, nor intended to be perpetuated in his church. Such persons may safely say of water-baptism, as the apostle Paul said of circumcision, "In Christ Jesus neither circumcision availeth any thing, nor uncircumcision, but a new creature." And furthermore, if we see any of these persons who manifest by a life and conversation consistent with godliness, that they are servants of the Most High, and enjoy his favor; is not this an evidence that he looks only at the heart, and that outward ceremonies are of no avail in securing his approbation?

John. This reasoning will apply equally well to all outward ceremonies, and especially to that of the Lord's supper; yet there appears to be a command of our Saviour for the observance of this ceremony, where he says, "This do in remembrance of me."

Father. It is true that he eat the *passover* with his disciples; but there is no evidence that he intended it to be perpetuated in the church; nor is there any reason to suppose that he instituted a new ceremony on that occasion. He sent two of his disciples, saying, "Go into the city to such a man and say unto him, I will keep the passover at thy house with my disciples." Now we know that the paschal lamb which was eaten on this occasion, was instituted to commemorate the salvation of the Israelites, when the first-born of the Egyptians were slain by the destroying angel.

This lamb was also a figure of the meek and spotless nature of "Christ our passover,"—"the Lamb of God that taketh away the sins of the world." As in the outward passover, the blood was sprinkled on the door-posts, and they eat standing, with their loins girded, as men prepared for a journey; and with the lamb they partook of unleavened bread; so with the antitype, the spiritual body and blood of Christ, which is *the life and power that dwelt in him*, it is only those who partake of it that are saved by it; and we must receive it as those who are prepared for a journey to the promised land, and with "the unleavened bread of sincerity and truth." (1 Cor. v. 8.)

Previous to this memorable occasion, the Divine Master had instructed his disciples in the nature of that spiritual food which nourishes the soul unto everlasting life; saying, "I am the living bread which came down from heaven." "He that eateth my flesh, and drinketh my blood, dwelleth in me, and I in him." John vi. 51, 56. This language offended many who understood it literally,—but to his disciples he explained it by saying, "The flesh profiteth nothing, it is the *spirit that quickeneth*: the words that I speak unto you, they are spirit, and they are life."

(To be continued.)

For Friends' Intelligencer.

MEMOIR OF ANNA HAWXHURST.

In transmitting to posterity some account of the lives of the departed, our motive is not to eulogize the creature, but to exalt that Divine power by which they were enabled to walk in the straight and narrow way that leads to eternal life. Believing the evidences the faithful in all ages give, that those who are obedient to this Divine principle receive the same great and peaceful reward, tend to encourage those feeling their own weakness and many infirmities, to look to the same source for aid, we feel inclined to preserve a brief memoir of the life and exercises of Anna Hawxhurst, of whom an obituary notice appeared some months ago in Friends' Intelligencer.

She was born the 27th of 5th mo. 1819. Her parents, Townsend and Rebecca Hawxhurst, were members of Westbury Monthly Meeting, Long Island, and being concerned to train up their children in the nurture and admonition of the Lord, she was in early life instructed in the principles and doctrines professed by Friends. In the eleventh year of her age she was deprived of the pious example of her father, who being removed by death, the care of a numerous family devolved on her surviving parent. Anna had an affectionate disposition, and being religiously inclined, she endeavored as much as possible to relieve her beloved mother, who was pressed with many cares. She watched over her brothers and sisters with maternal tenderness and solicitude, and gaining their confidence and affection, she was looked up to, not only by them, but by her mother, as a care-taker and counsellor.

Having submitted to the teachings of the Holy Spirit in her own mind, the consistency of her daily walk in life was apparent to those around her: cheerful and obliging in her disposition she won a large circle of friends, who were warmly attached to her; social converse with them, and that kind of reading that tends to elevate the mind, were sources of enjoyment in which she felt she might indulge. The contemplation of the works of Deity, "the beasts of the field, the fowls of the air, and every creeping thing," the forest and humble flower, were a great delight to her. The firmament, studded with innumerable stars, was viewed by her with love and admiration, as designed by the Creator to promote our comfort and enjoyment, and to raise our thoughts from low and puerile pursuits to a consideration of Himself, who shows us by these outward manifestations the magnitude of his power, our own insignificance and our dependence on Him. Therefore she sought not, but turned from, the vain, delusive pleasures of this world. It is confidently said of her that she never attended a place of amusement or diversion, but bore her testimony against them. Feeling the necessity of taking up the cross to

her natural inclination for gaiety and fashion, she did not consider our testimony to simplicity in dress, language and manners, as a traditionary form, but as consistent for the humble follower of the meek and lowly Jesus; she therefore maintained this testimony in all its branches, though mingling much with those not thus concerned. She was diligent in the attendance of all our religious meetings, when circumstances admitted, sometimes walking four miles to get to them, her countenance and deportment evincing her concern to worship her Father in the assemblies of the people. She frequently read the Scriptures of Truth with deep instruction, especially, the precepts and commandments of Jesus she felt binding on her to practice. And it may truly be said of her, that she endeavored in every particular to fulfil that injunction, "whatsoever ye would that men should do to you, do ye even so unto them." Although she had been taught by the precepts and example of her parents the inconsistency of using the produce of the labor of slaves, especially in those who exclaim against slavery, it was not until deep exercise and impressions had been made on her own mind, that she saw and felt that by using the products of the unrequited and compulsory toil of slaves, she was not clear, she writes, of "the blood of creatures constituted in the same manner, and by the same Almighty power as myself, and equally capable of pleasure and pain. In viewing it I feel a renewed desire to abstain from using the result of labor that may have cost a life, and much of sorrow and sadness."

Unassuming in her deportment, kind and affectionate to those with whom she had intercourse, she was useful in her neighborhood and meetings to which she belonged, was often on appointments in various services of the society, and was looked to with a cheering hope of her being a successor of the faithful standard bearers who are being removed from our midst. But she did not attain to this state of preparation for usefulness without many conflicts of spirit, and a humiliating sense of her coming far short of that full dedication and surrender of her will to which her Lord and master was calling her, as may be seen in some extracts from a diary kept when from home, teaching school, in which employment she was engaged for several years. Oft did she breathe forth a prayer for those she had watched over and labored for with a mother's love, and frequently a passage of Scripture is recorded as expressive of the feelings of her mind.

8th mo. 1, 1856. Let me praise thee, O Father, now and forevermore; thou hast manifested thyself for my help, may I trust in thee, and lean not to my own understanding.

2d of 8th mo. No good thing belongeth to me. Seek, O my soul, seek after the right path,

and walk therein. Knowing thy wisdom, O Lord, may I watch for thy counsel.

7th. Oh my unworthiness! Still this day have I known thy wondrous care over me, even round about to direct my ways, but I have come short of following thee in simplicity.

8th. Destitute of all good, I desire a portion from thee. O may I truthfully call thee Father.

12th. Weary not, O my soul, but struggle on; the preparation of the heart is of the Lord: it must be sought after with sincerity of purpose.

13th. May I bless thee always. Whatsoever cometh from thee is good, though I believe thy favors are oft disguised. One thing have I desired, oh withhold it not if consistent with thy will, bind together with the cords of thy love those near and dear to me.

15th. What shall I say of the goodness of the Lord? It has been this day as a staff to lean upon, but I have come short of walking before thee in simplicity. Be stimulated, O my soul, to a faithful walk, if another day is given.

19th. Thy loving kindness has been extended to me this day. Oh the encirclings of thy matchless love, fit me for so unmerited a favor.

20th. Oh that I may work with the ability that God giveth; and let go, the hold on my own understanding, then the answer of well done would be given.

21st. The safest time for me is when I feel despised and alone, then I desire thy presence more fervently. Thou didst visit me in the night season; then I could joy and rejoice. Oh that I may never be cast off from the Lord; may I keep in remembrance his loving kindness.

26th. Study to be quiet, and know thy own business with clearness. Something I trust above my own imagination warms my heart and whispers encouragement in the pursuit of good.

27th. Thou art wonderful in love and mercy, working miracles; O for a clean heart; a right spirit have I craved.

9th mo. 1st. A month has elapsed since I commenced noting down what impresses me most deeply, of the goodness and care of my Great Protector; may not self-righteousness find a place in my heart, but humility instead. After having done what appeared right; how encouraging the satisfaction following; may it stimulate me to hearken to and obey the dictates of Truth.

3d. What reason have I to thank thee, O Father for thy great care? what shall I render for all thy benefits? Teach me to estimate the worth of a heart cleansed and prepared for the abode of Divine Purity.

14th. Oh Heavenly Father direct my steps! When shall my goings forth and coming in be established in thee? Thy righteous sceptre I desire may be set up in my heart.

19th. Wilt thou be pleased to pass by my short-comings, and continue with me, Oh dearest

Father? Give me patience and perseverance to do my duty faithfully.

27th. To-day some things have caused my spirits to be depressed, and I have wondered that trifles should affect us so much. How delicately strung are the fibres of the heart; a *word*, a *look*, can cause a note of sadness that will reverberate through the whole nervous system. And again it will rebound with joy, if the finger of love and kindness pass ever so gently over its chords. May the mighty Balancer of mind poise mine in accordance with his will.

28th. I do believe thou wilt own me, if I am faithful. I desire to adhere to thy law, but trifles turn me from the precious way of life; thy love followeth me, may I not put it by, but dwell under it.

29th. May the overshadowing wing of Divine goodness be the covert and safe abiding place of the mother of my days, now in the evening of life. Regard in mercy, Heavenly Parent, all those near and dear to me.

10th mo. 1st. Do unto me as seemeth good to thee; make me more worthy of thy notice, for I am altogether undeserving; may I never forget thee, but know a growth in thy Truth.

2d. The spirit of peace and good will is offered to all, but we will not let it reign over and make us its children. Many are the children of strife and contention, for they give themselves servants to obey the passions and propensities of our human nature, instead of letting them be bound by the high and pure power that is given us, to be a ruler and a governor, even perfect wisdom.

3d. I desire to be instructed, may I be humble enough. Let my chiefest desire be towards thee, Oh Father, and all other desires be regulated by thy wisdom. Draw those near and dear to me within thy safe enclosure, for thy love comforteth us.

10th. "In my Father's house are many mansions, if it were not so I would have told you. I go to prepare a place for you, that where I am ye may be also," was the consoling language of the Divine Master to his followers.

18th. "What I say unto one I say unto all, *watch*." O for this watchfulness! it would keep out of heats and disputations, and give the still small voice opportunity to speak peace to our disturbed spirits.

20th. I have no cause to be discouraged, may I do more each day for the advancement of those under my care, being strictly just to all.

22d. Thou hast filled me with joy, O Father, even by thy presence which surpasseth all human conception.

26th. May I consider my latter end and be wise. Keep me mindful of the great end of my being; my feelings are alive to one subject, *home*;

would that my desires were more ardent after the home above.

11th mo. 2d. I thank thee, O Father, that thou condescends to my low estate; fit me and those of my mother's household for the enjoyment of thyself.

4th. Let my joy be of an enduring nature that forsakes us not in the day of trouble; may I cause none to err, may I give up my stubborn will to the dictates of Truth, and let it have dominion over me; all that I trust in must be given up, and I must acquiesce in the Divine will. Forsake me not, Oh Heavenly Parent! let the arms of thy love gather us all into thy peaceful enclosure.

13th. "Let the wicked forsake his ways, and the unrighteous man his thoughts, and turn unto the Lord and to our God, and he will abundantly pardon."

19th. Awake, O my soul, and act with energy in the path of thy allotment, seeking continual assistance of the Divine Arm of Power through the several scenes of labor each day brings.

22d. The language, "Search me and try me, O Lord, and if there be iniquity in me do thou it away," has been with me.

23d. Oft in the morning every thing looks promising, resolutions are fresh in the memory that seem sufficient to carry us through the day prosperously, that is the better life uppermost; but evening oft brings regrets, so it is with me now. Oh for more faithfulness! If succeeding days be granted, may more ardent desires arise, and a faithful walk be maintained.

26th. Thy tender love has been felt; may I be concerned to dwell under its canopy when it is spread, and have faith to seek after thee when it is withdrawn, for thou lovest those that seek after thee.

12th mo. 5th. May I be aroused, and not rest until my way be established, and I know of my goings forth to be under thy guidance, O Lord, so that I may inherit the blessing. Thy love has been felt, may I labor for it more than aught this world affords.

13th. May I have a heart to feel for those who are afflicted and cast down. Oh that all would seek the Great Counsellor for their friend, and know their consolation to be of Him. Then would that joy that has no alloy spring up in their hearts.

23d. Each day has its duties, may I bear in mind and feel that on the diligent performance of these rest our present and future happiness.

1st mo. 2d, 1857. Another year numbers with the past, it is gone no more to return, and what our actions have written on its pages cannot be erased. O then direct my steps and fashion me according to thy will.

1st mo. 10th. Nothing is in vain that comes from thee; that which I have had no agency in bringing about, may I receive for the best; even

though it may appear hard, yet a blessing may be hid beneath.

3d mo. 10th. Disobedience darkens our spirits, but the Sun of righteousness illuminates; then be watchful, O my soul, or thou wilt not be able to withstand the temptation of taking the government on thy own shoulders, instead of its resting on His, whose right it is to govern. Arise for my deliverance, Oh Lord, and permit me to call thee Father, for thou wilt keep them in perfect peace whose minds are staid on thee. I have a trust that notwithstanding my many deficiencies I may yet reach thy holy habitation.

31st. Finished with some satisfaction the business of this day, a part of which has been taking leave of some friends and those who have been under my care. In contemplating the past, I hope I have not discouraged any of these little ones from seeking the Father's house, or been a stumbling block to any of those with whom I have mingled, and in returning to the enjoyments of home, may I contribute my mite to its comfort and happiness.

From this time it does not appear that she kept any continued account of her feelings and impressions, yet it was evident to those with whom she mingled that her faith and confidence were increasingly established on that Rock, Christ the power and wisdom of God, that had been her continual refuge. For the last two years of her life she was mostly at home, faithfully performing her various duties, and her inmates can testify that her desire on returning to them to be instrumental in promoting their enjoyment was fully realized; thus her day's work was done in the day time, and preparation for death was not put off until the closing scene, and when prostrated on a bed of sickness, she had little to do more than endure the suffering of the body. Her health for several years was much impaired by neuralgia, but through all the seasons of agony which she endured, not a murmur or complaint was ever known to escape from her lips. For nearly six months previous to her decease her sufferings seemed mostly to cease, and hopes were entertained for her recovery, but an all-wise Providence, whose wisdom is inscrutable, and his ways past finding out by finite beings, saw meet to take her to himself.

On the 8th of 12th mo., 1858, she took a severe cold, which soon appeared to be of a serious character; all the assistance that kind friends and physicians could give, proved of no avail. Congestion of the lungs became firmly seated, her sufferings were severe, but she bore them with Christian fortitude and resignation. Although she could scarcely articulate through weakness, she expressed her love and gratitude to her friends for their kind attentions, her countenance bespeaking the peace and serenity of her soul. Her strength continued to fail, and on the morning of the 13th inst. she quietly breathed

her last, aged 39 years and six months. Thus her sun went down without a cloud to obscure its lightness, and we have not the shadow of a doubt that her immortal spirit is centered in that eternal rest and peace prepared for the righteous.

Westbury, 7th mo. 25th, 1859.

EXTRACTS FROM A MEMOIR OF
ELIZABETH T. KING.

(Continued from page 372.)

The following are extracts from letters written at this time to a young friend in whom she was warmly interested, who was struggling with the doubts and fears incident to the early stages of a Christian's course :—

BALTIMORE, 1 mo., 1846.

* * * Now, my dear, I must speak of some parts of thy letter, which touch me very much, though I scarcely know what to say, for human counsel, and the tenderest human sympathy, will not avail in the work which lies between us and our Maker. But He is a God nigh at hand, and His love and care are greater than any other. He will direct thy steps if thou look to Him for guidance.

Do not be discouraged; look up to Him with trust and love, for He commands this; but remember, that of old the sacrifices were made by fire unto the Lord, and many pleasant things must be given up now. "Whosoever he be of you that forsaketh not *all* that he hath, cannot be my disciple." Never let any thing, however insignificant, stand in the way of thy peace, and then thou wilt experience that in His presence *alone* is fulness of joy.

The way may at times seem dark, but light will arise, if thou trust in the Lord, and wait patiently for Him. That light may sometimes show hard things to be required, but do not be distressed if thy heart should rebel; bring thy unwillingness and disobedience to Him, in the faith that He will give thee power to overcome, for He cannot fail. "Greater is He that is in you, than he that is in the world," so keep close to Him, and the victory will be won. But do not, I beseech thee, neglect anything that is required, for disobedience brings darkness; and do not reason or delay, but simply follow the leadings of the Holy Spirit, and He will guide thee into all peace.

BALTIMORE, 1 mo. 29th 1846.

I long for thee, my dear, and feel painfully desirous that strength may be given to resist the temptations surrounding thee, that thou may not let go thy hold at all. We are seeking "a better country, that is an heavenly," and there is more true satisfaction in suffering for Christ than in any earthly enjoyment.

BALTIMORE, 2 mo. 1st, 1846.

Hold fast the profession of your faith, with-

out wavering, for He is faithful that promised. Never be discouraged; though we fall, we shall rise again, if we look to Him who will not fail to hear and help.

I long that every thing may work together for thy good—pleasure and pain, care and disappointment, if such come—but do not think it must be all gloom. While I would not have one burden lightened, which an All-wise Disposer of events lays upon us, or one cross removed, which He imposes, we must remember we do not serve a hard Master, but a merciful Father.

BALTIMORE, 4 mo. 3d, 1846.

Try to keep humble and quiet. Remember it is not in the whirlwind, or the fire, that the Lord speaks to His children, but in the still small voice. It is the enemy that disturbs the soul; but as in reverent stillness we endeavor to bow before the Lord, He will teach us of His ways, and give us strength to walk in His paths. As we continually strive to look to Him, He will not forsake us, and the work, of which He is the author, He will also finish. In the early part of our religious experience many fears arise lest sacrifices may be called for, which we think we can not make, but we must not look too much at these; just give ourselves up, trusting that strength will be given for whatever is required, and the way will be made clear when the time arrives; "Why are ye fearful, oh ye of little faith?"

We know we love those who are dear to us; we know we would not let them suffer unnecessarily, and that we would never let them stray, nor allow any harm to come nigh them. When we feel how strong this is in our finite natures, let us remember that "God is love," and that withal, He is All-wise and Almighty. "Enter not into the hurryings of the enemy, though they fill the soul," but look up with a trust, that though all is dark now, light will yet be given. This faith is more acceptable than any thing else; without it is impossible to please Him.

BALTIMORE, 6th mo., 1847.

A mad dog was killed yesterday just before our door, which rather alarmed me, as we were, unconsciously, near such great danger. All human prudence and foresight are unavailing to preserve us; we must take all proper precautions, and leave the result "to Him who doeth all things well." What a comfort to believe we are under His fatherly care; none can pluck us out of His hand, and whatever the dispensation allotted us, He sees and knows it all, and can preserve and comfort, through all He permits to befall us. I have been thinking much lately of the text, "Let patience have its perfect work." Life is not intended merely for enjoyment; it is a state of trial and discipline, and I have desired very much to resign every wish, hope, and ex-

pectation, *every thing*, into the hands of our heavenly Father, willing to receive daily the portion which He allows, though it may be, and often is, the cup of suffering. But He never lays more upon His children than He gives ability to bear, so let us look up to Him with filial confidence, and in His own time He will give "beauty for ashes, the oil of joy for mourning, and the garment of praise for the spirit of heaviness." If we follow the apostle's injunction, "In every thing give thanks," we shall not be desponding; and if it be the will of our heavenly Father that we should glorify Him in the fire, may He give us strength to say "Thy will be done." When the furnace was heated seven times hotter than it was wont to be, there was a form like the Son of God with the three children there.

(To be continued.)

DUTIES OF YOUNG MEN AND WOMEN OF LEISURE.

To the mass of people, business men, heads of families, both men and women, and the youth engaged in study or labor, each day brings its full occupation, so that comparatively little time can be devoted to other than the duties growing directly out of these relations. But there is another class, possessing all the opportunities of extensive usefulness, to whom have not yet been assigned specific duties, and who too often fail to discover for themselves what God or their fellow-men demand of them. We mean the young men and the young women of the land, who have finished their school training, and, with means sufficient to command their own time and pursuits, have yet no definite object in life, and have scarcely thought it a duty to select any.

If we can believe the great Persian story-teller, it was customary with the princes of the East, before ascending the throne, to spend some years in travel, not only seeking information, but often in the pursuit of valuable rarities or presents, worthy of the acceptance of the beautiful princess upon whom they had bestowed their hearts. The custom was a wise one, nor is there any reason why our own young men and women should not adopt something like it; only, instead of spending months or years in search of enormous diamonds, enchanted tapestry, and talismans of mystic value, ought not their energies and hearts to be enlisted in the pursuit of objects which would not only insure a constant self-culture, but would culminate in permanent benefit to others?

The misapplication of time, often its total waste, with young people of leisure, arises not so much, we believe, from unwillingness to be useful, as for want of seeing clearly how and when and where to begin. They do not know what to do. And yet this is not so difficult for each one to ascertain for himself or herself, if they will

but thoughtfully and honestly consider two or three things:—

First. What is their *natural* bent of mind, what talent or faculty have they which it gives them pleasure to use;—for what it pleases us to do, we are generally best fitted to excel in. Is there any educational acquisition which they have made which can be applied for the benefit of others, instead of being buried in their own consciousness? Or do they need most of all, and first, a course of *self-culture* to enable them to be of use to anybody?

Secondly. Having discovered what they are capable of, the next practical question to ask is, "Can I do this myself, or do I need the co-operation of others?"

Thirdly. Is this thing *needed*? will it be a benefit if accomplished? It is better not to ask if it is feasible, if the former questions can be truly answered in the affirmative, because so much looks impossible in this world to those who sit down to count over difficulties at the outset, that no great work or good work will ever find laborers, if all obstacles are to be first cleared away; and we may also be certain, that for what is needed and beneficial God himself will make a way in due time; and the "due time" for us is whenever we perceive a necessity for it.

In regard to private effort or organization, that depends entirely on the object selected. Some people can best work alone, others in company. Some work must from its nature be personal, and other objects are best accomplished by organization. He who feels himself called, like our departed Prescott, to the production of a pure literature, or who, like Greenough, must shape his thoughts in the enduring marble, or leave his lessons on the canvas, like Allston, can scarcely share their labors. But all have not their natural gifts for such life-work as this; and there is much to be done in the world which needs no such talent, but which yet enlarges the intellect, keeps alive the moral sense, and is eminently humanitarian in its purposes. And of these things we will name a few which offer opportunities of an eminently useful career to those who have the necessary leisure to pursue them.

For instance, there is a large class in this community, as in most others, who never come upon the public for assistance in any shape, who are self-supporting, industrious, honest, and well-intentioned people, who yet, from their limited means, and necessity of employing their children in profitable labor, have withdrawn them, at an early age, from our public schools. These people live in small and crowded apartments, where there is barely room for the family to eat, drink, and sleep; their dwellings contain no sufficient facilities for the maintenance of delicacy in their habits,—often, not for personal cleanliness,—certainly none for retirement or study. The young people in these families, if they have ever

so great a desire for improvement, have no means within their reach. How many thousands of such young people there are in this city, and still more in other cities of the Union! Now what is wanted to make this class of youth more intelligent, moral, and capable members of society? Some friendly hand stretched out to them, saying, "See, I have provided a comfortable, quiet room, where you can read or study; if you do not know wherein you are most deficient, I am here to aid you. Here are the books, the pen and ink, the pencils, the maps; and here, too, you can come once or twice a week and bathe. Whatever you want to know about your employment which will make you more skilful and your labor more profitable, I will put you in the way of ascertaining and learning." Select one family, or one individual, or a dozen or a hundred such, give them these facilities for a few years, and what different individuals they will be at the end of that time from what they would have been if left, without aid or encouragement, to muddle through life without any refining or elevating influence to meet and hold them up!

Then, again, there are a great many people in the world that are perfectly willing to do for themselves, but have no tact in selection, do not know what the place which nature intended them to occupy really is. Especially are these liable to be misled in placing their children in life employments. How much any individual might do in his lifetime, if he would select successive families, make the dispositions and capacities of the children a study, and *get them in their right places!* Perhaps there is no more common cause of unhappiness in the world, than misplaced talent, or misplaced mediocrity or stupidity. Try with a single family first, not officiously, but kindly and considerately, and see what can be done with them.

To those who have the nerve, a wide field is opened in the pursuit of medical science and its application to suffering humanity. Let any young man or young woman who does not at present know what he is living for, determine to take up some specialty of surgery or therapeutics, with the intent, eventually, of applying it for the amelioration of those unable to pay for the best medical aid, and what a new world this would be to him! Life would no more seem a playhouse in which to disport ourselves for a few days or years, and then go out into the dark vestibule of the future, unnoticed and unregretted; or a round of frivolities and selfish pleasures, ending in disappointment or *ennui*; but it would seem a glorious thing to live, when, by a *living* effort and purpose, thousands might yet rise up to call us blessed.

Another means of determining what there is for you to do, is to examine thoroughly the humanitarian, sanitary, physiological, intellectual, or purely moral organizations which exist, note

wherein *they* fail, or what else is needed to make them effective, and endeavor to supply it. We believe it is a fact, that there is not a single place where the girls of poor families can learn to *mend* their own clothes. That may seem a matter of little consequence to those who have never seen the vast amount of discomfort and actual destitution which comes of it. But to those familiar with the poor, their ways and necessities, it is a great thing. Here is a girl who has never learned to sew or mend properly (and *mending* is a peculiar art); she marries, gets a flock of little children about her, but from sheer inability to keep her own, her husband's and children's clothes in repair, the family sink into neglectful habits, avoid the school-house, the church, and even the Sunday school; sinking, from this single fact, several degrees in the social scale below the position they might otherwise have maintained. We have seen more than one family utterly ruined for want of this simple qualification in the mother. Any young lady can teach a little girl to sew and mend neatly, and, in a lifetime, teach hundreds; nor would it be easy to estimate the amount of good which might thus be done. The "Cotter's Saturday Night" would have been a scene of rags and confusion, had not that "gude auld wife" possessed the art of "making auld claes look a'maist as gude as new."

But if the way to use their leisure does not seem clear to any, let them do this much: try and enlist the conscience of some half-dozen or more of their companions to the simple fact, that they ought to be doing *something*. Let them agree to meet once a week or once a month, to consult as to what needs doing, and what they individually or collectively can do. During the interim, their observation will be awake, their consciences on the alert,—they will have gathered information; nor will it be long before they will find something to *do*, and know *how to do it*.

E. V. S.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, NINTH MONTH 3, 1859.

DIED, At West Branch Clearfield County, Pa., 8th mo. 2nd, after a short but severe illness, which she bore with much patience, ELIZA JANE, daughter of Wm. S. and Nancy Porter, aged fifteen years two months and nine days.

—, In Scipio, Cayuga County, New York, on the 12th inst., RICHARD SEARING, in the 59th year of his age, a member of Scipio monthly meeting.

—, on the 21st ultimo, at Oceanport, N. J., T. STERLING, only son of James P. and Hannah Henery Ellis, in the sixth year of his age.

—, on 4th day morning, 13th of 7th month, DAVID JONES, in the 84th year of his age.

—, 8th mo. 16th, at Woodstown, Salem Co.

N. J., SAMUEL HACKETT, a member of Pilesgrove meeting, aged 76 years and 6 months.

This our beloved friend was a minister of the Gospel for many years, and he was remarkably favored in his walks and conversation among men, to bear to the world the evidence that he practised the precepts of the Gospel.

It was with much difficulty that he spoke during his sickness, but he remarked to a friend, "My Saviour has done much for me. I believe if my work is not done (alluding to public service) my Master will raise me to finish it; if it is finished, the time of my departure is near." At another time he said, "I am favored with peace of mind, and O! if this continue it will crowa all."

Notwithstanding at times his physical sufferings were great, at no time during his sickness was he heard to murmur or seen to show an impatient disposition.

Thus ended the life of this good man, with an evidence that he had not lived in vain; that he had finished the work assigned him by his Divine Master; that he has gone to the eternal world to reap those rich rewards in the mansions of heavenly bliss, "prepared for the righteous from the foundation of the world."

For Friends' Intelligencer.

LETTER FROM AMELIA OPIE.

We would direct the attention of Friends, particularly the younger members, and those who have become negligent in their attendance of meetings, and indifferent respecting the maintenance of our religious principles, to the following from Amelia Opie, written in her fifty-sixth year, not long after she became a member of the Society of Friends. It was written at a period of her life, when her experience and impressions should be entitled to our regard, after she had been moving for a number of years in the literary, and fashionable circles of society. Joseph John Gurney, in a brief notice of her, says, "Admired for her amiability, her talents and her accomplishments, she was received in London at the houses of many of the nobility, and wherever she went she was a welcome guest. But she gradually discovered that all her vanities, her position in the world, and her novel writing, in which her reputation was high, must be laid down at the foot of the cross of Christ. Not satisfied with the forms of the Church of England, or of any class of the Dissenters, she took refuge in the quietness of our silent meetings, which she attended with assiduity. In the mean time it was evident that Christ himself was becoming her peaceful and permanent home; and by degrees she became thoroughly convinced of the principles of Friends." T.

Eleventh mo. 17th, 1859.

AMELIA OPIE TO T. R., SEN.

Norwich, Eleventh mo. 14th, 1826.

My dear Friend, . . . Much has happened since I came home, and much happened during my tour (in the north) and been observed by me, leading to make me deem the *Society of Friends* the most favored people in the world.

I see even good and pious men, who have left Friends, or never were Friends, exposed to associate with those they ought not, because the protecting poles are not round them which are round us. Friends, male and female, old and young, are not exposed to those dangers and temptations which those born in the world are. They are a blessed people, and if they could but see and know what persons not entrenched as they are have to undergo, they would own themselves so; and the young amongst us would never, never wish to quit a Society, the principles of which, if acted up to, must fit them for happiness here, and happiness hereafter. Really a Friend has no excuse for going wrong, and awful indeed is the responsibility of those who do.

"I cannot tell thee how I came to stumble on this subject; but it is often in my mind, and I wish all the young Friends whom I love to feel on this point as I do. As for myself, I feel daily, nay hourly and always, thankful that I am one of you. I believe I am where I ought to be; and often, how often! when in the world, and dissipated and courted and gay, something has said within my heart, "Thou art not where thou ought to be; thou wast intended for better things."

From the Leisure Hour.

ABOUT THE BREATH.

It is no easy matter to give to unseen things and unseen agencies the importance which belongs to them; and thus it is that people who do not set themselves resolutely to the task of studying the changes which go on in what I will call the "unseen physical world," remain ignorant of them to the last, unless some person should place the matter before them in a tangible sort of way.

Need I be formal enough to announce the well-known fact, that every living person amongst us breathes? From birth to death we go on breathing without one moment's intermission, except, perhaps, during a fainting-fit. Do all who happen to read this know what they breathe for, and how? I think not. I will not be content with such answers as, "Because I must;" "Because I couldn't live without air," etc. This is merely reasoning in a circle. I want a positive reply to the questions, Why we breathe, and how we breathe; and as nobody seems to answer me as I like to be answered, I shall set about explaining the matter in my own way.

Firstly, as the air, which is such an important element in the process of breathing, is invisible, and consequently is apt to be invested with some of the usual difficulties appertaining to invisible things, let us surround ourselves as much as possible with visible, tangible representatives. Do as I bid you, then, and for the present ask

no questions. Weigh out $13\frac{1}{2}$ oz. of charcoal, and set it on a plate. Place yourself near a tub full of water, and, by means of a pint measure, dip out the whole of the water by pintful at a time. Manage to dip once every three seconds, or twenty times in a minute, so that at the end of a minute you will have dipped out twenty pints. You may now dip out three more pints, if you please, to add to the water already emptied, for, strictly speaking, our pint measure is hardly big enough; but I have assumed a pint measure to have been employed, for the reason that everybody is well acquainted with the dimensions of it. We are not dealing with the invisible world now: a bulk of water and a heap of charcoal are tangible things. Let us now see what connection they have with the subject of breathing.

The connection is this: one great object of breathing is to remove charcoal from the body; and no less than $13\frac{1}{2}$ oz. of charcoal are thus removed from every human individual, on an average, during each twenty-four hours; so you will perceive why I have thought proper to set before you the tangible object of $13\frac{1}{2}$ oz. of charcoal on a plate.

Again: each human being, on an average, may be considered to take into his lungs and evolve from the same (by inspiration and expiration,) one pint of air every three seconds, or twenty pints per minute—something more, indeed, so that if at the end of the minute we give three pints over, it will be something near the mark. Now, what a stupendous matter for contemplation is this! If the bulk of air we take into our lungs during the twenty-four hours, and give out from our lungs during the same time, were only visible, so as to challenge our attention, we should be startled at the immensity of it. The real quantity is about $666\frac{1}{2}$ cubic feet; and in order to present to your mind a correct idea of this space, imagine a chamber 19 feet square and 19 feet high; such a chamber will correspond to that space almost exactly. Contemplate this fact, I say; realize to your mind these dimensions. Depend upon it, the Almighty does not oblige us to breathe and to expire daily such an enormous bulk of air for nothing. The act ministers to some good end, you may be certain; and be assured, moreover, that if we violate the laws so obviously set before us, we suffer. Now, a room 19 feet every way, is a pretty large room. Looking at the members of English population in the aggregate, how many do you think enjoy the benefits of a room so large?

Of course it may be said, and fairly said, that every room, however close, is supplied, notwithstanding, with some means of causing or permitting a circulation of air—a means, in other words, of ventilation. True, and fortunate that it is so. Even the largest room, were ventilative means not supplied, would in time become unfitted to

support life; and a comparatively small room may have its air retained up to a good standard of purity by an efficient ventilation. But ventilation, be it remembered, involves a current of air, and a current of air, when strong, is a wind—a draught; and draughts are so disagreeable that, rather than incur their effects, people will often put up with bad ventilation.

Having created tangible, visible representatives of invisible things, I will now apply myself to answering the question, Why do we breathe? We breathe, in order to evolve from the system the charcoal which is there continually accumulating; we breathe, to add to our stock of animal heat; we breathe, to relieve the lungs of moisture. Such are the chief objects which breathing subserves. There are others, but they are complex; and the nature of a few being disputed, we may omit the consideration of them here.

Perhaps some novice in this line of thought will feel no little surprise that animal heat should be developed by the act of taking into the lungs cold atmospheric air. Did that novice ever set himself the problem of determining what would become of the heat of a common fire, if air were not supplied to it? That air is just as cool as the air which enters our lungs; still, the heat of a fire is enormously greater than animal heat. Well, but—the novice will remind me—“in the grate there is combustion, and without air fire will not burn.” Granted; and so in the lungs, or breathing organs of animals, there is combustion too, although that combustion does not rise to the energy of combustion of fuel in a grate, there being neither smoke nor fire. But there are many grades of combustion, and respiration is a low grade of it. The difference between fuel combustion and breath combustion is, after all, less than any one who had not thought over the matter might suppose. In both cases we have atmospheric air playing a similar part; in both cases we have heat developed; in both cases we have charcoal converted into gas, and evolved in an invisible form. Yes, the very same invisible gas which charcoal yields when burned in a fire, it yields when burned in the lungs; and, as I have said, from the 19 cubic feet, or thereabouts, of gaseous matter which each human individual on an average discharges from his lungs in the course of twenty-four hours, the chemist, by his wonderful art, can extract no less than $13\frac{1}{2}$ oz. of real charcoal.

And now for the second question, How do we breathe? All animals breathe, but not by the same apparatus. The back-boned animals, which suckle their young, however, all breathe alike. In the chest of each individual of this class, we find certain spongy organs, called lights, or lungs—organs admirably adapted to the end of bringing impure blood into the presence of pure air. When the chest expands, the lungs expand

too, and air rushes in ; when the chest contracts, so do the lungs contract, and the air rushes out. In such manner is breathing performed in backboneed animals which suckle their young.

But whoever has seen the structure of a piece of lights (and who, having a cat, has not ?), must be aware that it is a heavy and bulky structure, and requiring a large chest to hold it. This sort of arrangement would not have sufficed for creatures like birds, which have to pass so large a portion of their time in the air, supported by mere force of wing. Yet no system of breathing apparatus, involving a lowering or a sluggishness of the breathing function, would have sufficed. Birds are exceedingly warm-blooded animals ; their animal heat is considerably higher than the animal heat of human beings. Mark, then, how admirably the breath apparatus of these creatures has been modified to suit the conditions under which the feathered tribe have to exist. Far back against the spine of a fowl or other bird you may chance to be partaking of, you will find a little spongy mass, so much resembling a general texture the lungs or lights of a land-animal, that you will be prepared to believe that the two are corresponding organs. Lungs so very small must be turned to their fullest account, in order to evolve the amount of animal heat which a bird requires ; and so, indeed, they are. It would be not very incorrect to say, that the body of a bird is *all lungs*, since all over the body there are cavities designed to contain air. The bones, too, are hollow and contain air ; so that whenever the bird moves a muscle, a circulation of air is determined towards its little wings ; and when the bird begins to fly, the violent muscular exercise necessary to this act raises the air circulation to its highest intensity, and may be said to fan the breath-combustion to the highest pitch of which it is susceptible.

Pause a minute now, and reflect how beautifully the teachings of philosophy accord with the teachings of experience and common sense. Who is there amongst us who does not know that the more an animal moves or exerts itself, the faster it breathes and the hotter it becomes ? Who amongst us is there who does not know that exercise begets hunger and thirst—it gives an appetite ? What marvel ? Corresponding with the degree of muscular effort brought into operation, there must have been a loss of bodily substance. The furnace has been burning its fuel in proportion, and more fuel has to be supplied. Again, who is there amongst us, who has not looked upon one asleep, and remarked the placid rapture of vitality characteristic of that state ? The muscular system is all at rest, save the heart and a portion of the system which presides over the breath. Wear and tear of the body are reduced to a low grade. There is no wearing application of the mind ; either lulled to oblivion altogether or disporting itself in dreams,

man's thinking part makes no call on its members or the things which minister to them, for stimulus or refreshment. Looking at these the prominent conditions of sleep, it should be—if the principles which our philosophy seeks to establish be sound—it should be, I say, that proportionately with the lowering of lung-combustion during the state of sleep, there should be a corresponding diminution of animal heat, and a decreased necessity for eating and drinking. Does not experience correspond with these suggestions ? How often must it have occurred to many who are now reading this paper, to go to bed on a winter's night, after briskly moving about, fancying they should be quite hot enough—to commit themselves to sleep, still feeling hot enough—but to wake, as the night advanced, under an unbearable sensation of cold, or if not awakening, to dream of rolling in snowdrifts, or taking cold baths, or standing in a shower with one's clothes off, or some other painful expression, in sleep's own grotesque way, of the unpleasant sensation of cold.

Then, as to eating and drinking, everybody knows they are the natural alleviators of hunger and thirst ; but next in order, as an alleviative agent, comes sleep. People exposed to want of aliment—people on the verge of starvation—feel an almost unconquerable desire to sleep ; and many a starving man and woman may pass in sleep a space of time, without eating or drinking, which awake, would have been impossible.—Think too of the following circumstance : we can draw a long breath or a short breath, as we will ; but no effort of will can prevent our breathing altogether.

Mark, too, that during the whole period of sleep, respiration goes on without our will having any conscious effort in the matter. Compare this with the heart. This organ is not subject to the will in any degree. No one by mere effort of volition can make his heart beat a long beat or a short beat, much less to cause the heart to stop for a few moments. How beautifully is all this ordered ! What benevolent foresight ! Frequent occasions arise when it is necessary to interfere momentarily with the breath. If a cloud of dust blow past, it is injudicious to breathe it ; and to avoid it, we must cease breathing momentarily by the force of will. We may have to thrust our heads under water for a few seconds ; in this case again it would be injudicious to go on breathing, and so we are permitted to subject the breath to the will within narrow limits. But under no conceivable conditions can any occasion arise for dictating to the heart at all : the sturdy little blood-pumper is boxed away inside the chest, and enveloped in a sort of leather bag as well : he is cut off from the external world like the veriest recluse. The heart has its own appointed work to do, and the most imperious will can in no degree affect him.

And now it remains for me to say that the breathing organs of some animals are not modelled after the type of lungs; and that other animals, although they breathe, are devoid of any special breathing organs. Need I say that fishes do not breathe by lungs? how could they? They breathe by those red fringe-like things called gills, no less admirably adapted to lay hold of the air which is dissolved in water, than our lungs are adapted to contain air as it exists in the gaseous form. Certain curious animals, too, are supplied with both gills and lungs; so that philosophers are at a loss to decide whether they are fish or reptiles. Insects breathe by tubes called trachææ, opening externally on various parts of the body, whence the secret of killing a wasp by smearing its body with oil; and certain lower animals, unprovided with special respiratory apparatus, breathe by absorbing air through their skins. Thus ends what I have to say about breathing. It may enable the reader to understand what is implied in the Divine record, when it is said that God "breathed into man's nostrils the breath of life."

A CHECK TO PRIDE.

A writer says, could we see what transpired on our continent thousands of years ago, our pride and vanity would be checked; and we should feel our insignificance. But for this, need we go so far back?

Looking back one year; take a month's retrospect; review the last day, even; and is not a reflection on its events sufficient to convince us of the littleness of our pursuits?

We need worthy life objects to enlarge the soul and strengthen the hands; that we may be so fully occupied as not to hear the voice of folly, and be induced to waste our powers on fitful and questionable interests.

Borne irresistibly onward as we are by the mighty current of life, and forming here a moment one of vanishing myriads, what have we to foster pride? Nothing. What are we of ourselves? Nothing? Then why proud?—How can one be vain? Vain! Of what? Of having been created, and placed here? O human weakness! For what are we here? This is the question for life. Only as we solve it correctly in deeds, do we live. Else, at the close of an earthly wandering, like the disappointed traveler at the head of the Nile, we shall feel—"is this all?" Ah! the agony of that conscious failure! It may be avoided by learning the object of life, and living for that object. Each must study the question for himself, and for himself he must solve it.—*Life Illustrated.*

Household affairs ought insensibly to slide along, and represent a still current without noise or waves.

MY PSALM.

I mourn no more my vanished years,
Beneath a tender rain,
An April rain of smiles and tears,
My heart is young again.

The west winds blow, and, singing low,
I hear the glad streams run:
The windows of my soul I throw
Wide open to the sun.

No longer forward nor behind
I look in hope and fear:
But, grateful, take the good I find,
The best of now and here.

I plough no more a desert land,
To harvest weed and tare:
The manna dropping from God's hand
Rebukes my painful care.

I break my pilgrim staff, I lay
Aside the toiling oar:
The angel sought so far away
I welcome at my door.

The airs of Spring may never play
Among the ripening corn,
Nor freshness of the flowers of May
Blow through the Autumn morn.

Yet shall the blue-eyed gentian look
Through fringed lids to heaven,
And the pale aster in the brook
Shall see its image given;

The woods shall wear their robes of praise,
The south wind softly sigh,
And sweet, calm days in golden haze
Melt down the amber sky.

Not less shall manly deed and word
Rebuke an age of wrong;
The graven flowers that wreath the sword
Make not the blade less strong.

But smiting hands shall learn to heal,
To build as to destroy;
Nor less my heart for others feel
That I the more enjoy.

All as God wills, who wisely heeds
To give or to withhold,
And knoweth more of all my needs
Than all my prayers have told!

Enough that blessings undeserved
Have marked my erring track—
That whereso'er my feet have swerved,
His chastening turned me back—

That more and more a Providence
Of love is understood,
Making the springs of time and sense
Sweet with eternal good—

That death seems but a covered way
Which opens into light,
Wherein no blinded child can stray
Beyond the Father's sight—

That care and trial seem at last,
Through Memory's sunset air,
Like mountain-ranges over-past,
In purple distance fair—

That all the jarring notes of life
Seem blending in a psalm,
And all the angles of its strife
Show rounding into calm.

And so the shadows fall apart,
 And so the west winds play;
 And all the windows of my heart
 I open to the day.

THE HEART-SONG OF THE MOTHER.

No artist am I, but the mother's heart sings;
 And its simplest cadence from deep love springs.
 While o'er the full chords comes a magic spell:
 The little ones know it, full well, full well!

No genius am I, but my pen I dip
 In an element pure as the dew on the lip
 Of the rose-bud fair, with its chalice white,
 That dwells in the charm of the early light.

No critic am I, but my heart doth tell
 When my child feeleth nobly or doeth well;
 And over my sheet steals a holy ray,
 And bright, happy thoughts all around me play.

No teacher am I, but my boy doth learn
 From the flower and the bird, and the tiny fern;
 From the breeze on the hill, from the sunset hue,
 From the moon and the stars, in their watch so true.

No schemer am I, for the angels wait
 Around these dear heads from their high estate.
 Sweet Nature loves them, and so let her be
 The arbiter true of their destiny.

With the good God above, and brothers around,
 And the sunlight to bless them, and flowers on the
 ground,
 I trust, oh! I trust them, and suffer no fear:
 Where the "reed is not broken," ill cometh not near.

CANDLES.

A very simple matter was it in the days of our grandfathers, nay, perhaps in our own days too, if we are not quite juveniles, to make a candle. A wick of cotton dipped in a pan of melted tallow, removed, and dipped again, and the process repeated until a sufficient amount of tallow had accumulated round the wick, and there was a candle. A primitive, simple candle, indeed, is one of this kind—a dip; but dip candles still hold their own in presence of all the modern mysteries of sperm and stearine. When our grandmamas wanted a candle better than a mere tallow dip, but less expensive than spermaceti or wax, they used ordinary tallow mould candles; composition candles, as they are now called, did not exist then. Few of us, I believe, know how much science is involved in the making of a composition candle.

Tallow candles have their uses, and they have also their defects. Their flame is never very brilliant, and their substance is liable to gutter; then what a plague it is to be obliged to snuff them so frequently! but tallow candles may be carried about with less damage to themselves than either candles of wax, spermaceti, stearine, or composition: this at last is an advantage. Suppose, however, tallow were a desirable thing of which to make candles universally, see what a position we should be in. Tallow, as most

people know, I presume, is only a sort of hard fat which accumulates in the bodies of certain animals. However good a fat may be, considered in relation to the materials of fuel and illumination, it must be hard—it must be *tallow*, if we are to make candles of it without the aid of chemistry; and even tallow of the best kind has great defects. Its odor is disagreeable, it is too soft, and it contains shreds of animal membrane, which makes the candle spit and throw off sparks.

If, on some very cold day, you squeeze a piece of tallow between two pieces of blotting paper, taking care you do not melt it, and, if the two pieces of paper be examined, they will be found soiled with oily matter: hence it appears that the tallow, hard though it be, really contains something which is not hard—a mere bland oil. This discovery was an important fact in the history of the candle manufacture. Follow me now to the oil cruet. The weather is still piercingly cold, and the salad oil looks different to what it did before the cold set in. Perhaps you will tell me the oil is frozen; and if you do, I do not know that one has much cause to quarrel with the expression. Experience proves, however, that cold though the day may be, the whole of any portion of salad oil never freezes, but remains fluid to the last. What is the natural inference to be deduced from this? Why, evidently, that olive oil is composed of two different fatty bodies, one capable of solidifying by cold, the other remaining fluid. In like manner, the inference is deduced that tallow is a compound of two fats, one a liquid oil, the other a fatty body, having a tendency to become solid when sufficiently cooled. This, I say, is the inference in either case—an inference proved to be correct by a celebrated French chemist, M. Chevreul, who worked at the subject of oils and fats for a period of more than twelve years.

Oils and fats are really not the simple bodies we often take them to be. As the hardest tallow contains something which is soft, and the blandest olive oil something which is hard, so, in like manner, are all fixed oils and fats made up of two or more fatty bodies. If we can remove the softest of these, and leave the hardest, we ought to be able materially to improve the manufacture of candles. This is what in reality has been done. By means of a chemical process, it is easy to extract the hard or most infusible part out of oils and fats, and turn the hard portions into candles.

Chemists are strange people. They tell us that each of the simple fatty bodies into which a compound fatty body may be separated is a salt—a compound of an acid with a base; a sweet substance called glycerine being the base, and the acid differing according to circumstances. In the case of ordinary animal tallow, the hard congealable part is a combination of stearic acid

with glycerine, and the soft liquid uncongealable part of a combination of oleic acid with glycerine. But to come to the point at which I am aiming : whereas formerly candlemakers were obliged to use such fats as came naturally to their hands, discarding all that might be too soft, they are now far less restricted. Since M. Chevreul, with his chemistry, has taught them to separate hard from soft fats, and to make hard fats still harder and more combustible by taking from them the incombustible portion called glycerine, the art of candlemaking has become not only more refined and philosophic, but also more easy. Those vexatious long wicks, so continually requiring snuffing, have had their *coup de grace*. If people now submit to be troubled by them, it is their own fault, for stearine or composition candles are manufactured cheap enough to be within the reach of all. Perhaps a tallow dip may be useful now and then for carrying about ; but as for tallow rushlights, I would banish them altogether in favor of Child's Night Lights, as they are called, made of stearine, by Price's Candle Company.

The discovery of Chevreul, to which allusion has been made, may hardly suggest to the non-scientific reader a true idea of its importance. It is considered by scientific men to be one of the master discoveries of this century, however ; and when I say that it has done more to give the death-blow to the African slave trade than any one single discovery beside, perhaps, the reader may have the curiosity to demand an explanation. That explanation is simply this. The reason why native Africans are kidnapped and sold is, because of the money realized by their sale : if they would realize more money by being kept at home, depend upon it they would never find their way across the Atlantic. From the extraordinary and growing demand which is now made for oils, this is likely to become increasingly the case ; for in Africa, and especially on its western coasts, there grow incalculable quantities of oil-producing trees, amongst which the oil-palm is pre-eminent.

Now palm oil is yellow and odorous, and it is not well adapted in its natural state for the manufacture of candles ; but if there be any truth in the doctrines of M. Chevreul, what should prevent the chemical manufacturer from extracting from yellow and not very hard palm oil, the hard and inodorous portion of it best adapted for the manufacture of candles ? Nothing prevents him ; accordingly, this is now done by one of many processes, each obvious enough to the chemist, but somewhat too elaborate for description here. Though, in deference to the presumed wishes of the reader, the beautiful principles of chemistry involved in the new candle-making operation have been rather indicated than entered into, I did nevertheless venture so far on the forbidden chemical ground as to intimate that every fat is

of the nature of a salt, that is to say, a compound of an acid and glycerine. Concerning this glycerine, let me now write a few words. It has become somewhat plentiful of late ; it may be obtained at any druggist's shop, and at the shop of almost every oilman. It is called glycerine because of its remarkable sweetness, and is altogether a very curious substance. Firstly, it is incombustible ; therefore no one will question the propriety of removing it from all fatty bodies intended for combustion, even did it not possess utilities of its own. Before the discovery of M. Chevreul, glycerine could not thus be taken out of oils and fats ; hence, useful or not useful, there it must remain. The manufacturer now extracts it, and turns it to account in many ways. The physician administers it instead of cod-liver oil, which latter is very disagreeable to most palates, though glycerine is delicious. The soap maker uses it to mingle with his soap ; the artist to grind his moist water colors with. It is good for chapped hands and sore lips. Meat and fruits immersed in it remain fresh and unchanged for an indefinite time. The photographer uses it, and many other classes of people, I have no doubt, whom I cannot just now remember.

Though palm oil may be considered the grand staple of stearine or composition candles, it is by no means the only one. Cocoa nut oil is also used extensively, and indeed the beauty of the discovery made by M. Chevreul is its applicability to all fatty bodies. There are some curious points yet to be adverted to in connection with stearine or composition candles. It was in the year 1847, if I mistake not, that Englishmen were all on the *qui vive* about poisoned candles. The fact was this. So thoroughly effectual was the treatment devised by M. Chevreul for separating the hard matter of fats and oils, that it threatened to be almost too hard : it crystallized around the wicks, and fell off in flakes. It would have been provoking indeed, had the new candles been worthless in consequence of their exceeding excellence ; but, at any rate, they must not be allowed to crystallize ; that would never do.

Next in the order of discovery, the fact was made out that a certain proportion of wax melted with the stearine prevented crystallization. Ay, but wax is dear. Well, terrible to relate, the fact was also discovered that a certain portion of white arsenic melted with stearine also prevented crystallization. The application of this arsenical discovery had fortunately but a short existence. Arsenic is never so dangerous as when absorbed through the lungs, and had arsenical candles maintained their sway, there is no foreseeing the amount of terrible consequences. They soon went out of vogue, conquered by another discovery most provokingly simple. Inasmuch as crystals can only form whilst particles are free to move in all directions, some person bethought himself of the expedient of pouring the stearine

into the candle moulds, not at the point of highest fusion as hitherto, but after it had become somewhat pasty by cooling. This simple expedient was tried with complete success, and it is now always adopted.

The discovery of Chevreul being properly applied to a fatty body, no matter how colored it may be, is competent to give an absolutely white product. Nevertheless, the fact will perhaps have been remarked, that the best English stearine candles will have a shade of yellow. Oh, prejudice! to what absurdities dost thou bring us! Wax candles are yellow or straw-colored; they cannot be made white; but sperm candles, which are white, occupy a lower rank than those of wax. Well, forsooth, in order that stearine candles may not be mistaken for sperm candles, and may wear the aspect of wax ones, they must needs be tinged (to their own detriment be it known) with gamboge. Apropos of wax candles, I may now state that they are neither made by dipping nor by moulding, but by dipping combined with rolling, the latter operation being performed on a slab of marble.

Some years ago there was considerable talk about candles manufactured, or, rather, to be manufactured, out of peat bog. There was no doubt as to the fact. I have not only seen such candles, but I have burned them, and excellent candles they are. They are composed of a chemical principle termed paraffine, which can be got out of peat bog, but all attempts to get it economically have failed.

There is one subject which the discovery of M. Chevreul suggests, so pregnant with future consequences, so expressive of the goodness of the Almighty in permitting a discovery to be made just when mankind wants it, that I cannot forbear touching upon it. Very little of the tallow of which candles, before Chevreul's discovery, had been made, was the produce of highly cultivated lands. We sent to the steppes of Russia for it, over which countless millions of horned cattle run wild; we sent also to South America and to Australia. So large an exuberance of animal life as the tallow merchant requires cannot be found in any land where population is thick, and ground is enclosed and cultivated. Except, then, we are prepared to admit that the present condition of the surface of the earth is permanent; that Russian steppes, and Australian grass lands, and the prairies and pampas of the New World, will never bend under the fuller dominion of man, and become enclosed, each bearing an appropriate crop; except we assume this, I say, man's necessities for grease will be developed in precise ratio to the difficulty of obtaining it. This is no mere groundless speculation. Not only, in the matter of soap and candles, were we crying out for grease, grease, of an exclusive kind, just as the discovery of M. Chevreul dawned; but our

steam-engines, our locomotives, and all the myriads of steam-moved combinations were thirsting for oil (liquid grease) so strongly, that lubricating matters of animal origin would not have been adequately forthcoming. Machinery is no less exclusive than are candles in the matter of grease. The former cannot have it too thin, while the latter cannot have it too thick; so the discovery of M. Chevreul suits them both.

ITEMS OF NEWS.

EUROPEAN.—The steamship *Ætna* brings the intelligence that the steamship *Great Eastern* was formally advertised to leave for Portland early in the 9th mo. Considerable confidence appears to be felt in the ultimate success of the Atlantic Telegraph, and its shares were quoted at £108. There is a vague rumor that Prince Napoleon was to be made sovereign of Tuscany, but it is not generally credited.

BRONZE MONEY.—Among the recent money-grants voted to the British Government by the House of Commons, is the sum of \$50,000 for alterations in the copper coinage of England. It is intended, as we have done in this country, to reduce the size of the inferior coin, and to change the metal—only, instead of *nickle*, (which was first issued here in 1857,) the material will be *bronze*. This metal has already been tried for coinage in Canada and Nova Scotia, and the new issue in England will resemble the small coinage adopted in those colonies.

SLAVERY.—The *Mississippian* says that the agitation in favor of the repeal of the slave trade law is confined to no political party nor class of our citizens, but is fast becoming the popular sentiment of the Southern people. "The sooner," it adds, "our Northern fellow citizens are convinced of the fact, and make up their minds to accede to our just demand, the better for the peace and prosperity of our political union."

VALUABLE DISCOVERY.—A vein of cannel coal has been discovered on the farm of our friend, L. M. Speer adjoining the town of Bellevernon. The vein is ten feet thick, and has been pronounced by Mr. Russell, of the North American Coal Oil Company, to be of good quality for the manufacture of oil. This discovery will give a new feature to the business of our valley, and a new impetus to the enterprising village of Bellevernon, and immediately be a source of wealth to the energetic and industrious proprietor.—*Monongahela (Pa.) Republican*.

MARINE TELEGRAPH STATION IN THE NARROWS.—The Americn Telegraph Company have obtained permission from the Secretary of War to open a marine telegraph station at Lafayette, in the Narrows, and will proceed immediately to lay a cable from that point to Fort Hamilton, where it will connect with the Brooklyn line, which stretches to New York. This line will give the company unequalled facilities for reporting marine news, night and day, as it will also connect with the line already constructed from Sandy Hook.

A steamboat has just returned to St. Louis, from a trip up the Missouri river to Fort Benton, three thousand miles from its mouth, and only seventy miles from the sources of the Columbia river. This is the furthest point yet reached by steamboat, and it is now demonstrated a steamboat may, without any difficulty, go from Pittsburg to Fort Benton and back. In truth, the internal navigation of the west is as yet in its infancy.

The Philadelphia Academy of Sciences has received from Africa 2500 specimens of different birds, and 250 of quadrupeds. They are the contributions of Dr. P. R. Du Chaille, who has travelled over 400 miles of that continent, in pursuing his natural history studies.

LARGE TUNNEL.—The big tunnel on the Covington and Ohio Railroad in Greenbriar county, Va., is 4700 feet long, and 700 feet below the surface of the earth. It is 300 feet longer than the Blue Ridge tunnel. The width is 27 feet to accommodate a double track, and the height is 23 feet.

LONDON TIMES.—The London *Times* is a wonderful establishment. Eighteen reporters are the force employed for the House of Parliament alone, when they are in session. Their work is altogether by night. Four cabs, owned by the *Times*, are employed solely in carrying reporters and reports to and fro, between Printing House Square and the Palace at Westminster.

TELEGRAPH.—The Russian government has begun the construction of the telegraph line which is to run from Moscow right across the north of Asia to the mouth of the Amoor, on the Pacific Ocean. The whole length will exceed 2,600 leagues. A project has been drawn up for continuing the line to the coast of America, which would afford great facilities for laying the cable to connect the two continents.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The receipts of Flour continue small, but there is very little shipping demand. Sales of 700 barrels fresh ground Western at \$5 50 a \$5 62½ per barrel. Sales to the home trade at \$5 a \$5 25 for superfine; \$5 50 a \$6 00 for extra and extra family, and \$25 a \$7 25 for fancy lots. Sales of Rye Flour at \$3 75. Corn Meal—Pennsylvania is held at \$3 62½.

GRAIN.—Sales of 2000 bushels good and prime Southern and Pennsylvania red Wheat at \$1 19 a 1 20; 6,000 bushels fair quality at \$1 16, and small lots of White at 1 28, a 1 30. New Rye commands 70 cts. on arrival. Corn is in good demand. Sales of 3,000 a 4,000 bushels yellow at 82 cts., afloat and in store, and 706 bushels white at 80 cents. Sales of 1100 bus. prime new Delaware at 35 cents, and some old Pennsylvania at 37½ cts. per bushel.

SEEDS.—In Cloverseed nothing doing. About 200 bushels new Timothy sold at \$2 75 per bushel. The market continues bare of Flaxseed.

LONDON GROVE BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—It is intended to commence the next Session of this Institution on the 1st of 11th month, 1859. Terms \$60 for 20 weeks; no extras, except for the Latin and Greek Languages, which will be \$5 each. For Reference and further particulars inquire for Circular of

BENJ. SWAYNE, Principal,
London Grove P. O., Chester Co. Pa.

9 mo 3, 2 mo.

GWYNEDD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The next session of this Institution will commence on the 14th of 11th month, 1859, and continue twenty weeks. Terms \$70, and no extras. For further information application can be made to

DANIEL FOULKE, Principal,

HUGH FOULKE, Jr., Teacher,

Spring House P. O.,

Montgomery co., Pa.

8 mo. 13--2 mo.

ELDRIDGES HILL BOARDING SCHOOL FOR YOUTH OF BOTH SEXES, will open its Winter Session 11 mo 1st.

Terms \$70 per session of 20 weeks. For particulars address the Principal for a circular.

ALLEN FLITCRAFT.

Eldridges Hill Salem County, N. J.

8 mo 27 3 m.

THE BANKSDALE BOARDING SCHOOL FOR GIRLS, will be reopened the 14th of 11th month, and be continued twenty weeks. The course of study will comprise the usual English branches and Drawing. Terms \$60.

For further information apply to ELIZA HEACOCK, Jenkintown, Montgomery Co. Penn.

8mo. 27 3m.

MOORESTOWN BOARDING SCHOOL FOR FEMALES will re-open the 1st Second-day of 10th mo. next. For Circulars apply to

MARY S. LIPPINCOTT, Proprietor,
Moorestown P. O., Burlington Co., N. J.

8th mo. 20--3 t.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

GEO. A. NEWBOLD,
Purcellville, Loudon Co., Va.

8th mo. 6, 1859.—6m.

BYBERRY BOARDING SCHOOL, FOR GIRLS. The ninth session of Byberry Boarding School, taught by Jane, Anne and Mary S. Hillborn, will commence on the first Second-day of Tenth month, 1859, and continue forty weeks without intermission, (including two terms of 20 weeks each.) The course of instruction embraces all the branches of a liberal English education.

Terms \$60 per session of 20 weeks, one half payable in advance. For circulars containing further particulars address

JANE HILLBORN,
Byberry P. O., Philada., Pa.

8th mo. 7—3m.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek; French, Pencil, and Pellis work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; reading, Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M.

Principal.

Attleboro', Bucks Co., 5th mo., 28, 1859. 6m.

Merrihew & Thompson, Frs., Lodge st., N. side old Penn'a. Bank.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, NINTH MONTH 10, 1859.

No. 26.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

CONVERSATIONS ON RELIGIOUS SUBJECTS, BETWEEN A FATHER AND HIS SONS.

BY SAMUEL M. JANNEY.
(Concluded from page 386.)

Baptism and the Lord's Supper.

James. But may we not suppose that he intended the bread and wine, which were used at the last supper, to be perpetuated in the church as symbols or figures of his flesh and blood? for it is not only mentioned by the evangelists but by the apostle Paul, who says, "I have received of the Lord that which also I delivered unto you, That the Lord Jesus, the same night in which he was betrayed, took bread: and when he had given thanks, he brake it, and said, Take, eat; this is my body, which is broken for you: this do in remembrance of me. After the same manner also he took the cup, when he had supped, saying, This cup is the new testament in my blood; this do ye, as oft as ye drink it, in remembrance of me: for as often as ye eat this bread and drink this cup, ye do show forth the Lord's death till he come." 1 Cor. xi. 23-26.

Father. All the ceremonies of the Mosaic law were observed by Jesus Christ; for that law was not abrogated till after his crucifixion. The pass-over was one of these ceremonies, and had a more immediate reference to himself than any of the others. It is not surprising then that he should, while celebrating this feast, endeavor to turn the attention of his followers to the spiritual meaning of it, by speaking of that bread which comes down from heaven and nourishes the soul; and of that wine which he would drink new with them in his Father's kingdom. He told them, as oft as they eat and drank, to do it in remembrance of him, and thereby they would show forth his death *till he came*. But did he not come to them again

to rule and to reign in them, when, after waiting at Jerusalem they were all baptized with the Holy Spirit? This was the fulfilment of his promise, "I will not leave you comfortless,—I will come to you," and "Lo! I am with you alway, even unto the end of the world." This was to them the second appearance of Christ. And to every regenerated soul he still appears in spirit, and is that substance and life which fulfils all the shadows and ceremonies of the law, and sets free from them.

Moses, when he gave forth the outward law, was exceedingly particular as to the time and manner in which every ceremony should be performed. He also left written directions respecting it, and instituted an order of priests and Levites to perform the service of the altar, and to explain the law to the people.

But when Jesus Christ came to introduce the new covenant dispensation, he prescribed no outward ceremonies, nor did he institute any order of priests. Let us read his admirable sermon on the mount, which is the clearest exposition we have of his doctrines, and we shall find nothing there that would lead us to place reliance upon rites or ceremonies of any kind. Nothing short of purity of heart and uprightness of conduct, can render us acceptable with God. When he was about to leave his disciples, he told them "to wait at Jerusalem until they should be endued with power from on high." "For John truly baptized with water, but ye shall be baptized with the Holy Ghost not many days hence." Acts i. 5.—"I have many things to say unto you, but ye cannot bear them now. Howbeit when he, the spirit of Truth, is come, he will guide you into all truth." John xvi. 12, 13.

I therefore conclude, that as Jesus Christ "blotted out the hand-writing of ordinances that was against us, which was contrary to us, and took it out of the way, nailing it to his cross," Col. ii. 14,—he did not intend to introduce in its stead another ceremonial religion; but to lead his followers to the spiritual reality of communion with God. "We are of the circumcision," said the apostle Paul, "who worship God in the spirit, and have no confidence in the flesh."

James. It appears from the history of the church, that the supper was celebrated by the primitive Christians, and the sacrament is still in use among almost every portion of the Christian churches.

Father. It is true that we have accounts of the supper being eaten by the primitive Christians ; but the ceremony now observed of eating a wafer and drinking of wine, is not a supper either as to time or form.

Mosheim informs us, that "both the Asiatic churches and those of Rome fasted during the great week, (so that was called in which Christ died), and afterwards celebrated, *like the Jews, a sacred feast* ; at which they distributed a *paschal lamb*, in memory of the holy supper." The eastern and western churches differed about the time and manner of observing this ceremony ; and it occasioned many bitter disputes, and much bloodshed, after the church became corrupted. If the supper which Christ partook of with his disciples, and which was imitated by the primitive churches, was intended to be observed by succeeding generations, who has a right to alter its form, or to omit some of its most interesting features, or to substitute in its place another ceremony ? Yet it has been altered, or entirely changed, by all the reformed churches, with the exception of the Mennonists, or United Brethren.

When Jesus had celebrated the passover with his disciples, "he took a towel and poured water into a basin, and began to wash his disciples' feet, and to wipe them with the towel wherewith he was girded. Peter saith unto him, Thou shalt never wash my feet ; Jesus answered him, If I wash thee not, thou hast no part with me. Simon Peter saith unto him, Lord, not my feet only, but also my hands and my head. Jesus saith unto him, He that is washed needeth not, save to wash his feet, but is clean every whit ; and ye are clean but not all. For he knew who would betray him ; therefore said he, Ye are not all clean. So after he had washed their feet, and had taken his garments and was set down again, he said unto them, Know ye what I have done to you ? Ye call me Master and Lord, and ye say well, for so I am. If I then, your Lord and Master, have washed your feet, ye also ought to wash one another's feet ; for I have given you an example, that ye should do as I have done to you." John xiii. 4 to 15.

Now, this part of the ceremony is fully as instructive as the rest, and was even more explicitly enjoined upon the disciples ; yet it is entirely omitted by nearly the whole of professing christendom. Instead of washing one another's feet, they sprinkle a little water in the face, and call it baptism ; and instead of eating the paschal lamb in the evening, they partake of a wafer in the middle of the day.

James. It appears to me, that if these ceremonies are to be observed at all, they ought to be performed precisely as described in the Scriptures ; and not only these, but the anointing of the sick, and every other ceremony observed by the primitive Christians. We shall be much more excusable for considering them all as types, which were

permitted for a season, but intended to be laid aside in the further progress of the church, than to select those which are most agreeable to ourselves, and to neglect and modify the others.

Father. There is much allowance to be made for the early Christians, in their fondness for ceremonial worship. The first converts were chiefly Jews, who had been accustomed from their infancy to the imposing rites of the old law, which had been enjoined upon them by the Most High through his servant Moses. Although the Messiah came to fulfil and to abrogate that law, we do not find any account in the Scriptures, that he prohibited the observance of it. But by instructing them in the spiritual nature of his kingdom, and directing their attention to the teachings of the spirit of Truth, which would lead them into all truth, he prepared the way for them to come out from their "bondage under the elements of the world," "that they might receive the adoption of sons." Gal. iv. 3, 5.

In the spiritual appearance of Christ, which is the establishment of Divine power in the hearts of his people, all the types and shadows of the old law and of John's dispensation, are fulfilled. By this means the soul becomes purified and "washed in the laver of regeneration," "in the name of the Lord Jesus, and by the spirit of our God." It also feeds upon the hidden manna, the body and blood of Christ, which are the substance and the life that come down from heaven, and give life to the soul. These can say with the apostle, "The cup of blessing which we bless, is it not the communion of the blood of Christ ? the bread which we break, is it not the communion of the body of Christ ? for we, *being many, are one bread and one body*, for we are all partakers of that one bread." 1 Cor. x. 16, 17. This can only be true of those who become members of that spiritual body of which Christ is the head. For, as in the animal body, every member is animated with the same life, and the same blood circulates through every part, and supplies nourishment to all ; so in the spiritual relation,—the members, though many, are all partakers of *one bread* and form but *one body*. "Behold, I stand at the door and knock," says Christ : "if any man hear my voice, and open the door, I will come in to him, and will sup with him, and he with me." Rev. iii. 20. This is indeed the banquet of the soul, in which the new wine of the kingdom and the bread of life are distributed to nourish the soul unto everlasting life.

I believe there are those among every sect and denomination, who come to partake of this spiritual food ; but many of these are so far influenced by education and tradition, as to believe it necessary for them to observe the typical ceremonies which were instituted in a darker age, and given to a superficial people. May we not say to these sincere professors, as Paul said to the Galatians, "Received ye the spirit by the works of the

law, or by the hearing of faith? Are ye so foolish? having begun in the Spirit, are ye now made perfect by the flesh?" Gal. iii. 2, 3. "Let no man, therefore judge you in meat, or in drink, or in respect of a holy day, or of the new moon, or of the sabbath days,—which are a shadow of things to come, but the body is of Christ." Col. ii. 16. Let us consider whether we have not a testimony to bear against many of those outward rites and ceremonies, which may have been instituted as signs of a gospel day to come:—but if that day has come, or if the "night is far spent, and the day is at hand," let us prepare ourselves to turn away from the shadows, and walk in the light, that we may be "children of the light and of the day" of pure gospel substance.

EXTRACTS FROM A MEMOIR OF
ELIZABETH T. KING.

(Continued from page 391.)

She writes thus in her journal:—

10 mo. 8th, 1847. I had a precious feeling of comfort this morning in the thought that it is no matter how despised we may be, if we are permitted to find acceptance in the Beloved. It may be that pride and self-love mingle with our desires for usefulness, even in the Church. If He see meet to refuse the qualification, He may give it to others. "The meek will He guide in judgment, and the meek will He teach his way."

The willingness to be nothing, if that be His will, is sweet, and I desire to be very thankful for this little ray of comfort, vouchsafed after a time of deep humiliation. I have the deepest cause for thankfulness in my abundant blessings; my cup runneth over. May I see clearly what my duty is, and be favored with strength to do it, not consulting my own ease or pleasure.

In a letter to a dear friend she thus continues this subject:

BALTIMORE, 11 mo. 7th, 1847.

This stripped, weak state is very trying to that part which would fain seek the honor which cometh from man. I have been well-nigh dismayed, sometimes entirely so, but the heights have a greater tendency to separate us from the love of God than the depths. When the cross of Christ is the only refuge, with what strength of despair the soul clings to it.

Ah, my dear, this is a pilgrimage—a warfare—no stopping for permanent rest until the journey is over—no putting off the armor, or laying down the weapons, until the victory is won. I have excused myself in various ways from labor. I said I was weak, that I had other cares, that I was afraid of a forward spirit; but I now see that it is in a great measure the withholding more than was meet that has tended to my deep poverty, and that if simple obedience had been yielded to gentle intimations, I should have had more peace.

Time is passing away very rapidly with us both; we ought before very long to stand as soldiers in the fight. Are we making the progress which will qualify us for this? Are we casting aside creaturely activity, the love of the world, and the fear of it, and deepening in the root? Indeed, this is a very serious matter for us to think of, now that we are mothers, and must seek for strength to guide and restrain those who are dearer to us than life. If we could but dwell under a constant concern for the right advancement of our dear children, I believe it would be very effectual. May the Lord take our little ones into His flock!

3 mo. 4th, 1848. I have had not a little quiet comfort this morning; but I have been exceedingly tried and exercised in the desire, that while I am faithful to the law and the testimony, I may in no wise depart from a loving and charitable spirit. I see much that I think is wrong; may I be favored to preserve the right medium between too much liberality and bigotry. Could I but be preserved in a loving humble spirit, how happy I might always be. There is the command, "Judge not:" let me ever bear this in mind.

As a member of Friends' Prison Association, she frequently spent the afternoon of First day at the Maryland Penitentiary, for the purpose of teaching the women confined there.

12 mo. 13th, 1848. I felt this morning after the reading as though I would like to express a desire that we might live nearer our heavenly Father; but I shrunk, because I feared I might do wrong during the day, and thus bring reproach upon His cause. This was faithless, I know, but I am *so weak*. Oh, my Father, look down with pity; and if Thou hast any service for me to perform, keep me near Thee in humility, and let none of my actions bring reproach upon Thy cause, or blood upon my own head.

In a letter to an aunt she writes:—

BALTIMORE, 12 mo. 20th, 1848.

My journeying has been mostly in the wilderness since we met; but this matters little if we can feel any evidence that the journey has been onward. The fear that it has not, has been cause of the greatest sorrow and discouragement, yet there has been some arising of the well-spring of life. May we be favored to journey forward, keeping very near to our Master, and willing to follow Him whithersoever He leadeth.

I thought I felt a freedom to speak in this way to thee, my dear, to whom I feel bound, not only by the ties of natural affection, but by a deeper and stronger tie of spiritual sympathy, in which I have felt to crave for thee, as for my own soul, greater advancement and more heartfelt devotion, and such a close keeping to the light, even here amid trials and temptations, that

so we may be "always with the Lord." Since we may truly say our cup runneth over, may we strive to prove our thankfulness by our obedience. Oh, how earnestly do I crave this, having proved so fully that the smile of our heavenly Father lights even the darkest path, and without it even the brightest is gloomy.

That one so sensitive as the subject of this Memoir, who habitually tested herself by the highest standard, should often feel deeply her own shortcomings, and that the entries in her journal, or her confidential letters, should at such times give evidence of it, will not surprise those who knew her. But it would be doing injustice to her character, and especially to her Christian course, did we suppose that these struggles after the "life hid with Christ in God" unfitted her for the cheerful performance of social duties, or lessened her enjoyment of the blessings by which she was surrounded. She was in truth the light of her household, and found a constant source of pure pleasure to herself in the duties of a wife and mother. She entered with the fullest sympathy into the innocent enjoyments of her family, drawing on her own resources for their encouragement and instruction; or aiding them in the appreciation of the beauties of Nature. It was beautiful to remark how all her experience of the love and mercy of her heavenly Father did but deepen her love, first for the little family group, and then in ever expanding circles for all the objects of His tender regard. Nor was it less instructive to learn from her example, that while true piety humbles us under a keener sense of our deficiencies, it teaches us to use all the faculties with which He has endowed us in the service of our Lord; and that such performance of duty is rewarded by an increase of ability, as well as by the evidence of His gracious approval.

(To be continued.)

ANECDOTE OF DAVID SANDS.

An anecdote of David Sands, related by Stephen Rogers to Thomas Scattergood and company, when travelling in New England:

David Sands and Joseph Walton, travelling together, came to a spot noted for being the haunt of robbers, and were attacked by three, who ordered them to deliver up their horses, saddle-bags, purses, etc. David endeavored to appease them, telling them he was a considerable distance from home, and so feeble as to be rendered quite incapable of getting there without the help of his horse and money. This availed nothing, for one of the ruffians mounted behind David, having his musket in his hand; and, as they advanced towards the forest, expecting there to be massacred, David perceived the robber behind him to lean back frequently, in order to have room to give him a stroke with

his musket, and knock him off of his horse; and in order to defeat his purpose, David leaned back also. His mind had been enveloped in darkness as to the future, and he looked for nothing else than death, as soon as they came to the woods. However, all at once he felt a little ray of light, and the robber suddenly, just as they entered the forest, enquired his name. He was answered, "David Sands." This struck him so, that he said, "I have often heard of you; you shall receive no hurt." They then dismounted, and left David and his friend on their horses; when the third robber, who had come on foot, was exceedingly exasperated, and said he would have something as a recompense—a great coat, if nothing else. The other two opposed this, and were finally obliged to hold him until David and Joseph escaped, his comrades telling them to ride off, for their accomplice would shoot them down if he could. This they did, and so escaped.

It is not the different practices from one another that breaks the peace and unity, but the judging of one another because of different practices.—*Isaac Pennington, vol. I. page 320.*

The great error of the ages of the Apostacy, has been to set up an outward order and uniformity, and to make men's consciences bend thereto, either by arguments of wisdom or by force; but the property of the true church government is to leave the conscience to its full liberty in the Lord, to preserve it single and entire for the Lord, to exercise and to seek unity in the light and in the Spirit, walking sweetly and harmoniously together in the midst of different practices.—*Ibid, page 323.*

PUBLICATION AND CIRCULATION OF BOOKS.

It is a very common thing to hear of the evils of pernicious reading, of how it enervates the mind, or how it depraves the principles. The complaints are doubtless just. These books could not be read, and these evils would be spared the world, if one did not write, and another did not print, and another did not sell, and another did not circulate them. Are those, then, without whose agency the mischief could not ensue, to be held innocent in affording this agency? Yet, loudly as we complain of the evil, and carefully as we warn our children to avoid it, how seldom do we hear public reprobation of the writers! As to printers, and booksellers and library-keepers, we scarcely hear their offences mentioned at all. We speak not of those abandoned publications which all respectable men condemn, but of those which, pernicious as they are confessed to be, furnish reading-rooms and libraries, and are habitually sold in almost every bookseller's shop.

If the inferior agents are censurable, the primary agent must be more censurable. A prin-

ter or a bookseller should, however, reflect, that not to be so bad as another is a very different thing from being innocent. When we see that the owner of the press will print any work that is offered to him, with no other concern about its tendency than whether it will subject him to penalties from the law, we surely must perceive that he exercises but a very imperfect virtue. Is it obligatory upon us not to promote ill principles in other men? He does not fulfil the obligation. Is it obligatory upon us to promote rectitude by unimpeachable example? He does not exhibit that example. If it were right for my neighbor to furnish me with the means of moral injury, it would not be wrong for me to accept and to employ them.

I stand in a bookseller's shop, and observe his customers successively coming in. One orders a lexicon, and one a book of scurrilous infidelity: one Captain Cook's Voyages, and a new licentious romance. If the bookseller takes and executes all these orders with the same willingness, I cannot but perceive that there is an inconsistency, an incompleteness, in his moral principles of action. Perhaps this person is so conscious of the mischievous effects of such books, that he would not allow them in the hands of his children, nor suffer them to be seen on his parlor table. But if he thus knows the evils which they inflict, can it be right for him to be the agent in diffusing them? Such a person does not exhibit that consistency, that completeness of virtuous conduct, without which the Christian character cannot be fully exhibited. Step into the shop of this bookseller's neighbor, a druggist, and there, if a person asks for some arsenic, the tradesman begins to be anxious. He considers whether it is probable the buyer wants it for a proper purpose. If he does sell it, he cautions the buyer to keep it where others cannot have access to it; and before he delivers the packet, legibly inscribes upon it, Poison. One of these men sells poison to the body, and the other poison to the mind. If the anxiety and caution of the druggist is right, the indifference of the bookseller must be wrong. Add to which, that the druggist would not sell arsenic at all if it were not sometimes useful; but to what readers can a vicious book be useful?

Suppose for a moment that no printer would commit such a book to his press, and that no bookseller would sell it, the consequence would be that nine-tenths of these manuscripts would be thrown into the fire, or rather that they would never have been written. The inference is obvious; and surely it is not needful again to enforce the consideration that although *your* refusal might not prevent vicious books from being published, you are not therefore exempted from the obligation to refuse. A man must do his duty, whether the effects of his fidelity be such as he would desire or not. Such purity of conduct

might no doubt circumscribe a man's business, and so does purity of conduct in some other professions: but if this be a sufficient excuse for contributing to demoralize the world, if profit be a justification of a departure from rectitude, it will be easy to defend the business of pick-pockets.

I know that the principles of conduct which these paragraphs recommend lead to grave practical consequences: I know that they lead to the conclusion that the business of a printer or bookseller as it is ordinarily conducted, is not consistent with Christian uprightness. A man may carry on a business in select works; and this by some conscientious persons, is really done. In the present state of the press, the difficulty of obtaining a considerable business as bookseller without circulating injurious works may frequently be great, and it is in consequence of this difficulty that we see so few booksellers among the Quakers. The few who do conduct the business generally reside in large towns, where the demand for all books is so great that a person can procure a competent income though he excludes the bad.

He who is more studious to justify his conduct than to act aright, may say that if a person may sell no book that can injure another, he can scarcely sell any book. The answer is, that although there must be some difficulty in discrimination, though a bookseller cannot always inform himself what the precise tendency of a book is—yet there can be no difficulty in judging respecting numberless books, that their tendency is bad. If we cannot define the precise distinction between the good and the evil, we can nevertheless perceive the evil, when it has attained to a certain extent. He who cannot distinguish day from evening, can distinguish it from night.

The case of the proprietors of common circulating libraries is yet more palpable; because the *majority* of the books which they contain inflict injury upon their readers. How it happens that persons of respectable character, and who join with others in lamenting the frivolity, and worse than frivolity, of the age, nevertheless daily and hourly contribute to the mischief without any apparent consciousness of inconsistency, it is difficult to explain. A person establishes, perhaps, one of these libraries for the first time in a country town. He supplies the younger and less busy part of its inhabitants with a source of moral injury from which hitherto they had been exempt. The girl who till now possessed sober views of life, he teaches to dream of the extravagances of love; he familiarizes her ideas with intrigue and licentiousness; destroys her disposition for rational pursuits; and prepares her, it may be, for a life of infamy. These evils, or such as these, he inflicts, not upon one or two, but upon as many as he can; and yet this person lays

his head upon his pillow as if, in all this, he was not offending against virtue or against man!—*Dymond's Essay, Essay 2d, Chapt. 9.*

A PSALM TO THE RAIN.

For a month past we have, with the exception of a single shower, suffered from a parching drought. The pastures were brown, the corn wilted, and even the deep-rooted trees, in exposed places, showed signs of thirst. On the Sabbath the sky gave tokens of a coming rain. All day the clouds seemed gathering their stores of water to pour forth. There were slight premonitory droppings, at intervals, all day, and we thought we detected, in the leaves of the trees and in the blades of grass, the dawning hope of a great rain, and it was so. It began raining at about six o'clock in the evening, and, with slight interruptions, rained till three on Monday morning. The timeliness of the shower, and its fall on the day of rest, brought to our minds the inimitable utterances of the Psalmist touching rain. We turned involuntarily to the one hundred and fourth psalm, that grand cosmical lyric—a portion of which Humboldt weaves most approvingly and appreciatingly into his "Cosmos." And well he may. He is more honored than honoring in the reference. These are the sacred poet's words on rain from heaven:

He sendeth the springs into the valleys;
They run among the hills.
They give drink to every beast of the field;
The wild asses quench their thirst.
By them shall the fowls of the heaven have their habitation;
They sing among the branches.
He watereth the hills from his chambers;
The earth is satisfied with the fruit of thy works.
He causeth the grass to grow for the cattle,
And herb for the service of man;
That he may bring forth food out of the earth—
Wine that maketh glad the heart,
Oil to make his face shine,
And bread, which strengtheneth man's heart

PSALM CIV. 10-15.

In another place the Psalmist rejoices thus:

Sing unto the Lord with thanksgiving;
Sing praise upon the harp, unto our God,
Who covereth the heaven with clouds,
Who prepareth rain for the earth,
Who maketh grass to grow upon the mountains.
He giveth to the beast his food:
And to the young ravens which cry.

PSALM CXLVII. 7-9.

The Prophet seems to touch the same harp in the following passages:

When he uttereth his voice, there is a multitude of waters in the heavens.
He causeth the vapors to ascend from the ends of the earth.
He maketh the lightnings with rain,
And bringeth forth the winds out of his treasures.

JER. IX. 13.

Again the sweet singer of Israel tunes his harp for this theme in these words:

Thou visitest the earth and waterest it;
Thou greatly enrichest it with the river of God, which is full of water;
Thou preparest them corn, when thou hast so provided for it.

Thou waterest the ridges thereof abundantly,
Thou settest the furrows thereof,
Thou makest it soft with showers,
Thou blessest the springing thereof.

Thou crownest the year with thy goodness,
And thy paths drop fatness.
They drop upon the pastures of the wilderness,
And the little hills rejoice on every side.

The pastures are clothed with flocks,
The valleys also are covered with corn;
They shout for joy,
They also sing.

PS. LXXV. 9-13.

Then here the Psalmist and Prophet accord in the following strain:

Thou, O God, didst send a plentiful rain, whereby thou didst confirm thine inheritance, when it was weary.—PS. LXXVIII. 9.

Are there any among the vanities (false Gods) of the Gentiles that can cause rain?
Or can the heavens give showers?
Art thou not he, O Lord, our God?
Therefore we will wait upon thee,
For thou hast made all these things.—JER. XIV. 22.

We close this psalm with the affirming questions of the sage of Uz:

Hath the rain a father?
Or who hath begotten the drops of dew?

JOB XXXVIII. 28.

[Ohio Farmer.]

THE BENEFIT OF ADVERSITY.

BY THOMAS A' KEMPIS.

It is good for man to suffer the adversity of this earthly life, for it brings him back to the sacred retirement of the heart, where only he finds that the heart is an exile from his native home, and ought not to place its trust in any worldly enjoyment. It is good for him also to meet with contradiction and reproach; to be evil thought of, and evil spoken of, even when his intentions are upright and his actions blameless, for it keeps him humble, and is a powerful antidote to the poison of vain-glory. When we are outwardly despised and held in no degree of esteem and favor among men, then chiefly it is that we have recourse to *the witness within us, which is God.* Our dependence upon God ought to be so entire and absolute, that we should never think it necessary, in any kind of distress, to have recourse to human consolations.

When a regenerate man is sinking under adversity, or disturbed and tempted by evil thoughts, then he feels the necessity of the power and presence of God in his soul, without which he certainly knows that he can neither bear evil nor do good: then he grieves and prays and

"groans to be delivered from the bondage of corruption;" then weary of living in vanity, he wishes to "die, that he may be dissolved and be with Christ," and then he is fully convinced that absolute security and perfect rest, are not compatible with his present state of life.

As long as we continue in this world, we cannot possibly be free from the trouble and anguish of temptation. In confirmation of this truth, it is written in Job, that "the life of man upon earth is a continual warfare." Every one, therefore, ought to be attentive to the temptations that are peculiar to his own spirit; and to persevere in watchfulness and prayer, lest his "adversary the devil, who never sleepeth, but continually goeth about, seeking whom he may devour," should find some unguarded place where he may enter with his delusions.

The highest degree of holiness attainable by man, is no security against the assaults of temptation, from which his present life is not capable of absolute exemption. But temptations, however dangerous and afflicting, are highly beneficial, because, under their discipline we are humbled, purified, and led toward perfection. All the followers of Christ have, through "much tribulation and affliction, entered into the kingdom of God;" and those that could not endure the trial, have fallen from the faith and expectation of the saints, and become reprobates."

There is no order of men, however holy, nor any place, however secret and remote, where, and among whom, temptations will not come for the exercise of meekness, and troubles rise for the trial of patient resignation; and that this must be the condition of human nature in the present life is evident, because it contains in itself those restless and inordinate desires, which are the ground of every temptation, so that when one temptation is removed, another succeeds, and we shall always have some degree of evil to suffer, till we recover the purity and perfection of that state from which we have fallen.

Many, by endeavoring to fly from temptations, have fallen precipitately into them, for it is not by flight, but by patience and humility, that we must become superior to all our enemies. He who only declines the outward occasion, and strives not to eradicate the inward principle, is so far from conquest, that the temptation will recur the sooner, and with greater violence, and he will feel the conflict still the more severe. It is by gradual advances, rather than impetuous efforts, that victory is obtained, rather by patient suffering that looks up to God for support, than by impatient solicitude and rigorous austerity.

In thine own temptations, often ask counsel of those that have been tried and have overcome, and in the temptations of thy brother, treat him not with severity, but tenderly administer the comfort which you desire to receive.

That which renders the first assaults of temp-

tation peculiarly severe and dangerous, is the instability of our own minds, arising from the want of faith in God; and as a ship without a steersman is driven about by the force of contrary winds, so an unstable man, that has no faith in God, is tossed and borne away upon the wave of every temptation.

"Gold is tried in the fire, and acceptable men in the furnace of adversity." We frequently know not the strength that is hidden in us, till temptation calls it forth and shows us how much we are able to sustain. We must not, however, presume, but be particularly upon our guard against the first assaults, for the enemy will be more easily subdued if he is resisted *in his approaches*, and not suffered to enter the portal of our hearts. A certain poet gives this advice,

"Take physic early; medicines come too late
When the disease has grown inveterate;"

and the caution may be successfully applied to the assaults of sin, the progress of which is gradual and dangerous. Evil is at first presented to the mind by a single suggestion; the imagination kindled by the idea, seizes it with strength, and feeds upon it; this produces sensual delights, then the motion of inordinate desire, and at length the full consent of the will. Thus the malignant enemy, not resisted in his first attack, enters by gradual advances and takes possession of the heart, and the longer opposition is deferred by habitual negligence, the power of opposing becomes every day less, and the strength of the adversary proportionably greater.

To some, temptations are more severe at the beginning of their religious course, to others at the end; some are afflicted with them during the whole of life, and some experience comparatively short and gentle trials. This variety is adjusted by the wisdom and equity of Divine Providence, which hath weighed the different states and dispositions of men, and ordered all its dispensations so as most effectually to tend to the salvation of all. Therefore, when we are tempted, let us not despair, but rather, with more animated fervors of faith, hope and love, pray to God that He would vouchsafe to support us under all our trials, and in the language of St. Paul, "with every temptation to make also a way to escape," that we may be able to bear it. "Let us humble our souls under the hand of God," who hath promised to "save and exalt the lowly and the meek."

By these trials, proficiency in the Christian life is proved. The power of Divine Grace is more sensibly felt in ourselves, and the fruits of it are more illustriously apparent to others. It is, indeed, a little matter for a man to be holy and devout when he feels not the pressure of any evil; but if, in the midst of troubles he maintains his faith, his hope, his resignation, and "in patience possesses his soul," he gives a considerable evidence of a regenerate nature. Some, how-

ever, who have been blest with victory in combating temptations of the most rigorous kind, are yet suffered to fall even by the lightest that arise in the occurrences of daily life; that being humbled by the want of power to resist such slight attacks, they may never presume upon their own strength to repel those that are more severe.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, NINTH MONTH 10, 1859.

PRIMARY INSTRUCTION.—The importance of placing *young* children under the care of well qualified teachers, has, we fear, been overlooked by very many who are deeply interested in the subject of education. Some parents who would willingly devote a liberal sum to the last two years of a child's school education, would consider that sum, expended for the same object in giving a child its earliest instructions, as extravagant and perhaps unnecessary. Is not this a great mistake, and does it not arise from ignorance of the best method of fitting a child for the duties of maturity?

The culture and direction of the intellectual faculties, and the formation of good habits of thought, are acknowledged to constitute the basis for future mental development; and is it not evident that the more freely both parents and teachers appreciate this, the better will they be able to further the promotion of the best interests of the child? Now, a teacher who gives a child a long lesson to learn which is imperfectly understood, and consequently badly recited, does a threefold injury; the brain is over-taxed, the understanding clouded, and a habit of inaccuracy encouraged. No conscientious, judicious teacher would thus deal with a child. Its tender mind is deemed too sacred a trust; and yet this is done, and will be done, so long as primary schools are conducted with so little reference to the desired end.

The inquiring mind of a child naturally turns to the visible objects by which it is daily surrounded, and by its numerous questions shows that it longs to know the whys and wherefores of each. To meet this want of the youthful inquirer, an injudicious teacher gives him to commit to memory, "Elements of Natural Philosophy," "Elements of Physiology," etc., arranged in formal questions and answers. "Definitions,"

in which neither word nor meaning is understood. Arithmetical examples to be worked out at home when the child is wearied and has but a confused idea of the principles upon which they are based. Compare this mode with that of an enlightened teacher, who directs the children *how* to observe, *how* to study, *how* to read with profit, and, in a word, how to use their powers. When children, thus trained, enter schools adapted to their maturer years, they study their lessons with pleasure to themselves, and bring their vigorous powers into healthful and legitimate play.

Pupils thus diversely developed, and *non*-developed, are placed at finishing schools. The difficulties attendant upon their classification are obvious, and the teachers are harassed in the endeavors to do justice to all. To accomplish this the well trained are kept back, and the badly trained are over-taxed; in many cases they leave school with enfeebled constitutions, from the fact that the work requiring quite six years, is crowded into two or three. With great justice, the present popular mode of education in the schools for all ages is severely censured. To denounce a system as wrong does little good, unless the evils are pointed out and proper remedies suggested. May not some of these evils be traced to the defective training of little children both at home and at school, and to the want of such a co-operation between parents, and teachers, as would result in a clearer understanding of the needs of children and the right way to supply them?

We leave the further examination of this subject at present, in the hope that it may arrest the attention of our readers, and lead them to feel its true importance.

DIED.—On Fourth day, the 31st ult., PINDAR ANTRIN, in the 82d year of his age; a member of the Monthly Meeting of Friends of Philadelphia, held on Spruce St.

— On the 26th ult., after a short illness, at the residence of Thomas Cockayne, Fall Creek, Madison Co., Ind., ELIZABETH, daughter of Marcellus S. and Eliza Cook, (the latter deceased), aged 1 year, 9 mos., and 24 days.

— Seventh month 12th, 1859, in London Grove Township, Chester Co., Pa., ANNA, widow of Amos Pyle, aged 51 years and 6 months.

— On First day, 1st of Fifth month, 1859, at the Hanson Farm, Kent Co., Delaware, after a short but severe illness, MATILDA CALLEY, aged about 67 years. She was remarkably patient, calm and composed, during the severe suffering through which she passed,

and manifested a meek and quiet spirit. Having had a presentiment, previous to her last sickness, that her stay here would be short, she appeared in no way alarmed when attacked, and although, owing to the nature of her disease, it was with difficulty she could speak, the peaceful serenity of her countenance, to the very last, went to confirm the evidence, which had previously been furnished in her virtuous life, that her day's work was done in the day-time. She was a member of Little Creek Preparative, and Camden Monthly Meetings of Friends. She was a zealous attender of meetings for worship and discipline; encouraging all her children and others to go to meeting, believing, as she often expressed, it was a duty enjoined upon us to observe. The poor and oppressed found in her a ready sympathizer in their troubles; and, as she was a woman endowed with great physical energy, her hands were not found idle, but were actively engaged attending to the duties of life, observing the Apostle's injunction, "to be not slothful in business."

FREE LABOR.

The undersigned avails himself of the privilege, kindly granted him through "*Friends' Intelligencer*," to inform the friends of Free Labor that he has received a full supply of Refined Sugars, of the usual grades, which he is selling at reduced prices. He is also filling up his stock of domestic Dry-Goods of his own manufacture, ready for the autumn sales.

GEO. W. TAYLOR,
Corner Fifth and Cherry Streets.

WANTED—A Male Teacher, qualified in every respect to teach a boarding-school for both sexes.

Address STEPHEN COX,
North Rush, Monroe Co., N. Y.
8mo. 23, '59.

From the Leisure Hour.

SUBTERRANEAN ROME.

Of the multitudes that throng the streets of Rome, mingling in the revelry of the carnival, or gazing with awe upon the colossal ruins of departed greatness, very few think of a city beneath their feet, by which not only a great part of the city is undermined, but whose ramifications stretch far out into the adjoining Campagna. If we may believe the Roman ciceroni, who, however, are not altogether trustworthy in the matter, the galleries and passages of this city extend for twenty miles. Certain it is, that the excavations of the far-famed Roman catacombs—for to these we refer—are of vast and unknown extent. Seroux d'Agincourt, who devoted several years to exploring their dark and interminable recesses, describes an adventure which illustrates their immensity. It happened in that branch which reaches from the church of St. Agnes to the river. "These catacombs," he says, "had long been closed, and I had them opened in hopes of finding monuments. My undertaking was unsuccessful, and it involved me

in extreme peril. My guides, as well as myself, were lost for more than hour. We had the utmost difficulty in keeping our lights from being extinguished, and seemed on the point of ending our lives there. The same accident happened to my old friend, M. Robert; and my draughtsman, M. Machiavelli, was once exposed to the same danger. Montfaucon, in his '*Diarium Italicum*,' relates a similar accident to another Frenchman and himself. We made our escape from the catacombs at last, by discovering one of the openings which served for the purposes of letting down bodies in the first ages of Christianity." These holes for the lowering of bodies and the admission of light and air, are numerous; and, together with chasms, where the superincumbent soil has given way and fallen in, are dangerous pitfalls to the incautious horseman.

The catacombs of Rome originated, we may mention, in excavations for building material. The imperial city stands upon a soil of volcanic origin, which has extensive beds of travertin and other rocks, so soft as to be easily worked, and yet hard enough for the architect's purpose. Layers of sand likewise occur, which is greatly valued from its cohesive properties when made into mortar. With the very earliest ages of the city, the work of excavating these beds and layers began, and materials for the greater part of the buildings on the surface were thus procured from the quarries beneath. This continued for many centuries, until the soil under and around the city has been burrowed into a network of galleries and passages, which are sometimes two or three deep, each of them being generally about eight feet high by four or five wide.

These dark and dreary caverns were once populous, but not with the living. Beneath imperial Rome was a necropolis—a city of the dead. Slaves, poor strangers and others, who from any cause were excluded from family sepulchres, were buried here;* and here, too, the Christians brought their dead. The bodies of the martyrs, mangled in the amphitheatre, mutilated by the sword, burnt at the stake, here found rest, till the avarice of Papal Rome invaded the sanctity of the tomb, and dragged thence, ruthlessly and indiscriminately, crumbling skeletons and rotten grave-clothes, to replenish her coffers by their sale as relics. There exists, we may observe, at Rome, a society of twenty-four persons who are called *Cavatori delle Catacombe*, whose sole business it is to explore the catacombs and supply the demand for the remains of martyrs and saints. By a whimsical arrangement, they are paid out of the fees received from the sale of indulgences for marriage within the prohibited degrees.

* Dr. Maitland, in his very valuable and interesting volume, "*The Church in the Catacombs*," seems to deny this; but the very passage he quotes from Horace is sufficient to prove it.

It is their connexion with the early and persecuted church, however, which invests the catacombs with their deepest interest. They afforded a refuge for the Christians when living, and a place of sepulture when dead. Either by the conversion to the new faith of some of the quarrymen who worked in these subterranean recesses, or by the consignment to these sepulchral vaults of some of the enslaved Christians, (many of whom we know to have been condemned to work in the quarries), the persecuted church gained free access to the spot. Sheltered far underground, the melody of their hymns could not reach the upper air. Superstitious terrors rendered their enemies loth to follow them into this abode of death; and, if pursued, faithful guides acquainted with the intricacies of the place, enabled them to baffle pursuit in the dark and tortuous passages. Some, indeed, of the galleries seemed to have been blocked up by artificial means, so as to render the more distant ramifications almost inaccessible; and, sheltered in them, some of the early Christians, for a series of years, eluded the pursuit of their sanguinary persecutors. Hippolytus, a Christian fugitive, was thus for a long time hidden, being supplied with food by the children of his sister Paulina, who, with her husband Adrian, though heathens, were yet faithful and kind to their relative. The unconverted state of the latter, living in the darkness of heathenism, preyed upon Hippolytus' mind; and, gratitude for their kindness, as well as affection for their children, who were the messengers of their bounty, rendered him growingly anxious that they should come to the knowledge of the truth. He therefore concerted a plan with his fellow fugitives for the detention of the children when they next came. The parents were thus compelled to seek them in the catacombs, where, after many efforts, they themselves at length yielded to the arguments and entreaties of their brother, and were baptized by Stephen, Bishop of Rome, who had long been a resident in the subterranean hiding-place. Being eventually discovered and seized, they all received the crown of martyrdom together.

Dark and intricate as these recesses were, they did not always afford a secure retreat. Guiseppe Sanchez asserts that, in the catacombs which he describes, several hundreds took refuge from the Diocletian persecution, and being pursued, were put to death on the spot. Three bishops of Rome, Xystus, Stephen and Caius, are also said to have suffered martyrdom there; the last, after residence in them for eight years.

For the purposes of worship, several passages into vaulted chambers were enlarged, and we can still discover indications of the religious assemblies, in fountains for the administration of baptism, slabs of stone on which the eucharistic bread and wine were placed, and sacred symbols inscribed on the walls. How inexpressibly affecting must

have been the meetings for worship here! cut off by a frightful abyss from the abodes of living men—surrounded by the dead—the torch dispelling for a little space the sepulchral gloom which encircled the band of worshippers, with a wall of darkness so dense as to seem solid—while the silence of the grave is broken at intervals by hymns of joy and triumph, and by the words, "I am the resurrection and the life; whoso believeth in me shall never die." Suddenly the tramp of men and the clatter of arms are heard sounding along the vaulted aisles. In an instant the torch is extinguished, a few suppressed whispers are heard, and the guides have led the faithful band beyond the reach of danger. Or, perhaps, there has been treachery, and every avenue has been occupied by the soldiers. Driven like frightened deer from point to point, the toils close around them; and young children, timid virgins, brave young men, and aged pastors, are alike cut down with ruthless cruelty! A Christianity that endured perils like these joyfully, must have been—in most cases at least—a real, not a nominal thing.

The name of cemetery, derived from a Greek word meaning a bed-chamber or sleeping place, has been given to the excavations we have described, in consequence of their having been the spot where the Christians interred their dead. The idea that death itself was, to the true Christian, but "a falling asleep," was thus brought to mind by the very name given to the body's final resting-spot. Numerous inscriptions have been discovered, marking the graves of the members of the primitive church; and these little mementoes, unimportant as they may have appeared at the time, furnish very important historical evidence as to the state of feeling prevalent among the poor and illiterate Christians in early times. Dr. Maitland, adverting to this subject, admirably says: "The fathers of the church live in their voluminous works; the lower orders are only represented by these simple records, from which, with scarcely an exception, sorrow and complaint are banished; the boast of suffering, or an appeal to the revengeful passions, is nowhere to be found. One expresses hope, another faith, a third charity. The genius of primitive Christianity, 'to believe, to love, and to suffer,' has never been better illustrated. These 'sermons in stones' are addressed to the heart, not to the head—to the feelings rather than to the taste." These inscriptions are sometimes so rude in execution, so ungrammatical in construction, and so incorrect in spelling, as to render it difficult to determine their meaning; but this rather increases than diminishes their value, since it proves them to be the natural and spontaneous utterances of illiterate believers.

The graves are niches cut in the rocky walls, one above another, in which the bodies were deposited, and then closed with slabs. These occur

generally in three tiers, and the total number of interments must have been immense. M. d'Agincourt speaks of them as forming millions.

Many of these graves have been opened, but on most of them time, as might have been expected, has done its devastating work. "It would be difficult," says the French writer just named, "to form an exact idea of the remains of a human body reduced so nearly to annihilation. A little white dust showed where the head, the bones of the shoulders, thighs, knees, and ankles had been. This dust showed the direction of bones, but it was not a body, not even in skeleton, that we saw; they were vestiges, hardly to be traced, and at a breath the whole disappeared."

A BRAHMIN INSULTED AT THE WHITE MOUNTAINS.

LETTER FROM J. C. GANGOOLY, A BRAHMIN.

To the Editor of the Boston Transcript.

Most of your readers are my valued friends, who take much interest in my Christian mission, and whose kind sympathy has been my hope and help ever since the wise Providence has committed me to their charge. During my travel over these United States, I had little time to tell even those intimately known about my trip. The easiest way to inform them of my course is through you, for a Bengalee proverb says, "By pouring water on your head you wet almost every part of your body." I was gone a little over ten weeks, and had kind hands and hearts for my guide. Wherever I went I met a Christian welcome among the brethren. An innocent curiosity to know all about me, drew crowds in the cars, steamboats, or hotels. My mouth, like the temple of Janus, was opened to answer the questions of the inquisitive Americans. And there was such a demand for my autographs, that my handwriting, which was wretched before, is now little improved, I had to write so much. I will speak of these pleasant things in my next; in this let me bring to your notice the sad, disagreeable experience that occurred in the latter part of my travel. This I do, because it is pleasanter to dispose of the vegetables first, and use the pies and custard at the end.

The object of note we visited last was the Mount Washington. As we must come home by way of Portland, we gave liberty to the Crawford House horses and fixed up ourselves with staves to walk down to the Glen House. After a fatiguing walk of four hours, we reached the place mentioned above. We were all tired, hungry and thirsty, for my part I should say I was entirely used up and very hungry indeed. The reasons are these: living in a country where a pice (less than a cent) will carry you seven miles on water, and being a Brahmin, I was never called on to labor. The Brahmin aristocracy is above physical labor. With a strong

force of will I now do take hold of anything innocently tiresome, that I might be useful in time of emergency. Secondly, owing to the entire change of my diet, I do not relish a great many things here, and very seldom I find a good breakfast, for it is composed of things which I am unaccustomed to eat, and the strong flavor of the hot drinks takes away half my appetite. In short I look at the dinner with a fond eye. It draws me toward it from the morning, and helps me to walk in the afternoon.

My first inquiry to the porter was, "What is your dinner hour, sir?" and being informed "one," I began to fix an ardent gaze upon the clock and on my own watch. The bell rang, and the ladies and gentlemen, like bees, rushed out of their rooms for the dining hall. My good friend, the clergyman, was then in the "wash-room," and I was impatiently waiting for him. He came out and we directed our steps to the hall. Sad hour! The chief officer whispered to my brother that he would not admit me in the house! Of course, my friend felt bad, and appealed to him in the name of my Boston friends, in the name of humanity, informed him who I was, my country, my worth, &c., and how I was treated respectfully in the first class hotels in New York, Philadelphia, Cincinnati, St. Louis, at Lake George and Saratoga. In vain he plead. His reasonings and remonstrances effected nothing. The tyrant knew before who I was when I wrote my name and place in the register. His hard heart did not move. I said to my friend, "Sir, does he want to put me in a separate place?" "Separate place!" he said; "to no place."

Shame and disappointment filled our hearts, and I, in despair, went near the counter and drank three tumblers of water as substitutes for the three different heads in the dinner, viz: the vegetables, pastry, and desert. Upon this, we both came out to the piazza, and my friend once more asked them the ground of such an unchristian act. A pale-looking, weak, tall man with an apron round his waist, heard all that we said, and seeing the passengers had got into the stage, took my friend in the parlor, and said we might take our dinners then if we chose. "All aboard!" the driver cried, and we bade farewell to the Glen House forever. We had time enough to buy our tickets at Gorham, as the train took us in right off. However, my good friend managed to secure four pieces of sponge cake from the Alpine House, where I had a letter of introduction from Rev. T. S. King. Mr. Editor, you can judge how we two men made our dinner on four pieces of cake.

In the boat there was no tea-arrangement, so we had to go to our berths for supper. I would not write any more of this; simply I should say that the man who refused admittance to me, for my oriental color, ought to know that, while complexion is not the standard in the whole world,

nor in heaven, his Master and Lord was an Oriental—the Apostles were so too; and finally, he ought to know this—that, as far as the civilization and pre existence of national glory is concerned, as there is distance between him and a negro, so there is the same distance between him and a Brahmin.

Dear sir, a gentleman recognizes a gentleman—“a jeweller knows a jewel.” The good host of Congress Hall, Saratoga, where the fashions and gaieties of the summer are proverbial, drew an extra chair by my side, and entertained me with the sweet words of his lips, besides the dainties of the table before me. J. C. GANGOOLY.

For Friends' Intelligencer.

Review of the Weather, &c., for EIGHTH Mo.

	1858.	1859.
Rain, during some portion of the 24 hours,	12 days.	9 days
Rain, all or nearly all day,	1 “	1 “
Cloudy without storms,	5 “	3 “
Ordinary clear,	13 “	18 “
	31	31

TEMPERATURES, RAIN, DEATHS, &c.

Mean temperature of the month per Pennsylvania Hospital,	76.25 deg.	73.35 deg
Highest do. during month do.	89. “	92. “
Lowest do. do. do. do.	54. “	54. “
Rain during the month,	4.94 in.	4.73 in.
Deaths during do. counting four current weeks for each year :		
Deaths in New York during the third week in 8 mo. of each year,	638	710
Do. in Philadelphia do. do.	281	205

The average of the mean temperatures of this month for the past seventy years has been 72.68 deg., while the highest during that period occurred in 1851, 77.50 deg.; and the lowest in 1816, 66 deg.

SUMMER TEMPERATURES.

Mean temperature of the three summer months of	1858,	75.62 deg.
Do. do. do.	1859,	72.45 “
Average of mean temperature of do. for the past seventy years,		73.26 “
Highest summer do. for three summer months,	1828, 1838,	77.66 “
Lowest do. do. do.	1816,	66.00 “

The retrospection called for by these reviews during the present year, have been to the compiler unusually interesting. Take the single item of deaths for the summer months of the past two years :

	1858.	1859.
Sixth month (four weeks),	760	709
Seventh month (five weeks),	1595	1217
Eighth month (four weeks),	1097	862

Total, 3452 2788

Showing a decrease of 664, and this, too, with a rapidly increasing population.

A glance at the figures shown by the mortality in New York, adds considerable interest to the subject. A carefully prepared editorial, published in a recent number of the *Evening Bulletin*, of this city, embraces the following statis-

tics. “We have summed up the reports of five cities, for the week ending August 20, as follows :

	No. of Deaths.	Estimated Population.	Ratio of deaths.
New York,	710	710,000	1 to 1000
Philadelphia,	205	600,000	1 to 2927
Brooklyn,	161	200,000	1 to 1242
Baltimore,	126	220,000	1 to 1746
Boston,	92	160,000	1 to 1739
Total,	1294	1,890,000.	1 to 1460.”

Then as to rain—during the greater portion of the three summer months neither flood nor drought has troubled us—the refreshing showers, or more lengthy rains, appear to have visited the husbandman just when it was wanted. The account for the eight months just closed, as compared with the two previous years, shews :

1857.	1858.	1859.
37.47 inches.	26.84 inches.	39.97 inches.

Again, as to temperature. When have we known as pleasant a summer as that we have just passed through?

Although the mean temperature is only a trifle below the average of the past seventy years, there have been fewer extremes of heat and cold than sometimes occur.

The splendid aurora, which appeared on the evening and night of the 28th ult., without any other striking phenomena, is alone sufficient to render both the month and the year memorable to every lover of the beautiful. J. M. E.

PHILADELPHIA, Ninth month 1, 1859.

“WHAT THE MEEK HEART DID.”

Look out, oh! weary heart, look out
In the wide world and see
If there thou findest a laurel wreath,
Or a great work for thee.

Then the weak heart looked sadly out,
On scenes of change and strife,
And saw no fame-wreath for its brow,
No great work for its life.

So, little deeds that thronged its path
That heart took meekly up;
Its meed of suffering humbly drank,
And drained the bitter cup.

The quiet life was truly lived,
To have done more it would;
But there is written this of such,
“She hath done what she could.”

CHARITY.

O love, how wondrous thou and holy;
When nought on earth hath power to quell
The iron might of melancholy,
One touch of thine hath snapt the spell.

One vigil by a fevered bed—
One solace given to heart oppress—
One pang assuaged, one aching head
With gentlest soothing lulled to rest :

To weary age one fond cares,
Poor guerdon for the love of years—
One smile at childhood's playfulness,
Or patient care to dry its tears;

Or less than these—the common flow

Of simple, self-forgetting mirth,
When veils the heart its inner woe,
So not to cloud the social hearth :

These, when, as locked in polar ice,
Lifeless and crushed the heart has lain—
These, like a breath from paradise,
Have warmed it into life again.

O gentlest minstrel! thou canst tell
What best can soothe the troubled breast :
"He prayeth well who loveth well !
He prayeth best who loveth best!"

E.

—*Chambers's Journal.*

PERSONAL APPEARANCE.

Indissolubly connected with the topic of personal appearance is the monotonous one of dress, and it would be difficult to give a better illustration of its importance than an anecdote related of Girard, the famous French painter.

When a very young man, he was the bearer of a letter of introduction to Lanjuinais, (the distinguished leader of the Girondists), and, in the carelessness or confidence of genius, he repaired to the (then) imperial counsellor's house, very shabbily attired. His reception was extremely cold; but in a few remarks, that dropped from him in the course of conversation, Lanjuinais discovered such striking proof of talent, good sense and amiability, that on Girard's rising to take leave, he rose too, and accompanied his visitor to the ante-chamber. The change was so striking that Girard could not avoid an expression of surprise. "My young friend," said Lanjuinais, anticipating the inquiry, "we receive an unknown person according to his dress, we part with him according to his merit."—*Titan.*

SMOKING A CAUSE OF INSANITY.

The terrible ravages which tobacco is making on the bodies and minds of the young, seem to be attracting the attention of medical men in various parts of the world. In a pamphlet just issued by Dr. Seymour of London, on Private Lunatic Asylums, and the causes of insanity of late years, the Doctor denounces with emphasis as one of the producing causes the immoderate smoking indulged in by boys and young men at universities and "larger schools called colleges." The Doctor's remarks are as applicable to the youths of this country as those of Europe. No one conversant with disease can doubt that *excessive* smoking, especially in the case of young people, must be highly injurious to both mind and body. Its effect is to depress the circulation—the heart becomes weak, irregular in its action, and the pulse is scarcely to be felt. The victim becomes irresolute and nervous, his appetite fails, and his mind fills with imaginary evils. This may continue for years, but at length the smoker dies, often suddenly; then the examination has shown that the muscular structure of the heart is im-

perfect in its action; the left side is thin, and in some cases, in which sudden death has occurred, there has been found little more than a strip of muscular fibre left on that side.—*N. Y. Waverly.*

THE SHAKERS.

This remarkable community, who have occupied a large share of public attention, was founded in England about the year 1750, by one James Wardly. They first obtained notoriety through the agency of their most distinguished member, Anne Lee. This person was born at Manchester, in 1736, and was the daughter of a blacksmith. In early life she was employed in manual labor, as a cutter of hatter's fur. She subsequently married a blacksmith named Standley. In 1756 she became a member of the new sect which Wardly had founded, and soon her peculiar qualities made her its chief member, and gave the sect unusual prominence. In 1774, in consequence of her vagaries and those of her associates, they were persecuted to some extent, and they determined to emigrate. They sailed from Liverpool, and arrived in New York, in that year. They located themselves at Water-vliet, near Albany, and there the first community of Shakers in this country was organized. Anne continued to be the presiding genius of the Society till her death, which took place in 1784.

This extraordinary woman asserted, and her followers believed, that she was the person referred to in the 12th chapter of Revelations; that she spoke seventy-two different languages, and that, though all these were unintelligible to the living, she conversed by their means with the dead; that she was the mother of all the elect; that she travailed in spirit for the whole world; that no blessing could descend upon mankind except through her; and that all should confess their sins to her, and ask forgiveness through her intercession, before they could obtain the pardon of God, and happiness either here or in the world to come.

In regard to their outward arrangement, the Shakers have always lived in isolated communities, and have observed a community of goods. Their arrangements are very primitive and singular; and the farms which they now possess have been remarkable for the excellence and abundance of their produce. The Shakers have always been exemplary in their conduct, and, notwithstanding their peculiar religious opinions, their industry, frugality, sobriety and chastity, have always been unsurpassed.

The most remarkable peculiarity of this sect is that which gives their name. Prominent in their public worship is a ceremony resembling dancing, in the execution of which they *shake* prodigiously, and hence their distinctive title. When they assemble in their meeting-house for public worship, the males are arranged in pairs,

following each other in regular file, two and two together. The women are arranged in the same way. They thus form a complete circle round the room, in the centre of which is a small company of a dozen males and females, who sing the tunes and mark the time. The following is a specimen of one of their verses:

“Perpetual blessings to demand,
Perpetual praise on every hand,
Then leap for joy with dance and song
To praise the Lord forever.”

While the congregation are marching and dancing to the music around the room, they keep time by beating the air with their hands, held out in front of them, very much resembling the usual attitude of kangaroos. Sometimes they give an occasional leap, when their emotions of joy become more exuberant than common. The first dance continues about five minutes. The second is characterized by much more rapid motion and lasts twice as long. After a while, they become worked up to such a pitch of fervor that the utmost violence and convulsion prevail. Each person breaking away from the rest, dance on their own hook, whirling themselves around in *pirouettes*, and performing evolutions with their arms horizontally extended, until they become perfectly exhausted. Sometimes the weaker women faint and go into hysterical convulsions, and the exercise is kept up until the assembly are compelled to stop from want of strength to proceed.

The Shakers defend this singular method of worshipping God by referring, as everybody else does, for authority to the Bible. They assert that the exercise of dancing was expressly instituted by God, as a part of his public worship, and that the Deity had expressed himself pleased with that form of his worship. Thus they quote such passages as the following: “O clap your hands all ye people; shout unto God with the voice of triumph. Sing unto the Lord a new song. Let the children of Zion be joyful in their King; let them praise His name *in the dance*. Again I will build thee, and thou shalt be built, O virgin of Israel! thou shalt again be adorned with thy tablets, and shall go forth in the *dances* of them that make merry. Then shall the virgins rejoice in the *dance*, both young men and old together.” Such texts as these the Shakers regard as furnishing sufficient authority to prove the propriety of making dancing a leading feature in public worship. They also hold that they ought to glorify God with all the organs of their body; and hence their hands and feet should be allowed to come in for a share of the duty. They think that if the mind be earnestly engaged in religious emotions, the intimate connection between the mind and body will necessarily lead to activity and commotion of body at the same time.

The religious doctrines entertained by the

Shakers are as peculiar as their form of worship. As to their external association, they have four leading ideas: 1. Community of property. 2. Celibacy of the members. 3. Non-existence of any priesthood. 4. The use of the dance in public worship. Their rules for the admission of members require that all who unite with them should do it voluntarily; that none are permitted to do so without a clear understanding of the obligations which they assume; no consideration of property is allowed to influence the admission; whoever wish to join them must first pay all their debts and obligations of every kind; any person who wishes to withdraw from the community may at any time do so.

Among the doctrines which they hold are the following: that the first resurrection has already come, and now is the time for Christians to judge themselves; that they now possess the power to heal the sick, to raise the dead, and to cast out devils; that they can hold intercourse with angels and departed spirits; that they can speak with divers tongues in public worship; that celibacy is a higher and purer form of Christian life, without the practice of which Christians cannot attain to full perfection of character; and that the future punishment of the wicked is not eternal (in this respect they are Universalists.) They also deny the doctrine of the imputation of Adam's sin to his posterity, and that of election and reprobation. The most important communities of the Shakers are to be found at Union Village and Beaver Creek, in Ohio, at Pleasant Hill, in Kentucky; at West Union, in Indiana, and at Economy, in Pennsylvania. Their whole number of members in the United States is about four thousand.

THE AURORA BOREALIS.—There was a beautiful scene presented in the heavens last evening, as wonderful as it was sublime: we mean the Aurora Borealis, or the northern light, a phenomenon of surpassing beauty and rare occurrence. Shortly after twilight it commenced at the northern horizon, and gradually extended along the whole heaven. The effect was most beautiful. At first the evening was as clear as when the moon is shining, or the sun about to rise. Presently the sky became of a light green color, interspersed with rays of scarlet and purple. At a few minutes past nine it reached the climax of its splendor, and presented a scene magnificent beyond conception. Directly overhead, as it were, was the focus of the light, from which diverged, in all directions, long, nebulous, translucent flakes of scarlet, green and purple light, extending over the heavens from the north to the east and west. There were all the colors of the rainbow blended in most harmonious grandeur. In about a half hour the scene changed, and the sky was covered, as it were, with a broad

mantle of deep purple. The scene, at this time, was sublime almost to terror. Every thing appeared tinged with the peculiar purple glare that emanated from the heavens. People wondered and gazed. Thousands of superstitious citizens thought the world was about to close, or that there was to be a pestilence, famine, or desolating war.—*Exchange Paper.*

THE EFFECT OF THE AURORA BOREALIS.

New York, August 29th.—The superintendent of the Canadian Telegraph Company's lines, telegraphs as follows in relation to the effect of the aurora borealis last night:—

"I never, in an experience of fifteen years in working telegraph lines, witnessed anything like the extraordinary effect of the aurora borealis, between Quebec and Father Point, last night. The line was in most perfect order, and well skilled operators worked incessantly from eight o'clock last evening until ten o'clock this morning, to get over in an intelligible form about four hundred words of the report per steamer Indian, for the Associated Press, and at the latter hour so completely were the wires under the influence of the aurora borealis that it was found utterly impossible to communicate between the telegraph stations, and the line had to be closed."

The same difficulty prevailed as far south as Washington.

Boston, Aug. 29th.—Dispatches from various and distant localities, describe the appearance of the aurora borealis, last night, as more brilliant, and of longer duration, than it has appeared for twenty years.

The Auroral influence was so strong on Friday morning, that the Telegraph line between Boston and Portland cut off their batteries and worked for several hours by this power alone.

TO CLEAR A ROOM OF MOSQUITOES.

A writer in a South Carolina paper says:

I have tried the following, and find that it "works like a charm." Take of gum camphor a piece about one-third the size of an egg, evaporate by placing it in a tin vessel, and hold it over a lamp or candle, taking care that it does not ignite. The smoke will soon fill the room, and expel the mosquitoes.

One night, not long since, I was terribly annoyed by them, when I thought of and tried the above, after which I neither saw nor heard them that night, and next morning there was not one to be found in the room, though the window had been left open all night.

ITEMS OF NEWS.

THE NORTH AMERICAN TELEGRAPH ASSOCIATION was in session in New York city on the 2nd inst. We understand that the Association, which embraces all the leading telegraph lines of the country, excepting two, have under consideration several propositions which

are calculated to effect changes in the business of telegraphing between the North and South upon the sea-board.

PROGRESS OF PUBLIC IMPROVEMENTS IN HONOLULU.—The *Advertiser* chronicles numerous improvements in Honolulu. It says:—"Its growth, though slow, is steady and permanent. Those who glance back ten years, and compare the town of 1849 with that of 1859, will need no illustration of the changes. Substantial and durable edifices, costing from \$5000 to \$40,000, now stand where then there were either grass huts or vacant spaces. Queen street was then a beach, the ripples washing the shore where now Severance's store and the market stand. The harbor has assumed a commercial look—wharves now standing over the former inconvenient beach, and every year the wharf facilities will be extended, so that eventually the harbor will be encompassed with wharves. These will all in time needed, for we are among those who believe that (let croakers say what they may) the business of the port will continue to increase.

JAPAN.—It appears from a late letter from Japan that, in consequence of a misunderstanding with Consul-General Harris, the Japanese Government now refuses to send commissioners to Washington to exchange the ratification of its treaty with the United States.

A GOOD IDEA.—There is in Ohio a State farm, established for the reformation of juvenile offenders. The farm is carried on upon a large scale, and the vagrant boys of the cities, who would otherwise be inmates of prisons, are there taught to support themselves at a business which never fails to yield a good return to labor. It is said that the employment of farming is so congenial to the active habits of the boys, that they take great delight in it, and cease to regard the establishment as a place of restraint upon them, and seldom break any of its rules. There are eighty boys in it at present. The system has its different grades of honor, and its badges, and when a boy has reached the highest grade, and worn for a specific time, and with approbation, the highest badge, he is honorably dismissed to his home and parents, and has a passport into any career of usefulness which he may choose; his transgressions are not remembered against him. An establishment of this kind appears to us to be the best of all kinds of reformatory schools, and might be adopted in every State with advantage.—*Ledger.*

INDUSTRIAL SCHOOL OF REFORM.—*Messrs. Editors:* In your paper of Saturday, you call attention to an establishment in Ohio, for the reformation of juvenile offenders. Your article concludes with these words: "An establishment of this kind appears to us to be the best of all kinds of reformatory schools, and might be adopted in every State with advantage." I am happy to inform and your numerous readers, that measures are being taken to establish a similar institution in our State. Last winter an act of incorporation was secured, and in the spring several meetings of the managers were held in this city. In a few months vigorous efforts will be made, in various parts of the State, to enlist public sympathy in favor of the movement, and we are confident our citizens will not be backward in promoting the welfare of the "Penn Industrial School of Reform." G. C.

WORTH KNOWING—IF TRUE.—Wm. L. Morgan, of Pottsville, Warren Co., Indiana, says that seed from the butt-end of an ear of corn will ripen its product all at the same time, and some three weeks earlier than seed from the little end of the same ear. He recommends farmers always to break their seed corn ears in two in the middle, and use the butt-ends only for seed.

COLORED PERSONS IN LOUISIANA.—An announcement is made at New Orleans, that from the first of September next, all the free persons of color arriving in that city, must immediately be lodged in jail, and there remain until the departure of the boat or vessel on which they came. This is in virtue of a law passed by the last Legislature.

SHIP RAILWAY.—A project for a ship railway from the Mediterranean to the Red Sea has been broached. Ships are to be lifted by hydraulic power, and transported across the Isthmus in cradles, resting on five lines of railway, at twenty miles an hour.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—There is no inquiry for Flour for shipment, and the sale are confined to the wants. The trade at \$4 50 a \$5 per barrel for old stock, and fresh superfine; \$5 a \$5 50 for extras, and \$5 62½ a \$6 50 for extra family and fancy lots. Nothing doing in Rye Flour or Corn Meal. We quote the former at \$3 75, and the latter at \$3 50 per barrel.

GRAIN.—Wheat is in fair request. Sales of 300 bushels good and prime red at \$1 17 a \$1 19 per bushel. White ranges from \$1 20, a \$1 25 for common and prime; 600 bushels choice Kentucky white sold at \$1 35. The market is nearly bare of Rye. Sales of Delaware at 72 cents, and Pennsylvania at 75 cents. There is a fair amount of Corn offering. Sales of 4,000 bushels yellow at 78½ a 79 cts. afloat and in store. Oats are dull; sales of 1500 bushels prime new Delaware at 34 cts. per bushel. Old Pennsylvania are steady at 37 cents. A small lot of fair new Barley sold at 70 cents.

SEEDS.—Cloverseed is unchanged; small sales at \$5 50 a \$5 75 per 64 lbs. Timothy is worth \$2 37½ a \$2 75 per bushel. Flaxseed is worth \$1 62.

EATON ACADEMY, KENNETT SQUARE, Chester Co., Pennsylvania.

The Fourth Term of this Institution, under the charge of the present proprietor, will open for the reception of pupils (of both sexes, on Second day, the 31st of 10 month next, and continue in session twenty weeks.

The course of instruction will embrace all the branches of a thorough English education, the higher Mathematics, Natural Sciences illustrated, the Latin, Greek, French and German Languages, and Drawing.

For terms and particulars, see Circulars, which will be forwarded to the address of every person requesting the same, upon application to

WILLIAM CHANDLER, Principal & Proprietor.
or to WILLIAM A. CHANDLER, Principal Instructor.

RUTHANNA JACKSON,
or to MAGGIE B. JACKSON,
CHARLES B. LAMBORN, } Assistants.

9mo. 10, '59, -2m

LONDON GROVE BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—It is intended to commence the next Session of this Institution on the 1st of 11th month, 1859. Terms \$60 for 20 weeks; no extras, except for the Latin and Greek Languages, which will be \$5 each. For Reference and further particulars inquire for Circular of

BENJ. SWAYNE, Principal,
London Grove P. O., Chester Co. Pa.

9 mo 3, 2 m.

G WYNEDD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The next session of this Institution will commence on the 14th of 11th month, 1859, and continue twenty weeks. Terms \$70, and

no extras. For further information application can be made to DANIEL FOULKE, Principal,
HUGH FOULKE, Jr., Teacher,
Spring House P. O.,
8 mo. 13—2 mo. Montgomery co., Pa.

ELDRIDGES HILL BOARDING SCHOOL FOR YOUTH OF BOTH SEXES, will open its Winter Session 11 mo 1st.

Terms \$70 per session of 20 weeks. For particulars address the Principal for a circular.

ALLEN FLITCRAFT.

Eldridges Hill Salem County, N. J.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, NINTH MONTH 17, 1859.

No. 27.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,

No. 324 South Fifth Street,

PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

The Christian Discipline of Friends gradually established, and the usefulness of the Society exhibited. Origin and Duties of Elders in the Society of Friends.

About the middle of the seventeenth century,* the Society of Friends began to be generally known, and in process of time their meetings became organized under that Christian Discipline, which still remains in operation. The formation of the Society appears to have progressed under the special care of Divine Providence, to the raising up of a people to bear testimony to the practical operation of gospel principles. The Society adopted no written creed, but received the gospel, in the love of it, as free and unfettered as it was left by Jesus Christ and his apostles. Individual conviction of their fundamental principle, the light of divine grace, or a measure of the spirit of Christ in every mind, was made manifest by corresponding consistent practice, and became the passport to their communion or Christian fellowship. No systematic theory of religious opinions founded upon private views, or the judgment of the individuals, was imposed upon one another by this Society.—Every one's conscience was left free and unfettered in his progress in the development of views respecting faith or belief, provided his practice and example were consistent with fundamental principle. As the Society increased over a wide extent of country, it became requisite to adopt those rules and regulations into which the wisdom of truth led, properly to minister to the wants and exigencies of the body, in a visible church capacity. These rules and regulations have been denominated Christian discipline. They were adopted from time to time

by the body according to the wants and circumstances of the Society. Being founded on gospel principles, they were designed to be administered in gospel feeling, for the help and welfare of all the members.

The object was to take care of the poor; to oversee orphans and others under suffering, in that day of trial; to superintend at marriages, that they might be orderly accomplished, and generally to extend care over each other, that the life and conversation of the members might be consistent with their profession. On this subject William Penn says in his preface to G. Fox's Journal, p. 33: "They distinguish between imposing any practice that immediately regards faith or worship. (which is never to be done, nor suffered or submitted unto,) and requiring Christian compliance with those methods that only respect church business in its more civil part and concern, and that regard the discreet and orderly maintenance of the character of the Society as a sober and religious community." The discipline of the Society was not to interfere with the faith of the members, but to superintend the practice. It was an outward rule, to lay hold on outward irregularities, and endeavor to regain and restore offenders, in the love and meekness of the gospel. It was the care of the body continually acting on itself, for preservation, or extending a hedge around the members that they might not stray from the fountain of Christian strength. The proper administration of Christian discipline has always been an object of great interest and solicitude to the Society. On this subject, the Yearly Meeting of Philadelphia, in the year 1808, handed down to its members the following advices.* "As it consisted with the will of our Heavenly Father, after he had called our primitive Friends from the various forms of religion to worship Him in spirit, to lead them into the establishing and support of a Christian discipline for the help and preservation of the body in a consistency of conduct, we exhort all who are concerned in the management of the discipline, that they fervently seek to be clothed with a right mind therein, that nothing may be done through rashness, strife, or vain glory, but all with a single eye to the honor of truth, and the good of individuals.

"The more we experience a preparation of heart for the exercise of our respective gifts, the

* Sewell's History from 1650 to 1666.

* See Christian Advices.

more amply shall we evince the expression of the tongue to be seasoned with that living virtue and divine power which proceeds from our Holy Head, and thus in conducting the important concerns of Society we shall be enabled to exemplify the beloved youth in a manner which will evidence to them, that neither tradition nor a mere outward education can fitly prepare them for successors in the church." "Therefore let all beware of their own spirits and keep in a gracious temper, that so they may be fitted for the service of the house of God, whose house we are, if we keep upon the foundation that God hath laid, and such he will build up, and teach how to build up one another in him; and as every member must feel life in himself and all from one head, this life will not hurt itself in any, but be tender of itself in all; for by this one life of the word, ye were begotten, and by it ye are nourished and made to grow into your several services in the church of God; it is no man's learning nor artificial acquirements; it is no man's riches, nor greatness in this world; it is no man's eloquence and natural wisdom, that makes him fit for government in the church of Christ."

Christian discipline founded on gospel principle, and administered in gospel feeling and qualification, purged the Society of Friends of many pretenders to their profession, whose extravagant and irregular behavior afforded reason to believe they had not come experimentally to submit to the operation of the Divine power. The Society in the exercise of its disciplinary functions, consistent with gospel liberty and simplicity has exhibited to the world, for several generations, the practicability of church government unconnected with political establishment or sanction. It concentrated the energies of Society the effect of which was practically to illumine the path of the progress of religious and civil liberty with their concomitant train of ameliorating influences on the general state of social life.

Whatever other circumstances contributed to the promotion of religious toleration and liberty of conscience, the Society of Friends, as a body, always adhered to the enjoyment of this inalienable right. No threatening, persecution, nor suffering could deter them from maintaining their testimony to the public worship of God in a way they believed to be required of them.—When their meetings were broken up by violence, they continued to meet in the street, and even on the ruins of their meeting houses in the most inclement season.* On these trying occasions, the passive perseverance and orderly deportment of the Society, combined with their explicit and steady remonstrances to those in power, as well as to the public at large, must have naturally tended to open the public view to see the propriety of adopting a general toleration.

* Suel's History, Vol. 2d, p. 3, 4.

When other religious professors yielded to the pressure of tyrannic sway, the Society of Friends, by constant perseverance, purchased with their blood the liberty of conscience, and paved the way for succeeding generations more fully to appreciate equal rights.

The political establishment of Pennsylvania, under the direction of Friends, afforded models in legislation and jurisprudence to surrounding states. The light of practical truth reflecting back from the oppressed of all nations concentrated under the auspices of liberty, has been re-acting on the throne of tyranny, and ultimately will crumble it to dust. The progress of discriminating knowledge, arising from the apprehension of essential principle, under the direction of virtue, is constantly giving an impetus to the power and weight of public opinion, which will in process of time effectually cancel the erroneous dogmas of political and superstitious assumption, and restore to suffering humanity the enjoyment of its legitimate rights.

The melioration of criminal law and prison discipline owe much to Friends. The abolition of slavery early obtained a deep interest among the objects of their care. Long and persevering endeavors to aid the Indian nations in attaining the habits and conveniences of civilized life, has cost the Society great labor and attention, and some of its members much personal solicitude and privation. The education of the children of the poor, and the promotion and support of humane and benevolent institutions for the indigent, diseased and distressed, has also claimed their particular attention. Whatever has tended to correct, elevate, and properly direct the human mind, has uniformly received the countenance and support of Friends. The simplicity and practical nature of their public instruction, it is believed, has contributed, with other causes, to soften, or neutralize, the asperities of sectarian dogmas. The non-resisting principles and peaceable testimony of the Society and the illustration of Christian virtue by practical benevolence, have dissipated the cloud of sectarian prejudice and reached the kindred feeling of human kindness in many minds, shedding a radiance of social peace, concord and domestic comfort in many circles of general society.

In exhibiting those traits of the usefulness of the Society of Friends, there is no intention to lessen the usefulness of other religious professors who have been fellow laborers in the promotion of Christian knowledge and human comfort. It is believed there has been a general advancement in the comprehension of correct or fundamental principles, and that as true knowledge increases, charity will prevail, and the benefits of effective religion become more generally experienced.

Let us recur to the history of elders in the Society. From a review of the records of the select

meeting within the limits of Philadelphia Yearly Meeting, it appears that in 1701, a meeting of ministers was held for the mutual encouragement, strength and comfort of one another, and continued to be held every three months for several years, without the company of elders or any disciplinary powers. In 1706, apprehending a benefit might arise from a few judicious Friends sitting with the ministers in those meetings, the proposal was laid before the Yearly Meeting, but was not concurred with at that time. In 1709 and also in 1712, the proposal for elders appears to have been carried up from Concord Quarter to the Yearly Meeting, but the consideration was postponed. In 1714, the Yearly Meeting agreed to the nomination of elders by such meetings as were prepared for the measure, and made some regulations thereon. That no misunderstanding might occur respecting the elders, Concord Quarterly Meeting made a minute permitting them to express their feelings in those opportunities. In 1728, further regulations and advices were sent down from the Yearly Meeting to the Quarters on this subject, and in 1755 the state and condition of select meetings being more fully considered by the Yearly Meeting, nine queries were sent down to be answered in the select Preparative meetings and carried up to the Quarters, and thence to the Yearly Meeting.

At this time Monthly Meetings were encouraged to appoint two or more elders in their several meetings: but it was some time before all were brought into the practice. In viewing the present discipline respecting select meetings, it does not appear that elders have any more power than ministers: mutual exhortation is all that is enjoined in the discipline. "We kindly recommend faithful Friends, and especially ministers and elders, to watch over the flock of Christ in their respective places and stations, always approving themselves, by their pious example in conversation and conduct, to be such as faithfully and diligently walk up to the testimony of the blessed truth whereunto the Lord hath gathered us in this his gospel day."

The legitimate duties of elders in a society constituted as that of Friends, appear to be, the necessary care in holding meetings for worship; seasonably closing the meeting at the proper time; and extending such care to Friends travelling in the ministry, as to aid and assist them in the appointment of meetings, for the furtherance of their religious services. It never was intended by Monthly Meetings to vest in the elders an exclusive authority to judge the ministry. This is the virtual and exclusive power of the Monthly Meeting itself. The discipline has wisely guarded against the encroachment of select members or meetings. "None of the said meetings of ministers and elders are in anywise to interfere with the business of any meeting for discipline."—*Cockburn's Review*.

EXTRACTS FROM A MEMOIR OF
ELIZABETH T. KING.

(Continued from page 391.)

The following letter was addressed to _____ and _____ on the occasion of the death of their two only children:—

BALTIMORE, 9 mo. 17th, 1849.

Although you may be at first surprised at receiving a letter from me, I do not think you will consider it an intrusion, since it is prompted by very deep and heartfelt sympathy with you in the recent affliction which you have experienced. I feel it more sensibly as my own children were very nearly of the same age with your little darlings, and I naturally felt a stronger interest in them. But I have very earnestly desired, that although this stroke may at first appear overwhelming, you may be enabled to trace in it the hand of a gracious Father who has taken your little ones from the evil to come, to be forever at rest in His bosom.

In looking on my own children, and thinking of the trials, the sorrows, and, above all, the temptations of this world, I have often felt that I could not ask life for them—only that when He saw meet, whether it was sooner or later, He would take them to Himself.

Indeed, my dear friends, there is abiding consolation in the thought, that whatever storms may now come, they can not reach these precious ones, who are now mingling with the angelic throng in that city where none can say "I am sick."

Do you think I am in any degree insensible to the suffering you must experience? I know how your hearts will yearn for the sweet voices of your children, and how lonely your home will seem; But I earnestly desire that the Father of mercies and God of all consolation may be near you, pouring the oil and the wine into your stricken hearts. Remember, "affliction cometh not forth from the dust, neither doth trouble spring from the ground;" all our chastenings are from the hand of a Father who loves His children better than we love ours, and doth not willingly afflict them. May you feel this a renewed call to be more dedicated to His service; and now, that your treasures are in heaven, may your hearts be there more exclusively, and the time may yet come that you will say with thankful hearts "It is good for me that I have been afflicted."

While I write I feel that words are inadequate either to express my own feelings or to convey any comfort to your hearts; and I again commend you, and particularly thee, my dear _____, as I know how keen the anguish of a mother must be, to Him who is the Comforter, the Helper, and the Stay of all who look to Him for consolation. May He give you resignation to His will, that you may be enabled to say, "It

is the Lord, let Him do what seemeth to Him good."

To one of her sisters:—

BALTIMORE, 12 mo. 1849.

We were speaking of the different views in regard to dress. I think we must learn not to put entire confidence in any one's judgment in regard to it. If we keep low and humble, with a single eye, we shall be directed, in little as well as great things; but if any Friend were troubled with any thing I wore, I should, if I felt at liberty, alter it. We may draw humiliating lessons from the condescending love and goodness of our heavenly Father, who certainly does give precious spiritual gifts to His unworthy creatures, who must appear beyond measure frail in His sight.

Some among us may indulge too much in dress; that may be *their* infirmity. Others indulge too much in making remarks upon it—that may be their weakness; but both may, redeemed and purified from all these besetments, join together in the most perfect love and harmony, in singing the song of Moses and of the Lamb. It seems to me that the only way to go through the world is just loving, and in the deepest humility, conscious of our own weakness, making allowances for everybody.

Her married life had hitherto been unclouded; but in the summer of this year, 1850, she was called to resign a lovely infant to the arms of her Saviour. While keenly feeling the blow, she clung with loving submission to the hand that dealt it, and, trusting in her God for strength, was enabled to say, "It is well with the child."

In a letter to a relative she thus alludes to her loss:—

BALTIMORE, 9 mo., 1850.

Since I have had a child in heaven, it has seemed to me I was nearer to the glorified spirits. I can not tell what an effect this bereavement has had upon me. There are times when my heart yearns so for my dear little babe, that it seems as if I could scarcely endure it; but for the most part I feel the deepest and purest thankfulness that she is at rest; that whatever I may have to struggle with, nothing can reach her. Sometimes I sink beneath it, but not often now, and I hope, that both through the joy and the sorrow, she may be the means of bringing me nearer to a state in which I may be fitted to rejoice her. It seems as if I almost forgot earth, with all its beauty and all its blessings, in thinking of those who have entered within the pearl-gates, into that city where none shall say, "I am sick," where God Himself shall wipe away all tears from their eyes. With this prospect before us, surely we shall always be found "rejoicing in hope, patient in tribulation;" and if at times a feeling of unworthiness so possesses our hearts, that we can not think an entrance into that kingdom can be

permitted us; let us remember in faith, that it is not by works, but "according to His mercy He saveth us. Surely if the Lord were pleased to destroy us, He would not have showed us the things we have heretofore been taught."

A family resided in an alley in the rear of her residence, which had become the terror of the neighborhood from the violent and imperious temper of the mother, and the abandoned lives of her sons, two of whom were about being tried for arson and murder.

The mind of Elizabeth T. King was drawn towards them, and, as might be expected, from the natural delicacy and timidity of her feelings, she shrank from the prospect of making them a visit. While hesitating under the concern, she stepped into a crowded omnibus in the lower part of the city, and as one after another of the passengers left it, she unexpectedly found herself riding alone with this woman. She felt no openness to relieve her mind then, but had a confirmation of her first impressions of duty, to visit her in her own house.

On parting from her, however, she affectionately commended her to a Saviour's love, to which the woman made no reply, but looked at her with wild surprise as though it were a new message.

The visit was paid next day, and the woman's respectful and interested manner showed that the gentle, loving spirit of our friend had won upon her heart. The opportunity was an open and relieving one, and we trust that He who had sent the message had prepared the heart to receive it. The woman was taken ill some time afterwards, and lingered for six months; but in this time she was mercifully favored to experience the forgiveness of her sins. A new heart was given her, and she died in the Christian's hope and trust.

(To be continued.)

THOUGHTS ON CHRISTIAN RETIREMENT.*

The truth and importance of the connection between Rest and Edification are well worth considering. It is a great truth that the human soul needs frequent Sabbaths. To work without ceasing is the prerogative of the Deity alone. It is true that Christianity confirms the saying of the Greek Philosopher, that action is the end of Thought, and that it represents the performance of duty as the proper Discipline of Humanity. Indeed this is one of the distinctive elements of Evangelical Philosophy, viz: that human life is not a theorem but a problem—a thing not to be speculated about merely, but to be done. Let this then be at once admitted, and borne in mind throughout. Not for indolence or seclusion or any form of asceticism am

* From the writings of the late Frederick Myers, M. A., author of "Lectures on Great Men."

I pleading now, but only and specially for this, that a spirit of contemplative devotion should ever be mingled with a spirit of practical energy; that our active exertions should be thickly interspersed with intervals of spiritual repose—yea that our whole life should be penetrated and pervaded by a spirit of tranquillity, and thoughtfulness and prayer. And mercifully, as it seems to me, has it been ordered by our wise and kind Father in Heaven, that these separate callings are not contrary the one to the other, but rather co-ordinate. In His Scriptures the exhortation to work while it is day, is consistently conjoined with the precept, that in the morning and at eventide we should watch. It is commanded equally that we should be diligent in business and fervent in spirit—that we should pray without ceasing, and yet zealously maintain good works. And in that Great Example, in which we are taught all the requirements of a Christian's life more emphatically than by precept, it is well to be reminded, how in him there was a conspicuous union of calmness with energy, and how spiritual peace was translucent through incessant toil and suffering and contradiction of sinners against Himself.

Matthew says of him (xiv. 23): "When he had sent the multitude away, He went up into a mountain apart to pray: and when the evening was come he was there alone."

Mark says of him (vi. 31): "When there were many coming and going, and they had no leisure so much as to eat, He said unto his disciples, come ye apart into a desert place, and rest awhile."

Luke (xxi. 37): "And in the day time he was teaching in the temple, and at night he went out and abode in the mount that is called the mount of Olives."

John (vi. 15): "He departeth into a mountain himself alone."

Now it is this being alone, this abiding for a night on the mount, this resting awhile, this going apart to pray,—it is this that I would suggest as a corrective to those influences which a life of uninterrupted activity cannot fail to exert for evil on our spirits. And surely when we see him whose holy soul was ever in essential communion with God, separating himself frequently from the crowd to converse with his Father yet more closely; when we see him who was holiness itself withdraw even from the works of a Divine benevolence, to refresh himself at intervals with prayer, we cannot for one moment doubt that our spirits need similar retirement for the sustenance of their truest life. It is not good, indeed, even for a man's religious life, that he should be habitually alone, but perhaps it would be worse for him if he were never alone. For in such case he could not surrender himself a living sacrifice unto God. He would lose by continual contact and collision with what is ex-

ternal to himself, his own native character, that peculiar impress on his soul which God gave him to cherish, and not to assimilate merely to that of others: and thus he would lose that integrity of nature which is of great price. Mingling with others, without also proportionably communing with his own heart and being still, a man learns to think with others' thoughts, and to feel with others' feelings: he receives the reflections of others' sentiments as the instinctive promptings of his own conscience, and thus he incapacitates himself for performing that distinctive work which he was sent into the world to do. Doubtless the due alternation of society and self communion it may be difficult to determine by any general rule, and I do not here attempt it: I only now am suggesting that an alternation is the healthiest state for ordinary Christians: not society always; for thus the mind becomes unable to develop and mature its own distinctive character, or to retain its own clearness and strength, but is weakened and worn away by its multiplicity and variety of interests and attractions: not self communion always; for thus it soon becomes the mere slave of the few objects or ideas with which it is intimately conversant, grows morbidly sensitive to its own processes of action and liabilities to injury, and loses its sympathy with the rest of that great family of its fellows, who have God for their parent too. And this mingling of contemplation with action—of spiritual repose with unusual energy—has been the secret source of the superiority of many of those whose names shine brightest in Christian annals—the inner spring of that sanctity and zeal which seem in some men only to have increased in freshness and in fragrance as they labored the longer, but which, as other examples also teach us, must assuredly have withered away in their work if they had not resorted to this cooling and strengthening stream wherewith to invigorate themselves daily.

In all Christian respects, at least, the calm are the only permanently strong. They who maintain a permanent communion with the Infinite and the Eternal—they alone will overcome the world. That peculiar gift of peace which Christ gave to his disciples as his parting gift, is not only one of their greatest treasures, as an essential blessing in itself, but is also a blessing conferring supernatural strength with which to work wonders among men. The man who feels himself through grace at any time prepared to meet his God—the man whose paramount aim in this world is to educate himself for another—this is the man to influence his brethren extensively for good. And where, I would ask, can such thoughts of the true measure and significance of life be obtained as from those points above it or beside it which prayer and retirement may enable a man to gain? Who have taken such

true and deep views of life as those who have been consciously on the point of quitting it? Read the records of the most thoughtful, and the most spiritual on their death beds, and compare their estimate of life with men's ordinary reckoning of it, and then say what a change contemplation may produce in us. When men come to die they feel themselves emphatically *alone*. However surrounded by the most kind and intimate friends, the individuality of their own nature manifests itself irresistibly; they indeed feel that, practically, the outward world is but a vain show, and that there are, at least for them, but as it were, two beings in the universe—their own soul and the Author of it. And so it is in a lesser and proportionate degree in sickness and afflictions. One of their principal means of benefit lies in the seclusion of the soul from the world, which they generally occasion—in that communion with the Unseen which they frequently compel.

But why, I would ask, should this seclusion from the world, this communion with the Unseen, need to be forced upon us? Why should it not be rather voluntary? why not desired and provided for? O infatuated creatures that we are, to need afflictions to make us draw near to God, and not to allow mercies to do so rather! O foolish and slow of heart to learn God's purposes of love to us—to misinterpret so the uses of his blessings! What, will we not use these seasons of rest which God gives us, rather than compel him to send us seasons of suffering, for holding communion with him? Will we never turn to God willingly and joyfully? will we never give him the sacrifice of a free and happy spirit—of a mind not bowed down by sickness, or made weak by suffering—of a heart subdued by the multitude of his mercies—melted to gratitude by the very sunshine of his blessings? will we always appear at his altar only as supplicants pursued by the avenger, and never as coming to present ourselves whole thank-offerings of gratitude and love?

But to return to the suggestion, that for the purposes of the spiritual life of the individual soul, labor and prayer are interdependent. Every life of Christian efficiency must be one of frequent meditation. No one can be really spiritually wise who does not study the human heart at its source, and he can only approach near to that in the depths of his own experience. Experience of the world, as it is called, is said to bring with it wisdom, and in some cases with reason, inasmuch as it certainly does enable men to calculate correctly the common phases of life, to conjecture skilfully the ordinary chances of conduct; but it does very little indeed to help us in understanding or in influencing the interior life of the earnest and of the unworldly. Here it is helpless and worse. The eye that would see this must be enlightened within—the

hand that would stir more than the surface must be strengthened from above.

And again consider: evangelical religion is emphatically a service of the spirit. It is the cultivation of a peculiar state of mind and heart—a state which is the preliminary condition essential to the acceptable performance of any act of duty whatsoever; and for the attainment of this characteristic state of thought and feeling, steady and frequent contemplation of the distinguishing articles of the Christian faith is indispensable. The performance of any series of acts, whether of worship or morality, is not the essence of Christianity, it is only its result: and though it uniformly causes its faithful recipients to perform all those duties which lead to the worldly well being of others and themselves, yet it does not really reside in any heart wherein there is not a sentiment towards Christ, which gives to those acts a significance and a worth quite other than that derived from their natural visible consequences. Thus the view taken of Life and Duty by the Gospel of Christ, by affecting our motives and modes of thought, makes the cultivation of our souls the one thing needful for us—all else, however important, only secondary. The preparation of ourselves for another state of being, compared with which the present in itself is insignificant, and this through special means of grace, and in consequence of, and in relation to, certain great truths and facts made known to us by a written Revelation—this is the main aim of every one who would rightly call himself a Christian. The education of our own souls, the working out our own salvation through faith and penitence, and prayer and love—the calling out into exercise every faculty he has given us by every opportunity of grace which he may give us—doing all that we do with reference to his will, and in reliance on his help, and out of gratitude for his grace—this should be the great aim and business of our lives. And all the rest that we do in the world, whatever it be—let it be a course of works of duty or of benevolence ever so good—to be of worth in God's sight, or to be for our own ultimate good, must be done subordinately to this great end, and in conformity with these great principles. . . . But let it also be remembered how great a truth it is, that "They also serve who only stand and wait,"—and that meekly to suffer God's will is as sublime a duty as actively to do it.

As individuals then, let us cherish a spirit of contemplation—let us improve a time of rest. When the world is too much with us,—let us "rest a while." When our very works of duty or labor of love render us unquiet or distracted, let us "rest a while." "Rest," however, not for mere indolence and slumber, but for that renewal and refreshing of the mind which closer communion with God can alone impart. Remember that mere seclusion from the world

will not of itself be necessarily improving to us. * * * * *

Most unwisely, then, may it be said, will he count the cost who thinks that such seasons of rest as I am recommending, are superfluous or waste—that time spent in prayer is time lost to duty. Rather our very duties may become hindrances to our improvement, if they be not done in this thoughtful spirit. If all our works, even that work which has God's service expressly for its aim, be not thus ennobled and spiritualized by contemplation, however useful it may be to others, it will be fruitless and even hurtful to ourselves. We know on Apostolical authority, that a man may give all his goods to feed the poor and his body to be burned, and yet not have that peculiar spirit which is characteristically Christian. * * * * *

Constant activity, even in good works, has always a tendency to draw us away from watchfulness over our motives of action, and uninterrupted usefulness to make us think more highly of ourselves than we ought to think: and if these things be not counteracted, by a self communion and communion with God proportionate to our activity, then though outwardly and to others we be still zealous and benevolent, yet in the eyes of Him who looks not at the outward appearance only, we shall assuredly be seen to be also prouder and colder every day, and gradually less like Christ continually. Let us not then ever neglect or abridge that period of repose which the health of our souls requires to be devoted to communion with our hearts, and with him who is greater than our hearts. Be sure that God can require of us no exertions for even the spiritual well being of others which must of necessity impair our own; and that if our own souls are not duly edified, it will be received as no excuse hereafter that we were trying to do God more service the while; seeing that reason alone might tell us that our efforts are not essential to God's service, while Scripture everywhere represents the cultivation of personal holiness as the one thing needful for ourselves.

"Man's wisdom is to seek
His strength in God alone;
And e'en an angel would be weak,
Who trusted in his own.
"Retreat beneath His wings,
And in His grace confide;
This more exalts the King of kings,
Than all thy works beside."

CHARITY.

The outward work, without charity, profiteth nothing; but whatsoever is done out of charity, be it ever so little and contemptible in the sight of the world, is wholly fruitful; for God weigheth more with how much love one worketh, than how much he doth. He doth much that loveth much; he doth much that doth a thing well.—*Wesley.*

ONE WAY AND THE OTHER.

"Father," said a woman to her husband one morning, "the boys want some new shoes."

"Want, want—always wanting!" said the man in a cross tone. "I've got no shoes; if you want them, get them."

"I don't know who should, if you can't," answered the wife, catching the spirit of her husband; and the spirit once caught, she carried it down stairs into the kitchen, where she quickly saw that breakfast was in a backward state. "Sally," she cried, "why in the world is not breakfast ready? the mornings are long enough."

"This awful green wood!" cried Sally, who until now had been doing her best; but catching her mistress' tone, she quite lost her temper. "The wonder is breakfast's got at all," she muttered; while her mistress went out, and little Joe came in from the wood house. "Tie my shoe, Sally," said he; "the string has tripped me up awfully." "Go away," cried Sally, "and not pester me at breakfast time." "Cross creature!" cried little Joe, pouting and pulling off his shoe, which for mischief, or not knowing what else to do, he swung at the cat lapping her milk. The shoe sent the cat one way, and cup another, and the milk in a puddle.

"You mischievous puppy," cried Sally, giving little Joe a shake, and sending him off to the sitting-room. Joe in a terrible pet fell upon his little sister, who was playing with a woolly dog, a little toy her auntie gave her, making it bark in a wheezy tone no real dog was ever guilty of. "Give it to me," cried Joe snatching it from her hand; whereupon Susy burst into an angry cry.—Joe's mother struck him for it, and he set up a howl equal to any young cub in a bear's den; so that by the time breakfast was ready the family sky was as dark and squally as it could well be: for crossness is catching, and "the beginning of strife is as when one letteth out water."—Prov. 17: 4.

THE OTHER WAY.

"Father," said a woman to her husband one morning, "the boys want some new shoes."

"Yes, I suppose it is most time," answers the husband, "but I can't so well spare the money just now. I wonder if I could not black them nicely up, to make them answer a little longer. Let's see now."

"Do not trouble yourself with them, husband," said the wife. "Let me try and see what a gloss I can put on them; "may-be they'll look good as new;" and away she tripped down stairs into the kitchen. "Sally," she said, "you are a little behind in breakfast, but I'll help you. No wonder; the green wood troubles you, I'm afraid."

"Please no," answers Sally; "I'll fetch breakfast on the table in a minute;" and Sally stirs about with cheerful briskness, while little

Joe comes in and asks to have his shoe tied. "In a moment, deary," answers Sally, "while I run down and get some kindlings; your ma wants breakfast."

"Let me go," says little Joe; "I'll bring you some beauties;" and away scampers the little boy, who soon comes back with an armful. "There, Sally," he says, "won't that help you?"

"Yes, deary," cries Sally; "now let me tie your shoe;" and while she does it, Joe is looking at pussy lapping milk. "Pussy's had her breakfast," says Joe, "and I'll take up her cup, lest somebody should step on it and break it. Come, Pussy go with me," and he carries her into the sitting-room.—"Pussy has had her breakfast," he said to sissy; "now will she think your woolly dog a real dog? Let's show it to her." Sissy put down her plaything, a woolly dog, and sure enough, puss, as soon as she saw it, bushed her tail and backed up her back, just ready for a fight; but pretty soon she saw her mistake, and ran under the table, as if afraid to be laughed at. How the children did laugh; and what a pleasant breakfast that was, where kindness was the largest dish: for "pleasant words are as a honey-comb, sweet to the soul, and health to the bones."—Prov. 17: 24.—*Child's Paper.*

FRIENDS' INTELLIGENCER.

PHILADELPHIA, NINTH MONTH 17, 1859.

DIED,—In Norristown, Montgomery Co., Pa., on the 1st inst.; after a short illness, CHARLES GRATZ, son of Joseph G. and Carrie Rowland, aged 3 months and 10 days.

— On the 5th of 8th month, near Mount Holly, N. J., JEMIMA R. BULLOCK, wife of Samuel Bullock, after a tedious and most distressing illness, which she bore with a degree of Christian patience and resignation that gave evidence of her hope of salvation being a well grounded one; and her pathway to the Spirit Land was bright and shining.

Her example as a wife, mother, friend and neighbor is worthy of imitation.

"JUDGE NOT THAT YE BE NOT JUDGED."

Who can read the spirit of another, or number its struggles after truth? As we pass through the crowded streets of a large city, how frequently cometh the thought of the deep histories which might be revealed to us, could we but see the human heart as we see the human face. There are many chapters in the volume of life, yet we may read but one,—our own. Alas! even this one is but imperfectly studied. Perhaps, if this were otherwise—if we daily and hourly went down to the secret recesses of our own hearts, searching for our most carefully hidden motives and feelings, and subjecting them all to the same impartial scrutiny which we would give to those of

another, we might come thence with a clearer knowledge of human nature than we can ever elsewhere obtain. We should thus gain humbler thoughts of self, juster thoughts of our fellow-men, more trusting thoughts of God. The mind is a crowded city, and we walk to and fro, in its gayest streets, peopled as they are with an ever-changing multitude of busy thoughts, and think ourselves familiar with the place; yet how little have we been amid the bylanes, and alleys, and courts where poverty, and misery, and even vice are lurking! How shall we then, who know not ourselves, what manner of spirit we are of, how shall we judge one another? 'Judge not, that ye be not judged.'

WHAT KNOWLEDGE IS OF MOST WORTH.

An article under this title, from the Westminster Review, is worthy the attentive consideration of all who are interested in the subject of education; we have, therefore, taken a large part of the essay.

It has been truly remarked, that, in order of time, decoration precedes dress. Before yet he thinks of protecting himself against the weather, the savage bestows much care on the painting of his skin. Among people who submit to great suffering that they may have themselves handsomely tattooed, extremes of temperature are borne with but little attempt at mitigation. Humboldt tells us that an Orinoco Indian, though quite regardless of bodily comfort, will yet labor for a fortnight to purchase pigment wherewithal to make himself admired; and that the same woman who would not hesitate to leave her hut without a fragment of clothing on, would not dare to commit such a breach of decorum as to go out unpainted. Voyagers uniformly find that colored beads and trinkets are much more prized by wild tribes than are calicoes or broadcloths. And the anecdotes we have of the ways in which, when shirts and coats are given, they turn them to some ludicrous display, show how completely the idea of ornament predominates over that of use. Indeed, the facts of aboriginal life seem to indicate that dress is developed out of decorations. And when we remember that even among ourselves most think more about the fineness of the fabric than its warmth, and more about the cut than the convenience—when we see that the function is still in great measure subordinated to the appearance—we have further reason for inferring such an origin.

It is not a little remarkable that the like relations hold with the mind. Among mental as among bodily acquisitions, the ornamental comes before the useful. Not only in times past, but almost as much in our own era, that knowledge which conduces to personal well-being has been postponed to that which brings applause. In the

Greek schools, music, poetry, rhetoric and a philosophy, which, until Socrates taught, had but little bearing upon action, were the dominant subjects; while knowledge, aiding the arts of life, had a very subordinate place. And in our own universities and schools at the present moment, the like antithesis holds. We are guilty of something like a platitude when we say that throughout his after career, a boy, in nine cases out of ten, applies his Latin and Greek to no practical purposes. The remark is trite, that in his shop or his office, in managing his estate or his family, in playing his part as director of a bank, or a railway, he is very little aided by this knowledge he took so many years to acquire—so little, that generally the greater part of it drops out of his memory; and if he occasionally vents a Latin quotation, or alludes to some Greek myth, it is less to throw light on the topic in hand than for the sake of effect. If we inquire what is the real motive for giving boys a classical education, we find it to be simply conformity to public opinion. Men dress their children's minds as they do their bodies, in the prevailing fashion. As the Orinoco Indian puts on his paint before leaving his hut, not with a view to any direct benefit, but because he would be ashamed to be seen without it; so, a boy's drilling in Latin and Greek is insisted on, not because of their intrinsic value, but that he may not be disgraced by being found ignorant of them—that he may have "the education of a gentleman"—the badge marking a certain social position, and bringing a consequent respect.

This parallel is still more clearly displayed in the case of the other sex. In the treatment of both mind and body, the decorative element has continued to predominate in a greater degree among women than among men. Originally, personal adornment occupied the attention of both sexes equally. In these latter days of civilization, however, we see that in the dress of men the regard for appearance has in a considerable degree yielded to the regard for comfort; while in their education, the useful has of late been trenching on the ornamental. In neither direction has this change gone so far with women. The wearing of ear-rings, finger-rings, bracelets; the elaborate dressings of the hair; the still occasional use of paint; the immense labor bestowed in making habiliments sufficiently attractive; and the great discomfort that will be submitted to for the sake of conformity; show how greatly, in the attiring of women, the desire of approbation overrides the desire for warmth and convenience. And similarly in their education, the immense preponderance of "accomplishments" proves how here, too, use is subordinated to display. Dancing, deportment, the piano, singing, drawing—what a large space do these occupy! If you ask why Italian and German are learnt, you will find that under all the sham reasons given, the real reason is, that a knowledge of those tongues is thought

lady-like. It is not that the books written in them may be utilized, which they scarcely ever are; but that Italian and German songs may be sung, and that the extent of attainment may bring whispered admiration. The births, deaths, and marriages of kings, and other like historic trivialities, are committed to memory, not because of any benefits that can possibly result from knowing them; but because society considers them parts of a good education—because the absence of such knowledge may bring the contempt of others. When we have named reading, writing, spelling, grammar, arithmetic and sewing, we have named about all the things a girl is taught with a positive view to their direct uses in life; and even some of these have more reference to the good opinion of others than to immediate personal welfare.

Thoroughly to realize the truth that with the mind as with the body, the ornamental precedes the useful, it is needful to glance at its *rationale*. This lies in the facts that, from the far past down even to the present, social needs have subordinate individual needs, and that the chief social need has been the control of individuals. It is not, as we commonly suppose, that there are no governments but those of monarchs, and parliaments, and constituted authorities. These acknowledged governments are supplemented by other unacknowledged ones, that grow up in all circles, in which every man or woman strives to be king or queen or lesser dignitary. To get above some, and be revered by them, and to propitiate those who are above us, is the universal struggle in which the chief energies of life are expended. By the accumulation of wealth, by style of living, by beauty of dress, by display of knowledge or intellect, each tries to subjugate others; and so aids in weaving that ramified network of restraints by which society is kept in order. It is not the savage chief only, who, in formidable war paint, with scalps at his belt, aims to strike awe into his inferiors; it is not only the belle who, by elaborate toilet, polished manners, and numerous accomplishments, strives to "make conquests;" but the scholar, the historian, the philosopher, use their acquirements to the same end. We are none of us content with quietly unfolding our own individualities to the full in all directions; but have a restless craving to impress our individualities upon others, and in some way subordinate them. And this it is which determines the character of our education. Not what knowledge is of most real worth, is the consideration; but what will bring most applause, honor, respect—what will most conduce to social position and influence—what will be most imposing. As, throughout life, not what we are, but what we shall be thought, is the question; so in education the question is, not the intrinsic value of knowledge, so much as its extrinsic effects on others. And this being our dominant

idea, direct utility is scarcely more considered than by the barbarian when filing his teeth and staining his nails.

If there needs any further evidence of the rude, undeveloped character of our education, we have it in the fact that the comparative worths of different kinds of knowledge have been as yet scarcely even discussed—much less discussed in a scientific way with definite results. Not only is it that no standard of relative value has yet been agreed upon, but the existence of any such standard has not been conceived in any clear manner. And not only is it that the existence of any such standard has not been clearly conceived, but the need for it seems to have been scarcely even felt. Men read books on this topic, and attend lectures on that; decide that their children shall be instructed in these branches of knowledge, and shall not be instructed in those; and all under the guidance of mere fashion, or liking, or prejudice; without ever considering the enormous importance of determining in some rational way what things are really most worth learning. It is true that in all circles we have occasional remarks on the importance of this or the other order of information. But whether the degree of its importance justifies the expenditure of the time needed to acquire it; and whether there are not things of more importance to which the time might be better devoted; are queries which, if raised at all, are disposed of quite summarily, according to personal predilections. It is true, also, that from time to time, we hear revived the standing controversy respecting the comparative merits of classics and mathematics. Not only, however, is this controversy carried on in an empirical manner, with no reference to an ascertained criterion; but the question at issue is totally insignificant when compared with the general question of which it is part. To suppose that deciding whether a mathematical or a classical education is the best, is deciding what is the proper *curriculum*, is much the same thing as to suppose that the whole of dietetics lies in determining whether or not bread is more nutritive than potatoes!

The question which we contend is of such transcendent moment, is, not whether such or such knowledge is of worth, but what is its *relative* worth? When they have named certain advantages which a given course of study has secured them, persons are apt to assume that they have justified themselves: quite forgetting that the adequateness of the advantages is the point to be judged. There is, perhaps, not a subject to which men devote attention that has not *some* value. A year diligently spent in getting up heraldry, would very possibly give a little further insight into ancient manners and morals, and into the origin of names. Any one who should learn the distances between all the towns in England, might, in the course of his life, find one or

two of the thousand facts he had acquired of some slight service when arranging a journey. Gathering together all the small gossip of a county, profitless occupation as it would be, might yet occasionally help to establish some useful fact—say, a good example of hereditary transmission. But in these cases, every one would admit that there was no proportion between the required labor and the probable benefit. No one would tolerate the proposal to devote some years of a boy's time to getting such information, at the cost of much more valuable information, which he might else have got. And if here the test of relative value is appealed to and held conclusive, then should it be appealed to and held conclusive throughout. Had we time to master all subjects we need not be particular. To quote the old song:—

Could a man be secure
That his days would endure
As of old, for a thousand long years,
What things might he know!
What deeds might he do!
And all without hurry or care.

“But we that have but span-long lives” must ever bear in mind our limited time for acquisition. And remembering how narrowly this time is limited, not only by the shortness of life, but also still more by the business of life, we ought to be especially solicitous to employ what time we have to the greatest advantage. Before devoting years to some subject which fashion or fancy suggests, it is surely important to weigh with great care the worth of the results, as compared with the worth of various alternative results which the same years might bring if otherwise applied.

(To be continued.)

Extract of a letter from HARRIET MARTINEAU to the Editor of the Anti-Slavery Standard, bearing the date of 15th ult.

The general impression as to the labor-question in the West Indies seems to be that it is approaching a clear solution. The Encumbered Estates Act is actually at work in several places, and producing effects as obviously good as the same procedure did in Ireland. In Ireland, the Encumbered Estates Act enabled embarrassed proprietors to sell a part of their lands, with an indisputable title, in order to disencumber the rest; or to sever themselves from the soil altogether. The land was purchased by persons able to do justice to it; it has risen in cultivation and in value from year to year, employing more laborers at improved wages, till now Ireland is at least as prosperous as any other part of the empire. The priests, whose poverty was formerly their main title to respect, are now so rich under the so-called voluntary system by which they live, that their incomes and their savings far exceed those of the average clergy of the English

Church; and it is believed that if the English Church in Ireland were offered to them to-morrow, they would refuse the gift. The parsonages and their lands and privileges, the secured incomes of all the livings would be a poor exchange for the wealth the Romish priests now acquire by their own levies on the comfortable peasantry. The operation of the same provision in the West Indies is clear enough. Deserted estates are bought by capitalists, British or colonial; capital is applied, and agricultural machinery and new methods disclosed by science, and the produce provides the means of further improvement. Less manual labor is required; and that labor is better paid. In short, the old planter notions and ways are superseded by modern intelligence and fresh intercourse with the laboring class; so that the increase in productiveness is undisputed on all hands; and the only critical question which remains is whether the indigenous population of each colony is sufficient for its needs, or whether immigration is really so profitable as to admit only of regulation, and not of discouragement. It is to be hoped that the proposed inquiry will be urged on, through the Colonial Office. Our impression is a strengthening one that coolie immigration will be found unnecessary; or that it will be so guarded by restriction as to come to an end of itself, instead of increasing with the expansion of cultivation. Meantime, there is comfort in resting on the great truths that emancipation is now proved to be a prudent economical expedient, as well as a great social success; that more sugar is produced, while more human beings are happy and content; and that the land and its inhabitants are rising together from a state of almost hopeless depression into the full development for which nature provided, but which the folly and greed of man long intercepted.

We cannot separate the West Indies and Africa in our thoughts and our cares. Amidst a long series of bad news from Africa we have now heard something pleasant. Painful accounts arrive occasionally of fresh shipments of negroes by French and other speculators; of the arrival of cargoes of victims at Martinique or on your Southern coasts; and of the check given to native industry in Africa, wherever the influence of the slave-trader extends. But we now hear also of something different—of the spread of industry in districts where it could not formerly establish a footing. There is part of the coast, near one of our chief establishments, where some money was spent, a few years since, with liberality and perseverance, by one or two rich Manchester manufacturers, in introducing the growth and preparation of cotton. The cotton was of excellent quality; but there was no inducing the people to work with the necessary steadiness and regularity. They would collect and sell palm-oil, and other products which gave them little

trouble; but they would not engage themselves further. Example seems to have wrought upon them; for the next news we hear, after a long interval, is that they have sold us four tons of excellent cotton, highly approved in the market, and that two tons more are on the way.

WM. PENN, AND PETER THE GREAT, EMPEROR OF RUSSIA.

In the year 1697, William Penn had an interview with the Czar of Moscow, since celebrated in history as Peter the great. This enterprising monarch, in order to inform himself concerning the arts and manufactures of nations more civilized than his own, spent some time in Holland and England, where he desired to remain incognito, and even worked as a ship carpenter. When he was in Deptford, William Penn, knowing that this monarch understood no other language than Russian and German, waited on him to present him with some German books, explanatory of Friend's principles, and was cordially received. Penn, conversing fluently in German, spoke to the ambitious conqueror in his usual mild and dignified manner about the folly, barbarity and criminality of waging war, and the sacred duty and blessed results of preserving peace. The grand monarch, so very much inclined to break out in the most violent rage at anything which displeased him, listened not only with patience, but with the greatest attention, and dismissed Penn with the most unequivocal signs of esteem. The impression he had received by this conversation appears to have been lasting, for on the 6th of March, 1711, on the very day when he declared his beloved Catherine with much pomp and many ceremonies, as his lawful consort and Empress of Russia, he said: "It would perhaps be much better if, in respect to war, all the nations of the world would adopt the principles of the Quakers." In the year 1712, being in the city of Frederickstadt, in Holstein, with an army to assist the Danes against the Swedes, he inquired if there were any Quakers there. Being told that there were some, he asked if they had a meeting-house, and being answered in the affirmative, he desired the Burgomaster of the city to inform them that if they would appoint a meeting, he would attend it. The Burgomaster said there could be no such meeting, because thirty soldiers were quartered in the meeting-house. Peter ordered them to be removed immediately, and the house to be put in order; which being done, the meeting was appointed, and he attended with a number of his officers. One of the Quakers preached in the German language, and Peter interpreted, observing at the close of the meeting, that whoever could live according to that doctrine would be happy.

If thou wilt suspect, let it be thyself.

FORGIVENESS.

BY JOHN G. WHITTIER.

My heart was heavy, for its trust had been
 Abused, its kindness answered with foul wrong;
 So, turning gloomily from my fellow-men,
 One summer sabbath-day I strolled among
 The green mounds of the village burial place;
 Where, pondering how all human love and hate
 Find one sad level—and how, soon or late,
 Wronged or wrong-doer, each with meekened face,
 And cold hands folded over a still heart,
 Pass the green threshold of our common grave,
 Whither all footsteps tend, whence none depart,
 Awed for myself, and pitying my race,
 Our common sorrow, like a midnight wave,
 Swept all my pride away, and trembling I forgave!

IN REMEMBRANCE OF JOSEPH STURGE.

BY JOHN G. WHITTIER.

In the fair land o'erwatched by Ischia's mountains,
 Across the charmed bay,
 Whose blue waves keep with Capri's silver fountains
 Perpetual holiday.
 A king lies dead, his wafer duly eaten,
 His gold-bought masses given;
 And Rome's great altar smokes with gums to sweeten
 A name that stinks to Heaven.
 And, while all Naples thrills with mute thanksgiving,
 The court of England's queen
 For the dead monster so abhorred while living,
 In mourning garb is seen.
 With a true sorrow God rebukes that feining;
 By lone Edgbaston's side,
 Stands a great city in the sky's sad raining,
 Bare-headed and wet-eyed!
 Silent, for once, the restless hive of labor
 Save the low funeral tread,
 Or voice of craftsman whispering to his neighbor
 The good deeds of the dead.
 For him no minster's chant of the immortals
 Rose from the lips of sin;
 No mitred priest swung back the heavenly portals
 To let the white soul in.
 But Age and Sickness framed their tearful faces
 In the low hovel's door,
 And prayers went up from all the dark by-places
 And Ghettos of the poor.
 The pallid toiler and the negro chattel,
 The vagrant of the street,
 The human dice wherewith in games of battle
 The lords of earth compete,
 Touched with a grief that needs no outward draping
 All swelled the long lament
 Of grateful hearts, instead of marble, shaping
 His viewless monument!
 For never yet, with ritual pomp and splendor,
 In the long heretofore,
 A heart more loyal, warm and true and tender,
 Has England's turf closed o'er.
 And, if there fell from out her grand old steeples
 No crash of brazen wall,
 The murmurous woe of kindreds, tongues and peoples,
 Swept in on every gale.
 It came from Holstein's birchen-melted meadows,
 And from the tropic calms
 Of Indian islands in the sun-smit shadows
 Of Occidental palms.

From the locked roadsteads of the Bothnian peasants
 And harbors of the Finn,
 Where war's worn victims saw his gentle presence
 Come sailing, Christ-like, in.

To seek the lost, to build the old waste places,
 To link the hostile shores
 Of severing seas, and sow with England's daisies
 The moss of Finland's moors!

Thanks for the good man's beautiful example,
 Who in the vilest saw
 Some sacred crypt or altar of a temple
 Still vocal with God's law;

And heard, with tender ear, the spirit sighing
 As from its prison cell,
 Praying for pity, like the mournful crying
 Of Jonah out of hell.

Not his the golden pen's or lip's persuasion,
 But a fine sense of right,
 And truth's directness, meeting each occasion
 Straight as a line of light.

His faith and works, like streams that intermingle,
 In the same channel ran;
 The crystal clearness of an eye kept single
 Shamed all the frauds of man.

The very gentlest of all human natures
 He joined to courage strong,
 And love outreaching unto all God's creatures,
 With sturdy hate of wrong.

Tender as woman; manliness and meekness
 In him were so allied,
 That they who judged him by his strength or weakness
 Saw but a single side.

Men failed, betrayed him; but his zeal seemed nourish'd
 By failure and by fall;
 Still a large faith in human kind he cherished
 And in God's love for all.

And now he rests; his greatness and his sweetness
 No more shall seem at strife,
 And death has moulded into calm completeness
 The statue of his life.

Where the dew's glisten and the song-birds warble
 His dust to dust is laid,
 In Nature's keeping, with no pomp of marble
 To shame his modest shade.

The forges glow, the hammers all are ringing;
 Beneath its smoky veil,
 Hard by the city of his love is swinging
 Its clamorous iron flail.

But round his grave are quietude and beauty,
 And the sweet heaven above—
 The fitting symbol of a life of duty
 Transfigured into love! —*N. Y. Independent.*

DEATHS CAUSED BY BURNING FLUID.

E. Meriam, of Brooklyn, states that he has kept a record of deaths, injuries, and conflagrations, resulting from the use of camphene and other burning fluids used for the purpose of illumination, since 1850. Since that date he has recorded the deaths of three hundred and seventy persons, and the injuries of four hundred and seventy-seven persons, many of the latter of whom the accounts stated were not expected to survive the injuries they received. The losses by fire from these fluids he estimated at upwards of one million of dollars. E. Meriam says that

when the weather becomes hot in summer, the danger in the use of burning fluid will increase. In the short term of thirty-six days, within the present year, he had recorded the death of nine persons, by camphene and burning fluid.—*Medical News.*

LUNAR INFLUENCES.

BY D. LARDNER.

Meteorological phenomena are not the only effects imputed to our satellite; that body, like comets, is made responsible for a vast variety of interferences with organized nature. The circulation of the juices of vegetables, the qualities of grain, the fate of the vintage, are all laid to its account; and timber must be felled, the harvest cut down and gathered in, and the juice of the grape expressed, at times and under circumstances regulated by the aspects of the moon, if excellence be hoped for in these products of the soil.

According to popular belief, our satellite also presides over human maladies; and the phenomena of the sick chamber are governed by the lunar phases; nay, the very marrow of our bones, and the weight of our bodies, suffer increase or diminution by its influence. Nor is its imputed power confined to physical or organic effects; it notoriously governs mental derangement.

If these opinions respecting lunar influence were limited to particular countries, they would be less entitled to serious consideration; but it is a curious fact that many of them prevail and have prevailed in quarters of the earth so distant and unconnected, that it is difficult to imagine the same error to have proceeded from the same source. At all events, the extent of the prevalence alone renders them a fit subject for serious investigation.

A large volume would be necessary to analyze all the popular opinions which refer to the supposed lunar influences. We shall confine ourselves therefore to the principal of them, and shortly examine how far they can be reconciled with the established principles of astronomy and physics.

The Red Moon.—It is believed generally, especially in the neighborhood of Paris, that in certain months of the year, the moon exerts a great influence upon the phenomena of vegetation. Gardeners give the name of *Red Moon* to that moon which is full between the middle of April and the close of May. According to them the light of the moon at that season exercises an injurious influence upon the young shoots of plants. They say that when the sky is clear the leaves and buds exposed to the lunar light redden and are killed as if by frost, at a time when the thermometer exposed to the atmosphere stands at many degrees above the freezing point. They say also that if a clouded sky intercepts the moon's light it prevents these

injurious consequences to the plants, although the circumstances of temperature are the same in both cases.

Any person who is acquainted with the beautiful theory of dew, which we owe to Dr. Wells, will find no difficulty in accounting for these effects erroneously imputed to the moon. If the heavens be clear and unclouded, all substances on the surface of the earth which are strong and powerful radiators of heat, lose temperature by radiation, while the unclouded sky returns no heat to them to restore what they have lost. Such bodies, therefore, under these circumstances, become colder than the surrounding air, and may even, if they be liquid, be frozen. Ice, in fact, is produced, in warm climates, by similar means. But if the firmament be enveloped in clouds, the clouds having the quality of radiating heat, will restore by their radiation, to substances upon the surface of the earth, as much heat as such substances lose by radiation; the temperature, therefore, of such bodies will be maintained at a point equal to that of the air surrounding them.

Now the leaves and flowers of plants are strong and powerful radiators of heat; when the sky is clear they therefore lose temperature and may be frozen; if, on the other hand, the sky be clouded, their temperature is maintained for the reasons above stated.

The moon, therefore, has no connexion whatever with this effect; and it is certain that plants would suffer under the same circumstances whether the moon is above or below the horizon. It equally is quite true that if the moon be above the horizon, the plants cannot suffer unless it be visible; because a *clear sky* is indispensable as much to the production of the injury to the plants as to the visibility of the moon; and, on the other hand, the same clouds which veil the moon and intercept her light, give back to the plants that warmth which prevents the injury here adverted to. The popular opinion is therefore right as to the *effect*, but wrong as to the *cause*; and its error will be at once discovered by showing that on a clear night, when the moon is new, and, therefore, not visible, the plants may nevertheless suffer.

Time for felling Timber.—There is an opinion generally entertained that timber should be felled only during the decline of the moon; for if it be cut down during its increase, it will not be of a good or durable quality. This impression prevails in various countries. It is acted upon in England, and is made the ground of legislation in France. The forest laws of the latter country interdict the cutting of timber during the increase of the moon. M. Auguste de Saint Hilaire states, that he found the same opinion prevalent in Brazil. Signor Francisco Pinto, an eminent agriculturist in the province of Espirito Santo, assured him as the result of his

experience, that the wood which was not felled at the full of the moon was immediately attacked by worms and very soon rotted.

In the extensive forests of Germany, the same opinion is entertained and acted upon with the most undoubting confidence in its truth. Sauer, a superintendent of some of these districts, assigns what he believes to be its physical cause. According to him the increase of the moon causes the sap to ascend in the timber; and, on the other hand, the decrease of the moon causes its descent. If the timber, therefore, be cut during the decrease of the moon it will be cut in a dry state, the sap having retired; and the wood, therefore, will be compact, solid, and durable. But if it be cut during the increase of the moon, it will be felled with the sap in it, and will therefore be more spongy, more easily attacked by worms, more difficult to season, and more readily split and warped by changes of temperature.

Admitting for a moment the reality of this supposition concerning the motion of the sap, it would follow that the proper time for felling the timber would be the new moon, that being the epoch at which the descent of the sap would have been made, and the ascent not yet commenced. But can there be imagined in the whole range of natural science, a physical relation more extraordinary and unaccountable than this supposed correspondence between the movement of the sap and the phases of the moon? Assuredly theory affords not the slightest countenance to such a supposition; but let us inquire as to the fact whether it be really the case that the quality of timber depends upon the state of the moon at the time it is felled.

M. Duhamel Monceau, a celebrated French agriculturist, has made direct and positive experiments for the purpose of testing this question; and has clearly and conclusively shown that the qualities of timber felled in different parts of the lunar month are the same. M. Duhamel felled a great many trees of the same age, growing from the same soil, and exposed to the same aspect, and never found any difference in the quality of the timber when he compared those which were felled in the decline of the moon with those which were felled during its increase; in general they have afforded timber of the same quality. He adds, however, that by a circumstance, which was doubtless fortuitous, a slight difference was manifested in favor of timber which had been felled between the new and full moon—contrary to popular opinion.

Supposed Lunar Influence on Vegetables.—It is an aphorism received by all gardeners and agriculturists in Europe, that vegetables, plants and trees, which are expected to flourish and grow with vigor, should be planted, grafted and pruned, during the increase of the moon. This opinion is altogether erroneous. The increase

or decrease of the moon has no appreciable influence on the phenomena of vegetation; and the experiments and observations of several French agriculturists, and especially of M. Duhamel du Monceau (already alluded to) have clearly established this.

Montanari has attempted, like M. Sauer, to assign the physical cause for this imaginary effect. During the day, he says, the solar heat augments the quantity of sap which circulates in plants by increasing the magnitude of the tube through which the sap moves; while the cold of the night produces the opposite effect by contracting these tubes. Now, at the moment of sunset, if the moon be increasing, it will be above the horizon, and the warmth of its light would prolong the circulation of the sap; but, during its decline, it will not rise for a considerable time after sunset, and the plants will be suddenly exposed to the unmitigated cold of the night, by which a sudden contraction of leaves and tubes will be produced, and the circulation of the sap as suddenly obstructed.

If we admit the lunar rays to possess any sensible calorific power, this reasoning might be allowed; but it will have very little force when it is considered that the extreme change of temperature which can be produced by the lunar light does not amount to the thousandth part of a degree of the thermometer.

It is a curious circumstance that this erroneous prejudice prevails on the American continent. M. Auguste de Saint Hilaire states, that in Brazil cultivators plant during the decline of the moon, all vegetables whose roots are used as food, and, on the contrary, they plant during the increasing moon, the sugar cane, maize, rice, beans, &c., and those which bear the food upon their stocks and branches. Experiments, however, were made and reported by M. de Chauvalon, at Martinique, on vegetables of both kinds planted at different times in the lunar month, and no appreciable difference in their qualities was discovered.

There are some traces of a principle in the rule adopted by the South American agronomes, according to which they treat the two classes of plants distinguished by the production of fruit on their roots or on their branches differently; but there are none in the European aphorisms. The directions of Pliny are still more specific: he prescribes the time of the full moon for sowing beans, and that of the new moon for lentils. "Truly," says M. Arago, "we have need of a robust faith to admit without proof that the moon, at the distance of 240,000 miles, shall in one position act advantageously upon the vegetation of beans, and that in the opposite position, and at the same distance, she shall be propitious to lentils."

Supposed Lunar Influence on Grain.—Pliny states that if we would collect grain for the pur-

pose of immediate sale, we should do so at the full of the moon; because, during the moon's increase, the grain augments remarkably in magnitude: but if we would collect the grain to preserve it, we should choose the new moon, or the decline of the moon.

So far as it is consistent with observation that more rain falls during the increase of the moon than during its decline, there may be some reason for this maxim; but Pliny, or those from whom we receive the maxim, can barely have credit for grounds so rational: besides which, the difference in the quantity of rain which falls during the two periods is too insignificant to produce the effects here adverted to.

(To be continued.)

HEARING WITH THE TEETH.

Lay a watch upon a table, glass side downwards, then stand so far from it that you cannot in the ordinary way hear the ticking. Now place one end of a small stick, say about six feet long, upon the back of the watch, and grip the teeth to the other; with the fingers close each ear to exclude all external noise, the beat of the watch will then be as audible as if placed against the ear. All other sounds can be conveyed in the same manner, no matter how long the stick be; for instance, if one end be put upon a piano-forte in a sitting room fronting a garden, and the stick be thirty feet long, extending outside the window on to a lawn, if the instrument be ever so lightly played, "the tune" will be instantly distinguished by any person applying the teeth to the opposite end of the stick.

Again, if a light bar of iron or any other metal be suspended by a thick string held between the teeth, and then struck with any hard substance, the sound will appear greater than by hearing with the ears.

ITEMS OF NEWS.

TWENTY-ONE SLAVES MANUMITTED.—The canal packet, "John B. Bortle," lying in the river above Broad street bridge, has on board twenty one slaves, men and women, manumitted by the will of their late owner, Pleasant Burnet, of Mecklenburg county, Virginia. They are likely-looking men and women, and with one exception, look forward with delight to the freedom and self-management in store for them. They are under the charge of Robert M. Hutchinson and Charles S. Hutchinson, who have selected lands in Hardin county, near Kenton, for their location, and for which they will take the train on the C. P. & Ind. R. R. this morning.

The testator, Mr. Burnet, did not free all his slaves; only selecting those who had been faithful, and were deemed competent to care for themselves. Good lands have been selected for the negroes to settle upon, in accordance with the provisions of the will, and they will be furnished with all the necessary tools and implements to commence operations.—*Ohio State Journal.*

THREE DAYS LATER FROM EUROPE.—The Steamship *Europa* arrived at Halifax on the night of the 7th inst. The Zurich Conference was still in session, and it was supposed that it would conclude its labors early in the 9th month. Sardinia has refused to permit the annexation of the Italian Duchies to her dominions without the consent of the other Powers, particularly France, but no disposition has yet been evinced by the inhabitants of Tuscany and Modena to allow their exiled sovereigns to resume their former positions.

TRADE OF CANADA VIA PORTLAND.—The 22d and 23d of Victoria, cap. 37, which passed last session, sets the trade of Canada quite free via Portland, permitting deals and butter, two articles specially excepted, to be imported into Great Britain at the same rate of duty as if imported direct from Canada. These articles were subject to the foreign duty of 10s per load on deals, and 10s per cwt. on butter; they will now be admitted at the colonial duty of 2s per load and 2s 6d per cwt. The Portland steamers had to proceed last winter to St. John's, N. B., for cargoes which could have been procured from the Canadian steam saw-mill, on the Grand trunk railway. Goods can now be forwarded in bond from Portland, through Canada, to any part of the Western States, and from the Western States and Canada to Portland, for shipment to Europe or any part of the world. The Great Eastern may now secure a cargo of deals from Portland, in addition to flour, corn, ashes and provisions.

THE AURORA.—The rare auroral illumination of the 28th ult. appeared all over New England, in New York and in Canada, and is characterized by all chroniclers as one of the most extensive and beautiful ever witnessed. A scientific observer, a member of the American Scientific Association, still visiting in this city, communicates a full record of its extent, prevalence and peculiarities. One of the most interesting of its influences, and going to show the connection of the auroral light with electricity, was that observed by the telegraphic operators. Their wires were charged somewhat as in thunder storms, with extra electricity, and on the Canadian line near Quebec it seriously hindered and finally forbade all working of the wires. So yesterday, in our printing office, there was a mysterious electrical influence affecting certain electrotyped plates and rendering it impossible to print from them. Other similar plates printed perfectly, and these probably will to day, but yesterday they were bewitched by the electricity in the atmosphere. So full and peculiar and prolonged an exhibition of the aurora as that of Sunday night ought to furnish materials for penetrating the mystery that still shrouds the cause of this phenomenon.—*Springfield Republican.*

NEVADA TERRITORY.—The Convention in session in Carson Valley has framed a Constitution for a Provisional Government, declaring Carson Valley independent of Utah, and giving the name of Nevada to the proposed Territory.

COL. SHAFFNER'S SUBMARINE TELEGRAPH.—The bark Wyman, of 200 tons, sailed yesterday, about 12½ o'clock, from Central wharf, under command of Capt. Wm. Baker, to survey the route for a line of telegraphic communication between this country and Europe, by the way of Greenland, Iceland, the Faroe Islands and Scotland. The vessel is chartered by Col. T. P. Shaffner, of Louisville, Ky., who has been residing in Worcester most of the time for the past two years. He has projected the expedition on his own responsibility, and there appears a fair prospect of success.—*Boston Courier, Aug. 30th.*

Letters by the steamer *Africa* state that Frederick N. Gisborne, the projector of a direct submarine telegraph between Boston and Nova Scotia, has organized a company in England for manufacturing telegraph cable. Their works are at Millwall, and two hundred workmen are now employed in the manufacture of cable for the line from Toulon to Algiers, the contracts of which are ratified to F. N. Gisborne by the Emperor of France. They are also manufacturing the Atlantic cable for the British Transatlantic Telegraph Company, to be laid down between Scotland and the Straits of Belle Isle to Canada.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—Fresh ground flour in held firmly owing to the high figure realized for wheat, but old stock is drooping. The only sales are \$500 barrels old extra family at \$5 50, and in lots to the trade at \$4 50 a 5 12½ per barrel for superfine; \$4 75 a \$5 50 for extra, and \$5 50 a \$6 50 for extra family and fancy. Nothing doing in Rye Flour or Corn Meal. We quote the former at \$3 75, and the latter at \$3 50.

GRAIN.—There is a fair amount of wheat coming forward and it is in good demand. Sales of 4500 bushels good and prime red at \$1 20 a 1 21 per pu., and fair and prime white at \$1 25 a 1 35. Rye is in demand; sales at 600 bushels Southern at 73 cents. Corn—Sales of 8000 bushels yellow at 80 cents, mostly afloat. Oats—4000 bushels new Delaware sold at 35 a 36c per bushel.

CLOVERSEED comes in slowly; a lot of new Ohio, of choice quality, was offered at the Corn Exchange at \$5 75, but this figure is above the views of buyers.

EATON ACADEMY, KENNETT SQUARE, Chester Co., Pennsylvania.

The Fourth Term of this Institution, under the charge of the present proprietor, will open for the reception of pupils of both sexes, on Second day, the 31st of 10th mo. next, and continue in session twenty weeks.

The course of instruction will embrace all the branches of a thorough English education, the higher Mathematics, Natural Sciences illustrated, the Latin, Greek, French and German Languages, and Drawing.

For terms and particulars, see Circulars, which will be forwarded to the address of every person requesting the same, upon application to

WILLIAM CHANDLER, Principal & Proprietor.
or to WILLIAM A. CHANDLER, Principal Instructor.

RUTHANNA JACKSON,
or to MAGGIE B. JACKSON, } Assistants.
CHARLES B. LAMBORN, }

9mo. 10, '59, -2m

LONDON GROVE BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—It is intended to commence the next Session of this Institution on the 1st of 11th month, 1859. Terms \$60 for 20 weeks; no extras, except for the Latin and Greek Languages, which will be \$5 each. For Reference and further particulars inquire for Circular of

BENJ. SWAYNE, Principal,
London Grove P. O., Chester Co. Pa.

9 mo 3, 2 m.

GWYNEDD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The next session of this Institution will commence on the 14th of 11th month, 1859, and continue twenty weeks. Terms \$70, and

no extras. For further information application can be made to

DANIEL FOULKE, Principal,
HUGH FOULKE, Jr., Teacher,
Spring House P. O.,
Montgomery co., Pa.

8 mo. 13—2 mo.

ELDRIDGES HILL BOARDING SCHOOL FOR YOUTH OF BOTH SEXES, will open its Winter Session 11 mo 1st.

Terms \$70 per session of 20 weeks. For particulars address the Principal for a circular.

ALLEN FLITCRAFT.

Eldridges Hill Salem County, N. J.

8 mo 27 3 m.

THE BANKSDALE BOARDING SCHOOL FOR GIRLS, will be reopened the 14th of 11th month, and be continued twenty weeks. The course of study will comprise the usual English branches and Drawing. Terms \$60.

For further information apply to ELIZA HEACOCK, Jenkintown, Montgomery Co. Penn.

8mo. 27 3m.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

GEO. A. NEWBOLD,
Purcellville, Loudon Co., Va.

8th mo. 6, 1859.—6m.

BYBERRY BOARDING SCHOOL, FOR GIRLS.

The ninth session of Byberry Boarding School, taught by Jane, Anne and Mary S. Hillborn, will commence on the first Second-day of Tenth month, 1859, and continue forty weeks without intermission, (including two terms of 20 weeks each.) The course of instruction embraces all the branches of a liberal English education.

Terms \$60 per session of 20 weeks, one half payable in advance. For circulars containing further particulars address

JANE HILLBORN,
Byberry P. O., Philada., Pa.

8th mo. 7—3m.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Pencilling, and Pellis work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; reading, Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL EATON, A. M. Principal.

Attleboro', Bucks Co., 5th mo., 28, 1859. 6m.

VOL. XVI.

PHILADELPHIA, NINTH MONTH 24, 1859.

No. 28.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,

No. 324 South Fifth Street,

PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

A Memorial of the Monthly Meeting of New York, concerning our beloved Friend, CAROLINE WILLETS, deceased.

Believing that "The path of the just is as a shining light, that shineth more and more, unto the perfect day," we feel concerned that the exemplary life, and peaceful close, of our beloved Friend, Caroline Willets, should be briefly held up to view, in order that survivors may be encouraged to follow her, as she endeavored to "follow Christ."

She was born at Flushing, Long Island, the twenty-sixth day of Seventh-month, 1794. Her parents were George and Elizabeth Farrington, who were concerned to give her a guarded education, and to impress upon her youthful mind the importance of a strict attention to that "monitor within," which would teach her "as never man taught."

Her mother, who had been convinced of our principles, and admitted into membership with us, felt concerned that her children should be partakers of the same privileges; and they were in their minority, at her request, likewise received into membership.

About the twentieth year of her age, she was visited with an illness, so severe, that her recovery was considered doubtful; but He, who is the Great "Physician of value," saw meet, in his loving kindness and mercy, to raise her up again, doubtless with a design for future usefulness in His service. Although up to this time her life had been one of much innocency, yet it was during this period of suffering, that she was awakened to see the need she had of a Saviour, and the necessity of taking up her cross to the fascinating pleasures of the world, and to follow in the path of self denial, Him, who thenceforth

became to her "the chiefest among ten thousand, and altogether lovely."

In the year 1828, she was married to Amos Willets, of this city, and soon after became a member of this Monthly Meeting.

Here, by continuing faithful to the requisitions of her Heavenly Father, made known in the secret of the heart, she became increasingly useful in the Society, filling, at different periods, some of the most important offices in the church.

She possessed an active and benevolent disposition, often visiting the widow and the orphan, and those in affliction, imparting to them the soothing language of comfort and consolation, and, from her earthly substance, ministering to their wants; and of this class we believe there are many who 'can rise up and call her blessed.'

The principles and testimonies of our Society were peculiarly dear to her; and ardent were her desires, that all who profess with us, might be found faithfully maintaining them to the world.

She highly valued the scriptures of truth, being a firm believer in them; and concerned to encourage the frequent reading of them by all, but especially the young, being sensible from her own experience, of the benefit to be derived from a careful and solid perusal of those precious and invaluable records.

In the attendance of religious Meetings, she was a bright example, being rarely absent from them, except through indisposition of body; and when there, often giving evidence that she had met with the "Beloved of souls;" and she could on her return testify, that He, whom she endeavored to serve, was not "a hard master," but on the contrary, a rich rewarder of all who diligently seek and serve him.

For a long period the house of her husband and herself was a home for their numerous Friends visiting this city. With many of these who were travelling in the work of the Ministry, and who, at times, were bowed under a sense of the greatness of the work before them, she deeply sympathized; and great was her concern that they might keep a single eye to the pointings of Truth, and be found faithful watchmen "on the walls of Zion."

With her friend Rachel Hicks, in her religious engagements, she had near unity, and often accompanied her in her visits of love, in this and other Yearly Meetings. And although in feeble

health at the time, it was from a sense of religious duty that she left her home the twenty-first of Twelfth-month last, to be absent for a short period, as companion to this her beloved friend, who was about to pay a visit in gospel love to the families and Friends in Philadelphia. This visit was entered upon accordingly, when on the evening of the third day after her arrival, (having attended the three Monthly Meetings in that city, and made nearly twenty visits,) she was attacked with, what ultimately proved to be, pneumonia.

Here, at the house of her kind friends, Samuel and Mary Caley, she received every attention that affection and kindness suggested. But from the first of her illness she suffered so greatly from debility, that it was exceedingly difficult for her to converse much; her remarks, however, gave evidence that her faith was unwavering, and that He who had hitherto been her support, was still with her, in this hour of proving and trial.

On the First-day morning after her attack, she said, "I feel as I lie here, that peace which the world can neither give nor take away. In vain do the votaries of fashion seek to obtain it in their round of folly; it is only to be found in a close walk with God, and in living under the circumscribing influence of his Holy Spirit."

So far from questioning the wisdom of that dispensation which had laid her upon a bed of suffering, (believing that her steps were ordered of the Lord,) she found it "sweet to lie passive in his hands," and expressed no yearnings for home—no wish to be in other circumstances than those in which His providence had placed her.

Under this feeling, she one day exclaimed, "Oh! how good the Lord is—my lines have indeed fallen in pleasant places—I am surrounded with every comfort—I have the best and kindest of nurses. How good the Lord is.

"Good when He gives—supremely good,
Nor less when He denies,
Even crosses from His sov'reign hand
Are blessings in disguise."

While receiving some kind attention from the hand of a beloved friend, she observed, "Oh! how grateful I feel for my many blessings. How little true happiness there is in this life, without a feeling of gratitude for the many blessings we enjoy."

It being remarked by a friend who was standing by, "that it was pleasant to witness the sweet composure of her spirit under the trying circumstances in which she was placed, she answered in the beautiful language of the poet,

"What cannot resignation do?
It wonders can perform;
That powerful charm, 'Thy will be done,'
Can lay the loudest storm."

And added, "This I have endeavored after, that I may ever be able to say, whether in heights or in depths, 'Thy will be done.'"

While lying, at another time, apparently absorbed in deep inward communion, she broke forth as follows:—"Return unto thy rest, Oh! my soul, for the Lord hath dealt bountifully with thee." "When this is the language of the heart, it is as the crown of life."

On Fourth day morning she thus addressed a young friend who was sitting by her bedside, "My dear, I want to encourage thee to be faithful, and thou mayst yet have to go about (like dear Rachel) from house to house, as a preacher of righteousness. With thy talents, thou mayst yet become an ornament and a pillar in the Church; but they must be sanctified, and laid upon His holy altar, who looks not to the head, but to the heart. Many a vessel is, I believe, marred upon the wheel for want of faithfulness. Keep a single eye to the truth and be ready to hear and obey."

That love which is the badge of true discipleship, overflowed her soul and was visible to all who approached her. In the midst of suffering, she had a pleasant smile, a kind word, or a tender admonition for all. On one occasion she said to those around her, "You seem like ministering angels, you watch over me so tenderly."

On Sixth-day evening, the thirty-first of Twelfth-month, she seemed to be sinking rapidly, and as her friends gathered around her to witness what they believed to be the closing scene, she spoke very audibly, and dictated several messages of love for the absent members of her family. In referring to her son, she said, "Give my love to him, and tell him, that if he will give his heart to the Lord, He will save him with an everlasting salvation. He knows the way; let it be his first thought in the morning and his last in the evening, to look to his Heavenly Father. As the mountains are round about Jerusalem, so will the Lord be round about him."

Alluding to her grandson, she said, "Tell him to look to the Lord, and he will preserve him;" and after a pause, she continued, "I am thinking of my nephews. O, that they may do nothing for which they will feel condemnation when they are laid upon a death-bed, for they will find it to be truly a detector of the heart."

To her brother-in-law, who remarked, "that it was hard to part with one so near and dear as she was, she replied, "It is as thou sayest, hard to part, but so it is; we do indeed love one another—the hand of the destroyer has never been suffered to mar our peace; he has never found a place in our midst. I love every body, and I love the Lord Jesus, and he will care for me. I feel nothing in my way, dear brother—all is peace. I have done my day's work in the day time. I have not been called to espouse the cause of righteousness publicly, but I have been called to a life of consistency: some plead the example

of others, as an excuse for their unfaithfulness, but 'what is that to thee? follow thou me.'

She observed that the prospect of a separation from her husband was like "dividing joint from joint"—but, she continued, I want to say, "not my will, Oh Lord, but thine be done," and presently added, "He suffereth not a sparrow to fall to the ground without His notice."

On Seventh-day the crisis of her disease seemed to have passed, and there was a slight prospect that she would rally; but this hope, while it cheered the hearts of those who watched her, did not elate or unsettle her. She had not from the first expressed any anxiety as to the result of her illness. "I feel entire peace," was her language, "let it terminate as it may."—Peace seems indeed to be the only suitable expression to represent the sweet unruffled state of her mind. Her hope being anchored on the "Rock of ages," was not to be shaken by external circumstances. In her experience the declaration was abundantly verified, that, "the work of righteousness shall be peace, and the effect of righteousness, quietness and assurance forever. We serve a kind Master," she said, "He is not an austere man, reaping where He has not sown, and gathering where He has not strewn."

On Seventh-day morning she said to Rachel Hicks, who came to bid her farewell for the day, "Go and be faithful to thy work"—and to another friend, she said at parting, "Dear John, farewell; be faithful, hold on thy way."

The promise of amendment which she had given on Seventh-day was of short duration. On First-day she relapsed into her former state of weakness and suffering, and thenceforward continued to fail until the end. On the morning of her decease, she called to her bed-side a friend who had watched with her during the night and said emphatically, "I see that there is a mansion prepared for me," which were the last audible words that she uttered.

From this time she lay, apparently, without much suffering, gradually breathing shorter and shorter, until about ten o'clock on Fourth-day morning, the fifth of First-month, being in the sixty-fifth year of her age. Her purified spirit was, we doubt not, permitted to enter "into that city, whose walls are Salvation, and whose gates are Praise."

Her funeral took place from Hester street Meeting House in this city, on the 8th day of First month, 1859, when a large and solemn meeting was held, and a number of testimonies borne to her worth, and to the efficacy of the ever blessed "Truth as it is in Jesus."

True charity will never smooth down error, for she thinketh no evil; neither will she attempt to shut our eyes to the distinction between him who serveth the Lord and him who serveth him not.

EXTRACTS FROM A MEMOIR OF
ELIZABETH T. KING.

(Continued from page 420.)

12 mo. 8th, 1850.—The recurrence of the birth-day of her oldest daughter:—

I have been feeling very seriously on this occasion our great responsibility and the constant need of watching, not only over the children, but also over ourselves, that no unfaithfulness in any way should so dim our spiritual sight, or weaken our strength, as that in the time of future need we should be unable to see or to follow the course which would be most for their good. There is a great deal in this, faithfully to do the present duty, little or great, that we may have light and strength for the rest; and oh, how important does this seem, when we have to guide and influence others who are dearer than ourselves!

To a young friend on the eve of marriage:—

BALTIMORE, 12 mo., 1850.

I know from experience that thy thoughts must often be very serious in looking forward to such an important event as marriage. Even under the happiest circumstances, and where the most perfect confidence exists, with reason, on both sides, still there are many moments when the heart, feeling its own weakness, bows in deep humility before the Source of Strength, asking for light to see, and ability to perform, all the duties which belong to the new and important station. I look to thee, knowing the influence thou wilt possess over thy husband, in the earnest hope that thou wilt use that influence for his good; that so you may go on together, earning and receiving the blessing which maketh truly rich, and unto which no sorrow is added.

Far be it from me to prescribe any particular course of conduct. I am only desirous that you may obey all the intimations of duty which are made manifest in the secrets of your own hearts, however little or however great they may be; and my only reason for desiring this is, that the peace of God which passeth all understanding may be added to the other blessings which in the richness of His mercy He is showering upon you, for, without this crown, the others lose their sweetest enjoyments. I speak that I do know, when I assure you, that the truest, the deepest, the most devoted affection given and received, will fail to satisfy the whole thirst of the soul, unless this is also added.

I believe you are both attached to the principles of our religious Society, although you may not be fully prepared to unite with, or at least to practice upon some of its peculiar views. May I say, that while I believe I feel the most unlimited charity towards all religious denominations, and heartily rejoice in the full conviction that many from them all will join the "innu-

merable company," in which I trust we also may some day be found; I have a decided belief that our own views, in all their strictness and purity, are the most conducive to the highest spiritual attainments, to the truest spiritual comfort and peace.

To one of her sisters:—

BALTIMORE, 4 mo., 1851.

I have been out riding to-day, and the beauty of the opening spring really exhilarated my spirits. The buds are unfolding, the willows are quite green, the grass is bright, and there are even some simple flowers among it. I thought how marvellous must be the loving-kindness of Him who could lavish such beauty around us.

If only our necessary wants had been provided for, it would have been enough to excite our gratitude; but think of the means provided for our enjoyment also.

In the summer of 1851 she was again called upon to part with an infant daughter. This bereavement was keenly felt; but with quiet submission she could say, "It is the Lord; let Him do as it seemeth Him good."

She thus speaks of this trial to a very dear friend:—

BALTIMORE, 6 mo. 20th, 1851.

* * * I must very briefly give thee an account of our situation, knowing that thy ready feeling and sympathy will fill up the outline. Words can scarcely describe my deep happiness, when lovely, perfect and apparently healthy, my darling babe was brought to me; but our Father saw meet very soon to destroy these hopes, which had almost become certainty, and, after a day and night of agonizing suspense, He took our darling to Himself.

I, too, have been brought very low, even to the brink of the grave; but He has raised me up, and very earnestly do I desire that this renewed chastisement may be the means of weaning us more from the world, and causing us to be *wholly* devoted to His service.

Now, my beloved friend, I cannot dwell longer upon this, neither is it needful. Thou wilt know what the suffering, the sorrow, the awfulness of the near prospect of eternity must have been. Thou wilt know what we must have felt in our human weakness, and thou wilt know, too, what we desire, and I humbly trust, are, at times, favored to feel, not only resignation, but acquiescence and thankfulness, in the undoubted belief that He doeth all things well.

Mayst thou be permitted to intercede for me, that all His purposes concerning me may be fulfilled, that in no wise may I fall short of His requirings.

To a friend who had spoken rather complainingly of the ingratitude to be found in the world, she writes:—

BALTIMORE, 12 mo., 1851.

Over sensitiveness is only a pretty name for self-love and unsubdued pride, and we must learn to give, hoping for nothing again; to be just as kind, just as thoughtful of the comfort of others as if we had a debt of gratitude to pay them.

I believe that death must pass over all our natural feelings, even those which seem most pure and lovely, and, as we progress in the new life, that charity which "beareth," "hopeth," and "endureth all things," which "never faileth" will take the place of our easily wounded and discouraged earthly affections, and we shall more and more "dwell in love."

Ah, how beautiful such a state looks; shall I ever reach it? But as I ask the question, the words of the Apostle spring up in my mind, "I thank God who giveth us the victory, through Jesus Christ our Lord." So we are bound to believe, that by watching and striving, through faith and obedience, our sincere, earnest prayers will be answered, and the Lord will, according to His promise, perfect that which concerneth us.

I dwell mostly in the valley of humiliation; and, though it is often bitter and painful, yet at times I am permitted to feel that the dews fall gently there, and that it is a sweet abiding place.

My great fear is of bringing reproach upon the cause, of being a stumbling-block in the way of others, and my petition is almost constant, "Let not them that love Thy name be confounded because of me."

BALTIMORE, 3 mo., 24th, 1852.

Let us try to get ourselves into the right spirit, one of quiet seeking to do the will of our heavenly Father, neither of restless activity, nor selfish shrinking from exertion, and I have no doubt we shall be daily and hourly directed where to go and what to do.

Very often our infirmities will cause us to make humiliating mistakes, which will also work together for our good, in rooting out pride and selfishness. I do not mean that we should require special direction about little matters. But when "the eye is single," the whole body will be full of light, and we shall realize the truth of the promise, "I will guide thee by mine eye."

(To be continued.)

GOVERN YOUR TONGUE.

More sin, it is probable, is committed, and more mischief done, by this small member, than in all other ways. The faculty of speech is one of our most useful endowments, but it is exceedingly liable to abuse. He who knows how to bridle his tongue, is, therefore, in Scripture, denominated "a perfect man;" and again, of him "who seemeth to be religious and bridleth not his tongue," it is declared, "that man's religion is vain."

From Friends' Review.

THE FIRST YEARLY MEETINGS OF FRIENDS IN AMERICA.

The first Yearly Meeting settled in this land appears to have been that for New England, at Newport, on Rhode Island. John Burnyeat mentions in his Journal, that after attending "the Half-Year's Meeting at Oyster Bay," on Long Island, he "took shipping for Rhode Island, and was at their Yearly Meeting in 1671, which begins the 9th* of the Fourth Month every year, and continues for much of a week, and is a General Meeting once a year for all Friends in New England." He attended it again in the following year, and observes, "it began the 8th day of the Fourth Month, which was the sixth-day of the week. At that General Meeting there were many Friends from most places in New England where Friends dwelt, and abundance of other people came into our public meetings. We had meetings for eight days together, every day a meeting, some public, and other men's and women's meetings for settling the affairs of the churches in the order of truth, that all things might be kept sweet, clean and well."

It is evident from these statements, that the Yearly Meeting for New England existed prior to 1671.

Previous to attending this meeting in 1672, he was in Maryland visiting friends there, and makes these observations :

"In the Second Month I appointed a meeting at West River, in Maryland, for all the Friends in the province, that I might see them together before I departed, for I was determined to go as soon as I could after that meeting. And, when the time appointed came, and Friends from all parts began to come, George Fox, with several brethren, came from Jamaica, and landed at Patuxent, and from thence came straight to the meeting. And there were Friends from all parts of the province where they dwelt, and we had a very large meeting, which continued for several days; and a men's and women's meeting for the settling of things, that men's and women's meetings might be established in the province, according to the blessed order of the Gospel of Christ Jesus, which Friends, by the power thereof, were gathered into in most places."

Respecting this meeting, George Fox has the following observations in his journal; viz: "Here we found John Burnyeat, intending shortly to sail for Old England, but upon our arrival he altered his purpose and joined us in the Lord's service. He had appointed a general meeting for all the Friends in the province of Maryland, that he might see them together, and take his leave of them before he departed out of the country; and it was so ordered by the good pro-

vidence of God, that we landed just time enough to reach that meeting, by which means we had a very seasonable opportunity of taking the Friends of the province together. A very large meeting this was, and held four days; to which, besides Friends, came many other people, divers of whom were of considerable quality in the world's account; for there were five or six justices of the peace, the speaker of the Assembly, one of their council, and others of note, who seemed well satisfied with the meeting.

"After the public meetings were over, the men's and women's meeting began, wherein I opened to Friends the service thereof, to their great satisfaction."

It would appear from these accounts, that this meeting was not properly a Yearly Meeting, but one of similar character and design with the Quarterly and Monthly Meetings. This opinion is confirmed by the subsequent remarks of George Fox. He says, "After this [meeting at West River] we went to the Cliffs, where another general meeting was appointed—To this meeting came many who received the truth with reverence. We had also a men's and women's meeting. Most of the backsliders came in again, and several of those meetings were established for taking care of the affairs of the church."

These several meetings being all in the province of Maryland, it is obvious they could not have been Yearly Meetings in the present sense of that term. The precise period at which Baltimore Yearly Meeting was established we cannot now state. Its limits, however, must have been small, for as late as the year 1790 the Quarterly Meetings of Warrington and Fairfax were constituent branches of Philadelphia Yearly Meeting; and they, with the extensive Quarterly Meeting at Chester, embraced nearly all the meetings subsequently included in Baltimore Yearly Meeting. In 1764, it applied to become joined to Philadelphia, and in the following year this was so far assented to, that it was agreed representatives should be sent from it to the latter Yearly Meeting. It was then held alternately at West River and Third Haven; and from that time up to 1790, representatives were accordingly sent to Philadelphia Yearly Meeting, with accounts of the state of Society, both as related to meetings for discipline and those for Ministers and Elders. The names of such representatives regularly appear on the minutes; and they, in connection with the other members, were appointed to services in the meeting.

In 1786, the representatives from Maryland applied to Philadelphia Yearly Meeting for a new arrangement of the constituent branches of the two meetings, which resulted some years after in setting off Warrington and Fairfax Quarters to Maryland, and attaching the members on the Eastern shore and in the lower parts of Delaware to Philadelphia. The latter Yearly

* It is probable the day of the week fixed for the Yearly Meeting to begin, fell that year on the 9th, and sometimes on other days of the month.

Meeting appointed a large committee to carry the changes into effect, and to attend at the opening of the Maryland Yearly Meeting under the new organization, which was thenceforward to be held at Baltimore.

Prior to 1672, it does not appear that there were any Meetings for Discipline in those parts of the country recently comprised in Virginia Yearly Meeting. William Edmundson says in his Journal, "I took boat and went to Virginia, where things were much out of order; but the Lord's power and testimony went over all. When I got several powerful meetings among them, and their minds a little settled, so that truth had got some hold, I appointed a men's meeting for the settling of them in the way of truth's discipline." This was in 1672.

John Burnyeat had visited them in the preceding year, and "advised them to have a men's meeting, and so to meet together to settle things in good order amongst them; but it does not appear that his recommendation was carried into effect until William Edmundson travelled among them.

At this time the number of Friends in North Carolina appears to have been very small. After settling the above-mentioned meetings in Virginia, William Edmundson set out to visit the few residing there, and after encountering many difficulties from the wilderness state of the country, reached the house of Henry Phillips, near Albemarle River. "He and his wife," says William, "had been convinced of the truth in New England and came to live here, and not having seen a Friend for seven years before, they wept with joy to see one." Subsequently to this, many were convinced in that province by the labors of faithful Friends, and meetings settled, which were evidently included in the Yearly Meeting of North Carolina.

Pennsylvania and West Jersey being granted to William Penn and Robert Barclay, the principal part of the early settlers were members of the Society of Friends. Having been acquainted with the order of the Discipline, and the benefits resulting from it, previous to leaving their native land, they soon established a similar system, after reaching their new homes. One of the first steps appears to have been the institution of Monthly or Quarterly Meetings. The records of Burlington Monthly Meeting commence with the following minute, viz:—

"Since, by the good providence of God, many Friends with their families have transported themselves into this province of West Jersey, the said Friends in these upper parts have found it needful, according to the practice in the place we came from, to settle Monthly Meetings, for the well-ordering of the affairs of the church, it was agreed that accordingly it should be done, and accordingly it was done, the 15th of the Fifth Month, 1678."

The following minute of Philadelphia Quarterly Meeting further illustrates this subject, viz:—

"The friends of God belonging to the Meeting in Philadelphia, in the province of Pennsylvania, being met, in the fear and power of the Lord, at the present meeting-place in the said city, the 9th day of the Eleventh Month, being the third day of the week, in the year 1682, they did take into consideration the settlement of meetings therein for the affairs and service of truth, according to that godly and comely practice and example which they had received and enjoyed with true satisfaction amongst their friends and brethren in the land of their nativity: And did then and there agree that the first Third-day of the week in every month shall hereafter be the Monthly Meeting day for the men's and women's meetings for the affairs and service of truth, in this city and county, and every third meeting shall be the Quarterly Meeting of the same."

In 1685 the Quarterly Meeting assumed the character of a representative body, Friends appearing in that capacity from each of the Monthly Meetings, whose names are entered on the minutes, which continues to be the practice to the present time. At the same meeting, viz: the 12th of Seventh Month, 1685, representatives were appointed to attend the Yearly Meeting, a practice which still continues.

The business of the Quarterly Meetings appears to have been, principally, the care of widows, orphans, and the poor, the adjustment of differences which might arise among the members and the oversight of the Society generally, that all might walk worthily and consistently with their religious profession. There were, however, other subjects, of much moment to the rising colony, occasionally transacted.

In 1687, William Bradford, printer, laid before the meeting proposals for printing the Bible, and it was directed that "each Monthly Meeting in the county should use their endeavors to forward the same."

(To be continued.)

RELIGIOUS INFLUENCE OF NATURE.

The natural world is the poetry of God, and in its pages may be read the sublime revelation of what we are, and what we are to be. The fade of the summer storm, the woodland blast and falling leaf, the withering flowers under October skies, the mourning of wintry wind, and all the varying, evanescent scenes of nature, keep continually before the thoughtful mind the hour of death, and sanctify the life. As we behold an autumn sunset, that island of gold, with silver and purple shores, far away in the blue abyss, we can almost picture to ourselves the glory of the scene, when, far over this cold and wildering maze, the land of immortality will rise

upon the view. The flowers of spring, as they appear, unfold the rainbow dyes of our own resurrection. As the tempest of summer uplifts its voice, we may hear it speaking in solemn admonition of the dreadful scene of the judgment day.

Nature inspires devotion. As we behold all her works delighting in the presence of the Lord, our hearts feel the influence, and our thoughts are borne away in gratitude and praise to heaven. The grandeur of architectural art possesses no power to lift the soul on high, like that of the mossy columns and the leafy arches of the woodland and forest, with their long, dim aisles of evergreen and flowers. In the balmy twilights of spring, in the quiet evenings of summer, in the melancholy nightfalls of autumn, we may there go forth, and worship in a temple of God's own building.—The rocks are its altars, and the birds are its choir. The scene itself breathes a spirit of meditation and prayer. From the solemn and delightful sermons of nature, we may there receive purifying influence for our earthly communion. There we may go and soothe the heart of sorrow, and the mind of care. When wearied with the sorrows and cares of the journey of life, the great Author of nature himself frequently sought its retreat.

“There if the Spirit touch the soul,
And grace her mean abode,
O with what peace, and joy, and love,
Does she commune with God!”

N. E. Farmer.

INEFFECTUAL EFFORTS AT REFORMATION.

One of the most common excuses offered by men for continuing any habit they know to be injurious or bad, is that they have tried so often to reform and failed. When the gay habits of youth are settling into those of a dissipated manhood, when habits of extravagance, or the use of tobacco, or of bad language, or of ardent spirits are settling down as fixed necessities of existence, every one in turn makes several struggles to get free from their thralldom, but in every relapse each makes use of the same excuse, he has tried and failed. These supposed failures are very often greater real successes than is commonly imagined, and if they prove failures, at last, it is often only because the successful combatants have too depressed a view of their own real successes. There is no doubt that for the time *while they last* the effect of these efforts is good. In fact, it is so far a perfect triumph, under every possible disadvantage. The first real step of open abandonment of a vice is the most difficult of any, and if a man can only keep this up for a short time—a few years, at most, he may repeat, at the close of his course, the words so memorable in the lips of Epaminondas, when he heard of the triumph of his army,

“Then I die unconquered,” and expired. But, however the struggle may terminate, while it lasts, the man has so many days or years of a virtuous, successful and honorable existence added to his lot, days a thousand times more happy than any he can ever know if he gives up—days to which he will look back as bright and full of promise. But if unsuccessful in the individual, they at least yield a testimony and a tribute to what is right and good and best, most valuable in its effects on others, often dearer to a man than himself. While the effort lasts, it saves his children from the evil of the example, and if it be but temporary, yet still it is a sort of testimony from a parent to a child that may and often does become an effectual protest and antidote, preventing the hereditary effects of an evil example, and suggesting the best ideas to grow up in the next generation out of the ruins of the preceding.

Besides, very few have any idea how imperfect all attempts at reformation are, especially at first. It is only in purpose and in effort and aim that any man can be said to be thoroughly reformed at first; and old habits will plead strongly, and for the moment seem to get the upper hand of a thousand good resolutions in those who afterwards become the most successful self-reformers. So that the greatest difference arises from this, that the finally successful man is the one who never gives up hope and effort. This habit of picking up again after each defeat, and not giving up, is the most valuable of all results in character. The *habit of attempting reformations* is one of the most growing and useful of habits possible. It increases like any other habit, and once formed gives a man courage to attack all his vices and errors. Any man, in proportion as he reforms himself, has a right to attempt to reform others; and none can be so successful as he. If, then, a man be unsuccessful in *one* attempt, yet the formation of the habit will lead him to success in some others, and his success will leave their effects.

It is through reformation and antagonism to error and bad habits that men rise to the greatest success and the formation of the most perfect and strong attachments in all that is excellent. Failure must go before success. What general ever expected to capture a fortification without many losses in storming the forlorn hope. Let every man look at his want of success but as the necessary precursor of apparent failure to real success, and try again. This alone can keep up his true and proper manliness of feeling. When that is gone all is gone. Lord Brougham was said to be fast hastening to a drunkard's grave twenty years ago—at sixty; but he never lost his courage to attack his own vices, and now is about as hale and hearty, and self-reliant and reforming a man as the public life of any nation can exhibit.—*Public Ledger.*

Prudence may enable a man to conquer a world, but not to rule his own heart; it may change one passion for another, but it is not a thing of potency enough to make man change his nature. Sincere and fervent prayer is a constant source of invigoration. But let us think while we are praying for the spirit of forgiveness, whether we are not disposed to indulge the spirit of wrath.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, NINTH MONTH 24, 1859.

DIED, at his residence, in Granville, Washington Co. New York, on the 27th of 8th month, STEPHEN DILLINGHAM, in the 86th year of his age.

He was a member of Danby Monthly Meeting, and had filled the station of elder for many years; had been a faithful and zealous attender of meetings from his early youth till within a few months of his death, evincing by his silent example his love for his Master's cause. The *travelling Friend* hath ever met a welcome smile at his hospitable board.

On First-day, P. M., the 28th, a large circle of relatives and friends followed his remains to their final resting place, on which occasion able testimonies were borne, and the impressive language was, "Mark the perfect man and behold the upright, for the end of that man is peace."

WHAT KNOWLEDGE IS OF MOST WORTH.

(Continued from page 424.)

In education, then, this is the question of questions, which it is high time we discussed in some methodic way. The first in importance, though the last to be considered, is the problem—how to decide among the conflicting claims of various subjects on our attention. Before there can be a rational *curriculum*, we must settle which things it most concerns us to know; or, to use a word of Bacon's, now unfortunately obsolete—we must determine the relative values of knowledge.

To this end, a measure of value is the first requisite. And happily, respecting the true measure of value, as expressed in general terms there can be no dispute. Every one, in contending for the worth of any particular order of information, does so by showing its bearing upon some part of life. In reply to the question, "Of what use is it?" the mathematician, linguist, naturalist, or philosopher, explains the way in which his learning beneficially influences action—saves from evil or secures good—conduces to happiness. When the teacher of writing has pointed out how great an aid writing is to success in business—that is, to the obtaining of sustenance—that is, to satisfactory living, he is held to have proved his case. And when the collector of dead facts (say a numismatist) fails to make clear any appreciable effects which these facts can produce on human welfare, he is obliged

to admit that they are comparatively valueless. All then, either directly or by implication, appeal to this as the ultimate test.

How to live?—that is the essential question for us. Not how to live in the mere material sense only, but in the widest sense. The general problem, which comprehends every special problem, is—the right ruling of conduct in all directions under all circumstances. In what way to treat the body; in what way to treat the mind; in what way to manage our affairs; in what way to bring up a family; in what way to behave as a citizen; in what way to utilize all those sources of happiness which nature supplies—how to use all our faculties to the greatest advantage of ourselves and others—how to live completely? And this being the great thing needful for us to learn, is, by consequence, the great thing which education has to teach. To prepare us for complete living is the function which education has to discharge; and the only rational mode of judging of any educational course is, to judge in what degree it discharges its function.

This test, never used in its entirety, but rarely even partially used, used then to a very small extent, and in a vague, half conscious way, has to be applied consciously, methodically, and throughout all cases. It behooves us to set before ourselves, and ever to keep clearly in view, complete living as the end to be achieved; so that in bringing up our children we may choose subjects and methods of instruction with deliberate reference to this end. Not only ought we to cease from the mere unthinking adoption of the current fashion in education, which has no better warrant than any other fashion; but we must also rise above that rude, empirical style of judging displayed by those more intelligent people who do bestow some care in overseeing the cultivation of their children's minds. It must not suffice simply to *think* that such or such information will be useful in after life, or that this kind of knowledge is of more practical value than that; but we must seek out some process of estimating their respective values, so that as far as possible we may positively *know* which are most deserving of attention.

Doubtless the task is difficult—perhaps never to be more than approximately achieved. But, considering the vastness of the interests at stake, its difficulty is no reason for pusillanimously passing it by; but rather for devoting every energy to its mastery. And if we only proceed systematically, we may very soon get at results of no small moment.

Our first step must obviously be to classify, in the order of their importance, the leading kinds of activity which constitute human life. They may be naturally arranged into:—1. Those activities which directly administer to self preservation; 2. Those activities which, by securing the necessaries of life, indirectly minister to

self-preservation; 3. Those activities which have for their end the rearing and discipline of offspring; 4. Those activities which are involved in the maintenance of proper social and political relations; 5. Those miscellaneous activities which make up the leisure part of life, devoted to the gratification of the tastes and feelings.

That these stand in something like their true order of subordination, it needs no long consideration to show. The actions and precautions by which, from moment to moment, we secure personal safety, must clearly take precedence of all others. Could there be a man, ignorant as an infant of all surrounding objects and movements, or how to guide himself among them, he would pretty certainly lose his life the first time he went into the street: notwithstanding any amount of learning he might have on other matters. And as entire ignorance in all other directions would be less promptly fatal than entire ignorance in this direction, it must be admitted that knowledge immediately conducive to self-preservation is of primary importance.

That next after direct self-preservation comes the indirect self-preservation which consists in acquiring the means of living, none will question. That a man's industrial functions must be considered before his parental ones, is manifest from the fact that, speaking generally, the discharge of the parental functions is made possible only by the previous discharge of the industrial ones. The power of self-maintenance necessarily preceding the power of maintaining offspring, it follows that knowledge needful for self-maintenance has stronger claims than knowledge needful for family welfare—is second in value to none save knowledge needful for immediate self-preservation.

As the family comes before the State in order of time—as the bringing up of children is possible before the State exists, or when it has ceased to be, whereas the State is rendered possible only by the bringing up of children; it follows that the duties of the parent demand closer attention than those of the citizen. Or, to use a further argument—since the goodness of a society ultimately depends on the nature of its citizens; and since the nature of its citizens is more modifiable by early training than by anything else; we must conclude that the welfare of the family underlies the welfare of society. And hence knowledge directly conducing to the first, must take precedence of knowledge directly conducing to the last.

Those various forms of pleasurable occupation which fill up the leisure left by graver occupations—the enjoyments of music, poetry, painting, &c—manifestly imply a pre-existing society. Not only is a considerable development of them impossible without a long-established social union; but their very subject-matter consists in great part of social sentiments

and sympathies. Not only does society supply the conditions to their growth; but also the ideas and sentiments they express. And, consequently, that part of human conduct which constitutes good citizenship is of more moment than that which goes out in accomplishments or exercise of the tastes; and, in education, preparation for the one must rank before preparation for the other.

Such then, we repeat, is something like the rational order of subordination:—That education which prepares for direct self-preservation; that which prepares for indirect self-preservation; that which prepares for parenthood; that which prepares for citizenship; that which prepares for the miscellaneous refinements of life. We do not mean to say that these divisions are definitely separable. We do not deny that they are intricately entangled with each other in such way that there can be no training for any that is not in some measure a training for all. Nor do we question that of each division there are portions more important than certain portions of the preceding divisions; that, for instance, a man of much skill in business but little other faculty, may fall further below the standard of complete living than one of but moderate power of acquiring money, but great judgment as a parent; of that exhaustive information bearing on right social action, joined with entire want of general culture in literature and the fine arts, is less desirable than a more moderate share of the one joined with some of the other. But, after making all qualifications, there still remain these broadly marked divisions; and it still continues substantially true that these divisions subordinate one another in the foregoing order, because the corresponding divisions of life make one another possible in that order.

Of course the ideal of education is—complete preparation in all these divisions. But failing this ideal, as in our phase of civilization every one must do more or less, the aim should be to maintain a *due proportion* between the degrees of preparation in each. Not exhaustive cultivation in any one, supremely important though it may be—not even an exclusive attention to the two, three, or four divisions of greatest importance; but an attention to all,—greatest where the value is greatest, less where the value is less, least where the value is least. For the average man (not to forget the cases in which peculiar aptitude for some one department of knowledge rightly makes that one the bread-winning occupation)—for the average man, we say, the desideratum is, a training that approaches nearest to perfection in the things which must subserve complete living, and falls more and more below perfection in the things that have more and more remote bearings on complete living.

In regulating education by this standard, there are some general considerations that should be

ever present to us. The worth of any kind of culture, as aiding complete living, may be either necessary or more or less contingent. There is knowledge of intrinsic value; knowledge of quasi-intrinsic value; and knowledge of conventional value. Such facts as that sensations of numbness and tingling commonly precede paralysis, that the resistance of water to a body moving through it varies as the square of the velocity, that chlorine is a disinfectant,—these, and the truths of science in general, are of intrinsic value: they will bear on human conduct ten thousand years hence as they do now. The extra knowledge of our own language, which is given by an acquaintance with Latin and Greek, may be considered to have a value that is quasi-intrinsic; it must exist for us and for other races whose languages owe much to these sources; but will last only as long as our languages last. While that kind of information which, in our schools, usurps the name History—the mere tissue of names and dates and dead unmeaning events—has a conventional value only: it has not the remotest bearing upon any of our actions; and is of use only for the avoidance of those unpleasant criticisms which current opinion passes upon its absence. Of course, as those facts which concern all mankind throughout all time must be held of greater moment than those which concern only a portion of them during a limited era, and of far greater moment than those which concern only a portion of them during the continuance of a fashion; it follows that in a rational estimate, knowledge of intrinsic worth must, other things equal, take precedence of knowledge that is of quasi-intrinsic or conventional worth.

One further preliminary. Acquisition of every kind has two values—value as *knowledge* and value as *discipline*. Besides its use for guidance in conduct, the acquisition of each order of facts has also its use as mental exercise; and its effects as a preparative for complete living have to be considered under both these heads.

These, then, are the general ideas with which we must set out in discussing a *curriculum*:—Life as divided into several kinds of activity of successively decreasing importance; the worth of each order of facts as regulating these several kinds of activity, intrinsically, quasi-intrinsically, and conventionally; and their regulative influences estimated both as knowledge and discipline.

(To be continued.)

UNION OF DIVINE AND HUMAN AGENCY.

The providence of God treats men as moral and free agents. Providence will do for a man nothing that he can do for himself. Providence will give seed to the sower, but it will not sow it nor reap the crop for him. Providence will fill the sail of the vessel with gales, but it will not steer the helm. Providence makes no ar-

range to encourage the idleness or inactivity of man, but all its provisions require and demand the full exercise of his agency. God promised to feed the Israelites in the wilderness with manna, but they were to gather and prepare it for food. Providence gives us our "daily bread," but not in baked loaves falling from the sky. Providence has made bread to be the staff of life, but here it meets us as free agents, for if we do not exercise our own agency to partake of it, it will avail us nothing.

Correspondence of The Syracuse Standard.

SAMUEL J. MAY'S LETTERS FROM EUROPE.

HOTEL BYRON, LAKE OF GENEVA, June 24, 1859.

Dear Friends:—Ever since my last of the 15th, (commenced at Horgen and finished at Arth), I have sought for time to give you some sketches of the beautiful and sublime scenes that have been daily passing before my eyes. But we have moved so rapidly from place to place, and there has been so much to be seen everywhere, that I have not found an hour to devote to you. On the whole, I am not sorry that my letter has been deferred until now, for there is no more appropriate spot to write about Switzerland than the *Hotel Byron*, situated at the head of Lake Lemman, i. e., the Lake of Geneva, within half a mile of the Castle of Chillon, and named for the poet, who has done more than any other by his writings to awaken in those who can read English a longing to visit Switzerland. A hotel placed here is really the most suitable monument that can be reared to the memory of that unhappy genius, Lord Byron.

At 3 P. M., on the 15th, we left the village of Arth—one of the ladies and myself on horses, the other lady in a chair carried by two men, and the two gentlemen on foot—to ascend Mount Reghi.

A mile from the hotel we left the common road, and commenced the ascent. It soon became very steep, rugged and zig-zag. I was glad, at 4½, to alight from my horse at a small inn about one-third of the way up the mountain, and rest myself and my panting beast. There was little or no danger in making the ascent. It is only laborious, for in many places the horses really had to scramble to get up. But I saw that it would be perilous to *descend* on horseback, and soon determined to get down in some other way. We reached the summit a little after 6 o'clock, and one glance at the panorama was enough to repay me for all my toil. More than half of Switzerland lay before me; and such a prospect, I venture to say, is nowhere else to be seen on earth—such a union of the sublime and the beautiful. In the distance was a range of lofty mountains, covered with perpetual snows, their white tops glistening and glowing in the light of the declining sun. Nearer and more

near were other ranges, some of them precipitous, rocky, jagged, barren; others of gentler descent, graceful in form, verdant to their summits. At the feet of the former were often to be seen huge heaps of stones and earth that had fallen from above, piled up in conical shape, some still naked, and the deep furrows made by their descent still visible on the mountain side; others covered all over with the greenest shrubs and trees. At the feet of the other ranges were still gentler slopes of pasture, orchard and vineyard, and then perfect levels of meadow land, covered, like our German flats on the Mohawk, or the Connecticut meadows at Southampton, with every kind of grain and grass, just now in their richest attire. Villages, hamlets and single houses were dotted all over the habitable surface, and that in Switzerland includes some pretty steep places. But not the least beautiful features of the panorama were the numerous lakes in plain sight—all of them looking small indeed from our post of observation, but varying in size from six to twenty miles in length, and from one to three miles in width. No picture that I have since seen, except the moving diorama at Lucerne, does any justice to the prospect from Mount Reghi. I am sure no verbal description can, and therefore I shall drop mine as it is half done, hoping that the Lucerne diorama may at some future time be carried to our country, and then many there who cannot come to Switzerland will have the pleasure of seeing something like the view from the top of Reghi.

When I was a boy, I used to read with thrills of horror Mr. Buckminster's account of the destruction of the village of Galdan by a fall of a part of the mountain Rossberg, calculated to have been three miles long, a thousand feet broad, and a hundred feet thick. From Mount Reghi I looked down upon the scene of that horrible catastrophe, and with a spy-glass could distinctly trace it from the avalanche, the outline of the space it covered, the remnant of the small lakes that it half filled up, and the huge masses of rock that were hurled across the valley, and part way up the opposite mountain.

Although I was extremely fatigued by my ride and walk up the mountain, I could not go to bed until I had seen the sun set. It was a gorgeous sight, but not unlike what I have seen at home. We were disappointed in not beholding the effects that are said to be produced upon the near and the distant mountains seen from Reghi when there is not a cloud intervening between them and the setting sun.

So I went to bed at 9 o'clock, hoping that at sunrise the next morning I should see what I was told would be a still more glorious sight.

But I was too tired to get to sleep immediately, and had slept half enough, when at 3½ o'clock, we were all roused by the mountain horn blown by stentorian lungs. Yes, roused only to another

disappointment. Banks of clouds were hanging on the eastern horizon, so that we did not know the sun had risen until he had attained ten or fifteen degrees of his ascent. It was very cold. I skulked to bed again, and made an appendix to my too short night's sleep.

At 9 o'clock we left the Mountain House, and commenced our descent on the opposite side. As I had before determined, I would not venture upon a horse's back down the many very steep places that I was told were on the way. I had not strength enough to walk to the bottom, so soon as our party wished to get there. Nothing else could I do, therefore, but take a "*chaaise a porteur*," i. e., a stout arm chair with a foot board, swung between two long poles and carried by two men. It proved to be an easy and, on the whole, an agreeable mode of conveyance, over such a road. One has to reconcile himself to the apparent misuse of his fellow-men in thus subjecting them to the work of horses. But I found men there eager for the job. They could earn more money that way, in three hours, than they could in two days at farming; and as one of them said to one of my lady companions, who expressed her unwillingness to impose on them such hard work—"Oh! God gives us the strength to do it, and gives you the money to pay for it." So I made myself easy—and more easy by occasionally getting out of my chair and walking a half mile. In this way we got down the mountain much quicker than we went up, and reached Weggis, a village upon the lake of the Four Cantons, a half hour before the steamboat. But she came at her appointed time; and we embarked at 10½ to go to Fluelen, at the head of the Lake. This is the most irregular, the most picturesque and the most historically interesting lake in Switzerland. It is rather a union of several lakes, viz: Lucerne, Kussnacht, Alpnach, Buochs and Uri. The shores of this compound lake are, as Murray says, "a classic region—the sanctuary of liberty; on them took place those memorable events which gave freedom to Switzerland. Here, the first confederacy was formed, and, above all, its borders were the scene of the heroic deeds and signal vengeance of William Tell. On this account they are sometimes called Tell's country." Those of you who have travelled upon Lake George and the upper halves of Skaneateles and Seneca Lakes, have seen sights that somewhat resemble those which we saw between Weggis and Fluelen. But the mountains that overhang our lakes are not so lofty, nor are the shores so irregular.

Soon after leaving Weggis, we came in sight of the village, once the republic, of Gersaw. It occupies not what can be called an interval, but the united slopes of two high, precipitous mountains, which together shut it out from the rest of the world, excepting by the way of the Lake. It is about three miles long, and two miles wide;

scarcely an acre of it is levelled ground, but it is cultivated throughout, supports a population of more than 1,300 souls, and from 1390 to 1798 it was an independent republic, governed by its own laws and magistrates.

A mile or two after passing Gersaw, we came to another thriving village, called Brunnen. There the lake turns almost at a right angle; the mountains on its shores are still more lofty and precipitous. We soon came in sight of a shelf of green earth, which we were told was Grutli, the spot where the three noble insurgents, founders of Swiss freedom—Werner Stauffacher, Erni an der Halden and Walter Furst—met, in the dead of night, at the end of the year 1307, and formed the plan which resulted in the liberation of their country from the yoke of Austria. We looked at it with veneration as we passed—veneration for the men who, though galled to the desperation of revolt by the wrongs they had suffered, bound themselves by a solemn oath to be just and merciful to their oppressors, as well as faithful to the cause of freedom.

But we soon espied, on the opposite shore, close to the edge of the water, a small building, towards which the eyes of all our fellow travellers were earnestly directed. We saw it was a chapel, and learnt that it was erected there to mark the spot upon which William Tell sprang from the boat of the tyrant Gessler, who was carrying him a prisoner to the dungeon of Kussnacht. Once a year the people of all the region round about come in boats to that sacred spot, and join in religious exercises, and listen to discourses, commemorative of that event.

A few minutes' sail, after passing the chapel, brought us to Fluelen, the port of the Canton Serri. There we took a carriage and rode three or four miles to Altorf—saw the monument that marks the spot where Tell stood, and dined at the hotel close by the spot where his son stood when he shot the apple with an arrow from the head of the boy. Yours truly, SAMUEL J. MAY.

THE SUNNY SIDE THE WAY.

Coldly comes the March wind,
Coldly from the north,
Yet the cottage little ones
Gaily venture forth:
Free from cloud the firmament,
Free from sorrow they,
The playful children choosing
The sunny side the way.

Sadly sighs the north wind
Naked boughs among,
Like a tale of mournfulness,
Told in mournful song:
But the merry little ones,
Happy things are they,
Singing like the lark, on
The sunny side the way.

Then the silvery snowdrop,
Daffodils like gold,—

Primroses and crocuses
Cheerfully unfold.
Poor, those cottage little ones—
Poor! no, rich are they,
With their shining treasures, on
The sunny side the way.

Coldly oft the winds blow
On the way of life.
Spreading on the wilderness
Care and pain and strife.
Yet the heart may shelter have,
Cold though be the day,
Choosing like the little ones
The sunny side the way.

J. SWAIN.

DEEDS OF KINDNESS.

Suppose the little cowslip
Should hang its golden cup,
And say, "I'm such a tiny flower,
I'd better not grow up;"
How many a weary traveller
Would miss its fragrant smell;
How many a little child would grieve
To lose it from the dell.

Suppose the glistening dew-drop
Upon the grass should say,
"What can a little dew-drop do?
I'd better roll away;"
The blade on which it rested,
Before the day was done,
Without a drop to moisten it,
Would wither in the sun.

Suppose the little breezes
Upon a summer's day,
Should think themselves too small to cool
The traveller on his way;
Who would not miss the smallest
And softest ones that blow,
And think they make a great mistake
If they were talking so?

How many deeds of kindness
A little child may do,
Although it has so little strength,
And little wisdom too.
It wants a loving spirit
Much more than strength, to prove
How many things a child may do
For others by its love.

THE UNSEEN BATTLE-FIELD.

There is an unseen battle-field
In every human breast,
Where two opposing forces meet,
But where they seldom rest.
That field is veil'd from mortal sight,
'Tis only seen by One,
Who knows alone where victory lies,
When each day's fight is done.
One army clusters strong and fierce,
Their chief of demon form;
His brow is like the thunder-cloud,
His voice, the bursting storm;
His captains, Pride, and Lust, and Hate,
Whose troops watch night and day,
Swift to detect the weakest point,
And thirsting for the fray.

Contending with this mighty force,
Is but a little band ;
Yet there, with an unquailing front,
Those warriors firmly stand.

Their leader is of God-like form,
Of countenance serene ;
And glowing on his naked breast
A simple cross is seen.

His captains, Faith, and Hope, and Love,
Point to that wondrous sign,
And gazing on it, all receive
Strength from a source divine.

They feel it speaks a glorious truth,
A truth as great as sure,
That to be victors, they must learn
To love, confide, endure.

That faith sublime, in wildest strife,
Imparts a holy calm ;
For every deadly blow a shield,
For every wound a balm.

And when they win that battle-field,
Past toil is all forgot ;
The plain where carnage once had reign'd,
Becomes a hallowed spot.

A spot where flowers of joy and peace
Spring from the fertile sod,
And breathe the perfume of their praise
On every breeze to God.

LUNAR INFLUENCES.

BY D. LARDNER.

(Continued from page 431)

Supposed Lunar Influence on the Complexion.

—It is a prevalent popular notion in some parts of Europe, that the moon's light is attended with the effect of darkening the complexion.

That light has an effect upon the color of material substances is a fact well known in the physics and in the arts. The process of bleaching by exposure to the sun is an obvious example of this class of facts. Vegetables and flowers which grow in a situation excluded from the light of the sun are different in color from those which have been exposed to its influence. The most striking instance, however, of the effect of certain rays of solar light in blackening a light colored substance, is afforded by chloride of silver, which is a white substance, but which immediately becomes black when acted upon by the rays near the red extremity of the spectrum. This substance, however, highly susceptible as it is of having its color affected by light, is, nevertheless, found not to be changed in any sensible degree when exposed to the light of the moon, even when that light is condensed by the most powerful burning lenses. It would seem, therefore, that as far as any analogy can be derived from the qualities of this substance, the popular impression of the influence of the moon's rays in blackening the skin receives no support.

M. Arago (who generally inclines to favor rather than oppose prevailing popular opinions),

appears to think it possible that some effect may be produced upon the skin exposed on clear nights, explicable on the same principle as that by which we have explained the effects erroneously imputed to what is called the *red moon*. The skin being, in common with the leaves and flowers of vegetables, a good radiator of heat, will, when exposed on a clear night, for the same reasons, sustain a loss of temperature. Although this will be to a certain extent restored by the sources of animal heat, still it may be contended that the cooling produced by radiation is not altogether without effect. It is well known that a person who sleeps exposed in the open air on a night when the dew falls, is liable to suffer from severe cold, although the atmosphere around him never falls below a moderate temperature; and although no actual deposition of dew may take place upon his skin. This effect must arise from the constant lowering of temperature of the skin by radiation. In military campaigns the effects of bivouacking at night appear to be generally admitted to darken the complexion.*

There is a proverb which is used in certain parts of France as a warning against night promenades:—

“ Que lou sol y la seraine
Fau gerie la gent Mouroine.”

It is remarkable that this proverb is current in places where the red moon is not noticed.

Supposed Lunar Influence on Putrefaction.—

Pliny and Plutarch have transmitted it as a maxim, that the light of the moon facilitates the putrefaction of animal substances and covers them with moisture. The same opinion prevails in the West Indies, and in South America. An impression is prevalent, also, that certain kinds of fruit exposed to moonlight lose their flavor and become soft and flabby; and that if a wounded mule be exposed to the light of the moon during the night, the wound will become irritated, and frequently become incurable.

Such effects, if real, may be explained upon the same principles as those by which we have already explained the effects imputed to the red moon. Animal substances exposed to a clear sky at night, are liable to receive a deposition of dew, which humidity has a tendency to accelerate putrefaction. But this effect will be produced if the sky be clear, whether the moon be above the horizon or not. The moon, therefore, in this case is a witness and not an agent; and we must acquit her of the misdeeds imputed to her.

Supposed Lunar Influence on Shell fish.—It is a very ancient remark, that oysters and other shell-fish become larger during the increase than

*Le hâle de bivouac is an effect quite recognized. Hâle is a term which expresses a state of the air which makes an impression upon the complexion, rendering tanned and burnt.

during the decline of the moon. This maxim is mentioned by the poet Lucilius, by Aulus Gellius, and others; and the members of the academy *del Cimento* appear to have tacitly admitted it, since they endeavor to give an explanation of it. The fact, however, has been carefully examined by Rohault, who has compared shell-fish taken at all periods of the lunar month, and found that they exhibit no difference of quality.

Supposed Lunar Influence on the Marrow of Animals.—An opinion is prevalent among butchers that the marrow found in the bones of animals varies in quantity according to the phase of the moon in which they are slaughtered. This question has also been examined by Rohault, who made a series of observations which were continued for twenty years with a view to test it; and the result was that it was proved completely destitute of foundation.

Supposed Lunar Influence on the Weight of the Human Body.—Sanctorius, whose name is celebrated in physics for the invention of the thermometer, held it as a principle that a healthy man gained two pounds weight at the beginning of every lunar month, which he lost toward its completion. This opinion appears to be founded on experiments made upon himself; and affords another instance of a fortuitous coincidence hastily generalized. The error would have been corrected if he had continued his observations a sufficient length of time.

Supposed Lunar Influence on Births.—It is a prevalent opinion that births occur more frequently in the decline of the moon than in her increase. This opinion has been tested by comparing the number of births with the periods of the lunar phases; but the attention directed to statistics as well in this country as abroad, will soon lead to the decision of this question.*

Supposed Lunar Influence on Incubation.—It is a maxim handed down by Pliny, that eggs should be put to cover when the moon is new. In France it is a maxim generally adopted, that the fowls are better and more successfully reared when they break the shell at the full of the moon. The experiments and observations of M. Girou de Buzareingues have given countenance to this opinion. But such observations require to be multiplied before the maxim can be considered as established. M. Girou inclines to the opinion that during the dark nights about new moon the hens sit so undisturbed that they either kill their young or check their development by too much heat; while in moonlight nights, being more restless, this effect is not produced.

(To be continued.)

*Other sexual phenomena, such as the period of gestation, vulgarly supposed to have some relation to the lunar month, have no relation whatever to that period.

THE MOTHER MOULDS THE MAN.

That it is the mother who moulds the man, is a sentiment well illustrated by the following recorded observation of a shrewd writer: "When I lived among the Choctaw Indians, I held a consultation with one of their chiefs respecting the successive stages of their progress in the arts of civilized life; and among other things he informed me that, at their start, they fell into a great mistake—they only sent boys to school. These boys came home intelligent men, but they married uneducated and uncivilized wives, and the uniform result was, their children were all like their mothers. The father soon lost all his interest in both wife and children."

"And now," said he, "if we would educate but one class of our children, we should choose the girls, for when they become mothers, they educate their sons." This is the point, and it is true. No nation can become fully enlightened, when mothers are not in a good degree qualified to discharge the duties of the home work of education.—*Ladies Home Magazine.*

Many, and perhaps most, of the trials and grievances in the religious and social world, arise from a want of due deference to the opinions and feelings of those with whom we are found to differ; from a departure from "the golden rule," which would lead us to be very tender of the views and scruples of those who are unable to see eye to eye with ourselves; and, if faithfully followed, might be the means of convincing them of their error, if, happily, we should be found in the right.

ITEMS OF NEWS.

USES OF PAPER IN JAPAN.—From a review in the *London Times*, of Capt. Sherard Osborn's book entitled "A Cruise in Japanese Waters," just published, we copy the following extract taken from the work itself:

"It was wonderful to see the thousand useful as well ornamental purposes to which paper was applicable in the hands of these industrious and tasteful people. Our papier-mache manufacturers, as well as the Continental ones, should go to Yeddo to learn what can be done with paper. We saw it made into material so closely resembling Russian and Morocco leather and pigskin that it was very difficult to detect the difference. With the aid of lacker-varnish and skilful painting, paper made excellent trunks, tobacco bags, cigar cases, saddles, telescope cases, the frames of microscopes; and we even saw and used excellent water-proof coats, made of simple paper, which *did* keep out the rain, and were as supple as the best Macintosh.

The Japanese use neither silk nor cotton handkerchiefs, towels, or dusters; paper in their hands serves as an excellent substitute. It is soft, thin, tough, of a pale yellow color, very plentiful, and very cheap. The inner walls of many a Japanese apartment are formed of paper, being nothing more than painted screens; their windows are covered with a fine translucent description of the same material; it enters largely into

the manufacture of nearly everything in a Japanese household, and we saw what seemed balls of twine, which were nothing but long shreds of tough paper rolled up. If a shopkeeper had a parcel to tie up, he would take a strip of paper, roll it quickly between his hands, and use it for the purpose, and it was quite as strong as the ordinary string used at home. In short, without paper all Japan would come to a deadlock; and, indeed, lest by the arbitrary exercise of his authority a tyrannical husband should stop his wife's paper, the sage Japanese mothers-in-law invariably stipulate, in the marriage settlement, that the bride is to have allowed to her a certain quantity of paper!"

It appears from Capt. Osborn's book that, owing to severe strictures in Com. Perry's Report, the Japanese refused to exhibit the brutal gladiatorial shows there spoken of, and declared that Europeans should never witness them again. This is creditable to the Japanese as well as to Com. Perry and his officers.—*Boston Journal*.

SLAVERY has been abolished at Fernando Po, the new Spanish settlement in the Gulf of Guinea. The Spanish government has refused to give up some fugitive slaves from the Portuguese islands of Sante Torne and Principe, on the ground that at Fernando Po slavery is not recognized, and all men in such countries are considered free.

THE EQUINOCTIAL STORM.—The storm was very severe along the Delaware front of the City, (Philadelphia) though no serious damage was done, except the sinking of two or three canal boats, at Reed street wharf and vicinity, and the blowing down of many shade trees, tops of chimneys, &c. we have heard of no one being injured or hurt. The U. S. steamer Wyoming dragged her anchor some distance, but she was again secured before getting near the wharf.

BALTIMORE, Sept 17.—The storm appears to have extended along the coast to Alabama, and as far west as Cincinnati. In the vicinity of Baltimore, all the streams and rivers are very high, and there is high water along the line of the Ohio and Philadelphia Railroads. The noon train failed to connect with the Washington road on account of the high water on Bush-River.

(Second Dispatch)

BALTIMORE, Sept. 18.—We have not yet received any reports of disasters on the coast. A rumor is prevalent that a Boston bark is ashore down the Bay; but it is indefinite. The Norfolk boat, which arrived this morning, reports encountering a heavy storm and rough sea. The weather to-day is delightful.

NEW YORK, Sept. 17.—The Equinoctial prevailed with unusual severity to-day, and did much damage to property. A brick tenement on Duane street, four stories high, was blown down this afternoon. Six of the inmates were taken out of the ruins. s.

THE NEW FRENCH WHEELBARROW.—The new wheelbarrow, which is worked by the men employed to repair the damage occasioned by the *fetes* in the gardens of the Tuileries, is attracting much attention. The novelty of the machine consists in the two legs of the barrow being replaced by two wheels, smaller than the one in front, and which are fixed immediately under the body of the barrow. The handles are raised so as to be on a level with the hands of the workman; and thus, upon a level road, a slight push is all that is necessary for the transport of the heaviest load. The three wheels being almost close together, the act of turning the barrow in the smallest space becomes as easy as possible. The workman has but to lean on one of the handles, and the front wheel is lifted from the ground, leaving the barrow free to be manœuvred like a common hand-cart.

MEHEMET ALI PACHA, who has arrived at Constantinople from Marseilles, after having visited the principal cities in Europe, proposes to open his saloons to European society, which is considered a remarkable act of innovation on the part of a high Ottoman functionary.

EARTHQUAKE.—The town of Sorcia, Italy, has been visited by an earthquake, causing a large destruction of property. Two hundred persons were killed and great numbers injured.

LEIGH HUNT, the celebrated author, died at London on the 28th ult., it the seventy-fifth year of his age.

SALE OF A NEGRO IN A FREE STATE.—A few days since, a free colored man, named Geo. Bowlin, was put up on the block at Carrolton, Green county, Illinois, and sold to the highest bidder. His offence was a violation of the law which prohibits the immigration of colored persons into the State.

Two Kangaroos have been brought to San Francisco from Australia. They stand, erect, about four feet and a half high, resemble, in color, the common black-tailed deer, and are said to be the most docile and beautiful pets that can be imagined. The same vessel brought some full-grown Japanese fowls, for a pair of which a quart pot would form very comfortable quarters, leaving room for half a dozen to roost very comfortably around the top edge, they are so diminutive.

THE JEWS.—An Imperial ukase recently published in St. Petersburg, makes some important ameliorations in the position of the Jews in Russia. They include the admission of Jews into the high trading guilds, as well as into the Russian Colleges, &c.

The Albany *Journal* states that by the recent decease of the Dean of Ripon, in England, the Hon. John Q. Wilson, of that city, becomes the last survivor of the party of cabin passengers who accompanied Robert Fulton in the first steamboat journey from New York to Albany.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—There is some inquiry for fresh ground Flour, but at figures below the views of holders. Old stock is entirely neglected. The transactions are confined to small lots for home consumption at from \$4 50 to 5 12½ per barrel for old and fresh ground superfine; and \$4 87½ to 6 50 for extra, and fancy lots. Rye Flour is firm at \$4. Corn Meal is quiet, but Pennsylvania is steady at \$3 50 per barrel.

GRAIN.—Sales of 1500 bushels good and prime Southern and Pennsylvania red Wheat at \$1 18 per bushel, and a lot of choice Tennessee at \$1 20. White ranges from \$1 25 to 1 35. Rye is in demand; 500 bushels Delaware sold at 75 cts. Corn—Sales of 7500 bushels yellow at 82c., afloat, and 81c in store.

Oats—Sales of 2000 bushels Southern at 36c per bushel. Nothing doing in Barley or Barley Malt.

New Cloverseed is in demand at \$5 25 a 5 50 per 64 lbs. Timothy ranges from \$2 50 to 2 62½. About 500 bushels of Flaxseed sold at \$1 60 per bushel.

WANTED.—A Male Teacher, qualified in every respect to teach a boarding-school for both sexes.

Address STEPHEN COX,
North Rush, Monroe Co., N. Y.
9mo. 17, 1859.

WANTED, a Friend competent to teach a few girls and assist in the care of the children of a private family, within a few miles of Philadelphia, where she would reside, and the home school be held. Any one, to whom a comfortable home and small compensation would be regarded as a satisfactory remuneration for the services indicated, may address "Family," at the Office of this paper, giving name, age, present address, reference, compensation required, etc., etc.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The Winter Session of this institution will commence on the 14th of 11th mo. next, and continue twenty weeks.

Terms \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address

HENRY W. RIDGWAY,

Crosswicks P. O., Burlington Co., N. J.

9th mo. 24—3 m.

FRRIENDS' SCHOOL. The undesignated, Trustees of the "BACON SCHOOL," at Woodstown, Salem County, N. J., under the control of "Pilesgrove Monthly Meeting of Friends," are desirous of obtaining a competent MALE TEACHER as Principal of said School. A member of the Society preferred. Good reference required. Address or apply to either

JAMES WOOLMAN,
WILLIAM M. CAWLEY,
JOSEPH ENGLE,
ABRAHAM WOOLMAN,
JOSIAH DAVIS,

Woodstown, 9th mo., 12th, 1859.—3t. Trustees.

ETATON ACADEMY, KENNETT SQUARE, Chester Co., Pennsylvania.

The Fourth Term of this Institution, under the charge of the present proprietor, will open for the reception of pupils of both sexes, on Second day, the 31st of 10th mo. next, and continue in session twenty weeks.

The course of instruction will embrace all the branches of a thorough English education, the higher Mathematics, Natural Sciences illustrated, the Latin, Greek, French and German Languages, and Drawing.

For terms and particulars, see Circulars, which will be forwarded to the address of every person requesting the same, upon application to

WILLIAM CHANDLER, Principal & Proprietor.
or to WILLIAM A. CHANDLER, Principal Instructor.

RUTHANNA JACKSON,
or to MAGGIE B. JACKSON,
CHARLES B. LAMBORN, } Assistants.

9mo. 10, '59,—2m

LONDON GROVE BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—It is intended to commence the next Session of this Institution on the 1st of 11th month, 1859. Terms \$60 for 20 weeks; no extras, except for the Latin and Greek Languages, which will be \$5 each. For Reference and further particulars inquire for Circular of

BENJ. SWAYNE, Principal,

London Grove P. O., Chester Co. Pa.

9 mo 3, 2 m.

GWYNEDD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The next session of this Institution will commence on the 14th of 11th month, 1859, and continue twenty weeks. Terms \$70, and

no extras. For further information application can be made to

DANIEL FOULKE, Principal,

HUGH FOULKE, Jr., Teacher,

Spring House P. O.,

Montgomery co., Pa.

8 mo. 13—2 mo.

ELDRIDGES HILL BOARDING SCHOOL FOR YOUTH OF BOTH SEXES, will open its Winter Session 11 mo 1st.

Terms \$70 per session of 20 weeks. For particulars address the Principal for a circular.

ALLEN FLITCRAFT.

Eldridges Hill Salem County, N. J.

8 mo 27 3 m.

THE BANKSDALE BOARDING SCHOOL FOR GIRLS, will be reopened the 14th of 11th month, and be continued twenty weeks. The course of study will comprise the usual English branches and Drawing. Terms \$60.

For further information apply to ELIZA HEACOCK, Jenkintown, Montgomery Co. Penn.

8mo. 27 3m.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

GEO. A. NEWBOLD,
Purcellville, Loudon Co., Va.

8th mo. 6, 1859.—6m.

BYBERRY BOARDING SCHOOL, FOR GIRLS.

The ninth session of Byberry Boarding School, taught by Jane, Anne and Mary S. Hillborn, will commence on the first Second-day of Tenth month, 1859, and continue forty weeks without intermission, (including two terms of 20 weeks each.) The course of instruction embraces all the branches of a liberal English education.

Terms \$60 per session of 20 weeks, one half payable in advance. For circulars containing further particulars address

JANE HILLBORN,
Byberry P. O., Philada., Pa.

8th mo. 7—3m.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Pencilling, and Pellis work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; reading, Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M. Principal.

Atleboro', Bucks Co., 5th mo., 28, 1859. 6m.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, TENTH MONTH 1, 1859.

No. 29.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,

No. 324 South Fifth Street,

PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

GROUND'S OF A HOLY LIFE.

BY HUGH TURFORD.

Paul, in his epistle to the Galatians had this saying, "Walk in the Spirit, and ye shall not fulfil the lusts of the flesh." And in his epistle to the Romans, he said, "If ye live after the flesh, ye shall die; but if ye through the Spirit do mortify the deeds of the body, ye shall live." From these Scriptures much may be learned.

The end of preaching is, that the sons and daughters of men may learn to deny, turn from, and forsake every evil deed; and that they may come to live sober, righteous, and godly lives in this present world; so that they may have peace with God in their own consciences while here, and eternal life hereafter.

Now, in order to effect this great work, the apostle gives this short exhortation, "Walk in the Spirit;" affirming to the Galatians, that if they walked in the Spirit, they should not fulfil the lusts of the flesh; they should not yield to evil emotions, nor satisfy their carnal desires. and this is the only way to mortify the deeds of the body, and to cure all spiritual infirmities. But this way of God's salvation having been rejected by many, until they know not what the Spirit is, where it is to be found, or how they may walk therein; in order that their understandings may be opened, let us consider,

First. Who was Paul, and how he came to be a Gospel minister?

Second. What were the people to whom he wrote those epistles?

Third. What did the apostle call flesh and spirit? and wherein do we walk after them?

Fourth. What are we to understand by his words die and live?

Fifth. How we may through the Spirit mortify the deeds of the body?

By reading the Scriptures we find that Paul was an Israelite, of the seed of Abraham, and that he was brought up a scholar, well instructed in the law; and as to his religion he was a Pharisee. The Pharisees were not a loose, profane people, but in outward appearances a very religious people, zealous for the temple and the service thereof, with all other outward observances: insomuch that Jesus said of them, that they "made clean the outside of the cup and the platter." But when the time drew nigh in which God would no longer be worshipped in temples made with hands, but would dwell in and be worshipped by sanctified hearts; and when the laws that were written by that great prophet Moses, for the house of Israel to observe and walk in, must no longer be the rule of righteousness; but Jews and Gentiles must walk by a law proceeding from the Spirit of God in their inward parts;—and when a greater than Moses was come, proclaiming the Kingdom of Heaven at hand, that consisted of a more excellent righteousness than theirs; testifying to those outside worshippers, that notwithstanding their great zeal for the temple and the service thereof, they were but hypocrites and blind guides;—then the rulers of those people were greatly offended; and notwithstanding their outside righteousness, being of a bitter spirit, they endeavored by persecution to stop the coming of that Kingdom; murdering the Prince and imprisoning his subjects. In which persecution none was more active than Paul, wasting the churches of Christ without measure.

But in the height of his persecutions, not man, but God, put a stop to his proceedings, by showing him it was not men, but Christ in men, that he persecuted, which was really so; for, had not the Spirit of Christ been in those whom Paul persecuted, opening the eyes of their understandings to see the emptiness of all shadows, and to turn from them, Paul would have had nothing to say to them. But they being worshippers of God in spirit, and slighting temple-worship, Paul looked upon them as a people not worthy to live.

But it pleased God to reveal in Paul the same Christ he persecuted in others; and that revelation, or inward knowledge of Christ, was the foundation of all Paul's knowledge in the mystery

of godliness. He had not his future teachings from men, nor from books; but from the operation of the spirit of Christ in himself. By keeping to the leading of this spirit, he grew in grace; and as he grew in grace, he grew in the knowledge of Christ; and so went not up to Jerusalem to them who were apostles before him for instructions or orders; but in the strength of the Lord, with his gift and a book of experience in his heart, instead of a Bible in his hand, he went into Arabia to preach the Gospel to the heathen.

Now, what foundation did Paul lay among the heathen? Not circumcision, which was the foundation of the Jews' religion; not John's baptism with water, which has since been considered by many as the foundation of the Christian religion; for Paul told the Corinthians that Christ did not send him to baptize, but to preach the Gospel; and he thanked God in that he had baptized none of them but Crispus, and Gaius and the household of Stephanus. Let us now consider what foundation Paul did lay.

As Paul's eyes were then open to see the gift of God in himself, so his work was to open the eyes of others, that they might see the gift of God in themselves also. Those heathens had, as every man that cometh into the world hath, an inward light that showed them, as it showeth us, what is right and what is wrong, what is just and what is unjust; though in their ignorance they might have had as little regard thereunto as any of us now have.

As the Kingdom of Heaven consisteth in righteousness, so Paul's work was to turn those people to a righteous life, and a heavenly conversation. And what better foundation could any man lay in order to a righteous life, than a divine light in ourselves that shines continually, manifesting every unrighteous action? a guide, that being truly followed will lead unto God; from whom, by unrighteous living, all men depart. This Paul had experienced; which made him an able minister, capable of preaching without book or study; and hence he confidently affirmed unto the Galatians, that the way to a righteous life was to "walk in the Spirit," or keep to this guide.

Thus have I shown how Paul became a Gospel minister, and now I shall show what the people were to whom he wrote those epistles.

The Romans and Galatians, before their conversion, were called heathens, because they knew not the true God, but worshipped dumb idols;—a people that lived as too many now do, in all manner of ungodliness; walking, as Paul told the Ephesians, "according to the Prince of the power of the air." But being turned from their darkness, they became acquainted with this true Light which never consented to any unrighteous action. And many of those heathens turned to this light, and took it for their guide, confiding

therein as a sure foundation. This was the true faith in Him who was given for a light to the Gentiles, and was one in nature with the faith of Abraham.

After they were thus turned unto the Lord, they were convinced that they had a race to run. As from God and godliness they had departed, so to God and godliness they were to return. They did not content themselves, as too many now do, with a Christian name; but following this light, they walked in newness of life, sober, righteous and godly.

This Paul commended, telling the Galatians that they run well. And we should run well also, if we run the like race, growing from day to day more just, more upright, more honest, more faithful, and more circumspect; which cannot be expected until we take their guide for our leader. But the churches of Galatia being at that time, as Paul called them, little children,—a people of small growth in the knowledge of the mystery of godliness—they were by some persuaded (as many now are) that an upright, sober, godly life, and blameless conversation, were not enough; but they must also be in the exercise of some outward observance; and the Jews' religion carrying the most show, they were persuaded to imitate their customs and ceremonies.

But Paul having experienced the insufficiency of outward ordinances to change men's natures and bring them to a righteous life, told the Galatians that if they were circumcised, Christ should profit them nothing. If they went from an inward guide, to rest as the zealous Pharisees did, on outward performances, he that was given them for a light and a leader would not be their light nor their leader. And indeed, it is evident, if Christ be the way—if walking in the Spirit be the means by which we must mortify sin and come to a righteous life, then whosoever goeth from this "way," whosoever slighteth this means, hath no more benefit by Christ in order to a righteous and godly life, than a traveller that forsaketh his guide hath from his guide.

As Christ is a quickening Spirit, so it must be by following Him in His spiritual manifestations that a righteous life is recovered; nothing less can change our natures and make us new creatures; and until we are new creatures, our conversations cannot be in Heaven.

The epistles of Paul were written to a people who were on their way from death to life. They were come out of Egypt, but had not yet come to the promised land: they were turned from their darkness, and had their faces Zion-ward, but were not come to the new Jerusalem, the city of God: they had received Christ, but were not yet rooted and grounded in Christ.

And to perfect what was begun, the apostle exhorted them to "walk in the Spirit;" as if he had said, Keep to your inward guide, the light of

righteousness; for it is this alone that can raise the sons and daughters of men from their fall, and bring them to a life of righteousness.

(To be continued.)

TRUTH.

In analyzing nature and man, we recognize the existence of spirit, or reality, in everything which appears. Of appearances the senses take note; but spirit, or reality, can only be perceived by spirit. Now, in our question, what is Truth? What mean we, than what is the reality of things? In every relation of events, every statement of opinion, every phenomena, we seek to find the reality of it, apart from its appearance merely. We, embodied spirits, surrounded by a world of appearances, are driven by instinctive desire to find our like,—to seize on and appropriate Truth. We hear it often said, Truth is the object of the soul's search. Perhaps the query has come up, why is this? What is the secret of this invincible love of truth, that will not let me rest, knowingly, in error or mere seeming? Why does the child say so early of ought that is told it, is it true?—and the sage, on the threshold of Heaven, still says, Show me Truth? It is, it seems to me, because we, as spirits, being reality ourselves, we do instinctively seek our like. Spirit seeks spirit in all things, to assimilate it unto itself. It is grieved, indignant, at the presence of deception, falsehood, because it is the thrusting upon it of appearance for reality. Truth is literally the food of the soul: for this was it born, and for this cause came it into the world, to bear witness to the truth.—Truth, primal, absolute, is the aim and object of search; but we always receive it in portions,—always meet it in forms. God is absolute reality, primal existence; but He reveals himself through reason, through conscience, through nature. We do not meet Him face to face. Try to conceive of Him, we cannot; try to comprehend Him, we cannot; try to conceive of pure existence, infinite, formless, eternal,—the greatest human in, teleet reels beneath it. So true are the Bible's words, that "no man can see God and live." The soul demands to see Him; it becomes impatient, and would pass the limits of its humanity to see Him. Though He has made a law, under which alone He is revealed, yet would it break these bounds.

"For light like this,
Who would not dare to die!"

The same truth is repeated in bold personifications, in the story in which Moses requests a personal interview with God. We sometimes say, What is God? We long to fathom his breadth and depth: but He says, This cannot be: if the finite could comprehend the Infinite, it would cease to be finite. Man, in comprehending God, would cease to be man: but my goodness shall flow in and around thee, and in the depth of thy

own affections, is revealed the God of love, and through thy discriminating justice shalt thou learn of the God of right: for close by me I will keep thee, as it were, in the cleft of a rock, and although upon thee I lay the conditions of the finite, so that my incomprehensible essence annihilates thee not, yet through the uplifted veil of reason and conscience shall I be revealed to thee, though my infinity may not be beholden.

We cannot comprehend God. We had better give that up at once. Into us He descends, a ceaseless tide of being, but we cannot get behind to overlook it; but in the fact of His infinity consists the inexhaustible nature of truth. We are learners forever.

We receive Truth under limitations: this must necessarily be so, and Progress consists in the continually passing from the form of truth we hold to a higher and wider form. The forms of truth are opinion: these forms must always be limitations of the truth, and true growth is the passing from one of these forms to another, which other shall not oppose or contradict the former, but enclose and transcend it: so that it is never new truth we attain unto, but necessarily higher forms of the old, eternal truth, which knows no "beginning of days nor length of years."

We say to a little child, that heaven or happiness is the reward of virtue. This is an eternal truth, though his fancy gives to his notion of heaven the accompaniments of waving flowers and cool streams: by-and-by, the heart begins to feel the conflict of virtue and sin: it resolves, resists, conquers, and the joy of a good conscience is heaven: and so on, until the heroes of the spirit tell us that virtue is itself heaven. Now the eternal truth remains the same. Heaven is always the hope of glory, whether it be the glory of the outward or that of the spirit made perfect through suffering.

Truth is a seed, wrapt round in opinion: it grows, it swells, it bursts its successive rinds, yet each one encloses the last, like the bark of a tree; but all the former are rejected because the ever-loving sap of life has overflowed their bounds.

Let us cling to truth; nor pause and falter in the demand for it: it is literally our life: but let us realize that our present opinion is never ultimate. But if we are true and free, by-and-by we shall lay it aside, and it will be to us an appearance only from which the reality has gone forth to seek new forms. The manna must be gathered every day. Woe to them who think to feed on the morrow with the food of the past. This conviction may serve to banish all bigotry, all conceit. All men hold truth, though under vast variety of forms: all immortal spirits must possess some portion of truth, however small, for spirit lives only on spirit; and however overlaid by the sensuous, if a spark of immortal life linger in the being, it lives on divine nourishment.

That which is to any soul actually the principle of life, is the same truth that gives vitality to every other soul. God reflects himself in infinite ways, but it is the same light that burns aloft in the star, or glistens far down in the recesses of the mine. All human beings are children of one mother: that cannot be food to one which is poison to another, but the same nutriment serves for all. Opinions, then, are necessarily perishing, because they are the forms truth takes in individual minds: they are dependent, often, on organization, always upon the mental and moral character of the individual. The forcing of any one's opinion upon another is an act of tyranny. The desire to do so is wishing to make a slave of one's brother: we seek to quicken a soul to truth, but the truth must come to that soul in its own form, not in ours: if the divine energy descended, we should not care, were we not bigots, whether it came like a tongue of flame, or in the likeness of the dew of heaven. Forms of truth, which are addressed to the imagination, or to the instincts of the universal heart, are most enduring. Forms of the imagination are infinitely elastic: woven of viewless air, yet they compose a texture so impervious that truth is often borne down in them from age to age. Of this kind is the Genius of the Bible. In the passage to which we referred above, the same thought was in Moses's mind as in ours at this moment, as in the boy at school when he knows that the less cannot contain the greater; that the soul cannot come into possession of absolute truth, which is the being of God: but that God reveals himself to man partially, and, as it were, by degrees: the same truth expressed in a boldly imaginative relation: the eternal facts of the infinite and finite assume form and converse together; and the infinite denies itself to the finite, yet promises to be always with it.

EXTRACTS FROM A MEMOIR OF
ELIZABETH T. KING.

(Continued from page 436.)

From her journal:—

5 mo., 17th. I am and have been much exercised to know how I can do good to others, there is so much that requires doing. Indolence and a love of pleasing interfere sadly with our usefulness. May I be always ready to hear the call, and obey it.

I am also deeply exercised about my call to declare to others the unsearchable riches of Christ. Permit me, oh merciful Lord, to commit this to Thee! Thou knowest I desire to be and to do all that Thou requirest; Thou knowest my weakness and ignorance. I give it all up to Thy care, beseeching that Thou wilt work in me to will and to do of Thine own good pleasure, since I humbly believe there is no wilful withholding.

BALTIMORE, 9 mo., 23d, 1852.

We serve one who is the best of Masters, and He calls for no service which He does not give strength to perform; therefore, all we have to do, is to lie prostrate before Him, in the confiding trust that "He knoweth our frame," and regardeth our low estate.

Since we have only the duty of the present moment to think of and perform, without looking back with unavailing regret, or forward with unavailing anxiety; since we are commanded to be careful for nothing, how quiet our minds should always be. If we can but feel that however weak and unworthy we are, we can with humble sincerity adopt the language, "Whom have I in heaven but Thee, and there is none upon earth I desire beside Thee." I am very jealous over myself, my dear ———, lest in seeking: the precious sympathy of my friends, *self*, our potent tormenter and deceiver, should be fed. There is also danger of saying too much on these subjects, without sufficiently feeling the life to arise and accompany the words.

I think we have seen a superficial tendency so prevalent as to render great care necessary not to "darken counsel by words without knowledge." It is so necessary to keep little, low and simple, and this is difficult for the spirit of man, which would far rather spread out in the branches than deepen in the root.

May He whom we truly desire to serve watch over and guard us in every way, and perfect that which concerneth us, according to His gracious promise.

* * * * *

But oh, my dear, what are we, what am I, trembling, helpless, frail, sinking to the earth, unless constantly upheld?

This humiliating sense of weakness is not unfrequently a snare to me; but I trust I am beginning to feel that it is not in our own strength we are called upon to act. We must go forth when bidden, relying that He who sends us to the battle will furnish weapons, armor and ability out of His abundance.

Truly we may adopt the language, "How great is His mercy towards them that fear Him," blotting out our transgressions, sustaining our weakness, and proving Himself to be "the Father of mercies and God of all consolation."

My heart seems to flow forth in this manner, though under a deep sense of my unworthiness of the least evidence of this abiding love; and I feel drawn towards thee, dear ———, in a sweet quietness of spirit.

In this I trust we may mingle together before the Throne of Grace, while at the same time the incense of adoration and praise may rise not acceptably from our hearts, as a fitting tribute from one at least who has had much forgiven.

Again recurring to the journal, the following entry occurs:—

9 mo., 30th, 1852. I want very much to be able to please our young people, that they may not be repelled by any dullness even—that I may so adorn the doctrine as to win them to better things.

In this I trust it is not merely their affection I seek. I believe there is a better motive, but it requires great care, lest self-seeking should not only come in, but gain the ascendancy.

Surely it is very desirable, placed in such a difficult position as we are, to maintain cheerfulness without levity, and to lead the conversation in mixed society to profitable things.

It may not always be suitable to introduce serious or religious subjects, as, unless the latter is done in the right way and time, and under a little of the right authority, it disgusts, instead of benefiting.

The following tribute to her memory from one of her young friends, will show that this desire was not without fruit.

"Together with a knowledge of books, and an appreciation of the charms of literature, she possessed an intense love for the beautiful works of our heavenly Father, as displayed in nature.

"A mind so constituted could not fail to attract the intelligent young people of her acquaintance, to whom she was easily accessible, and in whose welfare she took a lively interest.

"But what was most remarkable, as well as most valuable, in her intercourse with her younger friends, was the deep religious feeling, the ever present sense of religious obligation, which harmonized her own thoughts and feelings, and was impressed deeply upon all those who had the pleasure of her intimate acquaintance, both by the silent influence of example, and the gentle voice of affectionate precept."

The sentiment which pervades the preceding extract was one which greatly influenced her in society. To remarkable quickness of parts, she united a simplicity of manner, which was the natural expression of her artless and ingenuous character. A stranger would be impressed by the ease with which she placed herself by the side of the younger members of the social circle, and the gentle vivacity with which she entered into the conversation, wholly unconscious of superiority, and of the sweet influence she was shedding around her.

To a young friend:—

BALTIMORE, 12mo., 21st, 1852.

I have had quite a siege with infirmities of various kinds, since Yearly Meeting. My hands were disabled for about a month, being poisoned from gathering autumn leaves, but I find, as I have frequently before done, that it is not the circumstances in which we are placed, but the spirit in which we meet them, that constitutes our comfort; and that this may be undisturbed, if we seek for and cherish a feeling of quiet

submission, whatever may be the privations allotted us.

It has very sorrowfully impressed my mind, since I have been sick, how much strength and peace and comfort are lost from want of an unreserved dedication. Many feel a strong desire to do right, and make some, it may be many, sacrifices, but something is still kept back. The will is not yet entirely subdued, and they miss of the sweet and abundant peace with which He, who is a rich rewarder of all who diligently seek Him, fills the heart of His humble and obedient children. I have longed to plead with those that were near, and with those that were far off, to delay no longer; to fill themselves no longer with the miserable husks of earthly gratifications, but to turn with all their heart to the tender Father, the merciful Saviour, whose love has so long pursued them, and who is still waiting to be gracious. Words fail to express the marvellous loving-kindness and tender mercy of our God, even to the poorest and most unworthy of His creatures; how can *any* longer stand aloof?

(To be continued.)

Nothing is such an obstacle to the production of *excellence*, as the power of producing what is *pretty good* with ease and rapidity.

Every work of great genius, and every work of great care and industry, will have its value; but mediocrity with negligence gives products of no value at all.—*Dr. Aiken.*

WHAT KNOWLEDGE IS OF MOST WORTH.

(Continued from page 440.)

Happily that all-important part of education which goes to secure direct self-preservation is in great part already provided for. Too momentous to be left to our blundering, Nature takes it into her own hands. While yet in its nurse's arms, the infant, by hiding its face and crying at the sight of a stranger, shows the dawning instinct to attain safety by flying from that which is unknown and may be dangerous; and when it can walk, the terror it manifests if an unfamiliar dog comes near, or the screams with which it runs to its mother after any startling sight or sound, shows this instinct further developed. Moreover, knowledge subserving direct self-preservation is that which it is chiefly busied in acquiring from hour to hour. How to balance its body; how to control its movements so as to avoid collisions; what objects are hard, and will hurt if struck; what objects are heavy, and injure if they fall on the limbs; which things will bear the weight of the body, and which not; the pains inflicted by fire, by missiles, by sharp instruments—these, and various other pieces of information needful for the avoidance of death or accident, it is ever learning. And when, a few years later, the energies go out in running,

climbing, and jumping, in games of strength and games of skill, we see in all these actions by which the muscles are developed, the perceptions sharpened, and the judgment quickened, a preparation for the safe conduct of the body among surrounding objects and movements; and for meeting those greater dangers that occasionally occur in the lives of all. Being thus, as we say, so well cared for by Nature, this fundamental education needs comparatively little care from us. What we are chiefly called upon to see, is, that there shall be free scope for gaining this experience, and receiving this discipline,—that there shall be no such thwarting of Nature as that by which stupid schoolmistresses commonly prevent the girls in their charge from the spontaneous physical activities they would indulge in; and so render them comparatively incapable of taking care of themselves in circumstances of peril.

This, however, is by no means all that is comprehended in the education that prepares for direct self-preservation. Besides guarding the body against mechanical damage or destruction, it has to be guarded against injury from other causes—against the disease and death that follow breaches of physiologic law. For complete living it is necessary, not only that sudden annihilations of life shall be warded off; but also that there shall be escaped the incapacities and the slow annihilation which unwise habits entail. As, without health and energy, the industrial, the parental, the social, and all other activities become more or less impossible; it is clear that this secondary kind of direct self-preservation is only less important than the primary kind; and that knowledge tending to secure it should rank very high.

It is true that here, too, guidance is in some measure ready supplied. By our various physical sensations and desires, Nature has insured a tolerable conformity to the chief requirements. Fortunately for us, want of food, great heat, extreme cold, produce promptings too peremptory to be disregarded. And would men habitually obey these and all like promptings when less strong, comparatively few evils would arise. If fatigue of body or brain were in every case followed by desistance; if the oppression produced by a close atmosphere always led to ventilation; if there were no eating without hunger, or drinking without thirst; then would the system be but seldom out of working order. But so profound an ignorance is there of the laws of life, that men do not even know that their sensations are their natural guides, and (when not rendered morbid by long-continued disobedience) their trustworthy guides. Nay, not only are they mostly ignorant of this truth, but they actually deny it when propounded to them. Judging from various prevalent ascetic doctrines, the current belief would seem to be that our sensa-

tions exist not for our guidance, but for our misguidance; and should be thwarted as much as possible. So that though, to speak teleologically, Nature has provided efficient safeguards to health, lack of knowledge makes them in a great measure useless.

If any one doubts the importance of an acquaintance with the fundamental principles of physiology as a means to complete living, let him look around and see how many men and women he can find in middle or later life who are thoroughly well. Occasionally only do we meet with an example of vigorous health continued to old age; hourly do we meet with examples of acute disorder, chronic ailment, general debility, premature decrepitude. Scarcely is there one to whom you put the question, who has not, in the course of his life, brought upon himself illness which a little knowledge would have saved him from. Here is a case of heart disease consequent on a rheumatic fever that followed reckless exposure. There is a case of eyes spoiled for life by over-study! Yesterday the account was of one whose long-enduring lameness was brought on by continuing, spite of the pain, to use a knee after it had been slightly injured. And to-day we are told of another who has had to lie by for years, because he did not know that the palpitation he suffered from resulted from over-taxed brain. Now we hear of an irremediable injury that followed some silly feat of strength; and, again, of a constitution that has never recovered from the effects of excessive work needlessly undertaken. While on all sides we see the perpetual minor ailments which accompany feebleness. Not to dwell on the actual pain, the weariness, the gloom, the waste of time and money thus entailed, only consider how greatly ill-health hinders the discharge of all duties—makes business often impossible, and always more difficult; produces an irritability fatal to the right management of children; puts the functions of citizenship out of the question; and makes amusement a bore. Is it not clear that the physical sins—partly our forefathers' and partly our own—which produce this ill-health, deduct more from complete living than anything else? and to a great extent make life a failure and a burden instead of a benefaction and a pleasure?

To all which add the fact, that life, besides being thus immensely deteriorated, is also cut short. It is not true, as we commonly suppose, that a disorder or disease from which we have recovered leaves us as before. No disturbance of the normal course of the functions can pass away and leave things exactly as they were. In all cases a permanent damage is done—not immediately appreciable, it may be, but still there; and along with other such items which Nature in her strict account-keeping never drops, will tell against us to the inevitable shortening of our

days. Through the accumulation of small injuries it is that constitutions are commonly undermined, and break down, long before their time. And if we call to mind how far the average duration of life falls below the possible duration, we see how immense is the loss. When, to the numerous partial deductions which bad health entails, we add this great final deduction, it results that ordinarily more than one-half of life is thrown away.

Hence, knowledge which subserves direct self-preservation by preventing this loss of health, is of primary importance. We do not contend that possession of such knowledge would by any means wholly remedy the evil. For it is clear that in our present phase of civilization men's necessities often compel them to transgress. And it is further clear that, even in the absence of such compulsion, their inclinations would frequently lead them, spite of their knowledge, to sacrifice future good to present gratification. But we do contend that the right knowledge impressed in the right way would effect much; and we further contend that as the laws of health must be recognised before they can be fully conformed to, the imparting of such knowledge must precede a more rational living—come when that may. We infer that as vigorous health and its accompanying high spirits are larger elements of happiness than any other things whatever, the teaching how to maintain them is a teaching that yields in moment to no other whatever. And therefore we assert that such a course of physiology as is needful for the comprehension of its general truths, and their bearings on daily conduct, is an all essential part of rational education.

Strange that the assertion should need making! Stranger still that it should need defending! Yet are there not a few by whom such a proposition will be received with something approaching to derision. Men who would blush if caught saying Iphigénia instead of Iphigenia, or would resent as an insult any imputation of ignorance respecting the fabled labors of a fabled demigod, show not the slightest shame in confessing that they do not know where the Eustachian tubes are, what are the actions of the spinal cord, what is the normal rate of pulsation, or how the lungs are inflated. While anxious that their sons should be well up in the superstitions of two thousand years ago, they care not that they should be taught anything about the structure and functions of their own bodies—nay, would even disapprove such instruction. So overwhelming is the influence of established routine! So terribly in our education does the ornamental override the useful!

We need not insist on the value of that knowledge which aids in direct self-preservation by facilitating the gaining of a livelihood. This is admitted by all; and, indeed, by the mass is

perhaps too exclusively regarded as the end of education. But while every one is ready to endorse the abstract proposition that instruction fitting youths for the business of life is of high importance, or even to consider it of supreme importance; yet scarcely any inquire what instruction will so fit them. It is true that reading, writing, and arithmetic are taught with an intelligent appreciation of their uses; but when we have said this we have said nearly all. While the great bulk of what else is acquired has no bearing on the industrial activities, an immensity of information that has a direct bearing on the industrial activities is entirely passed over.

For, leaving not only some very small classes, what are all men employed in? They are employed in the production, preparation, and distribution of commodities. And on what does efficiency in the production, preparation and distribution of commodities depend? It depends on the use of methods fitted to the respective natures of these commodities; it depends on an adequate knowledge of their physical, chemical, or vital properties, as the case may be; that is, it depends on Science. This order of knowledge, which is in great part ignored in our school courses, is the order of knowledge underlying the right performance of all those processes by which civilized life is made possible. Undeniable as is this truth, and thrust upon us as it is at every turn, there seems to be no living consciousness of it; its very familiarity makes it unregarded. To give due weight to our argument, we must, therefore, realize this truth to the reader by a rapid review of the facts.

(To be continued.)

From the History of Civilization in England.

BRAZIL.

The trade wind, blowing on the eastern coast of South America, and proceeding from the east, crosses the Atlantic ocean, and therefore reaches the land surcharged with the vapors accumulated in its passage. These vapors, on touching the shore, are, at periodical intervals, condensed into rain, and as their passage eastward is checked by the gigantic chain of the Andes, which they are unable to pass, they pour the whole of their moisture on Brazil, which, in consequence, is often deluged by the most destructive torrents. This abundant supply, being aided by that vast river-system peculiar to the eastern part of America, and being also accompanied by heat, has stimulated the soil into an activity unequalled in any other part of the world.

Brazil, which is nearly as large as the whole of Europe, is covered with a vegetation of incredible profusion. Indeed so rank and luxuriant is the growth, that Nature seems to riot in the wantonness of power. A great part of this immense country is filled with dense and tangled forests, where noble trees, blossoming in unri-

valled beauty, and exquisite with a thousand hues, throw out their produce in endless prodigality. On their summits are perched birds of gorgeous plumage which nestle in their dark and lofty recesses. Below, their base and trunks are crowded with brushwood, creeping plants, innumerable parasites, all swarming with life. There, too, are myriads of insects of every variety; reptiles of strange and singular form; serpents and lizards, spotted with deadly beauty: all of which find means of existence in this vast work shop and repository of Nature. And that nothing may be wanting to this land of marvels, the forests are skirted by enormous meadows, which, reeking with heat and moisture, supply nourishment to countless herds of wild cattle, that browse and fatten on their herbage; while the adjoining plains, rich in another form of life, are the chosen abode of the subtlest and most ferocious animals, which prey on each other, but which, it might almost seem, no human power can hope to extirpate.

Such is the flow and abundance of life by which Brazil is marked above other countries of the earth. But amidst this pomp and splendor of Nature, no place is left for man. He is reduced to insignificance by the majesty with which he is surrounded. The forces that oppose him are so formidable, that he has never been able to make head against them, never been able to rally against their accumulated pressure. The whole of Brazil, notwithstanding its immense apparent advantages, has always remained entirely uncivilized; its inhabitants wandering savages, incompetent to resist those obstacles which the very beauty of Nature had put in their way. For the natives, like every people in the infancy of society, are averse to enterprise; and being unacquainted with the arts by which physical impediments are removed, they have never attempted to grapple with the difficulties that stopped their social progress. Indeed those difficulties are so serious, that during more than three hundred years the resources of European knowledge have been vainly employed in endeavoring to get rid of them. Along the coast of Brazil, there has been introduced from Europe a certain amount of that civilization, which the natives by their own efforts could never have reached. But such civilization, in itself very imperfect, has never penetrated the recesses of the country; and in the interior there is still found a state of things similar to that which has always existed. The people, ignorant, and therefore brutal, practising no restraint, and recognizing no law, continue to live on in their old and inveterate barbarism.—In their country, the physical causes are so active, and do their work on a scale of such unrivalled magnitude, that it has hitherto been found impossible to escape from the effects of their united action.

The progress of agriculture is stopped by im-

passable forests, and the harvests are destroyed by innumerable insects. The mountains are too high to scale, the rivers too wide to bridge; every thing is contrived to keep back the human mind, and repress its rising ambition. It is thus that the energies of nature have hampered the spirit of man. Nowhere else is there so painful a contrast between the grandeur of the external world and the littleness of the internal. And the mind, cowed by this unequal struggle, has not only been unable to advance, but, without foreign aid, it would undoubtedly have receded. For even at present, with all the improvements constantly introduced from Europe, there are no signs of real progress; while, notwithstanding the frequency of colonial settlements, less than one-fifteenth of the land is cultivated. The habits of the people are as barbarous as ever, and as to their numbers, it is well worthy of remark, that Brazil, the country where, of all others, physical resources are most powerful, where both vegetables and animals are most abundant, where the soil is watered by the noblest rivers, and the coast studded by the finest harbors—this immense territory, which is more than twelve times the size of France, contains a population not exceeding six millions of people.

This consideration sufficiently explains why it is that in the whole of Brazil there are no monuments even of the most imperfect civilization; no evidence that the people had, at any period, raised themselves above the state in which they were found when the country was first discovered.

T. H. BUCKLE.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, TENTH MONTH 1, 1859.

The exclusion of our colored population from the city passenger conveyances is certainly a most unjust and arbitrary regulation. However neatly attired, respectable, aged or infirm the colored man may be; however remote the distance he has to traverse, he is denied the general means of transit. Occasionally one may be seen standing on the *platform* of a City Passenger Railroad car, yet, although the fare exacted from him is equal to that paid by the more privileged citizen, on no condition is he allowed a seat within the car.

From the omnibuses he is invariably excluded; and while white men and women of every shade of character and appearance, even the most degraded, avail themselves of these public accommodations for purposes of business or recreation, an entire class of our citizens is debarred these

rights and privileges merely for being "guilty of a skin not colored like our own." That this should be more peculiarly the case in the land of Penn than in any other portion of our Union, is truly unaccountable. In most of our Southern Cities and States we see the people of color occupying seats in railroad cars and in other public conveyances, and in our Northern States there is seldom any prohibition on account of complexion.

We transfer to our paper an appeal entitled, the "Colored People and the Cars." It is time this subject was claiming the attention of the community. Very many of our citizens, no doubt a majority of them, would rejoice to see colored persons enjoying similar privileges to those extended to them in other cities, and a correct public sentiment will soon remedy the grievance.

The adjudicators of the prizes for the best essays on the cause of the decline of the Society of Friends in Great Britain, have issued a document, by which it appears that after careful consideration they have concluded, that an essay bearing a motto from the Epistle of York Quarterly Meeting, of the year 1855, should receive the first prize, and one bearing the motto "Verbum, Vita, Lux," the second prize. Some hesitation having been expressed by the adjudicators, as to the relative place which should be assigned to the two successful essays, the donor of the prizes has offered to make the second prize equal to the first. The author of the first essay is J. T. Rowntree, of York; of the second, Thomas Hancock, of Nottingham.

The adjudicators express their conviction that the publication of many of the rejected essays would be for the public advantage.

We have received the account of Richard Hopkins, Jr., written by Isaac Parry many years since, for (as he expressed it) his "after satisfaction," but think the *details* of more interest to particular friends than the general reader.

We would, however, notice the concern he felt that his "former associates who were running into scenes of vanity and dissipation," might be brought to see, as he had, the exceeding sinfulness of sin. He believed, could they feel what he had felt they would flee from the paths of

(guilty) pleasures as from flames of fire." His illness was a protracted one, during which he gave evidence that through the merciful dealings of an Almighty Power, the will of the "strong man" was subdued, and "there was an acquiescence with the divine will." Thus was death robbed of terror and "with lamb-like patience and a spirit clothed with love," he departed this life on the 13th of 12th month, 1802, in the 28d year of his age.

Good as the advice is in the London Epistle, dated 1692, it is so similar in character to several others which have already appeared in our paper, that we think it better to decline its publication.

DIED, On the morning of the 8th of 8th mo., 1859, ASA BLACKLEDGE, of Monroe co., Ohio, in the 59th year of his age. He was a consistent Member and worthy Elder of the Society of Friends, upright in all his walks, a lover of truth, patient, meek, and never swerving from duty.

COLORED PEOPLE AND THE CARS.

To the Editor of the North American and U. S. Gazette.

SIR:—As a colored man and a constant reader of your paper allow me a brief corner in your columns to make a few remarks on the sore grievance of genteel colored people in being excluded from the city passenger railroad cars, except they choose to "stand on the front platform, with the driver."

However long the distance they may have to go, or great their hurry—however unwell or aged, genteel or neatly attired—however hot, cold or stormy the weather—however few in the cars, as the masses of the colored people now understand it, they are unceremoniously excluded.

Of course my own humble opinion will weigh but little with yourself and readers (being, as I am, of the proscribed class) as to whether it is reasonable or unreasonable, just or unjust—as to whether it is a loss or a gain to railroad companies, thus to exclude colored people. Nevertheless, pardon me for saying that this severe proscription, for some unaccountable reason, is carried to an extent in Philadelphia unparalleled in any of the leading cities of this Union. This is not imagination or an exaggerated assertion.

In New Orleans, colored people—slaves as well as free—ride in all the city cars and omnibusses. In Cincinnati, colored women are accommodated in the city omnibuses, but colored men are proscribed to a certain extent. In Chicago it may be safely said that not the slightest proscription exists in the public conveyances of that flourishing city. In New York, Brooklyn, &c., (except on one or two of the New York

city passenger lines,) there is not the slightest barrier to any persons riding, on account of complexion. There is no obstruction in the way of colored persons riding in any of the Boston cars or omnibuses.

I need not allude to cities of minor importance, whether favorable or unfavorable, north or south. Sufficient are the facts in the examples of the cities already alluded to, to make it a very painfully serious inquiry with intelligent colored people, why it is so in Philadelphia, the city of "Brotherly Love," so noted as the bulwark of the "Religious Society of Friends, commonly called Quakers," so noted as one of the leading cities in the Union, in great religious and benevolent enterprises, so pre-eminently favorable to elevating the heathen in Africa, while forgetful of those in their very precincts—those who are taxed to support the very highways that they are rejected from.

But, doubtless, on a hurried consideration of the claims of the colored people, serious objections would be found by railroad boards and others, under the erroneous impression that the vicinity of St. Mary, Bedford, Seventh and Lombard streets, &c., furnishes a sample of the great body of colored people residing in Philadelphia.

While compelled by truth to admit that there is some room for fear from these localities; that in viewing the gross intemperance, filth and wretchedness abounding so largely, in which hundreds are hopelessly degraded, the innocent should have to suffer, it is, perhaps, no more than might be expected, yet it is an undeniable fact, that the chief source of degradation comes from rum. The rum comes from the licensed or unlicensed grog-sellers, who hold out their alluring cup for the sake of ready change, which they are sure to get, after which they turn their customers on the street, to appear hideous to all beholders. I need not say that these grogeries, low and degrading as they may be, are not licensed by colored men, nor in one case in twenty are they kept by colored men.

Hence, common charity would seem to dictate that some other class should be charged with a portion of this loathsome state of things, so much dreaded. (A hint to the wise is sufficient.)

Now, having frankly admitted the degradation of Seventh and St. Mary streets, &c., which has been a thousand times held up to the world by the press, not only of Philadelphia, but almost of the entire country, to the disgrace of every colored man in the country, I beg, Mr. Editor, to respectfully add, that the inhabitants of this ill-fated region are by no means a fair sample of the twenty thousand colored people of Philadelphia. The gulf between this degraded class and the great mass of industrious colored people, is well nigh as marked as was the gulf between Dives and Lazarus, in the parable, as I shall at-

tempt to demonstrate here, besides volunteering further to prove, by ocular testimony, if any of your readers choose to condescend to accompany me to parts and places where the decent portions of colored people reside; to the eighteen or twenty colored churches, with their Sabbath schools; to at least twenty day schools, of a public and private character; to the dozens of beneficial societies, united for the mutual support of their sick and disabled members; to the neat and genteely furnished three story brick houses, owned, occupied and paid taxes for, almost entirely by colored people—on Rodman street, Ronaldson street and Washington street; to observe the extent of valuable property owned on South and Lombard streets (in the most respectable part of those streets;) to examine some of the stores, (they may not be large) kept by colored men, (of which more will be said presently) to pass those living in respectable houses, elegantly furnished, houses alone worth from five to ten thousand dollars, likewise leaving out the many in various other parts of the city, where industrious, sober and decent people live, and own considerable real estate. I think abundant evidence may be found in the directions alluded to, to convince the most prejudiced against the colored man, that he is by no means so sadly degraded and miserably poor as the public have generally been led to suppose, from all that has been said of him in connection with the degraded localities alluded to before.

Previously I alluded to stores, &c., and will now refer more particularly to a few in my own immediate neighborhood, which is on South street, between Eighth and Ninth streets. Just in the square, there are six or seven stores—five of furniture, stoves, &c., one confectionery, and one small trimming store. I am sure these places are neatly and well kept, are well stocked generally, and these owners are active, intelligent and sober business men. Indeed, I might with propriety add in this connection, also on South street, below Eighth street, the colored tailor, shoemaker, furniture store keeper, and the dealer in crockery ware and fancy articles, may be found now where they have been, for years, creditably following these pursuits; also, above Ninth street, in South, carpenters, tailors and shoemakers are actually doing credit to their craft—comfortably supporting their families, educating their children, and leading lives of respectability.

But what avails all this? Why further add in this direction? I fear you will say Mr. Editor. Suppose Stephen Smith, who is reputed to be worth a quarter of million of dollars, with his tens of thousands of dollars invested in bank stocks, railroad stocks, &c., &c., having for so many years been well known among business men as an extensive lumber and coal merchant, dealer in real estate, &c., with taxes amounting to nearly two thousand dollars per annum to pay,

should enter a car, still, being colored, he would justly be assigned the "front platform," to stand up by the driver. Again, suppose Miss Greenfield (the Black Swan) wished to enjoy a ride to Fairmount; never mind, she must stand on the "front platform, by the driver," too. The fact that her extraordinary acquirements as a vocalist have won for her the very highest distinction both in this country and Europe, does actually weigh nothing when entering a City Passenger Railroad car—the front platform is the place for all that the Creator chose to make with a dark skin.

But I will now relieve your patience, trusting, ere long, decent colored men and women will find the same privileges in the City Passenger Railroad cars of Philadelphia that are extended to colored men and women in other cities.

Philadelphia, Aug. 30, 1859. W. S.

Correspondence of The Syracuse Standard.

SAMUEL J. MAY'S LETTERS FROM EUROPE.

GENEVA, June 26, 1859.

Since my visit to the country of William Tell, I have seen more that has interested me, and that would interest you, than I have seen in the same number of days since I left Rome. I have been to Lucerne, and have looked with admiration upon Thorwaldsen's Lion, of gigantic size, sculptured in the face of a rock at the base of a mountain, in memory of the Swiss Guards, who, animated by a sense of duty, suffered themselves to be cut to pieces, in defence of the King and Queen of France, in 1797. It was one of the most attractive and impressive works of the chisel I have ever beheld, though I have been to Rome.

I have travelled over the Brunig Pass, and been to the beautiful city of Interlaken; and thence made an excursion over the Wengern Alp, under the droppings of the very eaves of the majestic Jungfrau. I have seen there mighty avalanches of snow, in one of which enough fell to have filled our Fayette Park full to the tops of the houses. Then I descended to Grindelwald, and saw one of the largest glaciers, it is said, in all Switzerland. Afterwards we came to Berne, the city that is given almost to the worship of bears, the city in which there is the funniest clock in the world, and where we obtained the finest view of the oberland, or highest Alps in Switzerland.

From Berne we came to Vevey, over a most excellent road, through a charming country, on a delightful day, and saw a good-looking, happy-seeming population, all the way, out in the streets of their villages, for it chanced to be a holiday.

Next morning, from Vevey we went to the head of Lake Lemman, to the *Hotel Byron*, and visited the Castle and Prison of Chillon, and saw the slanting rays of the setting sun stream

across the gloomy dungeon of Bouivard, and took hold of the iron ring to which he was chained for four years.

And we have come down the beautiful Lake of Geneva, fifty miles in length, and have seen, as we passed, the house where Byron wrote "The Prisoner of Chillon," and the house where Gibbon wrote his history of "The Decline and Fall of the Roman Empire," and the villa where M. Necker and his illustrious daughter, Madame de Stael, lived and wrote.

But I have no time to tell you anything more about all these places and things, for here we are in Geneva, the place where John Calvin did his great and some of his wicked works—in Geneva, within sight and an easy day's ride of Chamouni and Mont Blanc—in Geneva, on the very confines of Sardinia, from which seat of war have just come tidings of another terrible battle, in which thousands have been murdered, many more thousands fearfully mangled, and the Austrians again routed.

Geneva is not in itself so pleasing as several other cities we have seen. But it is a central and important place.

We reached here yesterday at one o'clock; and after dinner I walked about to see the city, where many illustrious persons have lived, and which Calvin converted from the Roman Catholic faith, and then ruled it himself with a rod of iron. It is very irregularly built upon a very irregular surface of land, at the foot of the lake, all the old part of it between two rapid rivers, the Arve, which pours down a turbid stream from Mont Blanc, and the Rhone, through which the blue clear waters of the lake rush and rush onward to the sea. The meeting of these rivers takes place a mile and a half out of the city, and I have been, as almost all strangers go, to see it. It is very similar to the meeting of our own Mississippi and Missouri. For half a mile after they come together, the muddy Arve and the clear blue Rhone flow on, side by side, as if determined not to mingle their waters; but then their mutual repugnance is overcome, and the dirty river defiles the clear one all the rest of their joint career.

This forenoon I went to the large old cathedral church, where John Calvin preached for more than twenty years. It was despoiled of every vestige of the Roman Catholic worship, for which it was built. But it is ill adapted to the Protestant service, which it is intended the people should hear and understand. The voice of the preacher reverberated so from the lofty arches of the Gothic building, nave, aisles, transept and apse, that I could not perceive the articulation of half the words the reverend gentleman uttered. His manner was earnest, impressive, eloquent—but his words I could not hear, and I am ashamed to say (such is my ignorance of the French lan-

guage, in which he spoke) I should not have understood half if I had heard all.

At the conclusion of the service I went to the foot of the pulpit stairs, and waited until the minister descended. I found he understood no more of my language than I did of his. But I communicated to him my wish to know if that was indeed the church and the pulpit in which John Calvin used to preach. He assured me they were the same; "and there," said he, "is the chair in which he sat." So I ascended the pulpit stairs, and sat down awhile in the very chair of the great Reformer.

As I was coming out of the church, an agreeable-looking young gentleman accosted me in correct, but imperfectly pronounced English. I soon learned that he was a Norwegian, taking Switzerland on his way to one of the universities in Germany, whither he is going to study theology. We were not long in getting acquainted sufficiently to walk together to the house in which Calvin dwelt nearly all the while that he lived in Geneva. It is now occupied by the Sisters of Charity.

On my return to our hotel, I met upon the bridge that connects the old part of the city with the new, a blind old man, with a bundle of papers, which he was loudly crying for sale. I bought one, and found it, as I expected, an extra filled with items of news from the seat of the war, and from other parts of Italy—items that will reach you, no doubt, before this letter can. Truly, the last battle has been a fearful one, almost without a parallel in the history of modern warfare.

An old maxim of Dr. Franklin is, "What maintains one vice will bring up two children." More is paid by many for intoxicating liquor than for daily bread.

TRUE PIETY.

To be the thing we seem;
To do the thing we deem
Enjoin'd by duty;
To walk in faith, nor dream
Of questioning God's scheme
Of truth and beauty;

Casting self-love aside,
Discarding human pride,
Our hearts to measure;
In humble hope to bide
Each change in fortune's tide,
At God's good pleasure;

To trust, although deceived;
Tell truth, though not believed;
Falsehood disdaining;
Patient of ill received,
To pardon when aggrieved,
Passion restraining;

With love no wrong can chill,
To save, unwearied still,
The weak from falling:—

This is to do God's will
On earth,—and to fulfil
Our heavenly calling.

ONE ONLY CAN DISCERN WHAT ARE OUR REAL WEAKNESSES.

"Yet take thy dread burnt-offering to its altar,
Lay thy crushed heart on duty's holy shrine;
Faith shall uphold thy footsteps when they falter,
Hope cheer thee onward with her words divine.

"Christ in his majesty of patient sorrow
Takes the pale vesture of the martyr's King;
Thou from his eyes, so pure and deep, mayst borrow
Light and encouragement for every thing.

"And if thy heart be tortured nigh to breaking,
Take the wild burden to the Saviour's breast,
And the dumb agony of thought forsaking,
Lean on that deep eternity of rest.

"His gentle eyes are on thy soul forever,
He marks the anguish of the strife within;
*Reads the perplexities thou canst not sever,
Discerns between infirmity and sin."*

THE OPEN WINDOW.

The old house by the lindens
Stood silent in the shade,
And on the gravel pathway,
The light and shadow played.

I saw the nursery windows
Wide open to the air,
But the faces of the children
They were no longer there.

The large Newfoundland house dog
Was standing by the door,
He looked for his little playmates,
Who would return no more.

They walked not under the lindens,
They played not in the hall,
But shadow, and silence, and sadness,
Were hanging over all.

The birds sang in the branches
With sweet, familiar tone,
But the voices of the children
Will be heard in dreams alone.

And the boy, who walked beside me,
He could not understand,
Why closer in mine, ah! closer,
I pressed his soft, warm hand.

LONGFELLOW.

LUNAR INFLUENCES.

BY D. LÆRDNER.

(Continued from page 446.)

Supposed Lunar Influence on Mental Derangement and other Human Maladies.—The influence of the phenomena of human maladies imputed to the moon is very ancient. Hippocrates had so strong a faith in the influence of celestial objects upon animated beings, that he expressly recommends no physician to be trusted who is ignorant of astronomy. Galen, following Hippocrates, maintained the same opinion, especially of the influence of the moon. Hence in diseases the lunar periods were said to correspond with

the succession of the sufferings of the patients. The critical days or *crises* (as they were afterwards called), were the seventh, fourteenth, and twenty-first of the disease, corresponding to the intervals between the moon's principal phases. While the doctrine of the alchemists prevailed, the human body was considered as a microcosm; the heart representing the sun, the brain the moon. The planets had each its proper influence; Jupiter presided over the lungs, Mars over the liver, Saturn over the spleen, Venus over the kidneys and Mercury over the organs of generation. Of these grotesque notions there is now no relic, except the term *lunacy*, which still designates unsoundness of mind. But even this term may in some degree be said to be banished from the terminology of medicine, and it has taken refuge in that receptacle of all antiquated absurdities of phraseology—the law. Lunatic, we believe, is still the term for the subject who is incapable of managing his own affairs.

Although the ancient faith in the connection between the phases of the moon and the phenomena of insanity appears in a great degree to be abandoned, yet it is not altogether without its votaries; nor have we been able to ascertain that any series of observations conducted on scientific principles, has ever been made on the phenomena of insanity, with a view to disprove this connexion. We have even met with intelligent and well-educated physicians who still maintain that the paroxysms of insane patients are more violent when the moon is full than at other times.

Mathiolus Faber gives an instance of a maniac who, at the very moment of an eclipse of the moon, became furious, seized upon a sword, and fell upon every one around him. Ramazzini relates that, in the epidemic fever which spread over Italy in the year 1693, patients died in an unusual number on the 21st of January, at the moment of a lunar eclipse.

Without disputing this fact (to ascertain which, however, it would be necessary to have statistical returns of the daily deaths), it may be objected that the patients who thus died in such numbers at the moment of the eclipse, might have had their imaginations highly excited, and their fears wrought upon by the approach of that event, if popular opinion invested it with danger. That such an impression was not unlikely to prevail is evident from the facts which have been recorded.

At no very distant period from that time, in August, 1654, it is related that patients in considerable numbers were by order of the physicians shut up in chambers well closed, warmed, and perfumed, with a view to escape the injurious influence of the solar eclipse, which happened at that time; and such was the consternation of persons of all classes, that the numbers who flocked to confession were so great that the ecclesiastics found it impossible to administer that rite. An

amusing anecdote is related of a village curate near Paris, who, with a view to ease the mind of his flock, and to gain the necessary time to get through his business, seriously assured them that the eclipse was postponed for a fortnight.

Two of the most remarkable examples recorded of the supposed influence of the moon on the human body, are those of Vallisneri and Bacon. Vallisneri, declares that being at Padua recovering from a tedious illness, he suffered on the 12th of May, 1706, during the eclipse of the sun, unusual weakness and shivering. Lunar eclipses never happened without making Bacon faint; and he did not recover his senses till the moon recovered her light.

That these two striking examples should be admitted in proof of the existence of lunar influence, it would be necessary, says M. Arago, to establish the fact that feebleness and pusillanimity of character are never connected with high qualities of mind.

Menuret considered that cutaneous maladies had a manifested connexion with lunar phases. He says that he himself observed, in the year 1760, a patient afflicted with a scald head (*teigne*), who, during the decline of the moon, suffered from a gradual increase of the malady, which continued until the epoch of the new moon, when it had covered the face and breast, and produced insufferable itching. As the moon increased, these symptoms disappeared by degrees; the face became free from the eruption; but the same effects were reproduced after the full of the moon. The periods of the disease continued for three months.

Menuret also stated that he witnessed a similar correspondence between the lunar phases and the distemper of the itch; but the circumstances were the reverse of those in the former case; the malady obtaining its maximum at the full of the moon, and its minimum at the new moon.

Without disputing the accuracy of these statements, or throwing any suspicion on the good faith of the physician who has made them, we may observe that such facts prove nothing except the fortuitous coincidence. If the relation of cause and effect had existed between the lunar phases and the phenomena of these distempers, the same cause would have continued to produce the same effect in like circumstances; and we should not be left to depend for the proof of lunar influence on the statements of isolated cases, occurring under the observation of a physician who was himself a believer.

Maurice Hoffman relates a case which came under his own practice, of a young woman, the daughter of an epileptic patient. The abdomen of this girl became inflated every month as the moon increased, and regularly resumed its natural form with the decline of the moon.

Now if this statement of Hoffman were accompanied by all the necessary details, and if, also,

we were assured that this strange effect continued to be produced for any considerable length of time, the relation of cause and effect between the phases of the moon and the malady of the girl could not legitimately be denied; but receiving the statement in so vague a form, and not being assured that the effect continued to be produced beyond a few months, the legitimate conclusion at which we must arrive is, that this is another example of fortuitous coincidence, and may be classed with the fulfilment of dreams, prodigies, &c., &c.

As may naturally be expected, nervous diseases are those which have presented the most frequent indications of a relation with the lunar phases. The celebrated Mead was a strong believer, not only in the lunar influence, but in the influence of all the heavenly bodies on all the human. He cites the case of a child who always went into convulsions at the moment of full moon. Pyson, another believer, cites another case of a paralytic patient whose disease was brought on by the new moon. Menuret records the case of an epileptic patient whose fits returned with the full moon. The transactions of learned societies abound with examples of giddiness, malignant fever, somnambulism, &c., having in their paroxysms more or less corresponded with the lunar phases. Gall states, as a matter having fallen under his own observation, that patients suffering under weakness of intellect, had two periods in the month of peculiar excitement; and in a work published in London so recently as 1829, we are assured that these epochs are between the new and full moon.

Against all these instances of the supposed effect of lunar influence, we have little direct proof to offer. To establish a negative is not easy. Yet it were to be wished that in some of our great asylums for insane patients, a register should be preserved of the exact times of the access of all the remarkable paroxysms; a subsequent comparison of this with the age of the moon at the time of their occurrence would furnish the ground for legitimate and safe conclusions. We are not aware of any scientific physician who has expressly directed his attention to this question, except Dr. Olbers of Bremen, celebrated for his discovery of the planets Pallas and Vesta. He states that in the course of a long medical practice, he was never able to discover the slightest trace of any connexion between the phenomena of disease and the phases of the moon. In the spirit of true philosophy, M. Arago, nevertheless, recommends caution in deciding against this influence. The nervous system, says he, is in many instances an instrument infinitely more delicate than the most subtle apparatus of modern physics. Who does not know that the olfactory nerves inform us of the presence of odoriferous matter in air, the traces of which the most refined physical analysis would

fail to detect? The mechanism of the eye is highly affected by that lunar light which, even condensed with all the power of the largest burning lenses, fails to affect by its heat the most susceptible thermometers, or, by its chemical influence, the chloride of silver; yet a small portion of this light introduced through a pin-hole will be sufficient to produce an instantaneous contraction of the pupil; nevertheless the integuments of this membrane, so sensible to light, appear to be completely inert when otherwise affected. The pupil remains unmoved, whether we scrape it with the point of a needle, moisten it with liquid acids, or impart to its surface electric sparks. The retina itself, which sympathizes with the pupil, is insensible to the influence of the most active mechanical agents. Phenomena so mysterious should teach us with what reserve we should reason on analogies drawn from experiments made upon inanimate substances, to the far different and more difficult case of organized matter endowed with life.

In conclusion, then, it appears that of all the various influences popularly supposed to be exerted on the surface of the earth, few have any foundation in fact. The procession of the equinoxes, the accumulated effect of which rendered necessary the alteration of the calendar, which produced the distinction between the old and new style, is a consequence of the moon's attraction combined with that of the sun upon the protuberant matter around the equatorial parts of the earth; and the nutation of the earth's axis, and the consequent periodical charge of the obliquity of the ecliptic, is an effect due to the same cause. I have on another occasion shown that the tides of the ocean are real effects also arising from the combined attractions of the moon and sun, but chiefly of the former.

The procession of the equinoxes is a progressive annual change in the position of those points on the firmament where the centre of the sun crosses the equator on the 21st of March and the 21st of September. It has been ascertained by observation, and verified by theory, that these points move annually on the ecliptic with a slow motion in a contrary direction to the apparent motion of the sun; in consequence of which the sun, after each revolution of the ecliptic, meets these points *before* that revolution has been completed; consequently the sun's centre returns to the same equinoctial point before it makes one complete revolution of the heavens: hence has arisen the distinction between a sidereal year, which is the actual time the earth takes to make a complete revolution round the sun, and an equinoctial or civil year, which is the period between the successive returns of the centre of the sun to the same equinoctial point, and is the interval within which the periodical vicissitudes of the season are completed.

ITEMS OF NEWS.

FOREIGN NEWS BY THE ARABIA.—We have news by the *Arabia*, from Liverpool to the 10th inst. The Zurich Conference is suspended, and a general European Conference may be expected.

GREAT BRITAIN.—The great event of the week has been the departure of the Great Eastern for sea. The Nova Scotian, for Quebec, carried out the news that the vessel had proceeded down the Thames as far as Purfleet on the 7th, and anchored there for the tide of the following morning. Her departure from her moorings accompanied by four powerful steam tugs, two at the bows and two at the stern, gave rise to a scene of the greatest enthusiasm on the Thames, which was continued at all the prominent points. Capt. Harrison and the most experienced Thames pilot directed the ship's motion.

Scott Russell was on the bridge directing the action of the engines, both of which, screw and paddle, were under steam. Captain Comstock, of the Collins steamship Baltic, stood aft to transmit directions to the men at the wheel, the new steering apparatus not being completely fitted. The very first turn in the river demonstrated that the ship was as completely under command as a small river steamer, and that the only difficulties to contend with were the sharp curves in the stream.

She steers as easily as a wager boat, and her engines were found capable of starting her or arresting her motions, literally almost by a single motion of the hand. The only difficulty was experienced at Blackwall Point, where the river forms an acute angle, and in the centre of the channel at this point a bark and a schooner had unfortunately anchored. There was an anxious and perilous delay of fifteen minutes, but the danger was passed, and there was no other serious cause for uneasiness. There was not a single regular seaman on board during the river trip, the crew not having joined.

There were perfect ovations at Greenwich, Blackwall, Woolwich, and other points, where immense crowds had assembled. At Purfleet the ship swung round to her single anchor in beautiful style, and the anchor, "Trotman's patent," never yielded an inch from the spot where it dropped.

On the 8th, the Great Eastern got up steam and weighed anchor, and at 8.40 A. M. started from Purfleet for the Nore. As on the preceding day, she was accompanied by tugs, and the enthusiasm along the river, particularly at Gravesend, was very great. On arriving at Chapman's Head, at the top of Sea-Reach, the tugs were cast off and the great vessel was left to herself.

Increased speed was then got on her, simply to give her good steerage way, and move her engines readily, but with no view to test her powers. In ten minutes however, says the correspondent of the *Times*, she set at rest all doubts forever as to her being the fastest vessel, beyond comparison, in the world. Employing less than two thirds of her power, in her worst trim, being six inches down by the head, and too high out of water to permit her paddles or screw-blades to work properly, and with a strong tide against her, she ran a distance of fifteen statute miles in two minutes under an hour. The engines worked with astonishing ease, and there was scarcely a vibration perceptible. Before anchoring, the vessel was put about, and went completely round in less than three quarters of a mile. At 12.30 the vessel anchored at the Nore. She was to leave the Nore at 7 o'clock on the morning of the 9th, and steam away easily for Portland, Dorsetshire, which harbor she was expected to reach early on the morning of the 10th.

Much regret was felt that serious illness prevented I. K. Brunel from being on board to share in the triumph.

Great uncertainty still prevails as to the port whence the *Great Eastern* is to start and the day of her departure. One account says that she would leave Portland, in the South of England, on the 27th inst., for Portland, Maine. Another declares, equally positively, that she will take her departure from Holyhead, on the 29th. The voyage is expected to be made in eight days.

The *Great Eastern* is built of iron, her sides being only seven-eighths of an inch thick. Her length is 680 feet, her breadth 80 feet. I. K. Brunel is the engineer who designed the *Great Eastern*, and superintended her building and launch. His father Isambard Brunel projected the Thames Tunnel in 1823, commenced it in 1825 and completed it in 1843. He died at the age of 81 in 1849.

JAPAN.—The last China mail brings news from Japan to the 5th of 6th mo.

The intercourse of Europeans with the country was daily becoming more extensive, and is likely in a few years to effect a complete change in its aspect.

The Emperor, after the first experiments with the electric telegraph, ordered the construction of lines connecting together the towns of Yeddo, Nagasaki, Simoda, and Hakodadi. He also decided on transforming his fleet, and already possesses six steam war-junks. One of them, the *Nippon*, has started on a voyage of circumnavigation. Her engine is 350 horse power, and is of American manufacture. The crew consists entirely of Japanese sailors, who show great aptitude in the management of steam-engines.

A difficulty which arose between the American consul and the Japanese Government has been amicably settled. An American who had discovered a rich copper mine laid claim to the mine and to the soil, contrary to the laws of the country. The Government resisted, and the affair was assuming an unpleasant aspect, when the Emperor, to prevent all further dispute, proposed that a third Power should be selected as umpire, and designated first France and then Russia. The American consul had not sent in his answer when the author of the discovery, who was morally certain of the result, gave up his claims on the soil, and solicited authorization to work the mine and share the profit with the Japanese Government. The offer was at once accepted. Every one speaks highly of the Emperor's moderation in the case.—*The Press*.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market continues very dull and inactive—the demand being quite limited both for export and home consumption. A sale of 500 barrels new Western extra was made at \$5, and 1000 barrels fresh ground superfine at \$4 87½ per barrel. Small sales of the latter to the home trade at \$4 87½ a 5 12½; extra and fancy lots range from \$5 25 up to 6 50. Rye Flour continues to command \$4,500 barrels Pennsylvania Corn Meal sold at \$3 50 per bbl.

GRAIN.—Supplies of Wheat come forward slowly—sales of 2500 bushels good and prime Southern red at \$1 17 a 1 18, and white at \$1 25 a 1 35. Rye is wanted at the late advance, say 81 a 83c. Corn—Prices have fallen off three cents; sales of 600 bushels yellow at 86 cents; damaged white at 82c. Oats—1200 bushels new Delaware sold at 38 cents, and 1500 bushels old Pennsylvania at 39 cents in store.

CLOVERSEED is beginning to come in more freely and meets a firm demand at \$5 50 per 61 lbs. A lot of prime Timothy sold at \$2 62½ per bushel, and 200 bushels of Flaxseed at \$1 60.

GENESEE VALLEY SEMINARY will be re-opened for the reception of pupils of both sexes, on the 1st of 11th month next, and continue five months. The course of instruction will embrace all the branches of a liberal English education.

This school is situated at Scottsville station, on the Genesee Valley Railroad, ten miles south of Rochester, N. Y.

Terms \$50 per term of five months, one half payable in advance. For a circular containing further particulars address

STEPHEN COX, Proprietor,
10 mo. 1—4 t. North Rush, Monroe co., N. Y.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The Winter Session of this institution will commence on the 14th of 11th mo. next, and continue twenty weeks.

Terms \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address
HENRY W. RIDGWAY,
Crosswicks P. O., Burlington Co., N. J.
9th mo. 24—3 m.

FRIENDS' SCHOOL. The undesigned, Trustees of the "BACON SCHOOL," at Woodstown, Salem County, N. J., under the control of "Pilesgrove Monthly Meeting of Friends," are desirous of obtaining a competent MALE TEACHER as Principal of said School. A member of the Society preferred. Good reference required. Address or apply to either

JAMES WOOLMAN,
WILLIAM M. CAWLEY,
JOSEPH ENGLE,
ABRAHAM WOOLMAN,
JOSIAH DAVIS,

Woodstown, 9th mo., 12th, 1859.—3t. Trustees.

EATON ACADEMY, KENNETT SQUARE, Chester Co., Pennsylvania.

The Fourth Term of this Institution, under the charge of the present proprietor, will open for the reception of pupils of both sexes, on Second day, the 31st of 10th mo. next, and continue in session twenty weeks.

The course of instruction will embrace all the branches of a thorough English education, the higher Mathematics, Natural Sciences illustrated, the Latin, Greek, French and German Languages, and Drawing.

For terms and particulars, see Circulars, which will be forwarded to the address of every person requesting the same, upon application to

WILLIAM CHANDLER, Principal & Proprietor.
or to WILLIAM A. CHANDLER, Principal Instructor.

RUTHANNA JACKSON,
or to MAGGIE B. JACKSON,
CHARLES B. LAMBORN, } Assistants.

9mo. 10, '59, -2m

LONDON GROVE BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—It is intended to commence the next Session of this Institution on the 1st of 11th month, 1859. Terms \$60 for 20 weeks; no extras, except for the Latin and Greek Languages, which will be \$5 each. For Reference and further particulars inquire for Circular of

BENJ. SWAYNE, Principal,
London Grove P. O., Chester Co. Pa.

9 mo 3, 2 m.

GWYNEDD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The next session of this Institution will commence on the 14th of 11th month,

1859, and continue twenty weeks. Terms \$70, and no extras. For further information application can be made to

DANIEL FOULKE, Principal,
HUGH FOULKE, Jr., Teacher,
Spring House P. O.,
Montgomery co., Pa.

8 mo. 13—2 mo.

ELDRIDGES HILL BOARDING SCHOOL FOR YOUTH OF BOTH SEXES, will open its Winter Session 11 mo 1st.

Terms \$70 per session of 20 weeks. For particulars address the Principal for a circular.

ALLEN FLITCRAFT,
Eldridges Hill Salem County, N. J.

8 mo 27 3 m.

THE BANKSDALE BOARDING SCHOOL FOR GIRLS, will be reopened the 14th of 11th month, and be continued twenty weeks. The course of study will comprise the usual English branches and Drawing. Terms \$60.

For further information apply to ELIZA HEACOCK, Jenkintown, Montgomery Co. Penn.

8mo. 27 3m.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

GEO. A. NEWBOLD,
Purcelville, Loudon Co., Va.

8th mo. 6, 1859.—6m.

BYBERRY BOARDING SCHOOL, FOR GIRLS.

The ninth session of Byberry Boarding School, taught by Jane, Anne and Mary S. Hillborn, will commence on the first Second-day of Tenth month, 1859, and continue forty weeks without intermission, (including two terms of 20 weeks each.) The course of instruction embraces all the branches of a liberal English education.

Terms \$60 per session of 20 weeks, one half payable in advance. For circulars containing further particulars address

JANE HILLBORN,
Byberry P. O., Philada., Pa.

8th mo. 7—3m.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66.

75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Pencilling, and Pellis work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; reading, Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M. Principal.

Attleboro', Bucks Co., 5th mo., 28, 1859. 6m.

Merrilow & Thompson, Printers, Lodge st., N. side Penn'a Bank.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, TENTH MONTH 8, 1859.

No. 30.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

GROUND OF A HOLY LIFE.

BY HUGH TURFORD.

(Continued from page 451.)

The third thing to be considered is what the apostle calls *flesh* and *spirit*, and wherein we walk after them.

Evil thoughts and inclinations arise from that which Paul called *flesh*; good thoughts and good desires proceed from that which he called *spirit*. So then *flesh* is a root of evil, and *spirit* is a spring of good in ourselves. From the *flesh* proceed all such motions as lead into vice; from the *spirit* proceed such doubts as we find in ourselves of yielding thereunto; and all the rebukes that follow us, when we have suffered the evil to prevail over us. These rebukes of the *Spirit* are in love to us, even as our rebukes to our children are in love, that they may stand in awe and not offend again. If we yield to one evil motion, we shall be more exposed to another; and the oftener we yield, the more ground evil hath in us, and the more power it comes to have over us. All the refuge that any man hath to flee unto, when evil motions arise, is that in his own heart which Paul calls *Spirit*; for that will not consent to any evil deed. Whosoever keeps close to that, keeps close to God; and such abide with their guide, and "walk in the *Spirit*."

The converted heathens walked by this rule; they took the *spirit* of Christ in themselves for their guide; they confided therein, and became followers thereof, and that brought them to be "a holy nation, and a peculiar people." And we should be the same, did we turn to this gift of the eternal *Spirit* in our hearts, and order our conversation according to the leadings and guidance thereof; for by keeping to this we should not fulfil the deeds of the *flesh*.

The fourth thing to be considered is, what the apostle intended by the words *die* and *live*.

Certainly he did not by the word *die* intend a cessation of their mortal lives, for such a dying is common to all men; they that live after the *spirit*, as well as they who walk after the *flesh*, must go down to the grave. But the dying that the apostle intended, was a decay of our inward life, a dying unto righteousness; such a dying as the first man Adam died, when he fell from under the government of the *Spirit* of God; which was man's first state.

Now such as walk after the *flesh*, living in the practice of any known sin, depart farther from God, and come to have less life, less light, less grace, less fear of offending God, or injuring their neighbors; and this decrease is a dying unto righteousness. As they that live after the *flesh* have less life, less light, less grace, less fear; so such as walk after the *Spirit*, doing such things as are upright, honest, and of good report, from a principle in their own hearts, find an increase; they come to have more life, more light, more grace, more fear of offending God, or their neighbor; and this increase is a living unto righteousness. As the one goes farther from, so the other draws nearer to the kingdom of heaven.

Hence it appears that we have in ourselves, *spirit* as well as *flesh*; light as well as darkness; a conductor in the way of life and salvation, as well as a leader in the paths of destruction.

Paul knew what corrupted the sons and daughters of men, and from whence all the ungodliness that is in the world doth arise; and in order to cleanse, to purify, to make heathens become Christians, and sinners become saints, he prescribes no other means but this, "Walk in the *Spirit*." As we keep to this, we shall learn, as the converted heathens did, not only to deny ungodliness, but also to live godly in this present world. But if we rest, as the zealous Pharisees did, in outward performances, accounting ourselves righteous because we have, as we think, a right form of godliness, and make no use of the aforesaid means;—though we have as great zeal for our forms as ever Paul had for the Jew's religion, it will profit us no more than circumcision would have profited the Galatians.

We have had much preaching and teaching; the joys of heaven have been promised to them that did well, and the torments of hell threatened

to them that did ill. But have these promises and threatenings made us a holy nation, and a peculiar people, exceeding all others for justice, equity, truth, and faithfulness? Have all the exhortations we have had, enabled us to mortify the body of sin, which is the cause of ungodliness? Are we thereby translated, as the heathens were, out of the region of darkness into the kingdom of the dear Son of God; so as to have our conversation in heaven whilst our bodies are on earth? Can we say, old things are done away, all exalted thoughts, all covetous inclinations, all wrath and bitterness; and these new things come in their places, humility, meekness, temperance, self-denial, with unfeigned love to God and our neighbor? Can we say, there was a time in which sin had such dominion over us, that we did not refrain from fulfilling the lusts of the flesh, but now, we are so limited by the eternal Spirit that we must be temperate,—we must be sober and vigilant,—we must be just, upright and faithful in word and deed? If this be our state, we are as the primitive Christians were in their full attainments,—“dead unto sin, and alive unto righteousness;” and built upon the same Rock as they were.

But if we are not come to this, it would be our wisdom to turn to the Lord as they did, and build upon the same foundation that they built upon, viz: the light that enlighteneth every man that cometh into the world; that so we may become acquainted with the eternal Spirit, as they were, and have a guide and a leader in the paths of godliness, as they had. For it is by and through the assistance of the spirit of Christ in our own hearts, that our corruptions must be purged out, and our inside made clean. As our walking after the flesh made all wounds; so it must be our walking after the Spirit that must heal all wounds. As our living after the flesh was the growth of our unrighteousness; so, by walking after the Spirit, we mortify sin, and recover a life of righteousness.

Paul spoke from a good understanding when he told the Romans, “that which may be known of God is manifest within.” There he had his knowledge of the mysteries of godliness; whatever he preached, whatever he wrote, the spring was in himself. He knew no more of the operation of inward and spiritual grace than one of us, till he came to have his eyes inward, and to “walk in the Spirit;” so he recommended to the churches what he had experienced in himself.

Many can talk of redemption, justification, sanctification, and salvation by Christ; but he only is a Christian who is a witness of these things wrought in himself. Such may properly be called learned men, they know what it is to rise, what it is to die, and what it is to live;—what they are redeemed from, and by what means.

The fifth thing to be considered is, how the

sons and daughters of men may, through the Spirit, mortify the deeds of the body.

But first, we will consider what deeds of the body are to be mortified. As an evil spirit in man is the root of all evil deeds; so every deed that proceeds from that root is to be mortified; and nothing can manifest such deeds by giving us a true sight thereof, but the Spirit of the Lord, or light of righteousness in our hearts, as it comes to shine in brightness.

To know what deeds are to be mortified, in all our attempts and undertakings let us look to our ends therein. If we have nothing in view but justice, equity, honesty, and plain dealings, we may go on with safety; but if *self* be the moving cause,—if we have not an eye to our neighbor's interest as well as our own,—pretend what we will, such deeds proceed from an evil root, and are to be denied, and in denying them they come to be mortified. And what can manifest our ends, in every action? Not books, nor preachers, but the spirit of the Lord, which is an inward light.

We do not find that Paul directly charged the Galatians with any manner of loose living, but with their observing days and times; and what harm could there be in that? Though the Galatians might see none, yet Paul saw much, otherwise he would not have asked them who had bewitched them. They had begun in the Spirit; they had walked for a season after an inward guide, which is the only leader to such a life of righteousness as the Lord, in all ages, has required of the sons and daughters of men. This was not a form of godliness without life, but truth in their inward parts; for if we have truth in our hearts, equity will be performed by our hands. And to this, Paul knew they could never come by imitating an outward form of worship, or by observing days and times, (which in our age has become the nursery of vice,) and so he counted these things as deeds of the flesh, reasoning thus with them: “Are ye so foolish, having begun in the Spirit, are ye now made perfect by the flesh?” Which is all one as to say, are ye so void of understanding, that, having begun to walk in newness of life, you think to come to such perfection as to have your conversation in heaven whilst living on the earth, by going back to the performance of outward services? “This persuasion,” said he, “is not of Him that calleth you.” If it was not of God, it must be from the flesh; and many have been deceived by fleshly reasoning, persuading themselves that godliness consists in that which is called devotion, (but is not true devotion), more than in a well-ordered conversation. So they live in pride, covetousness, envy, and many other evil things, which are really deeds of the flesh, and never come so far as to be translated out of the kingdom of darkness and to live under the government of the spirit of God.

Man's fall was not from any outward religio-

or form of godliness, but from a life of righteousness; a state in which husband, wife, parents, children, masters, servants and all other relations, would have known their place and duty, and been found therein;—a state in which the creatures that God hath given for man's use would have been rightly used, and none of them, through excess, wasted or abused;—a state in which truth would have been found in our words, and equity in all our deeds;—a state in which the will of God would have been done in earth, as it is done in heaven, and the great God by us would have been glorified and not dishonored.

From this state, through the entrance and growth of sin, the sons and daughters of men are departed; to this state the primitive Christians, through the mortification of sin, returned. This was the life that the first Adam lost; this is the life that Christ, the second Adam, came to recover. As many as have the spirit of Christ, and become followers thereof, rise from their fall, return unto God, live under his government, and become witnesses of this life restored.

(To be continued.)

"I will be as the dew unto Israel."—Hosea, xiv. 5.—As the dew falls when all is still, when all is wrapt in silence, so it is in the silence of all flesh, with its noisy workings, and this sacred unction distils upon the soul, and causes it to grow as the lily, and cast forth his roots as Lebanon.

LETTER FROM JOHN LIVINGSTON TO A FRIEND
IN PHILADELPHIA.

My dear Friend:—Long as the time is, that has elapsed since the receipt of thy very acceptable epistle of 10th mo. last, the purpose of replying to it has never been abandoned. That epistle was received on the eve of our late Yearly Meeting. That meeting will long be remembered by us all, as a season of signal favor. On that occasion, evidence was furnished to every reflecting mind, and most minds appeared to be in a reflecting mood, that we are not forsaken by the Holy Head of the church. There was that felt during the several sittings, that had a tendency to repress the rising of any spirit in the assembly, that would prompt individuals or parties to endeavor to carry any points. No such feelings were manifested, for I believe none such were in the meeting. We acknowledge we have great cause of thankfulness for this, and every other evidence of divine goodness towards us. I have no doubt that many, and oh! how devoutly to be wished that all, were duly sensible of what we owe to the Universal Parent, "the author and giver of every good and perfect gift" to ourselves as subjects of the divine government, to our fellow members of the household of faith, and to the cause of truth and righteousness. It was a

circumstance well calculated to gratify the feeling mind, that such was the general solemnity that pervaded the body, on that occasion, that even the young men seemed to be under an impress of seriousness, that kept down every disposition to levity and thoughtlessness. Edward Stabler is removed from amongst us, and while we gratefully acknowledge the worth of his testimony and example, while he was lent to us, let us wisely read the lesson that this dispensation presents to our view, calmly submit to the high behests of the Judge of all the Earth, who will do right, and humbly kiss the rod that smites, and him that appoints it.

Your Yearly Meeting is again drawing near. I feel a living desire that that solemnity may be abundantly blessed to my friends of your Yearly Meeting, that you may be enabled in the strength of the Holy Leader to judge down all light and forward spirits, and that you may be "edified and built up in the most holy Faith." I have sometimes felt a little drawing towards Philadelphia at that time, but can say nothing positive at present. I very much desire to see thee, because I have many things to say unto thee which I have not now time to say, even if it were proper to put them on paper.

My health has been rather precarious this winter. I had a severe visitation of influenza, and ever since have felt rather delicate and apt to catch cold. The return of Spring may possibly have an invigorating effect. My friend, John Gillingham, the bearer of this, is worthy of every attention, which, if thou hast the opportunity, I know will be cheerfully extended. My time is out, for John did not tell me of his journey to Philadelphia, till two hours ago.

Tell thy dear D—— that I still remember her affectionately; and I desire that thou wilt render my friendly love and regard acceptable to her and the dear little lambs, to whom also my mind frequently recurs, without excluding myself.

I remain thy friend, J. L.

Baltimore, 3rd mo. 1, 1832.

EXTRACTS FROM A MEMOIR OF
ELIZABETH T. KING.

(Continued from page 453.)

To a sister:

BALTIMORE, 1 mo. 5th, 1853.

I can fully sympathize with thee in feeling, that mine enemies "are lively and they are strong," but I have lately had great comfort in another expression of the Psalmist, "Mine adversaries are all before Thee."

Not a temptation, not a besetment, not a weakness, but He sees, and He that is in us is greater than he that is in the world.

We appeal to Him in sincerity, that we do above all things desire to love and serve Him; let us have faith in His unutterable love and

compassion, that He will in His own time perfect that which concerneth us.

Let us commit ourselves to Him in perfect trust, that the sins which we unwillingly commit are regarded by Him with a pitying eye; that the fountain set open, is always ready for our cleansing, and that, being delivered from the bondage of corruption, we may rise to the glorious liberty of the children of God.

We are not to wait until, by painful effort, we have tried to make ourselves fit, but we are to come *now*, just as we are, just as the lepers, the sick, the blind, and helpless, came of old, and believe that His mercy is *now* extended, that His arm is now underneath for our support. I have sometimes such views of the matchless love and condescension of our heavenly Father, as are inexpressible.

I so long that those who hold themselves aloof from His calls, and seek pleasure only in the world, might come and see how good the Lord is, that my tears are often ready to fall in lamenting that they will persist in depriving themselves, not only of happiness in the world to come, but in this also.

To a sister :—

BALTIMORE, 2 mo., 13 th, 1853.

I went to see —— the other day; she is suffering keenly from her loss, but in submission. In the course of conversation, she said she had been made to feel very forcibly that to be any thing, we must be nothing.

We can not be too strongly convinced of this, yet the lesson of nothingness is very difficult to learn. Even with good motives, with a strong desire to promote the welfare of others, we may sadly err by working in our own strength. The authority must always be, "Have not I commanded thee?"

As we are willing and obedient, the field of labor will open before us more widely, though it may not be just that in which we would prefer to work.

To one of her sisters :—

BALTIMORE, 3mo., 1853.

I had a letter from —— a day or two since. It seemed to fall like dew on the mown grass. I felt so withered and dry, the remembrance of his meek and quiet spirit, which truly seems careful for nothing, was quite refreshing.

It was after an act of required obedience that I have felt thus stripped and poor, an evidence that the dealings of our wise and gracious Master are mysterious; while the clay is not to say to him that fashioneth it: "What makest Thou?"

No doubt if we are thoroughly purged, it must be by the spirit of judgment, and the spirit of burning, and so the work is accomplished, let Him use the means He seeth meet.

But we must remember, that the sun is always shining, however dark the clouds may be, and

the power of our God and the mercy of our Saviour are the same, even though in our weakness we can not see them clearly. His blessed will be done in us and by us!

Oh! that He may in His mercy qualify us all in some degree to labor for the advancement of His cause, that through whatever self-denial or suffering on our part, some poor wandering sheep may be brought into the fold of everlasting peace.

To a sister :—

BALTIMORE, 5 mo., 11th, 1853.

It is the *entire* giving up that is wanted, to bring us to the peace which would make up for everything else, and which, from holding back, we may, indeed we do, fail in acquiring. I had to express something of this in meeting to-day, desiring that we may know the "God of peace to sanctify us wholly."

My way is so wonderfully made in my great weakness, that it is marvellous to myself. "Did any ever trust in the Lord and were confounded?" Oh! my dear, I desire to speak in the deepest reverence and humility, but also with the deepest gratitude for the help I have experienced, for the extension of so much mercy to me so unworthy.

I have been reading one of the children's books, "Father Brighthopes." It is a very pretty one. One paragraph at the close, seemed to me to express a very enviable condition. "I am *going home*. Our Father has given me my work to do, and it is almost done. Oh, would I could tell you how joyfully I shall put off corruption for incorruption, and exchange mortality for immortality." I sometimes feel, when weary of the conflict and almost ready to faint by the way, what an unspeakable comfort it is to look forward to the time, when, through the merits of the Redeemer, we may be permitted to join the company of those who have come out of great tribulation. To enter that city whose inhabitants shall no more say, "I am sick;" where "there shall be no more death, neither sorrow nor crying, neither shall there be any more pain;" but "the Lamb that is in the midst of the throne shall feed them, and lead them unto living fountains of waters, and God Himself shall wipe away all tears from their eyes."

To return to her journal :

5th mo. 16th, 1853. This morning it seems forcibly impressed upon my mind, that we must keep ourselves in a state of readiness to hear and obey every call to service, which our Master may vouchsafe. So much time, so many opportunities for usefulness, are lost, because we are busy here and there, and neglecting the one charge which is of the most importance.

24th. A few words presented in meeting this morning, and remembering former experience, I thought it was safest to utter them. I found peace, great peace, afterwards; mainly I thought

because I was willing and strengthened to speak so as to be heard. But ah, how subtle and how powerful is the enemy! As John Barclay says,

"The approbation, the regard, the sympathy of such as love what is good, have required from me all the watchfulness, all the earnest desires for preservation, that I have been blessed with."

The unity and kindness of friends, with the sense of peace and relief, were used by him, in conjunction with the weakness of nature, and the strength of self-love, to endeavor to exalt me, and I have been so buffeted with these insinuations, that I have suffered greatly.

(To be continued.)

FOLLOW THE RIGHT.

"No matter who you are, what your lot, or where you live, you cannot afford to do that which is wrong. The only way to obtain happiness and pleasure for yourself is to *do the right thing*. You may not always hit the mark; but you should, nevertheless, always *aim for it*, and with every trial your skill will increase. Whether you are to be praised or blamed for it by others; whether it will seemingly make you richer or poorer, or whether no other person than yourself knows of your action, still, always and in all cases, *do the right thing*. Your first lessons in this rule will sometimes seem hard ones, but they will grow easier and easier, until finally doing the right thing will become a habit, and to do a wrong will seem an impossibility."

For Friends' Intelligencer.

It will be remembered that in the spring of 1857, a brief memoir appeared in Friends' Intelligencer concerning Martha Cleaver, a minister of Gwynedd Monthly Meeting, in Montgomery county, Pennsylvania. She kept memorandums of some of her exercises and observations for many years. These have been carefully copied by her husband, for the benefit of her near relatives and friends. I have the privilege of making some selections which may be acceptable to the readers of Friends' Intelligencer. I will first offer an abstract of her memorandum of the Yearly Meeting of women Friends in the year 1820. J. F.

At a Yearly Meeting of women Friends held 17th of 4th month, 1820.

Second day morning. The meeting opened by a communication from Mildred Rateliff, introducing it in the words of the Prophet, "Blow the trumpet in Zion, sanctify a feast, call a solemn assembly, gather the people," (Joel. ii. 15) &c., intimating that the sanctifying power of divine grace was alone able to gather the minds of the people into a solemn quiet. The representatives were called, who were generally in attendance. Epistles were read from the Yearly Meetings of London, New York, Rhode Island, Baltimore and Carolina, the contents of which

where salutary and edifying. That from New York, particularly, expressed a feeling sympathy with those who have to "sit at the King's gate," who dare not bow to the proud in heart, that in this humble situation discoveries will be made even to the saving of the people, and in time to their mounting on the King's horse. A committee was appointed to prepare essays of Epistles, and also to address, if way opened, the Yearly Meetings of Virginia and Ohio. The Representatives were desired to stop at the close of this sitting, to consider of suitable Friends to serve the meeting as clerk and assistant.

Afternoon. Catharine Morris, on behalf of the Representatives, reported the names of Hannah Lewis for clerk and Ruth Eli assistant, who were accordingly appointed. The Epistle from Virginia Yearly Meeting was now received and read, also the first and second queries were read and answered; divers weighty remarks were made thereon. Elizabeth Foulke (of Philadelphia) observed, in reference to the subject of detraction, that it was better to have our lips sealed in silence, and to appear as fools in company, than to have our tongues employed to the disadvantage one of another.

Third day 18th, morning. The remainder of the queries were read and answered; many pertinent and interesting observations were made. Elizabeth Kirk remarked on the subject of the education of youth, that we might bind them to conformity of appearance, but we could not instruct them in the way of the Lord, until we were acquainted with it ourselves; that there is a possibility of making a plain appearance, so as to intimate to our friends abroad that we live very near the principle, when in our private families the conduct of some evidently manifest them to be under the influence of selfishness and passion. Elizabeth Foulke remarked with respect to our living within the bounds of our circumstances, that we might feel our minds clothed with sympathy towards those who are distressed under indigent circumstances, and that citizens at the present time might be governed by the circumscribing power of truth, in furnishing their tables, &c. Hannah Evans suggested that it were better to appear in the greatest simplicity, than by extravagance and superfluity to involve ourselves in difficulties and anxieties which we may not overcome to the end of our lives. The meeting adjourned to four o'clock.

Third day afternoon. The first Annual Query with the answers to it from the Quarterly Meetings were read. It contained an account of the decease of many valuable Friends, Ministers and Elders, since last year. An Epistle from the Yearly Meeting of men Friends in London, addressed to our brethren of this Yearly Meeting, was read; also the general printed Epistle. The meeting adjourned to 10 o'clock, to-morrow morning.

Fourth day morning. A statement of the funds belonging to the Yearly Meeting in the hands of the Treasurer was read; also the minutes of last year, and the report of the committee who have charge of the Boarding School at West-town, at the conclusion of which the committee suggested the propriety of a new nomination; a large committee was accordingly appointed to propose to a future sitting the names of suitable Friends for that service.

Elizabeth Foulke laid before the meeting a concern that had impressed her mind to visit the men's meeting; it was united with, and Ann Cox and Mary Morton were appointed to bear her company. Mariah Imly addressed the meeting on the subject of living within the bounds of our circumstances, desiring that those who are blessed with the abundance of the good things of this life, might feel themselves bound nobly to set the example of moderation; she stated that there is no real enjoyment in any kind of superfluity; and that if we were more under the sanctifying power of the cross of Christ, it would lead many of us into greater simplicity. Mary Lukens concluded the meeting in solemn supplication.

Afternoon, (four o'clock.) Mildred Ratcliff observed that the privilege of attending this Yearly Meeting was not to be numbered among the least of our blessings; she desired that each individual might do their part towards promoting the solemnity of the occasion. Catharine Leeds referred to the great sufferings, imprisonments, trials and banishments of our predecessors, in treading the path before us, and that many of the testimonies for which they so deeply suffered, were too lightly esteemed, and trampled under foot by many of the present day.

We received a visit from Richard Mott, who appeared to be under a great weight of exercise. He introduced his concern in the words of the Apostle, "Let your moderation appear unto all men, for the Lord is at hand," entreating Friends so to live under the influence of the pure principle as evidently to evince to the children and domestics that the Lord is indeed at hand; that if ever there is a reformation in our Society, it must be begun here, and if there is not a reformation, trial will follow upon trial, and judgment upon judgment. That, indeed, it is a day of great events and agitation. In conclusion he very feelingly addressed those who, under a sense of these things, and of their own weakness and shortcoming, were almost ready to faint; to these he offered this cheering language, "Faith, still pursuing, is the Christian's motto." A general solemnity pervaded the meeting, and I doubt not that the language of many hearts was, "good is the Lord, and greatly to be praised," and that "great and marvellous are all his works." The foregoing testimonies engaged the time and attention of the meeting insomuch that no further

business was transacted. Rachel Rowland concluded the meeting in supplication. Adjourned to four o'clock, to-morrow afternoon.

Fifth day morning. Attended Green street meeting for worship; several Friends were engaged in the ministry, among whom was Caleb Mac-cumber, from Genesee; also a young man who very beautifully described the state of things among us. "That we were created for the two great ends of knowing our Creator, and for the salvation of our own souls, and in order to effect these ends, we are furnished with a sufficient portion of the unerring spirit of truth; but instead of attending to it, too many give the helm to their natural inclinations, and thereby are led into many inconsistencies. Stately houses are erected, costly furniture and sumptuous tables follow in the train of events, by which with, other occurrences, many bring disgrace on themselves, and give occasion to those who are not of us, and who are seeking an occasion against the truth, to say "the dog is returned to his own vomit again, and the sow that was washed to her wallowing in the mire," intimating that the principle which we profess to believe was not able to preserve us out of these snares.

Elizabeth Barton concluded the meeting in a solemn, deeply interesting supplication.

Fifth day afternoon. A memorial concerning our late deceased friend, Samuel Smith of Philadelphia, was read to the solemnizing of many minds, also a very interesting report of the committee on the Indian affairs. The committee appointed to bring forward names to have the care of the Boarding School, proposed for consideration a large number, who were united with, and they appointed to the service. Adjourned to ten o'clock, to-morrow morning.

21st of the month, and 6th of the week. Essays of Epistles to the Yearly Meetings of London, New York, Rhode Island, Baltimore, Virginia, Carolina and Ohio, were read, which, with some small alterations in some of them, were united with, and the clerk directed to forward them. Mary Walton and Elizabeth Barton had a few words of invitation to the young women. E. concluded with the following quotation:

"Religion is a heavenly plant where'er it takes its root,
But fairest in the youthful heart, and bears the
sweetest fruit."

Augustine.—I went out of the way like a wandering sheep, seeking that externally which was within me. I traversed the street and the ways of this great world, looking after thee, my God, and I found thee not, because I sought thee not aright, and therefore did not arrive at the spot where thou art to be found; I sought thee without, and thou art within me; I sought thee afar off, and thou art near at hand; I should have met with thee at once had I sought thee where thou art.

We have been kindly furnished by a friend in attendance with the following account of

INDIANA YEARLY MEETING.

For Friends' Intelligencer.

The Yearly Meeting of Indiana, which is constituted of three Quarters scattered through Ohio, Indiana and Illinois, convened on Second day, 9th mo. 26th, and is attended by about two or three hundred men and many more women friends. There were ten strangers with minutes from other Yearly Meetings.

On Third-day the State of Society claimed the consideration of the meeting, as represented by the answers. Much lukewarmness was apparent in the attendance of their religious meetings, particularly those held in the middle of the week; and the badge of discipleship, as called for in the second query, presented the deplorable evidence that there were great deficiencies existing.

These painful acknowledgements elicited some excellent remarks, wherein the cause was searched into, and the remedy of patient forbearance and Christian love extended, which would tend to gather and not scatter the flock.

The meeting closed on Fifth-day after a long sitting, having embodied the exercises of the meeting, which are directed to be printed, and sent down in the extracts to the subordinate meetings.

THE KINGDOM OF COREA.

Just below the mouth of the much talked of Amoor, lies a large peninsula, nominally dependent on China, but only nominally, of which very little is known to the civilized world. An entering wedge of civilization has, however, been driven into this country by the faith and perseverance of Mr. Mabault, a Catholic missionary, who, 22 years ago, landed on its shores from a Chinese junk, alone and unprotected. His boldness was rewarded with martyrdom, but not until others had joined him, and in 1847 there was established a church, counting 768 adult communicants and 469 catechumen. Through these missionaries something has been learned of the peninsula, which we find in a private letter of Baron Chassiron, communicated to the *Annales des Voyages*.

Corea is divided into eight provinces, each ruled, like the Chinese provinces, by a mandarin. The Government is absolutely despotic, but the King has a council of ministers. The crown is hereditary; the King never recognizes more than one legitimate son, and when there is no heir to the crown, it is made the duty of the ministry to find one and to announce him as the regular successor. The army consists of about 10,000 men; every man carries on his own trade, but none the business of fighting; it is a

rabble with no more organization than the Chinese army. There is never any use for this army. The soldiers are armed with match-locks, and in the capital, the missionaries say, there are some *immovable cannon*.

As in China, the mandarins have their train of shockboys, a heavy, miserable set, the outcasts of all the East, who support the shoulders of their master, while standing or walking, carry his tiger-skin, chains, and insignia of power, and do his body-work generally.

According to a royal census made some years ago the population of Corea is 7,342,361, but its imperfectness leads to the belief that it is eight or nine millions. As in Japan, everything bows before a noble, whether rich or poor. He is amenable to no law; the people dare not smoke in his presence; they must yield to him in the street, and if riding on horseback dismount as they pass his house. He may borrow or buy and never pay, because he is noble. The Corean is of medium size, active and frank, and though a great friend of quiet he is continually hard at work. He stands far ahead of the Chinaman in whatever he does. He wears cotton cloths in the Summer, which he lines with fur in the Winter, and though he is his own manufacturer, yet he buys considerable amounts of European manufactures, most of which come through Peking.

The slaves are completely in the power of their owners, who may kill them whenever they choose. The women are slaves, at least among the rich, who have as many as they can buy or keep. They are rarely permitted to visit their parents, or the graves of their dead, shut up in closed Sedan chairs, through which no friend or foreigner can penetrate, and severely watched. Among the common people they have more liberty, but the daughter is never considered as a member of the family, nor has she inheritance. She is married off or sold by her father, as he chooses, and after his death the same power descends to her eldest brother, or the next heir. Sons, on the contrary, are half deified; oftentimes they are not weaned until they are 8 or 10 years old.

Nearly 500 years ago cotton was introduced from China, and its culture with that of rice now constitutes the chief business of the country. Wheat and other cereals are known, but of little value. In the southern part of the peninsula, where the thermometer does not usually go beneath 10° below zero in the coldest of the winter, apples, pears, peaches, and even grapes, ripen, but they are insipid. Grape-wine is unknown; the inhabitants replace it by a kind of beer, used in others parts of the East. Tobacco grows remarkably well, and is very cheap. The commerce of Corea is carried on only with China and Japan, and at stated times and ports. Our domestic animals are found, but they are used differently: the ox is used in agriculture, and in

carrying loads, never for food; while the horse is never used in agriculture, but only to mount the nobility.

The interior is very rich in mines of gold, silver, iron, copper, and coal; but the Government has secured a complete monopoly of the gold and silver mines by placing them under guard of the Evil Spirits, so superstitious are the Coreans.

Every year at the time of the Chinese New-Year, the King sends an Embassy to Peking with presents; but as the peninsula is now practically independent of China, they can no longer be considered as tribute paid to a central Government; it is simply a kind of political demonstration of respect.

As to letters, Corea is to China what China is to Europe. The whole literary knowledge of the Coreans is limited to the learning of a few Chinese characters. The Corean language has an alphabetic writing which, even in its crude state, is far more complete than the 80,000 characters of the Chinese: but it is wholly in disuse, and every year the Government sends a second Embassy to Peking to fetch the calendar for the following year; the Embassy is gone about three months.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, TENTH MONTH 8, 1859.

DIED, 8 mo., 24, in the 91st year of her age, HANNAH OAKFORD, a minister in the Society of Friends, lately a member of Green Street Monthly Meeting, but formerly of Darby, Delaware County.

—, near Woodstown, Salem Co., N. J. on the 12th ult., CALEB ATKINSON, aged 26 years, a member of Pilesgrove Monthly Meeting. He was a promising young man, highly esteemed in society and his neighborhood.

—, in Wilmington, Del., 30th ult. JOSEPH C. GILPIN, in the 69th year of his age.

WHAT KNOWLEDGE IS OF MOST WORTH.

(Continued from page 455.)

For all the higher arts of construction, some acquaintance with mathematics is indispensable. The village carpenter, who, lacking rational instruction, lays out his work by empirical rules learnt in his apprenticeship, equally with the builder of a Britannia Bridge, makes hourly reference to the laws of quantitative relations. The surveyor on whose survey the land is purchased; the architect in designing a mansion to be built on it; the builder in preparing his estimates; his foreman in laying out the foundations; the masons in cutting the stones, and the various artisans who put up the fittings; are all guided by geometrical truths. Railway making is regulated from beginning to end by mathematics: alike in the preparation of plans and sections; in staking out the line; in the mensuration of

cuttings and embankments; in the designing, estimating, and building of bridges, culverts, viaducts, tunnels, stations. And similarly with the harbors, docks, piers, and various engineering and architectural works that fringe the coasts and overspread the face of the country; as well as the mines that run underneath it. Out of geometry too, as applied to astronomy, the art of navigation has grown; and so, by this science, has been made possible that enormous foreign commerce which supports a large part of our population, and supplies us with many necessaries and most of our luxuries. And now-a-days even the farmer, for the correct laying out of his drains, has recourse to the level—that is, to geometrical principles. When from those divisions of mathematics which deal with *space* and *number*, some small smattering of which is given in schools, we turn to that other division which deals with *force*, of which even a smattering is scarcely ever given, we meet with another large class of activities which this science presides over. On the application of rational mechanics depends the success of nearly all modern manufacture. The properties of the lever, the wheel and axle, &c., are involved in every machine—every machine is a solidified mechanical theorem; and to machinery in these times we owe nearly all production. Trace the history of the breakfast-roll. The soil out of which it came was drained with machine made tiles; the surface was turned over by a machine; the seed was put in by a machine; the wheat was reaped, thrashed and winnowed by machines; by machinery it was ground and bolted; and had the flour been sent to Gosport, it might have been made into biscuits by a machine. Look around the room in which you sit. If modern, probably the bricks in its walls were machine made; by machinery the flooring was sawn and planed, the mantel-shelf sawn and polished, the paper-hangings made and printed; the veneer on the table, the turned legs of the chairs, the carpet, the curtains, are all products of machinery. And your clothing plain, figured, or printed—is it not wholly woven, nay perhaps even sewed, by machinery? And the volume you are reading—are not its leaves fabricated by one machine and covered with these words by another? Add to which that for the means of distribution over both land and sea, we are similarly indebted. And then let it be remembered that according as the principles of mechanics are well or ill used to these ends, comes success or failure—individual and national. The engineer who misapplies his formulæ for the strength of materials, builds a bridge that breaks down. The manufacturer whose apparatus is badly devised cannot compete with another whose apparatus wastes less in friction and inertia. The ship-builder adhering to the old model is outsailed by one who builds on the mechanically-justified wave-line principle. And as

the ability of a nation to hold its own against other nations depends on the skilled activity of its units, we see that on such knowledge may turn the national fate. Judge then the worth of mathematics.

Pass next to physics. Joined with mathematics, it has given us the steam-engine, which does the work of millions of laborers. That section of physics which deals with the laws of heat, has taught us how to economise fuel in our various industries; how to increase the produce of our smelting furnaces by substituting the hot for the cold blast: how to ventilate our mines; how to prevent explosions by using the safety-lamp; and, through the thermometer, how to regulate innumerable processes. That division which has the phenomena of light for its subject gives eyes to the old and the myopic; aids through the microscope in detecting diseases and adulterations; and by improved lighthouses prevents shipwrecks. Researches in electricity and magnetism have saved incalculable life and property by the compass; have subserved sundry arts by the electrotype; and now, in the telegraph, have supplied us with the agency by which for the future all mercantile transactions will be regulated, political intercourse carried on, and perhaps national quarrels often avoided. While in the details of indoor life, from the improved kitchen-range up to the stereoscope on the drawing-room table, the applications of advanced physics underlie our comforts and gratifications.

Still more numerous are the bearings of chemistry on those activities by which men obtain the means of living. The bleacher, the dyer, the calico-printer, are severally occupied in processes that are well or ill done according as they do or do not conform to chemical laws. The economical reduction from their ores of copper, tin, zinc, lead, silver, iron, are in a great measure questions of chemistry. Sugar-refining, gas-making, soap-boiling, gunpowder manufacture, are operations all partly chemical; as are also those by which are produced glass and porcelain. Whether the distiller's wort stops at the alcoholic fermentation or passes into the acetous, is a chemical question on which hangs his profit or loss; and the brewer, if his business is sufficiently large, find it pay to keep a chemist on his premises. Glance through a work on technology, and it becomes at once apparent that there is now scarcely any process in the arts or manufactures over some part of which chemistry does not preside. And then, lastly, we come to the fact that in these times, agriculture, to be profitably carried on, must have like guidance. The analysis of manures and soils; their adaptations to each other; the use of gypsum or other substance for fixing ammonia: the utilization of coprolites; the production of artificial manures—all these are boons of chemistry which it behoves the farmer to acquaint himself with. Be it in the lucifer

match, or in disinfected sewage, or in photographs—in bread made without fermentation, or perfumes extracted from refuse, we may perceive that chemistry affects all our industries; and that by consequence, knowledge of it concerns every one who is directly or indirectly connected with our industries.

And then the science of life—biology: does not this, too, bear fundamentally upon these processes of indirect self-preservation? With what we ordinarily call manufactures, it has, indeed, little connexion; but with the all essential manufacture—that of food—it is inseparably connected. As agriculture must conform its methods to the phenomena of vegetable and animal life, it follows necessarily that the science of these phenomena is the rational basis of agriculture. Various biological truths have indeed been empirically established and acted upon by farmers, while yet there has been no conception of them as science: such as that particular manures are suited to particular plants; that crops of certain kinds unfit the soil for other crops; that horses cannot do good work on poor food; that such and such diseases of cattle and sheep are caused by such and such conditions. These, and the every-day knowledge which the agriculturist gains by experience respecting the right management of plants and animals, constitute his stock of biological facts; on the largeness of which greatly depends his success. And as these biological facts, scanty, indefinite, rudimentary, though they are, aid him so essentially; judge what must be the value to him of such facts when they become positive, definite, and exhaustive. Indeed, even now we may see the benefits that rational biology is conferring on him. The truth that the production of animal heat implies waste of substance, and that, therefore, preventing loss of heat prevents the need for extra food—a purely theoretical conclusion—now guides the fattening of cattle: it is found that by keeping cattle warm, fodder is saved. Similarly with respect to variety of food. The experiments of physiologists have shown that not only is change of diet beneficial, but that digestion is facilitated by a mixture of ingredients in each meal; both which truths are now influencing cattle-feeding. The discovery that a disorder known as "the staggers," of which many thousands of sheep have died annually, is caused by an entozoon which presses on the brain; and that if the creature is extracted through the softened place in the skull which marks its position, the sheep usually recovers; is another debt which agriculture owes to biology. When we observe the marked contrast between our farming and farming on the Continent, and remember that this contrast is mainly due to the far greater influence science has had upon farming here than there; and when we see how, daily, competition is making the adoption of scientific methods more general

and necessary; we shall rightly infer that very soon, agricultural success in England will be impossible without a competent knowledge of animal and vegetable physiology.

Yet one more science have we to note as bearing directly on industrial success—the Science of Society. Without knowing it men who daily look at the state of the money-market, glance over prices current, discuss the probable crops of corn, cotton, sugar, wool, silk, weigh the chances of war, and from all those data decide on their mercantile operations, are students of social science: empirical and blundering students it may be; but still, students who gain the prizes, or are plucked of their profits, according as they do or do not reach the right conclusion. Not only the manufacturer and the merchant must guide their transactions by calculations of supply and demand, based on numerous facts and tacitly recognising sundry general principles of social action; but even the retailer must do the like: his prosperity very greatly depending upon the correctness of his judgments respecting the future wholesale prices and the future rates of consumption. Manifestly, all who take part in the entangled commercial activities of a community are vitally interested in understanding the laws according to which those activities vary. Thus, to all such as are occupied in the production, exchange, or distribution of commodities, acquaintance with science in some of its departments, is of fundamental importance. Whoever is immediately or remotely implicated in any form of industry (and few are not) has a direct interest in understanding something of the mathematical, physical and chemical properties of things; perhaps, also, has a direct interest in biology; and certainly has in sociology. Whether he does or does not succeed well in that indirect self-preservation which we call getting a good livelihood, depends in a great degree on his knowledge of one or more of these sciences: not, it may be, a rational knowledge; but still a knowledge, though empirical. For what we call learning a business, really implies learning the science involved in it; though not perhaps under the name of science. And hence a grounding in science is of great importance, both because it prepares for all this, and because rational knowledge has an immense superiority over empirical knowledge. Moreover, not only is it that scientific culture is requisite for each, that he may understand the *how* and the *why* of the things and processes with which he is concerned as maker or distributor; but it is often of much moment that he should understand the *how* and the *why* of various other things and processes. In this age of joint-stock undertakings, nearly every man above the laborer is interested as capitalist in some other occupation than his own; and, as thus interested, his profit or loss often depends on his knowledge of the sciences bearing on this other occupation. Here is a mine,

in the sinking of which many shareholders ruined themselves from not knowing that a certain fossil belonged to the old red sandstone, below which no coal is found. Not many years ago, 20,000*l.* was lost in the prosecution of a scheme for collecting the alcohol that distills from bread in baking: all which would have been saved to the subscribers, had they known that less than a hundredth part by weight of the flour is changed in fermentation. Numerous attempts have been made to construct electro-magnetic engines, in the hope of superseding steam; but had those who supplied the money, understood the general law of the correlation and equivalence of forces, they might have had better balances at their bankers. Daily are men induced to aid in carrying out inventions which a mere tyro in science could show to be futile. Scarcely a locality but has its histories of fortunes thrown away over some impossible project.

And if already the loss from want of science is so frequent and so great, still greater and more frequent will it be to those who hereafter lack science. Just as fast as productive processes become more scientific, which competition will inevitably make them do; and just as fast as joint-stock undertakings spread, which they certainly will; so fast will scientific knowledge grow necessary to every one.

(To be continued.)

FRENCH SILK MANUFACTURERS.

The manufacture of silk is considered as an important branch of French industry, not only on account of the variety and beauty of the fabrics, but because the raw material is indigenous there. This kind of manufacture is not confined to any particular spot, but is carried on in different parts of the country, in all of which it diffuses prosperity. Nimes, Avignon, and Tours, have long been engaged in it. St. Chamond and St. Etienne owe a great part of their prosperity to the manufacture of ribbons, and the town of Ganges to bonneterie. Paris derives immense profits from her manufacture of silk stockings, and other fabrics, either of silk and a mixture of silk, or of wool and cotton. Silk is also the great staple manufacture of Lyons, in which it is carried on in all its branches with astonishing success; and in addition to fabrics of silk, all sorts of stuffs mixed with silk, and with cotton and wool, are manufactured. It was twenty years ago estimated that about sixty thousand or seventy thousand individuals, young and old, were supported by the silk manufacture in Lyons and the adjacent district, but the number has increased twenty five per cent since that time. The dyeing of silk, also, being an important branch of the manufacture, many experiments have been made to bring it to perfection—and, in particular, a dye of perfect black that would retain its color was a

desideratum. This dye was invented by a common dyer at Lyons, who received a pension, besides being made a member of the Legion of Honor. Prior to this, the black dye which was used changed in a few days to brown, and came off the stuff when it was hard pressed by the hand. Another improvement which was made consisted in producing a silk of a permanent white color. The eggs of the worm which produced this silk were brought from China, not, however, with the desired success. The worm was afterwards purchased from a merchant of Alois, and distributed in the northern department of the country; the produce of white silk is now very considerable, and of great importance in the manufacture of gauzes, crapes, tulles, and other similar styles of goods. From the progress which has already been made, ample evidence exists that the culture of silk may be profitably pursued in the United States to almost any extent, since the mulberry tree grows indigenously throughout the country, and it is believed that American silk is, of itself, decidedly superior to that of any other country on the globe.

Lowest do. do. do. do.	42 "	49 "
Rain during the month,	1.49 in.	7.68 in.
Deaths during the month, counting		
four current weeks for		
each year,	825	627
Deaths in New York during the		
third week in Ninth Month of		
each year,	518	480
Do. in Philadelphia during		
the same period only	184	107
The average of the mean temperatures		
of this month for the past 70 years		
is	65.93 deg.	
Highest do. during that entire period,		
1793, and 1804,	70 "	
Lowest do. do. do.	1840,	60 "

The temperature of the month just closed, it will be observed, varies but little, either from the same month of last year, or from the average for seventy years past.

But the rain tells a different story, the account for the nine months just closed, as compared with the two preceding months, being,—

1857.	1858.	1859.
38.57 in.	28.33 in.	47.65 in.

While from information kindly furnished from

the record at the Penn. Hospital, it appears that in but three instances for many years has the quantity in any corresponding month exceeded that of the month under review of the present year,—viz.:

1838,	9.51 inches.
1847,	8.07 "
1850,	7.73 "

Also, that the quantity that has fallen this year, thus far, exceeds the average for the whole year, for the past twenty years, by four inches.

And though the storm of the 16th and 17th, the present year affords a plentiful supply, being 4.26 inches,

And that of the 20th, 21st and 22d, being 2.98 inches,

They were exceeded in the following instances:—On the 12th Ninth Month, 1838, there fell in 24 hours, 6 inches. On the 1st of Seventh Month, 1842, there fell in 3 hours, 5.30 inches, and doubtless on other dates, not so remarkable.

A word or two in conclusion, as to the comparisons sometimes made between the deaths in this city and N. York—they are not selected as the *most striking* that could be found, as it is only occasionally the writer takes any note of those in our sister city; but his attention has been awakened anew to the subject of late, in consequence of one of her periodicals having recently mourned (?) over the declining health of Philadelphia, when there had been an *increase of two only* in that week over the preceding, when in either case the number was astonishingly small.

The only remaining comparative statements in our possession, for the month, of the years under review, being,—

Deaths in New York, first three weeks in	
Ninth Month, 1858,	1558
Deaths in Philadelphia during same	
period,	654
Deaths in New York during the last week	
in Ninth Month, 1859,	486
Deaths in Philadelphia during same	
period,	187

Let us not, however, indulge in a spirit of exultation over our neighbors, but let these comparisons rather beget thankfulness for the enjoyment of so great a blessing as the continued healthfulness our city manifests. J. M. E.

Philadelphia, Tenth Month 1st, 1859.

INVENTION OF THE MICROSCOPE.

It was in 1665, when John Milton's chief of men, who had wielded the power of England with a firm and vigorous hand, strongly contrasted with the royal but feeble fingers which, previously and subsequently, endeavored to direct it, had gone to his account, and just after the rupture of the close union which had endured almost without interruption for nearly seventy

years between England and Holland, that a Dutch youth of eighteen, holding a glass thread in the flame of a candle, perceived that the melted extremity assumed a spherical form. The intelligent lad instantly seized on the happy accident. He had seen Leuwenhoek manufacture lenses such as they were, went on burning his glass threads, and attempted to place his little spheres between two pieces of lead, through which he made an aperture with a pin's point. Placing a hair before this simply constructed instrument, he found, to his great joy, that he was the maker and possessor of a capital microscope for those times, and he secured to the micrographers of the day what they had so long sought.—*Fraser's Magazine.*

WHAT MIGHT BE DONE.

[BY CHARLES MACKAY.]

What might be done if men were wise—
 What glorious deeds, my suffering brother—
 Would they unite,
 In love and right,
 And cease their scorn of one another?

Oppression's heart might be imbued
 With kindling drops of loving kindness,
 All knowledge pour
 From shore to shore,
 Light on the eyes of mental blindness.

All slavery, warfare, lies, and wrongs,
 All vice and crime might die together;
 And milk and corn,
 To each man born,

Be free as warmth in summer weather.

The meanest wretch that ever trod,
 The deepest sunk in guilt and sorrow,
 Might stand erect,
 In self-respect,
 And share the teeming world to-morrow.

What might be done? This might be done,
 And more than this, my suffering brother—
 More than the tongue
 E'er said or sung,
 If men were wise and loved each other.

SONG OF A FAMILY.

[Translated from the German.]

O make our house Thy sanctuary!
 Come in to us a friendly guest,
 And in our circle ever tarry;
 Then shall we be for ever blest,
 And Thou, a house-mate, shall these walls
 Transfigure into royal halls.

Joy dwells, O Lord, where'er Thou stayest;
 There blooms a heavenly blessedness;
 In silk Thy poorest Thou arrayest,
 Though men see but a ragged dress.
 The purest high delight is there,
 And even in want is wealth to spare.

Thou every morning us awakest,
 And graciously to prayer dost call.
 The household cares Thou undertakest;
 Thou knowest what is best in all.
 And care, though 'twere a leaden load,
 Is but a feather's weight with God.

One tender bond all hearts embraces,
 A heavenly bond Thy hand hath wove;
 The rooms are turned to temple-spaces,
 Illumined with God's peace and love.
 Grace is the sunshine of our home,
 And there God's angels go and come.

THE EVENING WIND.

BY WM. C. BRYANT.

Spirit that breathest through my lattice! thou
 That cool'st the twilight of the sultry day!
 Gratefully flows thy freshness round my brow;
 Thou hast been out upon the deep at play,
 Riding all day the wild blue waves till now,
 Roughening their crest, and scattering high their
 spray,
 And swelling the white sail. I welcome thee
 To the scorched land, thou wanderer of the sea!

Nor I alone—a thousand bosoms round
 Inhale thee in the fulness of delight;
 And languid forms rise up, and pulses bound
 Livelier, at coming of the wind of night;
 And languishing to hear thy welcome sound,
 Lies the vast inland, stretched beyond the sight.
 Go forth into the gathering shade; go forth—
 God's blessing breathed upon the fainting earth!

Go, rock the little wood-bird in his nest;
 Curl the still waters, bright with stars; and rouse
 The wide, old wood from his majestic rest,
 Summoning from the innumerable boughs,
 The strange deep harmonies that haunt his breast.
 Pleasant shall be thy way where meekly bows
 The shutting flower, and darkling waters pass,
 And where the o'ershadowing branches sweep the
 grass.

Stoop o'er the place of graves, and softly sway
 The sighing herbage by the gleaming stone;
 That they who near the churchyard willows stray,
 And listen to the deepening gloom, alone,
 May think of gentle souls that passed away,
 Like thy pure breath, into the vast unknown,
 Sent forth from heaven among the sons of men,
 And gone into the boundless heaven again.

The faint old man shall lean his silver head
 To feel thee; thou shalt kiss the child asleep,
 And dry the moistened curls that overspread
 His temples, while his breathing grows more deep;
 And they who stand about the sick man's bed
 Shall joy to listen to thy distant sweep,
 And softly part his curtains to allow
 Thy visit, grateful to his burning brow.

Go—but the circle of eternal change,
 Which is the life of Nature, shall restore,
 With sounds and scents from all thy mighty range,
 Thee to thy birth-place of the deep once more.
 Sweet odors in the sea air, sweet and strange,
 Shall tell the home-sick mariner of the shore;
 And, listening to thy murmur, he shall deem
 He hears the rustling leaf and running stream.

THE BEST IS LEFT.

"I am fallen," cried Jeremy Taylor, "into
 the hands of publicans and sequestrators, and
 they have taken all from me. What now? Let
 me look about me! They have left me sun and
 moon, fire and water, a loving wife, and many
 friends to pity me, and some to relieve me; and I

can still discourse; and, unless I list, they have not taken away my merry countenance, and my cheerful spirits, and a good conscience; they have still left me the providence of God, and all the promises of the gospel, and my religion, and my hopes of heaven, and my charity to them too. And still I sleep, and digest, and eat, and drink; I read and meditate; I can walk in my neighbor's pleasant fields and see the varieties of natural beauties, and delight in all that in which God delights, that is, in virtue and wisdom, in the whole creation, and in God himself.

From Chambers' Journal.

NOTHING LOST.

When Lord Palmerston was Home Secretary, under Lord John Russell's premiership, he had to attend to sanitary reform, and to many other subjects far removed from the foreign diplomacy with which his name is more especially connected. While so engaged, he propounded an aphorism which is excellent both for its epigrammatic neatness and for its truth: 'Dirt is only matter in the wrong place!' If society would duly act upon this truth, we should save millions a year; if, instead of considering dirt and refuse, sweepings and cuttings, scourings and washings, to be valueless, we could only bring ourselves to believe that they are good things in wrong places, we should be better both in health and in pocket than we are now. Practical chemists have long known this; medical men not unfrequently impress the fact on their patients; patentees of new inventions often show an appreciation of it; and the world is getting wiser thereon every day. A few months after the close of the Great Exhibition of 1851, Dr. Lyon Playfair gave a lecture on some of the results of that wonderful display, taking for his principal topic the recent advances in industrial chemistry. The production of perfumes was not the least curious of these examples. The lecturer showed that beautiful perfumes are now produced from the most trivial, and often from the most fetid and repulsive substances. If this were all, it would be a triumph of chemistry, and a benefit to mankind; but, unfortunately, the crooked commercial morality with which we are all too much acquainted, stepped in, and encouraged a system of cheating and deception. It is scientific to obtain from decayed or unsightly refuse a perfume similar in odor to that obtained from a beautiful fruit or flower; but it is dishonest to call it by the name of that fruit or flower, and to charge a high price accordingly. "A peculiar fetid oil," said Dr. Playfair, "termed fusel oil, is formed in making brandy and whiskey; this fusel oil, distilled with sulphuric acid and acetate of potash, gives the 'oil of pears.' The 'oil of apples' is made from the same fusel oil, by distillation with sulphuric acid and bichromate of potash. The 'oil of

pine apples' is obtained from a product of the action of putrid cheese on sugar, or by making a soap with butter, and distilling it with alcohol and sulphuric acid; and is now largely employed in England in making 'pine apple ale.' 'Oil of grapes' and 'oil of cognac,' used to impart the flavor of French cognac to British brandy, are little else than fusel oil. The artificial 'oil of bitter almonds,' now so largely employed in perfuming soap and for flavoring confectionery, is prepared by the action of nitric acid on the fetid oils of gas-tar. Many a fair forehead is damped with 'Eau de Millefleurs,' without knowing that its essential ingredient is derived from the drainage of cow-houses."

But without dwelling further at present on the roguery involved in all such misnomers and masked substitutions, let us glance at some among the almost innumerable examples of honest utilization of substances which used formerly to be denominated waste, or were at most regarded as possessing scarcely any appreciable value. Dr. Lyon Playfair adverted to some of these examples: "The clippings of the travelling tinker are mixed with the parings of horses' hoofs from the smithy, or the cast-off woollen garments of the inhabitants of the sister isle, and soon afterwards, in the form of dyes of brightest blue, grace the dress of courtly dames. The main ingredient of the ink with which I now write was possibly once part of a broken hoop of an old beer barrel. The bones of dead animals yield the chief constituent of lucifer matches. The dregs of port wine—carefully rejected by the port wine drinker in decanting his favorite beverage—are taken by him in the morning, in the form of Seidlitz powders, to remove the effects of his debauch. The offal of the streets and the washings of coal-gas reappear carefully preserved in the lady's smelling-bottle, or are used by her to flavor 'blanc mange' for her friends." Very recently, this highly interesting subject has been traced throughout a much wider range by Mr. P. L. Simmonds, an experienced authority on all that relates to the materials for manufactures. In a paper read before the Society of Arts, he gave a wonderful variety of instances of the utilization of apparently unimportant substances. A bare enumeration of them would be beyond our limits; but it will be seen that—even leaving out all that concerns the devising of new forms of food for human beings, all that concerns the discovery of new fibrous substances for paper-making, and all the schemes for making town-sewage available as agricultural manure—the variety is very remarkable.

Beginning with animal substances, and with such parts of them as belong to the skin, hair, and wool, we find that the skin of the dog-fish is used to make an abrading substance analogous to sand-paper. Eel-skin is made by the Americans into ropes and whip-lashes. Sole-skin is used

to refine coffee and other liquids, in the manner of isinglass. Porpoise and walrus skins are tanned into shoe-leather. Alligator skin is tanned by the Texans into leather much resembling fine calf. Snake skin is dressed to imitate shagreen. Old boots and shoes are "vamped" up, in Monmouth street and in Petticoat lane, the fractures doctored with "clauber," made of ground cinders and paste, and a little further life of usefulness given to them. In Yorkshire, there are "waste dealers," who buy up all the odds and ends from the woollen factories, and sell it to "shoddy" mill owners at Leeds, Dewsbury, and Batley. These mill owners work up the refuse wool into shoddy or mungo, mix it with a little new wool, and spin and weave it into broadcloth, doeskins, pilot cloths, druggets, coarse carpetings, baize, and table covers. Woollen rags, however dirty, are bought up, torn to shreds, cleaned, made into an inferior shoddy, and wrought into the cheapest kinds of pilot cloths, beaverteens, Petershams, mohairs, Talmas, Raglans, paletots, and other superbly named woollen fabrics. It is said that Leeds alone reproduces from rags as much wool annually as would represent the fleeces of four hundred thousand sheep. These rags may be the relics of worn out clothing, tailors' cuttings, old worsted stockings, carpeting, &c.; and there are large quantities imported from abroad, in aid of our home supply. A small portion, when ground up, makes flock paper for paper hangers; and another portion, chiefly carpet waste, is used to stuff mattresses, and also as an ingredient in the manufacture of Prussian blue. All the delicate materials for ladies' dresses, known by the names of balzarines, Orleans, Coburgs, alpacas, &c., are now imitated by mixtures of wool and cotton, although they may originally have been really wool or worsted. These mixtures, when decayed by long wear to the state of rags, undergo a metempsychosis; chemicals are employed to destroy the cotton, and the residue is worked up with a little new wool into cloth. It is within the region of fair probability that some of the wool in a lady's balzarine dress this year, may form part of her husband's overcoat twelve months hence. Cow hair is used in making mortar, felt, ropes, carpets, and various substitutes for horse hair. And when the ingenuity of man can find no further manufacturing uses for the above varied animal substances, the farmer is always ready to buy them as manure; 2½ pounds of woollen rags are said to contain as much fertilizing power as 100 pounds of farm-yard manure.

Turning, next, to the skeleton and the inner portion of animals, the value derived from trifles is not less remarkable. Of bones, the best parts are worked up into handles for knives, &c.; into articles of turnery; and into numerous useful productions. Some portions are used to make bone-black or animal charcoal; others are boiled

to extract size for dyers and cloth-finishers; and all the rest are ground up into manure for farmers. The almost incredible sum of £800,000 is said to be paid annually in England for bones. Horns and hoofs are used for so many purposes that it would be scarcely possible to enumerate them; many valuable chemical substances are obtained from these sources. Whalebone cuttings and shavings are used for stuffing cushions, &c., for fire-grate ornaments, and for yielding Prussian blue. Dog fat is used to prepare kid gloves at Paris, and is also made to yield an oil used as a cheap—perhaps fraudulent—substitute for cod-liver oil. Wool-scourers' waste, in which tallow or fat of some kind is always an ingredient, is now made to give up the wherewithal for stearine candles. The blood of slaughtered animals is used in sugar refining, in making animal charcoal, in producing the once-famous Turkey-red dye, and in many other ways. The bile or gall of the ox is used as a detergent for wool or cloth; as a medicine; and by painters for cleaning ivory tablets used in miniatures, for fixing chalk and pencil drawings, and for mixing with certain colors. Fishes' scales are used for bracelets and ornaments, and fishes' eyes for undeveloped buds in artificial flower-making.—Butchers' and knackers' offal is cooked up in such modes as to be acceptable as food to cats and dogs. Bladders and intestines are prepared into the cases for sausages and such like articles of food; into water-tight coverings for jars and apothecaries' vessels; into strings for violins and guitars; and into the beautiful membrane named (somewhat equivocally) "goldbeaters' skin." The French buy our old written parchments, and return them to us in the form of delicate kid gloves. All the odds and ends of skin and parchment of every kind are "grist to the mill" of the glue manufacturer. Calf's feet are boiled down to yield neat's foot oil for leather dressing; and sheep's feet to yield trotter-oil, not unknown to our makers of hair oil. Fish garbage, whether at our fishing stations or at markets such as Billingsgate, is always saleable as manure. Last autumn, one particular shoal of herrings of Lowestoft was so enormously beyond the wants of herring-eaters, that the fishers sold the fish to the farmers at 4s. 6d. per ton. Many a fine field of hops in Kent has been rendered fertile by manure of sprats and old woollen rags. One more example of the utilization of animal substances we cannot resist the temptation to mention. There are certain small brown domestic annoyances which tidy housewives cannot endure to hear even named, and which have received the masquerading designation of "B flats." Now, Australia has the misfortune to be very prolific in these B flats; and an enterprising colonist has devised the means of obtaining a useful brown dye from them. Knowing as we do what kind of red dye is obtainable from the cochineal insect, we have

no difficulty in believing this statement concerning another small individual. The colonist will be a real "blessing to mothers," and to households in general, if he succeeds in using up this peculiar material.

To be concluded.

ITEMS OF NEWS.

THE GREAT EASTERN.—An accident has occurred on board the steamer Great Eastern, which will prevent her from starting on her trip to Portland for about three weeks. The feed pipe casing in one of her funnels exploded during the trial trip, with terrific force. Five of her firemen were injured so as to cause death, and there are others wounded. The damage to the fittings is serious, but the ship and machinery received no harm.

On the afternoon of the 9th inst., when the Great Eastern was off Hastings, a feed pipe casing in the forward funnel, which had been introduced on the ground of economy in heat, and to keep the heat of the funnels from the cabins, exploded with terrific force, scattering the funnel to pieces, and demolishing the grand saloon and lower deck cabins, through which the funnels passed, and otherwise doing great damage to the internal fittings. Great consternation prevailed on board, but prompt efforts were made to get at the unfortunate men in the engineers' department, who were either buried in the rubbish or prostrated by the steam.

The explosion is stated to have been probably one of the most violent which a vessel has ever survived, and which none in the world could have withstood, save a structure of such marvellous strength as the Great Eastern. She not only resisted it, her frame sustaining no injury whatever; but it made so little difference in the movements of the vessel, that the engines were never once stopped till she reached Portland. It is asserted that great objections had been made to the casing round the furnaces, but the director persisted in adopting the plan, notwithstanding it had been tried and abandoned in the Collins steamers.

Prior to the accident, the performance of the vessel was most satisfactory, and she was almost without motion, while large vessels in her vicinity were pitching and tossing in a stormy sea. A survey of the vessel had been held, and estimates sent in to forthwith repair the damage, at a cost of not more than \$25,000, the injury being far less considerable than was at first supposed.

It is officially announced that the Great Eastern will leave Portland, Weymouth, on her trial trip, on the 8th of this month, instead of the 17th ult., and finally sail from Holyhead to Portland, Maine, on the 20th. This delay of three weeks is the time in which Mr. Scott Russell contracts to repair the damage occasioned by the explosion, and to put the vessel in the same condition that she was in when she sailed from the Thames. This contract, however, does not include any repairs which the boilers may be found to require, and although they apparently sustained no damage, an investigation is said to have shown that the internal stays of the boiler most directly exposed to the force of the shock have either been displaced or greatly weakened, so that the boiler cannot be safely used in its present state.

The decease of J. R. Brunel, the eminent engineer, occurred at his residence in London, on the 15th ult., at the comparatively early age of fifty-four years. His last important work was the Great Eastern. On the 5th he was carried from the Great Eastern to his residence in a very dangerous and alarming condition, having been seized with paralysis, induced, it was believed by over mental anxiety.

TELEGRAPH.—The Red Sea and India Telegraph Company have announced the arrangements under which they will be prepared, on and after the 1st of October to transmit messages for the public between Alexandria and Aden. Messages for Australia and China will be forwarded by post from Aden. There is every probability that a direct communication with Alexandria will be established through Constantinople in the course of a few weeks. The news from India will then reach London in ten or eleven days. The cable for the Kurrachee section, in course of shipment at Burkenhead, will be laid by the end of the year.

IMMENSE PEACH ORCHARD.—The Cassidy Peach Orchard in Sassafras Neck, Md., says the Cecil Democrat, now the property of Anthony Reybold, of Delaware, comprises 650 acres, from which the proprietor has already realized over \$36,000 this season, and expects his sale to exceed, before the season is over, \$40,000. The orchard, with its busy hive of industrious "pickers," is a great curiosity, and worth a visit to those who are not familiar with the business.

INDIANS. HORACE GREELEY WRITES FROM CALIFORNIA.—It is supposed that ten years ago, there were 60,000 Indians in the State; to-day there are not 10,000. They have been driven from the homes inherited from their fathers through unknown generations; their lands have been taken without compensation; they have been deprived of the means of subsistence; they have been despoiled of all their property, and robbed of every hope for the future. They have the same humanity, the same wants, passions, and affections, with ourselves; many of them are or were good, kind men, as I have seen for myself; but they have red skins and savage modes of life; they stand in the way of the whites, who hate them and will not tolerate them.

COLORED EMIGRATION TO JAMAICA.—A movement is on foot, in the Western part of Canada, having for its object the emigration of colored persons to Jamaica. Nearly a week ago, about fifty had resolved to go. They are to be provided with free passages; and the Government of Jamaica guarantees them employment, or to provide for their subsistence till employment can be found. The advantages of this offer to those colored persons who desire to go to a climate less rigorous than this, and more suited to their constitutions, are clear and decided; and it can hardly be that many will not avail of them.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—There is some little inquiry for Flour for shipment, and superfine is steady at \$5 per barrel. Sales to the trade for from \$5 to 5 50 for common and extra brands, and \$6 62½ up to 6 75 for extra family and fancy lots. Rye Flour and Corn Meal continue scarce. The former is firm at \$4 12½, and the latter at 3 75 per bbl.

GRAIN.—The offering of Wheat have somewhat fallen off; sales of 1500 bushels good and prime red at \$1 19 a 1 20, and 600 bushels fair Southern white at \$1 30, afloat. Rye is wanted; sales of 1000 bushels Southern at 85c. Corn is in good demand; sales of 2500 bushels yellow at 88c., in store, and a small lot at 90c., afloat and from the cars. Oats are held firmly; sales of 3500 bushels new Delaware at 40 a 40½c. per bushel, and some old Pennsylvania at the former figure.

WANTED, a situation to teach in a family, or small school. Instruction can be given in French if desired. Address Rebecca I. Magill, New Hope Bucks Co., Pa.
10th mo. 8—2t.

GENESEE VALLEY SEMINARY will be re-opened for the reception of pupils of both sexes, on the 1st of 11th month next, and continue five months. The course of instruction will embrace all the branches of a liberal English education.

This school is situated at Scottsville station, on the Genesee Valley Railroad, ten miles south of Rochester, N. Y.

Terms \$50 per term of five months, one half payable in advance. For a circular containing further particulars address

STEPHEN COX, Proprietor,
10 mo. 1—4 t. North Rush, Monroe co., N. Y.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The Winter Session of this institution will commence on the 14th of 11th mo. next, and continue twenty weeks.

Terms \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address
HENRY W. RIDGWAY,
Crosswicks P. O., Burlington Co., N. J.
9th mo. 24—3 m.

FRIENDS' SCHOOL. The undesigned, Trustees of the "BACON SCHOOL," at Woodstown, Salem County, N. J., under the control of "Pilesgrove Monthly Meeting of Friends," are desirous of obtaining a competent MALE TEACHER as Principal of said School. A member of the Society preferred. Good reference required. Address or apply to either

JAMES WOOLMAN,
WILLIAM M. CAWLEY,
JOSEPH ENGLE,
ABRAHAM WOOLMAN,
JOSIAH DAVIS,

Woodstown, 9th mo., 12th, 1859.—3t. Trustees.

EATON ACADEMY, KENNETT SQUARE, Chester Co., Pennsylvania.

The Fourth Term of this Institution, under the charge of the present proprietor, will open for the reception of pupils of both sexes, on Second day, the 31st of 10th mo. next, and continue in session twenty weeks.

The course of instruction will embrace all the branches of a thorough English education, the higher Mathematics, Natural Sciences illustrated, the Latin, Greek, French and German Languages, and Drawing.

For terms and particulars, see Circulars, which will be forwarded to the address of every person requesting the same, upon application to

WILLIAM CHANDLER, Principal & Proprietor.
or to WILLIAM A. CHANDLER, Principal Instructor.

RUTHANNA JACKSON,
or to MAGGIE B. JACKSON,
CHARLES B. LAMBORN, } Assistants.

9mo. 10, '59, 2m

LONDON GROVE BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—It is intended to commence the next Session of this Institution on the 1st of 11th month, 1859. Terms \$60 for 20 weeks; no extras, except for the Latin and Greek Languages, which will be \$5 each. For Reference and further particulars inquire for Circular of

BENJ. SWAYNE, Principal,
London Grove P. O., Chester Co. Pa.

9mo 3, 2 m.

GWYNEDD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The next session of this Institution will commence on the 14th of 11th month,

1859, and continue twenty weeks. Terms \$70, and no extras. For further information application can be made to

DANIEL FOULKE, Principal,
HUGH FOULKE, Jr., Teacher,
Spring House P. O.,
Montgomery co., Pa.

8 mo. 13—2 mo.

ELDRIDGES HILL BOARDING SCHOOL FOR YOUTH OF BOTH SEXES, will open its Winter Session 11 mo 1st.

Terms \$70 per session of 20 weeks. For particulars address the Principal for a circular.

ALLEN FLITCRAFT.

Eldridges Hill Salem County, N. J.

8 mo 27 3 m.

THE BANKSDALE BOARDING SCHOOL FOR GIRLS, will be reopened the 14th of 11th month, and be continued twenty weeks. The course of study will comprise the usual English branches and Drawing. Terms \$60.

For further information apply to ELIZA HEACOCK, Jenkintown, Montgomery Co. Penn.

8mo. 27 3m.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

GEO. A. NEWBOLD,
Purcellville, Loudon Co., Va.

8th mo. 6, 1859.—6m.

BYBERRY BOARDING SCHOOL, FOR GIRLS. The ninth session of Byberry Boarding School, taught by Jane, Anne and Mary S. Hillborn, will commence on the first Second-day of Tenth month, 1859, and continue forty weeks without intermission, (including two terms of 20 weeks each.) The course of instruction embraces all the branches of a liberal English education.

Terms \$60 per session of 20 weeks, one half payable in advance. For circulars containing further particulars address

JANE HILLBORN,
Byberry P. O., Philada., Pa.

8th mo. 7—3m.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Pencilling and Pellis work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; reading, Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M.

Principal.

Attleboro', Bucks Co., 5th mo., 28, 1859. 6m.

Merrihew & Thompson, Printers, Lodge st., N. side Penn'a Bank.

No. 324 South Fifth Street,

PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

FOUNDATIONS OF A HOLY LIFE.

BY HUGH TURFORD.

(Continued from page 467.)

When I have looked into that book called *The Book of Divine Service*, I have found as good words therein as could be collected out of the Scriptures. It is there said, not one is to be admitted into the church without security, promising, in their behalf, as much as had been mentioned of a life of righteousness.

These promises, were they truly performed, would make us a holy nation, no way behind the chiefest of saints: for those holy men that rose highest, were no higher than to walk in God's commandments all the days of their lives.

But it is rare to find one man who performs that covenant, and the reason is this: we say the Scriptures are our rule, but we keep not thereunto. Paul's advice is not followed; we do not "walk in the spirit;" if we did this, the light of righteousness in our own hearts would show us the risings of evil notions and what they lead to; and then is the time to "forsake the devil and all his works," with all worldly vanities and sinful lusts. For if we deny evil motions, we shall never be found in evil actions; and until we depart from evil we cannot do the things that are good. Sin must be mortified before we can lead a religious life. The "work of the devil" must be denied, before the commands of our God can be walked in one day, much more all the days of our lives. This Paul experienced, which made him with great confidence say, "Walk in the Spirit, and ye shall not fulfil the lusts of the flesh." For if we deny and turn from every notion that the light of righteousness in our own hearts shows us to be evil, we shall

not fulfil them; but shall mortify the root from whence they arise; and thus that which is not fed, in time comes to die.

By this the converted heathens come to be a holy nation. This is the way to become citizens of the New Jerusalem. By this means the Colossians were (and we may be) "translated into the Kingdom of the dear Son of God," to live under his Government." This is the kingdom that John the Baptist proclaimed to be at hand. This is the kingdom that the disciples of Christ were to pray for the coming of. This is the kingdom that consisteth of righteousness, and standeth in power. This is the kingdom that all believers are first to seek: for under the government of the Spirit of Christ in our hearts, the sons and daughters of men are limited and kept from doing any unrighteous thing.

Many of the professors of Christianity seem to think that, though they are unrighteous in their lives, yet, being in the exercise of something called religion, it shall go well with them. But the Living God doth not regard what religion we are called by, but what leader we follow; for let our profession of religion be what it may, if we live after the flesh, we shall die: and though little appears that is commonly called religion, yet if we walk after the Spirit—if our conversation be in Heaven—if truth be in our mouths, and equity performed by our hands,—we shall live.

But some may say, who are capable of walking after the Spirit, and though the Spirit of mortifying the deeds of the body?

We may find many even amongst those who bear the name of Christians, that through a continuance of illdoing, are become dead in sin, having no sense or feeling of anything in themselves that is of God: and such as have no acquaintance with the Spirit, cannot walk after the Spirit. Others there are who are not dead, but dying; yet they have both sense and feeling: they have that in themselves which would lead them to better things than they practice, but they have little or no regard thereunto; they take it not for their guide. And while they slight that in themselves which manifests the deeds of the body, they can in no wise mortify them.

But some may be found who are weary of their sins and burdened with their iniquities, and have in themselves a hunger and thirst after righteousness. All such are living people, and capable

through the Spirit of mortifying the deeds of the body.

I am satisfied that many have been awakened from the sleep of sin, and have had in themselves a true hunger and thirst after righteousness; but such as have been thus awakened by an outward ministry, have too often from that source expected to have their hunger and thirst satisfied.—Many may be awakened with, but they are not quickened by, an outward ministry. "It is," Jesus said, "the Spirit that quickeneth." And what can raise life but that which giveth life? What can satisfy a soul that thirsteth after righteousness, but that which is in very truth the spring of righteousness? It is in ourselves the well is to be found, of which whosoever drinketh shall never thirst: there is the spring that floweth up unto everlasting life.

As the kingdom of Heaven stands not in words but in power, so it is not words, but the power of God, that can mortify the deeds of the body, change our natures, and make us new creatures.

If words would fill us with righteousness, justice, truth, equity and faithfulness, we should have been a holy nation long since; for there hath been no lack of words: but there is still a want of equity and faithfulness in men's deeds. If good words could reduce hearers to a righteous life, instead of saying "Walk in the Spirit," Paul would have said to the Galatians hearken to your minister. He would have had no cause to recommend unto them an inward guide. But Paul's experience had given evidence to him, that it was not by the hearing of words, but through his obedience to the law of the Spirit, that he came to mortify the deeds of the body, and to lead a righteous life: and what he found to be effectual in himself, that he recommends to the churches.

Words, though ever so numerous, may be forgot; they do not abide: but the Eternal Spirit abides, and that is the teacher that can never be removed into a corner. The use of words in the work of salvation, is to awaken such as are asleep in sin, and to turn them, as Paul turned the heathens, to an inward guide; and also for admonition, whilst they are on their journey, to keep with their guide.

Had such who hungered and thirsted after righteousness, pressed after that which they hungered for,—had they acquainted themselves with the Eternal Spirit that begot those desires, and followed the leadings thereof,—it would have rooted out all pride and all selfishness; it would have reduced them to an humble, lowly, meek, patient, peaceable frame of mind; it would have taught them to keep their promises, to be just in all their dealings, and to do the things that were right at all times. This would have removed the burden, and given them rest and peace.

If we could be as the primitive Christians were, we must begin where they did; we must turn to

the light of righteousness in our own hearts, and walk in that light, until we become children of the light; we must walk in the just man's path by the guidings thereof, till righteousness becomes our centre. This made the primitive Christians a religious people indeed, and by this they profited: otherwise those who had been blind, ignorant heathens, could not have come to be "fellow citizens with the saints and the household of God."

Paul was no settled minister at any one place, they heard him but seldom: but they heard the voice of the Eternal Spirit, and it reproved them as oft as they strayed from justice, equity and faithfulness. To this voice Christians ought to incline their ear; for under the new covenant, God doth speak unto His people by his Son, through the Eternal Spirit in their hearts.

The first step towards a life of righteousness, is to acquaint ourselves with that in our own hearts which reproves us for unrighteousness; because until we come to that, we are strangers to the foundation of a right conversation. All right buildings, all journeying, all rising, all approaching near to the kingdom of God,—depends on our denying, turning from, and utterly forsaking what the light of righteousness in our own hearts doth convict us of, and reprove us for. It is by such self-denial that the deeds of the body come to be mortified. As we make this our concern, and are faithful therein, our light shines more and more; and the more light we have, the greater discovery it makes of what is evil, what is to be denied, turned from, and forsaken. Guiding our steps by this, we build on the true foundation,—we walk in a living way,—we grow in grace and in the knowledge of Christ, and draw nearer and nearer to his kingdom and righteous government; and all power is given us to lead a righteous life.

This was the advice of Christ: "Strive to enter in at the straight gate." He testified that the way to eternal life was narrow. And what is this straight gate and narrow way? Not self-interest, not self-righteousness. Self-interest is the root of all covetous practices, fraudulent dealings, and unjust actions. Self-righteousness is the root of all formality and contention about religion, of which there hath been and still is too much, in what is called the Christian world;—persecuting one another, as the unconverted heathens did the primitive converts. But neither of these paths leads to that Kingdom which consists of righteousness and peace.

Had the converted heathens walked in these selfish paths, they would not have been a holy nation;—their conversations would have been in the earth, and not in Heaven. But the straight gate and narrow way that leads to a righteous life, is self-denial; or a denying of every thing (the smallest concern, as well as things that seem weighty) which proceeds from an evil root; which

nothing can manifest but an inward Divine light, shining in its brightness.

But with sorrow we may say, it is rare to find one amongst many, who lives in the practice of what he himself acknowledges to be right. Who is there but will confess, that to speak the truth on all occasions is a right thing? Who is there but will allow, that to keep every promise, though it be to our hurt, is an honest thing? Who is there but will grant, that to do unto all men as we would be done by, is a just thing? Yet at the same time, these live not in the practice thereof. If we do not live in the practice of what we know to be right, what doth our knowledge profit us? We may, as Israel in the wilderness did, keep moving; but unless we walk in the narrow way, we can never come to a righteous life.

Thus, if we do not wilfully shut our eyes, we may plainly see that the way to a righteous life is to "walk in the Spirit,"—to follow the leadings of an inward guide,—to deny and turn from what the light of righteousness in our own hearts manifests unto us to be unrighteous, unjust, or dishonest. And by turning from evil, we come to embrace the good;—by forsaking vice, we come to be filled with virtue;—by dying unto sin, we come to be made alive unto righteousness:—Truth, equity, and honesty, come to be uppermost, and we become centered therein; and to such, as Paul said, "there is no condemnation." They have the answer of a good conscience; they have peace with God, and peace in themselves; they have peace while they are here, and peace when they go hence.

ON HUMILITY.

What a mercy is humiliation to a soul that receives it with a steadfast faith! There are a thousand blessings in it for ourselves and for others; for our Lord bestows his grace upon the humble. Humility renders us charitable towards our neighbor; nothing will make us so tender and indulgent to the faults of others as a view of our own.

Two things produce humility when combined; the first is a sight of the abyss of wretchedness from which the all-powerful hand of God has snatched us, and over which he still holds us, as it were, suspended in the air, and the other is the presence of that God who is *All*.

Our faults, even those most difficult to bear, will all be of service to us, if we make use of them for our humiliation, without relaxing our efforts to correct them. It does no good to be discouraged; it is the result of a disappointed and despairing self-love. The true method of profiting by the humiliation of our faults, is to behold them in all their deformity, without losing our hope in God, and without having any confidence in ourselves.

We must bear with ourselves without either

flattery or discouragement, a mean seldom attained; for we either expect great things of ourselves and of our good intentions, or wholly despair. We must hope nothing from self, but wait for everything from God. Utter despair of ourselves, in consequence of a conviction of our helplessness, and unbounded confidence in God, are the true foundations of the spiritual edifice.

That is a false humility, which, acknowledging itself unworthy of the gifts of God, dares not confidently expect them; true humility consists in a deep view of our utter unworthiness, and in an absolute abandonment to God, without the slightest doubt that He will do the greatest things in us.

Those who are truly humble, will be surprised to hear anything exalted of themselves. They are mild and peaceful, of a contrite and humble heart, merciful and compassionate; they are quiet, cheerful, obedient, watchful, fervent in spirit and incapable of strife; they always take the lowest places, rejoice when they are despised, and consider every one superior to themselves; they are lenient to the faults of others in view of their own, and very far from preferring themselves before any one.—*Fenelon*.

Selected.

LAW AND LOVE.

What do we mean by Revelation? Knowledge imparted of things, not recognisable by the senses. By the word Revelation, we acknowledge that there is a veil over such things, and this veil is to be put back or taken away: that these lie not in utter obscurity, but are veiled. Now these veiled objects are truths of the spirit,—realities. What we see, touch, and hear, is a veil: the veil of appearance over the reality behind it, that we do not see, or at least discern but imperfectly. We would have this veil lifted: we would know what lies behind it: we demand revelation. Now what veils the spiritual world to us? Obviously appearances, impressions, the sensuous, the outward; and so the more we are absorbed in the transitory, the passing, by vanity, ambition, any love or mode of life that has the outward for its end and aim, so much thicker is the veil that hides from us the eternal; for these modes and forms of life is the very veil itself that conceals the sublime reality behind them. God, Truth, Reality, lie sun-like near us, but shine dimly upon us, because the veil of the outward interposes like a fog between us and them.

Now it follows necessarily from this, that those who are least thralls to the outward fact discern most clearly the inward truth. Their veil is thinned. To the dwellers in the spirit, the veil of the senses becomes transparent; they see truth, and tell what they see, and we receive what they tell and call it a revelation. Now

these truths must be equally near to us; only the veil is more or less thick over our moral vision. Must it not be so? Can God be nearer to one soul than another? The *consciousness* of his nearness varies greatly, but if he be infinitely near to each must he not be equally near to all? His omnipresence cannot admit of degrees: as he encloses everywhere he cannot be more in one place than another. We lie in his immensity, as the bird floats in the surrounding sunlight. He cannot be nearer to one than another, though we differ widely in our consciousness of this nearness. The veil of the outward comes between our consciousness and him, so that he is hid: we are in the bosom of the Father, yet He is not unveiled—revealed.

Now must not all revelation be one, and that the unveiling of the real, the spirit, the good—God? We cannot say, for instance, that one came by Moses, one by Jesus; for there can be but one subject of revelation—God or Truth: but various forms and degrees of it. To Moses, God was revealed as law,—to Jesus, as free favor: to the one under the idea of sovereign Justice,—to the other as condescending love; to the one was he Jehovah,—to the other, Father. But though the form thus varied, the great reality could not vary, and not in the revelation, but in the recipient, was the difference. Neither, if both were true, could Jesus abolish or supersede that of his predecessor: the revelation of the one is eternal as that of the other; Moses and Jesus both saw truth; but Jesus, from the greater width and depth of his spiritual experience, was let into a truth that absorbed and transcended that of Moses. Moses might not, perhaps, recognise the truth of Jesus, though Jesus would set his seal to that of Moses, for he who holds a higher truth can recognise its lower forms; but the possessor of the lower cannot discern the higher,—like two men ascending a mountain; one mid-way says,—I see streams and plains, and dwellings, and a gentle range of hills environing the whole; but the one on the summit exclaims, —I see all that you do; but instead of your range of hills bounding the whole, there is another and nobler range enclosing these. Different views depend on different positions. According to this spiritual position is a man's revelation: stands he higher, he overlooks the lower: the truth he once deemed ultimate is found to be only the foreground of another and wider.

Unto Moses the veil of the senses, of appearances, was lifted: he too looked through the "shows of things," and saw that, behind the outward, which makes the outward what it is. To his earnest and manly soul was revealed the truth, that a man is not free, but bound, that he cannot do as he would, but as he must; that he is not free to do wrong, but bound to right by a triple chain of pain and fear: he saw and felt

the presence of penalty: that God had attached pain to certain courses of action, and pleasure to other and quite opposite courses; and that this was *law*, from which man could not get away: that fire would burn and water drown, that sin would bring evil and remorse, and let man try hard as he might, he could not make it so that fire would not burn nor water drown, nor intemperance of the body destroy the soul; he stood awed before the majesty of *Law*. And how great was that revelation.

We talk of the revelation of Jesus, and many of us have not come up to that given by Moses. How few of us realized the constant action of an Eternal Law, which man's mightiest efforts cannot repeal: how we all seek at some or another time to elude this terrible Presence. Myriads think by some possibility to rid themselves of it,—to neglect duty and yet have the rewards of duty: men recognise law outside of them: know that the heavy will fall; that the light will float; that on the swallowed poison disease or death will ensue; and yet dream of evading the action of the *same* law, by which misery clings to vice, and happiness radiates from virtue. We are so enveloped and absorbed in shadows, that we at last believe that every thing is a shadow which can easily be dodged aside, and do not see the great rock of reality against which we beat in vain. We hope to be idle without being ignorant; to be selfish without being self-tormented; to be sensual without being robbed of spirit; and yet law is inviolable: the path of God is straight as a cannon ball's: it turns not aside for our regrets or wishes. What we sow we reap, says Paul: the action that we do, its weight we must bear: the fault of to-day brings forth its fruit in the failure of to-morrow. Can the guilty enter into the bliss of the innocent? can the drunkard have the clear eye and firm hand of the temperate? can the vain woman assume the serenity and dignity of her who possesses her own kingdom in peace? No, law is inviolable. Sublime and fearful is the hour to every one when in peculiar vividness it is revealed to the soul. We need not consult the experience of Moses to learn of its terrible grandeur: the smoking mount, the tempest of thunder and lightning, are but the outward picturings of a scene that is laid in the inward life of each: the accompaniments of a great drama, that goes on with more or less vividness within every individual. We have been present at the giving of the law. We cannot do as we will, but as we must. We sometimes wish that it was not so difficult to be good—not so hard to be learned. We wish that we could be self-indulgent and yet be good for all that, that we could idle off our time and yet be learned for all that: but the law that attaches virtue to discipline, learning to intellectual toil, we cannot abrogate: we shrink like weak children before its sovereignty:

it seems to issue from a great height above us : it utters its voice in thunders : we bow before the Mount Sinai in our souls.

The law came by Moses : serious, severe, majestic Moses. No wonder he seems to us grave, even to sternness. The recognition of law is always a serious and stern experience, revealed in its fulness it is terrific and unsparing, the most fearful of interviews with God. God sovereign, and man subject. All pass through it, more or less consciously, more or less fully. Many linger forever at the foot of the mount ; they perceive the thunderings and the lightnings, but *hear no voice* : they know not that there is a higher revelation than law, and that is Love. Is law and love then opposed ? No, for Truth cannot contradict itself : but love is highest law.

Jesus ascended the spiritual height, farther than Moses : the impassable mountain-ridge of law, that seemed ultimate to the latter, became in the experience of the former fused in the embracing atmosphere of love.

But to attain the position of Jesus, we must first have stood in the line with Moses. If God is to us law, we must be faithful to that revelation before we receive its completion in love. We must fulfill law to our utmost endeavor before the fulness of time comes for the higher revelation : that is, if we are lax and easy, and comfort ourselves, by saying, that God is not a sovereign but a Father, we must remember that to be faithless to the first revelation is no way to receive the second, and that unless we are faithful subjects we can never become free children : unless we obey God, as a law-giver, only as a law-preserver will He announce himself to us, and never as the Father. Jesus, as the most obedient servant, became the best beloved son : through faithfulness to law he transcended law, and lived in the bosom of free love.

This revelation of love is the highest we can attain unto : law is revealed in the sense of necessity, of obligation ; it is often sublime, always stern, and this sternness, this unloveliness, so appalling to the heart, is the sense of separateness it gives of man from God, of opposition between the two. God seems on one side and the soul on the other : there is a gulf between us and Him. We feel that it is harsh and unlovely, and this feeling is the instinct of the soul demanding a higher revelation : that this gulf be filled up : that the soul find itself at home in God, on the same side with him, one with him. The sense of obligation to being outside of us is always oppressive : it is the presence of a master, however lightly felt ; it is the abhorred weight of a chain, and the instinct of the soul is for freedom,—for freedom rather than life ; far down in the inward spirit of man lies the principle by which he will die sooner than be a slave, for the wildest range of the sea-breeze is not so free as the soul insists on being ; thence its earn-

est and oftentimes perplexing question how to reconcile law with liberty ? thence its problem how to be free in law ; and this question is answered and problem solved in the revelation of the truth, that God and man are not opposite to each other as sovereign and subject : but that the soul is one with God, in oneness of nature, the flowing forth from him, the son of the Father, so that truth and right is its native direction : in obeying God, it obeys itself : in fulfilling his law it fulfils its own, from the fact that there is no division between it and him, but oneness of life ; and this revelation of oneness is the revelation of love. Love is spontaneous, springs from unity : spirit recognises itself under all forms, and through love seeks reunion : the soul seeks truth, beauty, goodness, from the instinctive impulse that springs from unity of nature. Separation from them is pain and wrong, and sense of utmost need. In the fact that the soul is one in its nature with God, that it is the everlasting Son of the everlasting Father, is all division of will, all diverseness of interests, all arbitrariness on one side and obligatoriness on the other, done away : law vanishes in love ; this is the reconciliation in the Son. Then does the soul no longer hear a voice above it, compelling it, a power mightier than itself, that it must obey out of sheer weakness to resist, but feels itself the child, heir of all things, goes forth to take possession of its own inheritance of Truth and Goodness out of free will and spontaneous action. The secret of the soul's feeling of obligation to the true and right, is explained in this oneness of its being with that to which it aspires ; the cause of the sense of duty is laid bare in the revelation of love.

The revelation of the relation the infinite sustains to the finite, under any form, is grand and awful : the conception of the infinite in its *sovereignty* over the finite, the great incomprehensible reality, the being of all beings, may well call upon the imagination for its most fearful pictures : the earth is said to quake at his coming, the mountains to smoke : man, the finite, shrinks shudderingly before the presence of the Infinite : he says, " Let not God speak to us, lest we die ; " but to feel one's self at home in God, not outside, nor apart nor even below, but one in Him—this is the bridge that was wanting to unite the finite and infinite ; the former is not opposed to the latter ; but the finite is Son to the infinite, proceeding forth forever from its bosom. Grand as is this latter revelation, its grandeur is soft and beautiful, not terrible ; its sublimity is hidden from us by its effectationateness. Seeing God, as Father, the radiance of the infinite is softened : we become children, and worship without fear, and yet this is the sublimest thing of all, that the soul can say, Father to the infinite, incomprehensible, with such a joyous reverence, and only from the fact of its oneness, its sonship, could this be possible.

We are no longer servants, but children; loving truth, beauty, goodness, out of the freest impulse of our being, and repeating them in action from the same sweet necessity.

How appropriately is a revelation like this emblemed by the singing of angels and the rising of a star. These exquisite pictures represent facts in the inward life. The consciousness of God as Father always seems to come with a sound like the chorus of angels; and the felt reality of his indwelling presence is as the rising of a wonderful star, throwing the brightness of its rays directly across the path upon which we are to go.

EXTRACTS FROM A MEMOIR OF
ELIZABETH T. KING.

(Continued from page 467.)

The summer of this year was passed in New Bedford for the benefit of her health. From this place she thus writes to her husband:

NEW BEDFORD, 8 mo., 1853.

With regard to my spiritual condition, I think I may humbly and thankfully say, that there seems to have been a little growth, in this, that I see my faults more clearly, which conduces to humility, and charity also. Not but that I sometimes slide from this, but I trust that in general I have more love, though my soul has been so often pained with a liberty which seems not of the truth, that I am afraid I let in a judging spirit.

I had such an impression made on my mind the other evening, during the children's reading, by this text, that I think I will tell thee. "And he did not many mighty works there because of their unbelief." No doubt there would be much more done for us, if we would but follow the injunction "Be not afraid, *only believe.*"

May we be favored to go on "from faith to faith," from "strength to strength," until we obtain the stature of a perfect man in Christ Jesus. But oh, how deeply and painfully I feel, that there are so many, who for want of a single eye and a simple faith, are falling short of the requisitions, which would conduce to their own peace as well as usefulness.

* * * * *

NEW YORK, 9 mo. 14th, 1853.

It is quite late, my dear husband, and I have no very satisfactory materials for writing, but I wanted so much to make thee a sharer in the sweet feelings of gratitude I have had to-day for our preservation every way, that I could not refrain from a few words of communion with thee. I feel so satisfied with our situation, that it was best to go, and best now to return, and on looking back I can truly say that the assurance given the morning I left home, "Behold the Lord thy God is with thee whithersoever thou goest," has

been fully realized; I have had so much experience of His love, not only in His sensible presence, but also in the withdrawal of it—so that not only the fatness of the earth but the dew of heaven has been my portion—I say this in reverent thankfulness, and now I do earnestly crave that we may *follow on* to know the Lord yet more and more, and I believe the injunction to us is, in the midst of our weakness and infirmities, "Trust ye in the Lord forever, for in the Lord Jehovah is everlasting strength." So I trust we may be favored to go on in the strength of the Lord God—for he *can not* fail us if we keep close to Him. Truly this evening my cup runneth over—and I ask, "What shall we render unto the Lord for all His benefits?" Oh, my dearest, what an unspeakable favor to have this feeling of peace after this visit, instead of condemnation, for although I have nothing to speak of but infirmities, it is such a mercy to have been kept—to feel that even the sins I may have committed have gone beforehand to judgment, that they have not been willful, that they have not been persisted in, and humbly to trust that they are forgiven, washed away in the blood of the Lamb.

The accident on the Sound steamer last week, made us a little thoughtful, but on lying down greatly fatigued, and having gone through so much excitement that I feared I could not arrive at any quiet of body or mind, these words seemed given as my portion, "I will both lay me down in peace and sleep, for Thou, Lord, only, makest me dwell in safety." I cannot express to thee, my dearest husband, my feelings of gratitude for this most unexpected boon of sweet peace. I have gone on my way in such weakness and trembling, feeling my own nothingness so much, that now to be blessed in this manner, seems an unutterable favor. I hope I have not seemed to wish to display my treasures—they are not mine, but His who can, and who no doubt will, resume them, for we are not to be trusted long with such—but I want thee to unite with me in thanksgiving, and in earnest seeking to know and to do more entirely the will of Him, who has blessed us more abundantly than we can ask or think.

A letter to one of her sisters:—

BALTIMORE, 11 mo., 27th, 1853.

I had a view to-day of the nature of the prayer of faith, which was very instructive to me. It was shown me that we do injustice to the character of the Father of mercies, by the doubting manner in which we prefer our petitions—that He is far more ready to give us good gifts than we are to ask for them. He loved us before we loved Him, while we were yet in sin; how much more will He love us when we are earnestly desiring to forsake it, and turn unto him with full purpose of heart. Since we can truly say that

we desire neither outward comforts nor inward consolations, but only that we may perfect holiness in His fear, we are bound to believe we have the petitions we desire of Him, and to come to Him in faith, nothing doubting.

On the opening of the new year she thus writes to a friend who was laboring under discouragements:

BALTIMORE, 1 mo., 1st, 1854.

I did not have an opportunity, my dear friend, of fully telling thee all I would like this evening, and I think I will use this means, hoping that I shall not darken counsel by words without knowledge.

In reverent humility, and with a deep consciousness of entire unworthiness of the least of the Lord's mercies, I may acknowledge that this has been a day to me of peculiar enjoyment, a feast of fat things, an experience of joy in believing, with which I am not often privileged, not being worthy to be trusted with such treasures. Yet with all this there is a deep feeling of self-abasedness and a sense of the necessity of pressing forward, and of the baptisms which are needed for purification and refinement. But under this abounding feeling of the mercy and goodness of our heavenly Father, how dare I doubt that He who has, I humbly trust, begun a good work in us, is able to carry it on to His own praise? Dear friend, we must not limit the Holy One of Israel. He is able to keep that which we have committed unto Him—let us not therefore do injustice to His love or His power by our distrust. I have a very strong tendency to discouragement naturally, and for the most part can scarcely keep my head above the billows—but I have lately had such a view of the *efficacy* and the *necessity of faith*, that I have not dared to let go my hold—may I not hope that this was given in some measure for thy encouragement also? I can not express to thee the power with which it was sealed upon my own mind.

I know the state of things is very sorrowful among us—the suffering I endure at times is little short of agony on that account—but let us have “long patience;” surely, I often think, if I am borne with, there is no cause for discouragement on account of any. But, my dear friend, let us, in this also, cast our care upon the Lord, patiently bearing whatever portion of sufferings He sees meet to call us to fill up for His body's sake, which is the Church, but not giving way to unprofitable discouragements. Our own faithfulness is all with which we have to do, and it may be that He may condescend to bless that to the advantage of others, though I feel it an attainment almost beyond my reach, if I may be kept from doing them harm. I hope in what I have said I have not been presumptuous in arrogating anything to myself, for truly I abhor

myself, and have nothing to glory in but my many and abounding infirmities. But I have had such a view to-day of the preciousness and all sufficiency of the Saviour, that I have been glad to be nothing, and feel that both for myself and others I can “praise Him for all that is past, and trust Him for all that is to come.”

(To be continued.)

ON SLAVERY.

The writer having from early life viewed those of our fellow men, whom the laws of this country have doomed to bondage, as being subjected to all the injustice, and sufferings that tyranny is calculated to inflict—impressed with this view of the system a testimony against it has been deemed of no small importance, and this importance has not been diminished by years of reflection on the arguments put forth in behalf of slavery. It has, indeed, had its advocates, and still continues to have; political, commercial, and even religious—and these seem to have come forth in numbers, and with a solicitude proportionate to the growth of a testimony in the community against the system.

The cause of the slave being founded in justice is destined, no doubt, to advance, however impeded it may be.

When the politician enters the field and attempts to brace up the odious institution, although he may exhibit an eloquence and power of logic worthy a better cause, he can do nothing towards changing the principle of immutable justice, and can but lessen his character for moral honesty and Christian candor, with all well disposed persons.

The same ill success attends the religious professor, who, by his apologies for the system, does more to exhibit his own weakness and ignorance of Christianity, or want of conformity to its requisitions, than anything towards establishing the validity of man's claim of property in his fellow man. So likewise the man of traffic, who willingly patronizes and advocates slavery, does much more to cast himself down, than he can do in building up a system of iniquity, for which no valid plea can be made. He may injure and retard the cause of the slave, by becoming participant with the slave-holder, but, in so doing, does he not exhibit a greater regard for dollars and cents, than for sound morality, or the just and sacred rights of his fellow men?

It is not my design to pronounce these classes of men as destitute of any virtues or respectability—but to show the legitimate effects of the system, in thus prostrating its advocates,—so that it is evident, if causes cease not to produce their own effects, the time of the liberation of the slave must be approaching, notwithstanding his case may, at times, be enveloped in thick clouds of discouragement.

While many have been the opponents of abolition, few have been its advocates; and even the labors of these in so just and noble a cause, would, it is confidently believed, have been crowned ere this with entire success, had it not been that many among these few, although they have placed the system beneath highway robbery, have failed practically to withhold their participancy and partnership connection with it.—Doubtless this great error has done more to obstruct the successful operations of their own labors, than the combined efforts of their opponents could do.

Think for a moment how powerful and effective would have been the united testimony, if all who have been abolitionists in words, had also been so in deeds. Such a testimony must have reached the heart, conscience, and pocket, too. This would have been laying the axe at the very root—and it would have even extinguished the inducement for slave-holding. Is not, then, the continuance of slavery and its attendant evils, to be, in no small degree, ascribed to the inconsistency and unfaithfulness of the friends of abolition? It is never too late to learn—never too soon to mend, where we see we have missed it.

It has been asserted by wise and discerning men, and with much show of reason, "that to effect the entire abolition of the slave-trade, slavery must be abolished." Laws of trade having demonstrated the fact that supply follows demand.

Now how does it harmonize with these truths, for those who are zealously denouncing the injustice of slave-labor, to keep constantly a market open for its products? And again, upon what other principle can the purchase of such products be made, than that by which the slave is held in cruel bondage?

The injunction of the Prophet was, not merely to denounce evil, but to "cease to do evil."—This important step taken, how easily we might "learn to do well."

In ceasing from participancy in injustice,—the highway to the accomplishment of justice, is most surely entered upon. D. I.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, TENTH MONTH 15, 1859.

History of the Society of Friends by
S. M. JANNEY.

We are informed that unusual interest has been manifested in the publication of this work, and that the subscription lists are very encouraging. The first volume is now being stereotyped, and will probably be ready for delivery next month. Persons having subscription lists

are requested to complete and forward them at their earliest convenience.

As a year or two may probably elapse before the second volume will be ready, and, in the mean time, some of the subscription papers in the hands of the agents may be lost, the author requests—that complete lists of the subscribers may be forwarded to Hays & Zell, 439 Market St., Philadelphia.

A circular, acknowledging the receipt of subscription lists, will be sent this week to all the agents who have been heard from; those who do not receive it, may conclude that their lists have not come to hand.

DIED, On Third-day morning, 9th mo. 13th, at the residence of his son-in-law, A. G. Washburn, Morris, Otsego Co., N. Y., RUFUS CLARKE, late of the city of New York, aged 83 years and 6 months.

In noticing the death of this aged friend, we record the departure of one whose warfare was accomplished, and who had long been quietly waiting to be gathered to his rest. The innocence of his daily life, and the unvarying sweetness of his spirit, prove him to have been a faithful learner in the school of Christ. He was not educated in the principles of our Society, but, though born in New England, and nurtured in the most rigid doctrines of Calvinism, he became, in middle life, from sincere conviction, a convert to our pure and simple faith. Though never called *publicly* to advocate the cause of Truth, it may be said that, by the powerful language of example, he was a preacher of righteousness. Thoroughly imbued with the spirit of love, he beheld with lively sorrow the dissensions in our midst; but he took no active part in religious controversy, choosing to abide by the "still waters of Shiloh" until the storm was overpast. Of a quiet, sensitive and thoughtful nature, he shrank from the confusion of opinions, and the strife of tongues, yet was ever ready, when called upon to "give a reason for the hope that was in him with all meekness and fear," occasionally taking up the pen, in answer to direct inquiry, yet never using it in needless and unprofitable argument. Having a retentive memory, (seemingly unimpaired by age,) well-stored with the fruits of reading, observation and travel, he was a pleasant fireside companion, and particularly attracted the young by his innocent and childlike simplicity. A year or two before his decease, in addressing one of his children, he wrote thus: "Thy mother and myself may be compared to two aged trees; the storms of many winters have wrestled with their branches and stripped them of their foliage, but *the roots are still alive*, being watered by those "streams which make glad the city of God." He had an evidence that he had "passed from death unto life," for he declared that it was "impossible to offend" him, as he felt "a love for the whole creation of God." In this sweet and tranquil frame of mind he contemplated, without dismay, the final summons, which came suddenly at last. But we believe that he was one of those, who, having "oil in their lamps," are ready, whenever bidden, to enter in to the "marriage supper of the Lamb."

—, On the 30th ult., at his late residence, Wilmington, Del., JOHN RICHARDSON, in the 77th year of his age.

—, At Avondale, Chester Co., Penna., on the 6th inst., THOMAS ELLICOTT, in the 82d year of his age.

DIED, At her residence, in Little Britain, Lancaster County, Pennsylvania on the 2d inst., MARY LETITIA, wife of James Paxson, in the 34th year of her age.

This dear friend, a few years since, after a time of close trial of her religious faith, felt it her duty to attend the Meetings of the Society of Friends, and sometime after was admitted a member of Eastland Particular Meeting, which she continued to attend regularly, when health permitted, and was often heard to say she felt a great interest and satisfaction in so doing. She manifested a truly Christian disposition in all her movements, and entire resignation to the Divine will, expressing to her husband but a few days before her death, that she believed her time here was about to close, but that she saw nothing in her way, and that he must give her up. She appeared much concerned for the preservation of her dear children, all too young to appreciate their loss, but may we not hope that "He, who tempers the wind to the shorn lamb," will watch over, preserve and enable them "to follow her as she followed Christ.

"Blessed are the pure in heart for they shall see God."

NOTICE.

More than a month having elapsed since the time fixed for the return of my proposals for publishing "*A Retrospect of Early Quakerism, &c.*," persons who hold subscriptions for the work will please return them, as therein directed, at their earliest convenience.

And oblige

New Garden, 4th of 10th mo. 1859. E. MICHENER.

EXTRACT OF A LETTER FROM HALLIDAY JACKSON, WHILE A RESIDENT AMONG THE INDIANS.

Genesingukta, 1st mo. 23d, 1799.

Dear Father, In my last letter I mentioned that I was going on a journey to Cataraugus, an Indian village, about forty-nine miles from here, to help a young man along on horseback, who was disabled from walking, by an accident. To give a particular detail of that journey would swell this letter too much, I shall therefore only give thee a short sketch, as I had many difficulties to encounter before my return, although they were made more easy than I could possibly have looked for, as perhaps thee will believe. As we had but one creature fit to ride, I went on foot. We left home in the morning and went up the river about ten miles, to an Indian's house, with whom I am acquainted; and it coming on snow, we staid all night, as there was no house between that and Cataraugus. Next morning we set out and traveled that day through the snow nearly half leg deep. About four o'clock we concluded it was time to prepare for lodging; as my companion was lame, it kept me pretty busy to gather wood enough to do us the night-season, but, in short, about dark we had a rousing fire, made ourselves some chocolate, tied our horse to a sapling and fed him with oats, and having prepared our bed of hemlock boughs, set up one of my blankets in the form of a tent, crept under, where we rested very comfortably, the first night I ever lay out in my life. Being in a great valley between two mountains we

were sheltered from the wind, but the wolves made plenty of music, though not to prevent one from sleeping. Next morning we set forward early, and got into another path, which was broken and much easier travelling. About dark we reached Cataraugus, and having met an Indian, some distance from the village, who could talk some English, he kindly invited us to his house, and gave us such lodging as he had, which was some rough, dirty plank; yet the addition of our blankets made it feel like a paradise to me, as I was extremely fatigued with the journey. Next morning I took a walk through the village to procure some bread and meat, which I got at my own price. There are thirty or forty houses enclosed with a fence, in a pretty green pasture; they have a good many cattle, abundance of swine and fowls, and situated in the most fertile country I ever saw, the woodland abounding with large sugar maples and black walnuts of an enormous size. I felt rather weary to return homeward that day, and concluded to go with my companion down to Lake Erie, about six miles from the village, where he expected to get a passage by water to Buffalo, about thirty-six miles from that place. When we got there the lake was dreadfully rough, so that no boats could go on it, and exhibited a prospect somewhat gratifying to me, as I had never seen so large a sheet of water before. We returned to a black man's house, about a mile from the lake, who kept a kind of tavern, very injurious to the Indians in the neighboring villages. Here we consulted awhile, and although I was pretty well tired already, I concluded to go as far as Buffalo, as it was good travelling along the beach of Lake Erie. Accordingly we set forward about two o'clock, and that night lay on the beach very comfortably, where the dashing of the mighty waves prevented me from hearing any wolves. Next day, about noon, we reached Buffalo, where there is about a dozen houses, inhabited by white people, situated on high ground, commanding an extensive prospect of the lake, and opposite Fort Erie, on the British shore. About four miles above this place, on the creek, is the Indian village where the Farmer Brothers and the main body of the Seneca Nation live. I was now within about twenty miles of the great Falls of Niagara, to which place I had a strong inclination to go, but having no company, and the Niagara river to cross, I declined the notion, and next morning returned homewards, having about eighty miles to go, through a lonesome wilderness. This day as I rode along the beach of Lake Erie, I plainly saw the mist or fog rising from the great Falls of Niagara, at a distance of thirty or forty miles. I reached Cataraugus village in the evening, and going to the house where I had lodged before, I found it evacuated and the door barricaded up with bark. I then went

through the town, and could find but three or four houses open, in which there was nobody but children, who, when they saw me approaching, ran in, and shut the doors, and the dogs followed me about as though I was something come to devour them. At length I saw a squaw coming from the woods, with a load of wood on her back, and after making her sensible of what I wanted, she ran away to a small cabin, and beckoned to me to go there; accordingly I did, and found an old man (who could speak English) lying sick. I told him I was a Quaker, in order to succeed the better, and wanted lodging in some of their houses. He said his old woman was out, and he could not tell how it might be, for *he* lay there, his old woman at the *other* side, and a little girl at one end, and the house not above ten or twelve feet in length, in which I suppose there were thirty bushels of corn, and a fire in the middle—but he said he would try to make room for me. Accordingly, when the old woman came in, they concluded to let me have her birth, which was a warm and comfortable one. I got myself some chocolate for supper, and then asking the old man if he knew his age, he said he knew very well; and this very summer he was one hundred and twenty years old, that he had seen a great many days, and been in a great many wars, but no bullet had ever hurt him; and had been twice in Philadelphia when it was a little town; he said his wife was above eighty, and she and her daughter had raised six hundred and ninety strings of corn this summer, nine of which make a bushel. All of which, with a great deal more, he related with so much innocence and simplicity, that I had no reason to doubt the truth of it. I was well pleased with my lodging and the old man's company, as he was with mine, and in the morning I left them as soon as it was light, in hopes of reaching a house on the Alleghany river that day.

The day proved very wet, and I soon found I should have to lie in the woods that night. I travelled on till about three o'clock, when I came to where the path forked, and the nearest one home I was not acquainted with, but knowing the difficulty of the other I thought I could not get much worsted if I did get lost in coming the nigh road, and so pursuing it till about an hour up sun, I concluded it was time to look about for lodging; and getting on to the side of a hill a little sheltered from the wind, I gathered some of the dryest wood I could find, and having plenty of it, I thought to have a fire in a hurry, but every thing being so damp and wet, with all my efforts I could not bring it into a blaze, although I worked faithfully for more than an hour. At length, wearied with blowing, I finally gave it over, and resolved as the best expedient to seek shelter under some friendly log; nor had I much time to make choice of one, as dark was coming on; but having chosen the best

one I could find, which was elevated a little from the ground, I cut some hemlock boughs and spread under me, fixed one of my blankets over me, tied my horse to a sapling and fed him with corn, eat some victuals myself, and then crept into the den I had made, where I lay till morning, after being saluted by the wolves and wild beasts that set up a tremendous howling some distance from me, but yet I was preserved from fear in a wonderful manner, fell asleep and dreamed I was home in New Garden. As soon as morning appeared I crept out of my den, stript off my stockings and ran through the snow to warm my feet, eat a bite of victuals, and so left my temporary lodging rather better than I found it. I went on pretty well, till about nine o'clock, when I got off the path, and wandered through the woods, among some mountains, a considerable time, when I began to conclude I should have to lie in the woods another night, as I supposed it would take me till near sun set to reach home if I went on at the best rate. However, at length, by the help of a pocket compass and my judgment of the course, I was favored to get into the right path again, which I pursued with a single eye, the most difficult road I ever travelled, and reached my companions a little before dark, after being absent eight days and travelling one hundred and sixty or one hundred and seventy miles.

I believe I received no injury to my health from this journey, which I think a great favor.

I have not much to add at present as there is an Indian waiting for the letters, but may just say that my present source of happiness *continues to be a conviction* that I stand in my proper allotment, and an evidence of the Divine presence which I am often favored to feel in a conspicuous manner. I expect some of you will be looking for my return the ensuing summer, but I can say nothing to that yet. Henry Simmon has written to the Committee his prospect of return, and if some others should come forward perhaps I may be released also, but be that as it may I yet feel *no anxiety* about it, believing it good for me to be here.

I hope thee will be careful to write timely in the spring, that letters may come forward with the articles that come from the Committee.

Please give my love to sisters and all that enquire after me. So wishing all your preservation in the one unchangeable truth, and a close attention to the dictates thereof,

I conclude and remain thy

Affectionate son,

HALLIDAY JACKSON.

A tree that is every year transplanted will never bear fruit; and a mind that is always hurried from its proper station will scarce ever do good in any.

WHAT KNOWLEDGE IS MOST WORTH.

(Continued from page 474.)

That which our school-courses leave almost entirely out, we thus find to be that which most nearly concerns the business of a life. All our industries would cease, were it not for that information which men begin to acquire as they best may after their education is said to be finished. And were it not for this information, that has been from age to age accumulated and spread by unofficial means, these industries would never have existed. Had there been no teaching but such as is given in our public schools, England would now be what it was in feudal times. That increasing acquaintance with the laws of phenomena, which has through successive ages enabled us to subjugate Nature to our needs, and in these days gives the common laborer comforts which a few centuries ago kings could not purchase, is scarcely in any degree owed to the appointed means of instructing our youth. The vital knowledge—that by which we have grown as a nation to what we are, and which now underlies our whole existence—is a knowledge that has got itself taught in nooks and corners; while the ordained agencies for teaching have been mumbling little else but dead formulas.

We now come to the third great division of human activities—a division for which no preparation whatever is made. If by some strange chance not a vestige of us descended to the remote future, save a pile of our school-books, or some college examination papers, we may imagine how puzzled an antiquary of the period would be on finding in them no indication that the learners were ever likely to be parents. "This must have been the *curriculum* for their celibates," we may fancy him concluding, "I perceive here an elaborate preparation for many things: especially for reading the books of extinct nations and of co-existing nations (from which indeed it seems clear that these people had very little worth reading in their own tongue); but find no reference whatever to the bringing up of children. They could not have been so absurd as to omit all training for this gravest of responsibilities. Evidently, then, this was the school-course of one of their monastic orders."

Seriously, is it not an astonishing fact, that though on the treatment of offspring depend their lives or deaths, and their moral welfare or ruin; yet not one word of instruction on the treatment of offspring is ever given to those who will hereafter be parents? Is it not monstrous that the fate of a new generation should be left to the chances of unreasoning custom, impulse, fancy—joined with the suggestions of ignorant nurses and the prejudiced counsel of grandmothers? If a merchant commenced business without any knowledge of arithmetic and book-keeping, we should exclaim at his folly, and look for disastrous consequences. Or if, before studying ana-

tomy, a man set up as a surgical operator, we should wonder at his audacity and pity his patients. But that parents should begin the difficult task of rearing children without ever having given a thought to the principle—physical, moral, or intellectual—which ought to guide them, excites neither surprise at the actors nor pity for their victims.

To tens of thousands that are killed, add hundreds of thousands that survive with feeble constitutions, and millions that grow up with constitutions not so strong as they should be; and you will have some idea of the curse inflicted on their offspring by parents ignorant of the laws of life. Do but consider for a moment that the regimen to which children are subject is hourly telling upon them to their long-life injury or benefit; and that there are twenty ways of going wrong to one way of going right; and you will get some idea of the enormous mischief that is almost every where inflicted by the thoughtless, haphazard system in common use. Is it decided that a boy shall be clothed in some flimsy short dress, and be allowed to go playing about with limbs reddened by cold? The decision will tell on his whole future existence—either in illnesses, or in stunted growth, or in deficient energy; or in a maturity less vigorous than it ought to have been, and consequent hindrances to success and happiness. Are children doomed to a monotonous dietary, or a dietary that is deficient in nutritiveness? Their ultimate physical power, and their efficiency as men and women, will inevitably be more or less diminished by it. Are they forbidden vociferous play, or (being too ill clothed to bear exposure) are they kept in-doors in cold weather? They are certain to fall below that measure of health and strength to which they would else have attained. When sons and daughters grow up sickly and feeble, parents commonly regard the event as a misfortune—as a visitation of Providence. Thinking after the prevalent chaotic fashion, they assume that these evils come without causes; or that the causes are supernatural. Nothing of the kind. In some cases the causes are doubtless inherited: but in most cases, foolish regulations are the causes. Very generally, parents themselves are responsible for all this pain, this debility, this depression, this misery. They have undertaken to control the lives of their offspring from hour to hour; with cruel carelessness they have neglected to learn anything about these vital processes which they are unceasingly affecting by their commands and prohibitions; in utter ignorance of the simplest physiologic laws, they have been, year by year, undermining the constitutions of their children; and have so inflicted disease and premature death, not only on them but on their descendants.

Equally great are the ignorance and the consequent injury, when we turn from physical training to moral training. Consider the young mo-

ther and her nursery legislation. But a few years ago she was at school, where her memory was crammed with words, and names, and dates, and her reflective faculties scarcely in the slightest degree exercised—where not one idea was given her respecting the methods of dealing with the opening mind of childhood; and where her discipline did not in the least fit her for thinking out methods of her own. The intervening years have been passed in practising music, in fancy-work, in novel reading, and in party going: no thought having yet been given to the grave responsibilities of maternity; and scarcely any of that solid intellectual culture obtained, which would be some preparation for such responsibilities. And now see her with an unfolding human character committed to her charge—see her profoundly ignorant of the phenomena with which she has to deal, undertaking to do that which can be done but imperfectly, even with the aid of the profoundest knowledge. She knows nothing about the nature of the emotions, their order of evolution, their functions, or where use ends and abuse begins. She is under the impression that some of the feelings are wholly bad, which is not true of any one of them, and others are good, however far they may be carried, which is also not true of any one of them. And then, ignorant as she is of that with which she has to deal, she is equally ignorant of the effects that will be produced on it by this or that treatment. What can be more inevitable than the disastrous results we see hourly arising? Lacking knowledge of mental phenomena, with their causes and consequences, her interference is frequently more mischievous than absolute passivity would have been. This and that kind of action, which are quite normal and beneficial, she perpetually thwarts; and so diminishes the child's happiness and profit, injures its temper and her own, and produces estrangement. Deeds which she thinks it desirable to encourage, she gets performed by threats and bribes, or by exciting a desire for applause: considering little what the inward motive may be, so long as the outward conduct conforms; and thus cultivating hypocrisy, and fear, and selfishness, in place of good feeling. While insisting on truthfulness, she constantly sets an example of untruth, by threatening penalties which she does not inflict. While inculcating self-control, she hourly visits on her little ones angry scoldings for acts that do not call for them. She has not the remotest idea that in the nursery, as in the world, that alone is the truly salutary discipline which visits on all conduct, good and bad, the natural consequences—the consequences, pleasurable or painful, which, in the nature of things, such conduct tends to bring. Being thus without theoretic guidance, and quite incapable of guiding herself, by tracing the mental processes going on in her children, her rule is impulsive, inconsistent, mischievous, often in the

highest degree; and would, indeed, be generally ruinous, were it not that the overwhelming tendency of the growing mind to assume the moral type of the race, usually subordinates all minor influences.

And then the culture of the intellect—is not this, too, mismanaged in a similar manner?—Grant that the phenomena of intelligence conform to laws; grant that the evolution of intelligence in a child also conforms to laws; and it follows, inevitably, that education can be rightly guided only by a knowledge of these laws. To suppose that you can properly regulate this process of forming and accumulating ideas, without understanding the nature of the process, is absurd. How widely, then, must teaching as it is, differ from teaching as it should be; when hardly any parents, and but few teachers, know anything about psychology. As might be expected, the system is grievously at fault, alike in matter and in manner. While the right class of facts is withheld, the wrong class is forcibly administered in the wrong way, and in their wrong order. With that common limited idea of education which confines it to knowledge gained from books, parents thrust primers into the hands of their little ones years too soon, to their great injury. Not recognizing the truth that the function of books is supplementary—that they form an indirect means to knowledge, when direct means fail—a means of seeing through other men what you cannot see for yourself; they are eager to give second-hand facts in place of first-hand facts. Not perceiving the enormous value of that spontaneous education which goes on in early years—not perceiving that a child's restless observation, instead of being ignored or checked, should be diligently administered to, and made as accurate and complete as possible; they insist on occupying its eyes and thoughts with things that are, for the time being, incomprehensible and repugnant. Possessed by a superstition which worships the symbols of knowledge instead of the knowledge itself, they do not see that only when his acquaintance with the objects and processes of the household, the streets, and the fields, is becoming tolerably exhaustive—only then should a child be introduced to the new sources of information which books supply: and this, not only because immediate cognition is of far greater value than mediate cognition, but also because the words contained in books can be rightly interpreted into ideas, only in proportion to the antecedent experience of things. Observe next, that this formal instruction, far too soon commenced, is carried on with but little reference to the laws of mental development. Intellectual progress is of necessity from the concrete to the abstract. But regardless of this, highly abstract subjects, such as grammar, which should come quite late, are begun quite early. Political geography, dead and uninteresting to a child, and

which should be an appendage of sociological studies, is commenced betimes; while physical geography, comprehensible and comparatively attractive to a child, is in a great part passed over. Nearly every subject dealt with is arranged in abnormal order: definitions and rules, and principles being put first, instead of being disclosed, as they are in the order of nature, through the study of cases. And then, pervading the whole, is the vicious system of rote learning—a system of sacrificing the spirit to the letter. See the results. What with perceptions unnaturally dulled by early thwarting, and a coerced attention to books—what with the mental confusion produced by teaching subjects before they can be understood, and in each of them giving generalizations before the facts of which these are generalizations—what with making the pupil the mere passive recipient of others' ideas, and not in the least leading him to be an active inquirer or self-instructor—and what with taxing the faculties to excess; there are very few minds that become as efficient as they might be. Examinations being once passed, books are laid aside; the greater part of what has been acquired, being unorganized, soon drops out of recollection; what remains is mostly inert—the art of applying knowledge not having been cultivated; and there is but little power either of accurate observation or independent thinking. To all which add, that while much of the information gained is of relatively small value, an immense mass of information of transcendent value is entirely passed over.

(To be continued.)

From the National Era.

THE GLACIERS OF GRINDENWALD.

"These glaciers, or rather ice-waves, extend over more than a hundred square miles, and in places rise in architecture of the greatest natural beauty."—*Recollections of the land of Tell.*

Waves, Waves, without motion! no rushing, no roar,
As this storm-lifted sea heaves its breakers ashore;
No anthem of ocean, far-sounding and deep,
Comes solemn and slow from this billow asleep.

No calming is here when the north wind hath died,
No ebbing or flow of this adamant tide;
But grandly and high stands the ice sculptured flood;
Like the white gleaming walls round the city of God.

As if the Almighty, whose pillarless throne
The wing of infinity spanneth alone,
Had poured from his hand, which no fountain can fill,
The cloud stores of heaven—then spoken, "*Be still.*"

As if the "pale horse" with his rider had stood,
From the circuit of earth by the brink of the flood,
To quench his fierce thirst, and the waves 'neath his
breath,
Affrighted had shrunk to this 'semblance of death.

A tomb of the waters, where sepulchred rest
The stream of the gorge and the show of the crest,
Where locked they may lie in the mountain-scooped
urn,
Till the voice of the Lord its foundations o'erturn.

Cincinnati, Ohio, Jan. 13, 1853.

STELLA.

A BLIND MAN'S THOUGHTS.

I little knew the worth of sight
Before my lamp was snatched away;
Ah, had I garnered up the light,
My mind had not been dark to-day!
Had coming eve foreshadowed thought,
How precious, then would morn have been;
Alas, I saw not what I ought,
And saw what I should not have seen!

The blow descended as I slept,
I woke unconscious of my doom,
While morning unsuspected crept
With stealthy footsteps round my room;
But when the dawn had passed away,
Th' unwonted merry call of some
Who came to tell me it was day
Told me—my polar night was come.

It died—that first bewild'ring pain;
But rapid mem'ry, ne'er at rest,
Marshals a long and mournful train
Of dead enjoyments once possessed;
So to the minds of drowning men,
When past the anguish and the strife,
One flashing moment shows again
Each letter of the page of life.

Yet would I not complain; I feel
Some pleasures are obscured by light.
As darkness can alone reveal
The solitary orbs of night:
The flowers unseen yield sweeter scent;
The touch of love is prized the more;
And woman's silvery voice is blent
With music never heard before.

Yea, though I tread the vale of night,
I fear no ill, for He is there
Who with the rod of pain to smite
Has given the staff of strength to bear.
And thus with darkened steps and slow,
Yet led by faith, I venture on,
So close to Him who deals the blow
That half its heavy weight is gone. R. R.

SAMUEL J. MAY'S LETTERS FROM EUROPE.

CHAMOUNI, June 28th.

In December, 1820, I went to Springfield, Mass., to visit my friend W. B. O. Peabody. He was a true poet himself, and an ardent lover of the good poetry of others. During my stay with him, he repeated to me many choice pieces. One in particular is now brought most affectingly to my remembrance. It was Coleridge's "Hymn to Mont Blanc, written at Chamouni, an hour before sunrise." I was so much delighted with it that I copied it, and committed it to memory. It had not then been published in our country. Mr. Peabody had recently received it, in manuscript, from a friend in England. It was too good to be kept for the gratification of the few. So I sent a copy of it to the H. Ware, Jr., then editor of the *Christian Disciple*, Boston; and it was published, in that excellent periodical, in the course of the year 1821.

If you were now within the reach of my voice, I should love to repeat or read it to you in the

imposing presence of the mountain that inspired it.

I confess that, when we reached this valley last evening, I was at first disappointed. The mountain did not seem so elevated as I expected. Mont Blanc did not present the appearance which Mr. Coleridge described. I went to bed with the feeling that poets take greater liberties in the pictures they give us than painters.

But I arose about 1 o'clock this morning—looked out of my window, which commanded a fine view of the lofty pile, and then I saw the vision that presented itself to the adoring eyes of the author of the Hymn.

To-day I have clambered up and down one of the mountains that belong to this mighty group. I have been to the *Mer de Glace*, i. e., the Sea of Ice—the largest of all the glaciers. It is 6,300 feet above the level of the sea, and nearly 3,000 above the valley of Chamouni. Still it is far below the monarch of the Alps—*Mont Blanc*—whose summit is said to be 15,760 feet above the sea.

It took us three hours and a half, on a mule's back, to reach the small inn, that overlooks the Sea of Ice, or rather the lower portion of it, which alone is visited by ordinary travellers.

After taking rest and refreshment, we ventured forth upon the "motionless torrent," the "silent cataract." Each of us was furnished with an alpine staff, which terminates in an iron point; and those who wished were aided also by the strong arm of the practised guide. Walking upon that sea was less difficult than I expected. The ice was not very slippery. The surface was quite uneven, the guides knew how to lead us over the frozen billows; and one went before with an axe to cut steps in the ice, wherever it seemed necessary.

Three of our party went only half across the sea; the younger and stronger ones went entirely over, and returned to the valley by another path. We were told by our guides that we had seen, when half across, all the wonders of that frozen deep that could be seen without going to the other side, which we had determined (I now think unwisely) not to do. After spending about an hour upon the glacier, we returned to the inn. We had walked over many acres of ice under a hot sun. We had looked into *crevasses* or fissures in that frozen sea, down which streams of water were falling, three, five, seven hundred feet. We had seen the *sources* of the Arve and Arveiron, those mountain rivers that rave ceaselessly at thy base," O! Blanc! And we thought we ought to be satisfied. But we have since learned that, on the other side, we should have seen new wonders, the sight of which would have amply repaid us for the additional fatigue we should have endured and danger we might have incurred.

After an hour's rest at the inn we remounted

our mules, and commenced our return to the valley. The descent was more rapid but less pleasant, and often dangerous. At one place I alighted from my beast, preferring to get down as best I could, on my feet, than trust myself on the back of the most sure-footed of animals. But soon my admiration of the caution and singular discretion of the mules in selecting the best stepping places inspired me with confidence. So I remounted and have reached the valley and our hotel without any mishap, grateful to my careful mule, my devoted guide, and to that good Providence which has bestowed such gifts and graces upon these Alpine men and beasts.

S. J. M.

SLEEPING ROOMS.

The largest part of our rest is taken in sleep. Of course, the kind of room in which we sleep is worthy of consideration. Hufeland says: "It must not be forgotten that we spend a considerable portion of our lives in the bed-chamber, and consequently that its healthiness or unhealthiness cannot fail to have a very important influence upon our well-being." It should at least be large. That is of prime importance, because, during the several hours that we are in bed, we need to breathe a great deal of air, and our health is injured when we are obliged to breathe it several times over. We should at least pay as much attention to the size, situation, temperature and cleanliness of the room we occupy during the hours of repose, as to the parlors or drawing-room, or any other apartment. And yet how different from this is the general practice of families. The smallest room in the house is commonly set apart for the bed and its nightly occupants. The sleeping-room should have a good location, so as to be dry. It should be kept clean, and neither too hot nor too cold.—And more important still, it should be well ventilated. One bed occupied by two persons is as much as should ever be allowed in a single room; though two beds in a large room are of course no worse than one in a small one. Both objectionable.—*Dr. Warren.*

ITEMS OF NEWS.

EUROPEAN NEWS.—The screw steamship Fox, Captain McClintock, sent by Lady Franklin to the Arctic regions in search of the traces of Sir John Franklin's expedition, had returned to England, having been completely successful.

At Point William, on the northwest coast of King William's Island, a record was found, dated April 25, 1848, signed by Captains Crozier and Fitzjames. The record says the Erebus and Terror were abandoned three days previously, in the ice, five leagues to the N. N. W., and that the survivors, in all amounting to one hundred and five, were proceeding to the Great Fish river.

Sir John Franklin had died on June 11, 1847, and the total deaths to date had been nine officers and fifteen men.

Many deeply interesting relics of the expedition were found on the western shore of King William's Island, and others were obtained from the Esquimaux, who stated that after their abandonment, one of the ships was crushed in the ice, and the other forced ashore.

The Fox was unable to penetrate beyond Bellot's straits, and wintered in Brentford bay.

Minute and interesting details of the expedition are published.

Several skeletons of Franklin's men, large quantities of clothing, &c., and a duplicate record up to the abandonment of the ship, were discovered.

THE FINANCIAL REFORM AGITATION.—The Liverpool Financial Reformers intend opening their campaign against the Customs duties by a grand demonstration to come off early in November, at Liverpool, Richard Cobden and John Bright have promised to attend and take part in the proceedings. The crusade when thus inaugurated, is to be carried on vigorously during the winter months by public meetings being held throughout the country, the members of the Council have promised to lend active assistance in prosecuting the objects of the association. The warcry of the campaign, we understand, is to be "An untaxed breakfast and tea table for the working classes;" the argument being that the time is come when there should be untaxed tea and coffee as well as untaxed bread.

The British Government is said to have made a contract for a cable 1,200 miles long, to be laid from Falmouth to Gibraltar, in June next; this to be succeeded by a cable to Malta and Alexandria, thus giving England an independent line, free from continental difficulties.

COOLIES.—The total arrivals of vessels with coolies since the commencement of the traffic in 1857, at Havana, sum up 116; tonnage, 90,216; Chinese shipped, 50,123; landed, 42,500; loss, 7,622; total average loss, 15.20 per 100.

At a meeting of the New York Board of Education, on the 5th inst., the following resolution was offered by a Mr. McQueen.

Resolved, That in order to obviate the injurious results of prolonged confinement in the schools upon children of tender years, it be recommended to the trustees of schools to diminish the time occupied in actual instruction, in the primary schools and departments in their several wards, by devoting more of the time of school sessions to intermissions for safe and innocent recreation in the play grounds of the schools.

THE GREAT BALLOON VOYAGE.—The Watertown (N. Y.) *Reformer* of the 5th instant, contains an account of the balloon ascension of Mr. LA MOUNTAIN and Mr. HADDOCK, from Watertown on Thursay, the 22d ult., written by the latter. They ascended at 5.33 P. M. and in six minutes were far above the clouds. At 5.50 they were at least two miles high—thermometer 34 degrees. They continued to ascend very rapidly, and at 6.10 the thermometer indicated a temperature of 18 degrees. The balloon then began to descend, and a quantity of ballast was thrown over. At about half past seven they descended into a valley near a high mountain, but as the place looked forbidding they threw over 30 pounds of ballast and rose again. In about twenty minutes they made another effort to descend, but found themselves surrounded by a dense wilderness and over a small lake. They then threw over all their ballast but 18 pounds, and, after getting over the wilderness, settled down by the side of a tree to wait till morning. Much rain fell through the night, and they became thoroughly drenched with it. At about six o'clock next morning they threw overboard all their remaining ballast, blankets, shawls, &c.,

and rose again. They were rapidly driven northward over an unbroken wilderness, and concluded that they had gone too far.—*The Press.*—Mr. HADDOCK says:

"As the current was driving us still to the north, we dare not stay up, as we were drifting further and still further to that 'frozen tide' from which we knew there was no escape. Mr. La M. seized the valve cord and discharged gas, and we descended in safety by the side of a tall spruce. We made the Atlantic fast by her anchor, and for a moment talked over what we should do. We had not a mouthful to eat; no protection at night from the damp ground; were distant we know not how far from habitation; were hungry to start with; no earthly hope of raising a fire, and no distinct idea as to where we were. We settled in our own minds that we were either in John Brown's tract or in the great Canada wilderness—to the south, we thought, of the Ottawa—and knew that a course south by east would take us out, if we had strength enough to travel the distance.

To the southeast, then, we started. After travelling about a mile and a half we came to the bank of a small creek, flowing down from the westward. At this point we were agreeably surprised to find that some human being had been there before us; for we found several small trees cut down, the coals from an old fire, and a half barrel, which had contained pork."

After a perilous adventure of several days, they arrived at Byrun, Canada, in charge of Indian guides, having landed three hundred miles north of their starting place in the midst of a dense wilderness. They lost everything, and were without food four days.

THE NEW AERIAL SHIP.—Mr. Lowe's Aerial Ship, City of New York, rivals the Great Eastern in magnitude. With it he confidently expects to make the trip from New York to Europe in 48 hours. It is nearly five times larger than the largest balloon ever before built, its dimensions being as follows: Greatest diameter, 130 feet; transverse diameter, 104 feet; height, from valve to boat, 350 feet; weight, with outfit, 3½ tons; lifting power (aggregate), 22½ tons; capacity of gas envelope, 725,000 cubic feet. Six thousand yards of twilled cloth have been used in the construction of the envelope. Reduced to feet, the actual measurement of this material is 54,000 feet, or nearly 11 miles. Six of Wheeler & Wilson's sewing-machines were employed twelve days to connect the pieces. The upper extremity of the envelope, intended to receive the gas valve, is of triple thickness, strengthened with heavy brown linen, and sewed with triple seams. The pressure being greatest at this point, extraordinary power of resistance is requisite. It is asserted that 100 women, sewing constantly for two years, could not have accomplished this work, which measures by miles. The material is stout, and the stitching is stouter.

Letters from Florence, says the *Boston Transcript*, state that Elizabeth Barrett Browning has passed most of the summer at Siena, in Tuscany—seeing no visitors, and most of the time unable to walk, except across the room; the change of air and entire rest have begun to yield good fruit; she has gained strength, and her worst symptoms have abated.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—Superfine is held firmly at \$5 a 5 12½ per barrel; extra at 5 25 a 5 37½; extra family at 5 62½ a 6 50; and scraped at 4 00. There is a steady inquiry for the supply of the home trade, within the range of the above quotations. The market is bare of both Rye Flour and Corn Meal, and there is little or none coming forward.

GRAIN.—There is little Wheat offering, and prices remain without change; small sales of prime red at \$1 23 a 1 25, and white at 1 30 a 1 38. Rye is scarce

and wanted, at 90c. Corn is in good request; sales of 5000 bushels yellow at 94 a 95. in store and 95c. afloat. Oats command 41a42c. per bushel.

CLOVERSEED.—Prime seed is selling at \$5 50 per 64 lbs.; Pennsylvania at 5 70: old crop at 5 00 a 5 70. A small lot of prime Timothy sold at 2 37 a 262½. Flaxseed is worth 1 55 a 1 60.

WANTED, a situation to teach in a family, or small school. Instruction can be given in French if desired. Address Rebecca I. Magill, New Hope Bucks Co., Pa.

10th mo. 8—2t.

GENESEE VALLEY SEMINARY will be re-opened for the reception of pupils of both sexes, on the 1st of 11th month next, and continue five months. The course of instruction will embrace all the branches of a liberal English education.

This school is situated at Scottsville station, on the Genesee Valley Railroad, ten miles south of Rochester, N. Y.

Terms \$50 per term of five months, one half payable in advance. For a circular containing further particulars address

STEPHEN COX, Proprietor,

10 mo. 1—4 t. North Rush, Monroe co., N. Y.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The Winter Session of this institution will commence on the 14th of 11th mo. next, and continue twenty weeks.

Terms \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address

HENRY W. RIDGWAY,

Crosswicks P. O., Burlington Co., N. J.

9th mo. 24—3 m.

EATON ACADEMY, KENNETT SQUARE, Chester Co., Pennsylvania.

The Fourth Term of this Institution, under the charge of the present proprietor, will open for the reception of pupils of both sexes, on Second day, the 31st of 10th mo. next, and continue in session twenty weeks.

The course of instruction will embrace all the branches of a thorough English education, the higher Mathematics, Natural Sciences illustrated, the Latin, Greek, French and German Languages, and Drawing.

For terms and particulars, see Circulars, which will be forwarded to the address of every person requesting the same, upon application to

WILLIAM CHANDLER, Principal & Proprietor.

or to WILLIAM A. CHANDLER, Principal Instructor.

RUTHANNA JACKSON,

or to MAGGIE B. JACKSON,

CHARLES B. LAMBORN, } Assistants.

9mo. 10, '59-2m

LONDON GROVE BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—It is intended to commence the next Session of this Institution on the 1st of 11th month, 1859. Terms \$60 for 20 weeks; no extras, except for the Latin and Greek Languages, which will be \$5 each. For Reference and further particulars inquire for Circular of

BENJ. SWAYNE, Principal,

London Grove P. O., Chester Co. Pa.

9 mo 3, 2 m.

GWYNEDD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The next session of this Institution will commence on the 14th of 11th month,

1859, and continue twenty weeks. Terms \$70, and no extras. For further information application can be made to

DANIEL FOULKE, Principal,

HUGH FOULKE, Jr., Teacher,

Spring House P. O.,

Montgomery co., Pa.

8 mo. 13—2 mo.

ELDRIDGES HILL BOARDING SCHOOL FOR YOUTH OF BOTH SEXES, will open its Winter Session 11 mo 1st.

Terms \$70 per session of 20 weeks. For particulars address the Principal for a circular.

ALLEN FLITCRAFT.

Eldridges Hill Salem County, N. J.

8 mo 27 3 m.

THE BANKSDALE BOARDING SCHOOL FOR GIRLS, will be reopened the 14th of 11th month, and be continued twenty weeks. The course of study will comprise the usual English branches and Drawing. Terms \$60.

For further information apply to ELIZA HEACOCK, Jenkintown, Montgomery Co. Penn.

8mo. 27 3m.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

GEO. A. NEWBOLD,

Purcellville, Loudon Co., Va.

8th mo. 6, 1859.—6m.

BYBERRY BOARDING SCHOOL, FOR GIRLS.

The ninth session of Byberry Boarding School, taught by Jane, Anne and Mary S. Hillborn, will commence on the first Second-day of Tenth month, 1859, and continue forty weeks without intermission, (including two terms of 20 weeks each.) The course of instruction embraces all the branches of a liberal English education.

Terms \$60 per session of 20 weeks, one half payable in advance. For circulars containing further particulars address

JANE HILLBORN,

Byberry P. O., Philada., Pa.

8th mo. 7—3m.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66.

75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Pencilling, and Pells work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; reading, Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M.

Principal.

Atleboro', Bucks Co., 5th mo., 28, 1859.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, TENTH MONTH 22, 1859.

No. 32.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA.

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

ON PRAYER.—FENELON.

Many are tempted to believe that they no longer pray, when they cease to enjoy a certain pleasure in the act of prayer. But, if they will reflect that perfect prayer is only another name for love to God, they will be undeceived.

Prayer, then, does not consist in sweet feelings, nor in the charms of an excited imagination, nor in that illumination of the intellect that traces with ease the sublimest truths in God: nor even in a certain consolation in the view of God: all these things are external gifts from his hand, in the absence of which, love may exist even more purely, as the soul may then attach itself immediately and solely to God, instead of to his mercies.

This is that *love by naked faith* which is the death of nature, because it leaves it no support; and when we are convinced that all is lost, that very conviction is the evidence that all is gained.

Pure love is in the will alone; it is no sentimental love, for the imagination has no part in it; it loves, if we may so express it, without feeling, as faith believes without seeing. We need not fear that this love is an imaginary thing—nothing can be less so than the mere will separates from all imagination; the more purely intellectual and spiritual are the operations of our minds, the nearer are they, not only to reality out to that perfection which God requires of us; their working is more perfect; faith is in full exercise while humility is preserved.

Such love is chaste: for it is the love of God n and for God; we are attached to Him, but not for the pleasure which He bestows on us; we follow Him, but not for the loaves and fishes.

What! some may say, can it be that a simple will to be united with God is the whole of piety?

How can we be assured that this will is not a mere idea, a trick of the imagination, instead of a true willing of the soul?

I should indeed believe that it was a deception, if it were not the parent of faithfulness on all proper occasions; for a good tree bringeth forth good fruit; and a true will makes us truly earnest and diligent in doing the will of God; but it is still compatible in this life with little failings which are permitted by God that the soul may be humbled. If, then, we experience only these little daily frailties, let us not be discouraged, but extract from them their proper fruit, humility.

True virtue and pure love reside in the will alone. Is it not a great matter always to desire the Supreme Good whenever He is seen; to keep the mind steadily turned towards Him, and to bring it back whenever it is perceived to wander; to will nothing advisedly but according to his order; in short, in the absence of all sensible enjoyment, still to remain the same in the spirit of a submissive, irreclaimable burnt-offering? Think you it is nothing to repress all the uneasy reflections of self-love; to press forward continually without knowing whither we go, and yet without stopping; to cease from self-satisfied thoughts of self, or at least, to think of ourselves as we would of another; to fulfil the indications of Providence for the moment, and no further? Is not this more likely to be the death of the Old Adam than fine sentiments, in which we are, in fact, thinking only of self, or external acts, in the performance of which we congratulate self on our advancement?

It is a sort of infidelity to simple faith when we desire to be continually assured that we are doing well; it is, in fact, to desire to know what we are doing, which we shall never know, and of which it is the will of God that we should be ignorant. It is trifling by the way in order to reason about the way. The safest and shortest course is to renounce, forget and abandon self, and through faithfulness to God to think no more of it. This is the whole of religion—to get out of self and of self-love in order to get into God.

As to involuntary wanderings, they are no hinderance to love, inasmuch as love is in the will, and the will only wanders when it wills to wander. As soon as we perceive that they have occurred, we drop them instantly and return to God, and thus, while the external senses of the

spouse are asleep, the heart is watching; its love knows no intermission. A tender parent does not always bear his son distinctly in mind; he thinks and imagines a thousand things disconnected with him, but they do not interfere with the paternal affection; the moment that his thoughts rest again upon his child, he loves, and feels in the depths of his soul that though he has ceased to think of him he has not for an instant failed to love him. Such should be our love to our Heavenly Father; a love simple, trustful, confident and without anxiety.

If our imagination takes wing and our thoughts wander, let us not be perplexed; all these things are not that "*hidden man of the heart in that which is not corruptible, even the ornament of a meek and quiet spirit,*" of which St. Peter speaks. (1 Pet. iii. 4.) Let us only turn our thoughts, whenever we can, towards the face of the Well-beloved without being troubled at our wanderings. When He shall see fit to enable us to preserve a more constant sense of his presence with us, He will do so.

He sometimes removes it for our advancement; it amuses us with too many reflections which are true distractions, diverting the mind from a simple and direct look toward God and withdrawing us from the shades of naked faith.

We often seek in these reflections a resting-place for our self love and consolation in the testimony we endeavor to extract from them for self; and thus the warmth of our feelings causes us to wander. On the contrary, we never pray so purely as when we are tempted to believe that we do not pray at all; we fear that we pray ill, but we should only fear being left to the desolation of sinful nature, to a philosophical infidelity, seeking perpetually a demonstration of its own operations in faith; in short, to impatient desires for consolation in sight and feeling.

Never should we so abandon ourselves to God as when He seems to abandon us. Let us enjoy light and consolation when it is his pleasure to give it to us, but let us not attach ourselves to his gifts, but to Him; and when He plunges us into the night of Pure Faith, let us still press on through the agonizing darkness.

Moments are worth days in this tribulation; the soul is troubled and yet at peace; not only is God hidden from it, but it is hidden from itself, that *all* may be of faith; it is discouraged, but feels nevertheless an immovable will to bear all that God may choose to inflict; it wills all, accepts all, even the troubles that try its faith, and thus in the very height of the tempest, the waters beneath are secretly calm and at peace, because its Will is one with God's. Blessed be the Lord who performeth such great things in us, notwithstanding our unworthiness.—"*Spiritual Progress.*"

Wisdom is never so attractive as when she smiles.

EXTRACTS FROM A MEMOIR OF
ELIZABETH T. KING.

(Continued from page 487.)

Baltimore, Third mo. 1, 1859.

The prospects of a European war, and the movement towards the extension of slavery in this country, weigh down my spirit with such sorrow, that I sometimes feel as if I could scarcely endure it.

I am afraid I suffer more than is consistent with perfect acquiescence in the will of Him who sees the end from the beginning, and who can so control it as to make the wrath of man praise Him. But when I think of the misery the devastation, the sin, the souls that will be hurried unprepared into eternity, the evil passions that will be fostered and strengthened, how can I feel any thing but the deepest sorrow? * * * * *

While on a visit from home, she thus writes to her husband:

* * * I have had great cause for thankfulness since being here; every thing seems to have been ordered right. More than all, I feel quiet, conscious of abounding weakness, yet feeling as if He, who "took our infirmities and bare our sicknesses," condescended to look down in pity on His feeble child.

I want to be kept in humility but faithfulness, yet I am sometimes discouraged by thinking I am too much of a child in spiritual things even to know what I ought to do. However, I trust that patient waiting, and quiet hoping, will bring me out right at last.

Take good care of thyself, and remember we concluded to have for the motto in our new establishment, and in all our actions and plans, henceforth, "*But one thing is needful.*"

In the summer of this year, 1854, she removed to a pleasant home, a few miles distant from the city, where, in the enjoyment of the varying charms of nature, she passed the remaining years of her life.

It was her delight to ramble with her children, in the woods near the house, calling their attention to the beautiful spring flowers, the little brook with its sparkling waters, the many colored leaves of autumn, and the mosses of winter. All these she delighted to point out as tokens of the love and mercy of our heavenly Father, who has not only provided so many things for our need, but gives so many more for our enjoyment. The children were often summoned to accompany her to some small houses not far distant, occupied by poor colored families, to carry soup to a sick woman, or clothes to a little child, thus teaching them the pleasure of relieving the necessities of others. On the afternoon of First day, the children of these families were invited to her house, and a company might be seen assembled round the table, listening with eager interest to the wonderful stories of the Bible,

and learning lessons, which seemed strange perhaps to them, of the love and mercy of their Saviour.

Her daughters always had a part to perform in the school, and it proved a pleasant hour to both teacher and pupils.

She had the faculty of improving time to a remarkable degree, yet it was done so quietly and systematically that nothing seemed to be an effort to her. She often quoted an expression of a dear aged father in the church, upon whose sympathy and experience she loved to lean, "I never was in a hurry." Truly a meek and quiet spirit, and a loving, cheerful heart, were given to her, and all within her influence felt its charm. Having some leisure this year, she devoted a part of it to the study of German from a sense of religious duty, believing that it would be of service to her in mingling with that class of the population. She accustomed herself to read the German Bible daily for several years, and often expressed her belief that, if her life were spared, she would be led to labor among that people. On one occasion, in visiting the Almshouse with a minister—who had religious service with the inmates—a poor German met them at the close, and with much feeling gave her to understand that she did not comprehend what had been said. E. T. K. felt her heart warmed toward the woman; and, after a little silent waiting, text after text in German was given her, and she was able to relieve her own mind and comfort the poor woman. She said afterwards that this alone richly repaid her for the trouble of acquiring the language.

Remembering the injunction, "Occupy till I come," she was careful to embrace openings for usefulness, however small they might seem. Watchful over her own spirit, and constantly depending on the Strong for strength, few were more fully qualified to comfort others with the comfort wherewith she herself had been comforted of God. Yet these acts were so quietly and unostentatiously performed, as often to be known only to the recipient. A note sent to one under an impression of duty, or a few words of counsel to another under temptation, not unfrequently made an impression which will long remain.

While thus careful, as she says to a friend, "to remember the injunction dear — gave us, not to live too much to ourselves," she was very attentive to her domestic duties, and it was in the privacy of home that the beauty of her character was especially manifested.

The education and training of her children was, to her, a subject of great importance, which she was unwilling to delegate to others. Their lessons were daily attended to, and while cultivating their minds, she was careful to embrace every opportunity for inculcating religious truths. Any manifestation of wrong feeling was gently and tenderly rebuked, as a source of unhappi-

ness to them as well as to herself, but more than all as a sin against their heavenly Father, to whom they were taught to look as their Protector, cognizant of every action.

With a view of instructing, as well as interesting them, she wrote some little tracts, drawn from incidents in their daily lives, which were intended to enforce the lessons she desired to teach. They were originally prepared only for her own children, but were afterwards published.

She had also commenced a Child's History, in which she intended to present the history of various nations in a more moral point of view than is generally taken in such books.

Her aspirations after faithful and entire dedication will be shown by the following lines, written by her about this time :

I ask the rest that spirit knows,
Whose will is wholly bowed to Thine;
The quiet and serene repose
That can its every wish resign.

I want to labor faithfully
Within Thy vineyard all my day,
But guided only by Thine eye,
Nor dare to choose *my* work or way.

And yet whenever, in Thy love,
Thou givest the command, "Be still,"
May I as joyfully prepare
To *suffer*, as to *do* Thy will.

I ask not comfort, joy, or peace,
For *self* in these oft makes her throne;
I only ask, Thou wilt not cease
Until Thy work be wholly done.

I cannot rest until my heart
Is purged from every taint of sin,
And, through the blood of sprinkling, made
Fit for Thyself to enter in.

And well I know Thy changeless love
Will all Thy loving children cheer,
Whenever, on their thorny way,
Their spirits droop from doubt or fear.

All this I trust to Thee alone,
But leave me not, until there be
On every action, word, and tone,
The impress, Holiness to Thee,

(To be continued.)

ADVICE TO READERS.

Readers are not generally aware of the fact, nevertheless it is a fact, and one of great magnitude, and of terrible importance, that their first grand necessity in reading is to be vigilantly and conscientiously select. Books are, like human souls, divided into "sheep and goats," or compared to beasts, may be divided into "clean and unclean."

All poor and worthless books should be placed in the position of the goats, on the left hand of the judge, if they have any place at all, and should be entirely ignored by the reader. The world is full of books, and nothing is of more importance to the rising generation than a careful selection among them. What a useless waste

of time it is to read over thousands of pages in which not a single idea occurs worth remembering, or which imparts any really useful information! This remark will apply to nineteenth-tenths of the light reading in newspapers and periodicals. Carlyle was right in saying that all sane men and women should ignore such nonsense.—*Life Illustrated*.

A LETTER OF THE LATE HORACE MANN,

ADDRESSED TO A POOR YOUNG MAN IN REPLY TO INQUIRIES
CONCERNING AN EDUCATIONAL COURSE.

[Although not intended for the public, from its applicability to the condition and circumstances of many young men throughout the country, the following is considered worthy of publication. Hoping it may become as much an incentive and encouragement to others as it has been to him to whom it was originally addressed, I herewith transmit it for the columns of LIFE.—W.]

ANTIOCH COLLEGE YELLOW SPRINGS, }
Sept. 17th, 1857. }

MR. ———: *Dear Sir*—I gladly answer your letter. Youth struggling for improvement presents to my mind the most interesting sight on earth. It is the greatest pleasure of my life to counsel and assist such.

* * * * *

My advice to you would be to obtain as complete an education as the best institution can give you. No matter if your time for entering upon the active duties of life should be postponed till you are thirty, you will be farther advanced, be richer, know more, have a better standing and position in society at forty-five, than if you had entered life, unprepared, at twenty.

As to means, if you can borrow, certainly do so. There are two objects for which I would run in debt, though I am as much opposed to it as even Dr. Franklin was—those objects are *to save life* and *get an education*; and I would do it about as readily for the latter object as for the former. Life without knowledge is hardly worthy of the name. One year, after going well through college, will be worth any two years before, in the salary it will command. What a saving or rather what a creation is here.

As to your living *cheaply*, I have no objection, provided you live *healthfully*; but many young people, who board themselves, live so sparingly, and eat such innutritious and poorly-selected food, that they lower the tone and vigor of the system, and have not the use of more than half their faculties. Beware of erring on this side.

You could probably find some means, here, of defraying a part of your expenses (by manual labor), but I fear not all.

If you can not borrow money, work a year, and then, when your earnings are exhausted, keep school; but borrow, by all means, if you can. If

you do well, you will be able to defray all your college bills by the income of one or two years after graduating. * * * *

While you stay out of college, prepare yourself in the early studies of the course.

Wishing you a continuance of your resolutions (for if they keep strong, all else will be well), I am, with best regard,

Yours, very truly, HORACE MANN.

Life Illustrated.

INFANCY.

Many practical inferences of the greatest importance are involved in the one principle, that infancy is, in a peculiar sense, Nature's own season:—or in other words, that it is the period during which very little need be done except to exclude any foreign disturbance of the natural development of the animal and mental functions.

How much superfluous anxiety might be avoided, and how many ill-judged, and even mischievous endeavors to develop the mind might be saved, were but this principle fully understood and assented to! Nor is this all; for what is really to be done by the mother for her infant, during its first five or six years, and which, consists almost entirely in warding off causes of disturbance, and which is enough to employ her hands and thoughts, might be done much better than often it is, did she but confine her attention to it, exclusively of the fruitless, and often pernicious labours, which she imposes on herself, in compliance with the prevailing customs and notions that regulate education.

Not a syllable of book-learning need have been acquired, and scarcely a task learned, and yet the mind of a child, in its fifth year, may be not merely in a state of the happiest moral activity, but may be intellectually alive, and actually possessed too of various information, concerning the visible universe; and he may have made acquaintance with whatever presents itself under a pleasurable aspect—and assuredly nothing but what is agreeable should at all be presented to the infant mind:—this rule excludes, not merely objects or ideas positively unpleasing, but all such as are dry, and devoid of attractions.

In the flower-garden, and among the gay, winged, humming tribes that frequent it, Nature opens her school;—we have but to lead our infant charge thither, and simply to act as her interpreters; and when this bright alphabet has been learned, it will be easy to go to a field, and thence to mount higher and higher, until we tread the skies, and make some acquaintance with distant worlds. None but the most dronish teachers can need to be told that the exacting of volumes of lessons, may entirely fail of quickening the mind. There may, however, be many who, from a conscious, or a supposed want in themselves of various information, and of the requi-

site fertility of thought, adhere to the stultifying practice of lesson-giving, although they perceive its inutility, and would gladly, if not at too great a cost of exertion, adopt a different method.

It is not so much the actual process of learning to read, as the consequences of being able to read, during early years, which are to be guarded against; and this period, be it remembered, extends to the time when the organization of the brain is complete, and when its ultimate dimensions are nearly attained. In learning to read, if the process be conducted with a fair degree of discretion, the mind is not taxed by the demand of continuous attention; on the contrary, its frequent stops and trips, and the consequent interposition of the teacher, break up the exercise into morsels, and afford respites and *turns-off* to the brain. Moreover, before that habit of the eye and ear is perfectly formed, which enables an adult to read without a thought of the combination of letters in words, the mind is still occupied with the visible symbols, on the page; nor does the mental operation essentially differ from that which is every hour going on, while the names of familiar objects are becoming associated with them in the memory.

The only injury likely to accrue from the mere operation of learning to read, is that which happens when the exercise, each time is continued a little too long, so as to impair the animal vivacity. But the mental process becomes altogether of another sort when a good degree of proficiency has been made; for, from that time, and until the connexion between written words and the ideas they stand for has become so familiarly perceived, as that the mind is no longer conscious of any act in passing from the one to the other—until that time, there is an ill-adjusted movement going on in the brain, of a kind that is always more or less hurtful.

This circumstance deserves to be better understood and more considered than it usually is. Let it be observed then that the mind, or the brain, and it is of no importance here to inquire which, is, in every instance, perturbed, and exposed to injury, when two operations, linked one with another, are going on, but which do not accurately keep time, or advance precisely at the same rate. It is hence that most cases of confusion of the thoughts arise; and an attention to the simple fact might, in very many instances, greatly aid those who, in the transaction of complicated affairs are liable to lose the ready command of their faculties.

Instances of the sort are easily named, such as when an unpractised writer is laboring to keep pace with a speaker; or when a clerk, less expert, is collating accounts in company with one more so; or to name an instance precisely in point, when an adult has made just that degree of acquaintance with a new language which exempts him from the necessity of incessantly breaking

off from his books to consult his lexicon; so that he pursues, or endeavors to pursue, the sense of the writer at the ordinary pace at which the eye traverses a printed page. In this case, he finds that the rate of progress to which the eye is habituated, and which it does not readily slacken, greatly exceeds that at which the mind can get through the complicated process of recollecting the meaning of single words, and of analysing the construction of sentences. There is therefore a perpetual jar—a want of synchronous movement, and a sense of distress, and a strain, which quickly exhaust the power of attention; or if persisted in, impair the brain.

During early childhood enough is done—in fact everything (in relation to intellectual culture) which should be thought of, if MENTAL VIVACITY be maintained. Far more safe is it to stop at this point, than to attempt any development of the reason; and far more useful too, if we look to the future, than is the conveyance of any amount of knowledge that may be imparted at the cost of a child's animal hilarity. If the mind be quick—if a child reaches the second period of life apt to learn, even if he knows little or nothing, a wise parent may be content.

Intellectual vitality, as distinguished from a precocious development of reason, and from specific acquirements, results in a spontaneous manner from converse with those who themselves possess it. Vivid intellectuality is an emanation, absorbed unconsciously by all coming within its circle. An intelligent mother, for instance, if she will but trust to the unthought-of radiation of her own mind, without deeming it incumbent upon her to reduce this influence and to abate it, under the form of set exercises, and processes of instruction, will rarely fail to have the satisfaction of handing her children over, in their ninth and tenth year, to those who are to commence a more defined course of training, in a state really the best for deriving advantage from it.

The sparkling flow of desultory intercourse, which, while it is little more than prattle on the one side, is, on the other, a pointed, playful, but well aimed rejoinder—having its ulterior purpose, though unperceived: such a style of converse involves nearly all the education which young children need receive. A prompt and concise reply to every question, and a leading on, in each instance, a little further, but not far, will enable a mother not only to make herself sought after, and courted, as the most agreeable companion her children can find, but to convey, no one can tell how, or when, so much knowledge of what is afterwards to be systematically learned, as shall serve to remove all ruggedness from the entrance to the temple of learning.

In this mode an adroit teacher contrives, as if it were incidentally, to lift the corners of the curtain of Philosophy, to awaken the zest of children, and to give them some familiarity with things

and terms, without taxing their attention, in any case, five minutes at a time, or loading their memories with a single technical term.

But it must be confessed that a teacher who pursues a method such as this, will have less leisure for herself, than one who imposes stated tasks upon her pupils; for she will never be able to say—her work is done, while her charge are up and about. The indolent, therefore, will choose rather to condense all they have to do into a two or three hours' schooling, and then be free. On the other hand, an ambitious teacher does not readily consent to relinquish the triumph of an exhibition of the incredible proficiency of her pupils in getting through task-work: but a mother, we presume, has at once the energy and the self-denial demanded by the very different course we have been speaking of.

As to schooling, with its stated hours for application and sitting still, it is no doubt highly useful, as a means of filling up the day, so as to give a zest to every moment of it. But there is enough in the purely mechanical parts of education to occupy these hours; and the employments during what are called school hours should be such as tend rather to tranquillize, than to excite the faculties. It is OUT OF SCHOOL—it is on the play-ground, and abroad, and at table, that the vivifying communion of minds between parents and children will take place.—“*Home Education.*”

(To be continued.)

WHAT KNOWLEDGE IS OF MOST WORTH.

(Continued from page 491.)

Thus we find the facts to be such as might have been inferred *à priori*. The training of children—physical, moral, and intellectual—is dreadfully defective. And in great measure it is so, because parents are devoid of that knowledge by which this training can alone be rightly guided. What is to be expected when one of the most intricate of problems is undertaken by those who have given scarcely a thought to the principles on which its solution depends? For shoe-making or house-building, for the management of a ship or a locomotive-engine, a long apprenticeship is needful. Is it, then, that the unfolding of a human being in body and mind, is so comparatively simple a process, that any one may superintend and regulate it with no preparation whatever? If not—if the process is with one exception more complex than any in Nature, and the task of administering to it one of surpassing difficulty; is it not madness to make no provision for such a task? Better sacrifice accomplishments than omit this all-essential instruction. When a father, acting on false dogmas adopted without examination, has alienated his sons, driven them into rebellion by his harsh treatment, ruined them, and made himself miserable; he might reflect that the study of

Ethnology would have been worth pursuing, even at the cost of knowing nothing about Æschylus. When a mother is mourning over a first-born that has sunk under the sequelæ of scarlet-fever—when perhaps a candid medical man has confirmed her suspicion that her child would have recovered had not its system been enfeebled by over-study—when she is prostrate under the pangs of combined grief and remorse; it is but a small consolation that she can read Dante in the original.

Thus we see that for regulating the third great division of human activities, a knowledge of the laws of life is the one thing needful. Some acquaintance with the first principles of physiology and the elementary truths of psychology is indispensable for the right bringing up of children. We doubt not that this assertion will by many be read with a smile. That parents in general should be expected to acquire a knowledge of subjects so abstruse, will seem to them an absurdity. And if we proposed that an exhaustive knowledge of these subjects should be obtained by all fathers and mothers, the absurdity would indeed be glaring enough. But we do not. General principles only, accompanied by such detailed illustrations as may be needed to make them understood, would suffice. And these might be readily taught—if not rationally, then dogmatically. Be this as it may, however, here are the indisputable facts:—that the development of children in mind and body rigorously obeys certain laws; that unless these laws are in some degree conformed to by parents, death is inevitable; that unless they are in a great degree conformed to, there must result physical and mental defects; and that only when they are completely conformed to, can a perfect maturity be reached. Judge, then, whether all who may one day be parents, should not strive with some anxiety to learn what these laws are.

From the parental functions let us pass now to the functions of the citizen. We have here to inquire what knowledge best fits a man for the discharge of these functions. It cannot be alleged, as in the last case, that the need for knowledge fitting him for these functions is wholly overlooked; for our school courses contain certain studies which, nominally at least, bear upon political and social duties. Of these the only one that occupies a prominent place is History.

But, as already more than once hinted, the historic information commonly given is almost valueless for purposes of guidance. Scarcely any of the facts set down in our school histories, and very few even of those contained in the more elaborate works written for adults, give any clue to the right principles of political action. The biographies of monarchs (and our children commonly learn little else) throw scarcely any light upon the science of society. Familiarity with court intrigues, plots, usurpations, or the

like, and with all the personalities accompanying them, aids very little in elucidating the principles on which national welfare depends. We read of some squabble for power, that it led to a pitched battle; that such and such were the names of the generals and their leading subordinates; that they had each so many thousand infantry and cavalry, and so many cannon; that they arranged their forces in this and that order; that they manœuvred, attacked and fell back in certain ways; that at this part of the day such disasters were sustained, and at that such advantages gained; that in one particular movement some leading officer fell, while in another a certain regiment was decimated; that after all the changing fortunes of the fight, the victory was gained by this or that army; and that so many were killed and wounded on each side, and so many captured by the conquerors. And, now, out of the accumulated details which make up the narrative, say which it is that helps you in deciding on your conduct as a citizen. Supposing even that you had diligently read, not only "The Fifteen Decisive Battles of the World," but accounts of all other battles that history mentions; how much more judicious would your vote be at the next election? "But these are facts—interesting facts," you say. Without doubt, they are facts (such, at least, as are not wholly or partially fictions); and to many they may be interesting facts. But this by no means implies that they are valuable. Factitious or morbid opinion often gives seeming value to things that have scarcely any. A tulipomaniac will not part with a choice bulb for its weight in gold. To another man an ugly piece of cracked old china seems his most desirable possession. And there are those who give high prices for the relics of celebrated murderers. Will it be contended that these tastes are any measures of value in the things that gratify them? If not, then it must be admitted that the liking felt for certain classes of historical facts is no proof of their worth; and that we must test their worth as we test the worth of other facts, by asking to what uses they are applicable. Were some one to tell you that your neighbor's cat kitteden yesterday, you would say the information was worthless. Fact though it might be, you would say it was an utterly useless fact—a fact that could in no way influence your actions in life—a fact that would not help you in learning how to live completely. Well, apply the same test to the great mass of historical facts, and you will get the same result. They are facts from which no conclusions can be drawn—*unorganizable* facts; and therefore facts which can be of no service in establishing principles of conduct, which is the chief use of facts. Read them, if you like, for amusement; but do not flatter yourself they are instructive.

That which constitutes History properly so

called, is in great part omitted from works on the subject. Only of late years have historians commenced giving us, in any considerable quantity, the truly valuable information. As in past ages the king was everything and the people nothing; so, in past histories, the doings of the king filled the entire picture, to which the national life forms but an obscure background. While only now, when the welfare of nations rather than of rulers is becoming the dominant idea, are historians beginning to occupy themselves with the phenomena of social progress. That which it really concerns us to know, is the natural history of society. We want all facts which help us to understand how a nation has grown and organized itself. Among these, let us of course have an account of its government; with as little as may be of gossip about the men who officered it, and as much as possible about the structure, principles, methods, prejudices, corruptions, &c., which it exhibited: and let this account not only include the nature and actions of the central government, but also those of local governments, down to their minutest ramifications. Let us of course also have a parallel description of the ecclesiastical government—its organization, its conduct, its power, its relations to the State: and accompanying this, the ceremonial, creed, and religious ideas—not only those nominally believed, but those really believed and acted upon. Let us at the same time be informed of the control exercised by class over class, as displayed in all social observances—in titles, salutations, and forms of address. Let us know, too, what were all the other customs which regulated the popular life out of doors and in doors: including those which concern the relations of the sexes, and the relations of parents to children. The superstitions, also, from the more important myths down to the charms in common use, should be indicated. Next should come a delineation of the industrial system: showing to what extent the division of labor was carried; how trades were regulated, whether by caste, guilds, or otherwise; what was the connection between employers and employed; what were the agencies for distributing commodities; what were the means of communication; what was the circulating medium. Accompanying all which should come an account of the industrial arts technically considered; stating the processes in use, and the quality of the products. Further, the intellectual condition of the nation in its various grades should be depicted: not only with respect to the kind and amount of education, but with respect to the progress made in science, and the prevailing manner of thinking. The degree of æsthetic culture, as displayed in architecture, sculpture, painting, dress, music, poetry, and fiction, should be described. Nor should there be omitted a sketch of the daily lives of the people—their

food, their homes, and their amusements. And lastly, to connect the whole, should be exhibited the morals, theoretical and practical, of all classes: as indicated in their laws, habits, proverbs, deeds. All these facts, given with as much brevity as consists with clearness and accuracy, should be so grouped and arranged that they may be comprehended in their *ensemble*; and thus may be contemplated as mutually dependent parts of one great whole. The aim should be so to present them that we may readily trace the *consensus* subsisting among them; with the view of learning what social phenomena co-exist with what others. And then the corresponding delineations of succeeding ages should be so managed as to show us, as clearly as may be, how each belief, institution, custom, and arrangement was modified; and how the *consensus* of preceding structures and functions was developed into the *consensus* of succeeding ones. Such alone is the kind of information respecting past times, which can be of service to the citizen for the regulation of his conduct. The only history that is of practical value, is what may be called Descriptive Sociology. And the highest office which the historian can discharge, is that of so narrating the lives of nations, as to furnish materials for a Comparative Sociology; and for the subsequent determination of the ultimate laws to which social phenomena conform.

But now mark, that even supposing an adequate stock of this truly valuable historical knowledge has been acquired, it is of comparatively little use without the key. And the key is to be found only in science. Without an acquaintance with the general truths of biology and psychology, rational interpretation of social phenomena is impossible. Only in proportion as men obtain a certain rude, empirical knowledge of human nature, are they enabled to understand even the simplest facts of social life; as, for instance, the relation between supply and demand. And if not even the most elementary truths of sociology can be reached until some knowledge is obtained of how men generally think, feel, and act under given circumstances; then it is manifest that there can be nothing like a wide comprehension of sociology, unless through a competent knowledge of man in all his faculties, bodily and mental. Consider the matter in the abstract, and this conclusion is self-evident. Thus:—Society is made up of individuals; all that is done in society is done by the combined actions of individuals: and therefore, in individual actions only can be found the solutions of social phenomena. But the actions of individuals depend on the laws of their natures; and their actions cannot be understood until these laws are understood. These laws, however, when reduced to their simplest expression, are found to depend on the laws of body and mind in general. Hence it necessarily follows, that biology

and psychology are indispensable as interpreters of sociology. Or, to state the conclusion still more simply:—All social phenomena are phenomena of life—are the most complex manifestations of life—are ultimately dependent on the laws of life—and can be understood only when the laws of life are understood. Thus, then, we see that for the regulation of this fourth division of human activities, we are, as before, dependent on Science. Of the knowledge commonly imparted in educational courses, very little is of any service in guiding a man in his conduct as a citizen. Only a small part of the history he reads is of practical value; and of this small part he is not prepared to make proper use. He commonly lacks not only the materials for, but the very conception of, descriptive sociology; and he also lacks that knowledge of the organic sciences, without which even descriptive sociology can give him but little aid.

(To be continued.)

FRIENDS' INTELLIGENCER.

PHILADELPHIA, TENTH MONTH 22, 1859.

PARENTAL CARE.—In a former number the necessity of employing well qualified teachers for little children was advocated. We are aware, however, that in many retired situations such cannot be obtained, and in that case we would encourage parents to undertake the duty themselves, rather than permit the period of infancy and childhood to pass by unimproved. Very many who have extensive out-door engagements, or heavy household cares, may shrink from the undertaking from a fear of their inability to instruct their children properly, without neglecting their other duties, but we believe that when the importance of the subject is felt, and parents bring their whole intelligence to bear upon it, they will be able to economize their time in such a way as to accomplish both with entire satisfaction.

To do this may at first require much thought, and perhaps some change in conducting affairs both in and out doors. But is not the well-being of a whole life time quite worth some temporary inconvenience; and is it not a duty which parents owe to their children to surround them with every advantage within their power?

We are not advocating a school routine; we know that would be impracticable to very many, even were it desirable, we only write to urge parents to see what they can do and how it had

best be done. Every right effort brings its own reward, and they who devote proper attention to the expansion of the minds and bodies of their little children will be amply repaid, not only in their progress, but in the peculiar sympathy that will spring up between them and their offspring. From early training and subsequent habit many persons perform much drudgery that might be done by even inefficient "hired help." To see work awkwardly done requires much patience on the part of employers, but if these have the noble end in view of devoting more time and thought to their children, may they not be sustained by our kind Heavenly Parent to hold out to the end?

From a mistaken idea of what is necessary in the training of little children, many parents feel that their book learning is not such as would qualify them for the task. It is true that a highly cultivated mind has within itself resources which a less cultivated one does not possess; but the latter must not flinch from an evident duty because it cannot be performed in the most finished manner. Parents who study the minds of their children and seek how to answer their little inquiries with clearness, will soon discern the best method of directing their powers of perception and observation into a pleasurable and healthful channel. If at work in the flower or vegetable garden, they may divert the attention of their little charge to a particular flower or fruit, and watch with them its daily growth, and perhaps point out some peculiarities that belong to certain families of plants; and when mothers are obliged to pass several hours of the day in the kitchen, they may manage by a little ingenuity to keep several children properly interested with attempts at drawing or copying printed letters from a book. A free use of the pencil is thus early acquired which greatly aids in learning to write.

We could cite many other examples that might be made available in a system of home education, if we did not know that the fidelity of a mother's love will supply abundant resources so soon as the conviction is realized that this mode is practicable and produces good results.

Isaac Taylor,* in his Home Education, has treated the period of infancy at some length. It is so full of excellent suggestions that we transfer to our columns a large portion of the chapter.

* Brother to the Authors of the Original Poems.

DIED, At Mount Kisco, West Chester county, N. Y., on the 11th of 9th mo. last, of consumption, BENJAMIN WEEKS, a member of Shappaqua Monthly Meeting, aged nearly 66 years.

In recording the decease of our dear departed friend, we feel that this language of Scripture may be appropriately applied, "Write, blessed are the dead that die in the Lord, from henceforth, yea, saith the Spirit, that they may rest from their labors, and their works do follow them." During his lingering illness, which he bore with Christian patience and resignation, he imparted much sweet counsel and encouragement to those whose privilege it was to watch beside his dying bed. Now, having finished his earthly course, his bereaved family and friends feel the consoling evidence that his purified spirit is received into the mansions of everlasting rest, where the redeemed of the Lord are forever ascribing salvation to our God which sitteth on the throne and unto the Lamb.

M. S. W.

—, At her late residence, in Mill Creek Hundred, New Castle county, Delaware, on the 1st of 6th month last, JANE THOMPSON, in the 73d year of her age. In the death of this our beloved friend we feel that a mother in our Israel has fallen. She was a woman of superior mind, and often near the close, gave evidence that her day's work was accomplished; she had nothing to fear, she was prepared and resigned to meet the pale messenger, and to pass through the dark valley and the shadow of death; her faith was firm, that there was a home prepared for her in the glorious mansion of rest and peace.

—, On the 19th day of the 6th mo., 1859, at his residence near Kennett Square, Chester co., Pa., JOHN HADLEY, in the 66th year of his age.

He was deeply concerned for the welfare of all, and spoke his mind freely without deceit, in what he felt to be right; setting an example himself by acting accordingly.

—, On the evening of the 14th inst., CYNTHIA, relict of the late Jonathan Ely, in the 80th year of her age.

The Annual Meeting of the "LIBRARY ASSOCIATION OF FRIENDS," will be held at the Library Room, in the third story of the centre building of the new Meeting House, Race Street, on Sixth day evening, the 21st inst., at 7½ o'clock.

Particular attendance is requested, by both males and females. Entrance on 15th Street.

10th mo., 1859.

THOS. RIDGWAY, Clerk.

For Friends' Intelligencer.

I want to tell all my good friends who rejoice in noble acquaintances, that I dined to-day with an artist who paints a good picture—can cook her own dinner, as well as wash the dishes, &c. Let every one cultivate his or her talent whatever it may be. Vigorous employment is the very best antidote for sickness of body, or derangement of mind. Allow me to assure my young sisters that regular duties and cares will often prevent the heart from being quite broken—and help to bind it up when it feels as if some of its tenderest cords were really severed.

How do we suppose that wives, who have faithless or worthless husbands, manage to earn bread for their families, and even lay up something for time to come? I learned the secret from such a wife; it was by persevering industry

and economy. When I see healthy and talented women content to eat the bread of idleness, and burden the family of relatives who have already more care than is healthy for them, I am reminded of the fig tree, or the unprofitable vine.

Human slavery can never cease, until rational intelligent beings of both sexes enter fully into the noble and independent principles of freedom obtained by work or labor. When this labor is justly divided, we may hope to see more of the Divine order, and less oppression of all kinds. The fair white threads of brotherly and sisterly kindness and of charity will be woven into the web of many an existence, which is now pining in solitude and want.

R.

For Friends' Intelligencer.

Many are the discussions in our Society at the present day, respecting abstract doctrinal points, and theoretical views of religion, and many ingenious efforts are made to bring Scripture passages to corroborate favorite opinions. If the time spent in such unprofitable discussions were devoted to cultivating a closer communion with the Divine Father, can we doubt that the work of righteousness on the earth would be more effectually advanced? For not in the noise of tongues, and confusion of controversy, do we see the cause of the Redeemer's kingdom promoted, but by the quiet, earnest efforts of individuals seeking after holiness; by the beautiful example of their daily lives; by the heavenly-mindedness of their spirits. These whom we see walking in robes of purity, and glorifying our Father in heaven, have gained their strength, by daily and hourly watching unto prayer. Unto us is the same door opened. We too may dwell in the inner court, and have the Holy of Holies unveiled before us. Do we avail ourselves of our privileges? Does not the worldliness of our spirits too often lead us away from this unceasing prayerfulness? Do we not too often grow weary of remaining on the watch. Oh, what preachers of righteousness we might all become, did we habitually dwell in this atmosphere of heaven, and bring its sweet influences into all the common concerns of life!

H.

A BEAUTIFUL THOUGHT.

How few men seem to have formed a conception of the original dignity of their nature, or the exalted design of their creation. Regarding themselves only as the creatures of time, endowed merely with animal passions and intellectual faculties, their projects and aims, and expectations, are circumscribed by the narrow outline of human life. They forget that instability and decay are written upon all earthly objects—that this world with all its pageantry of pomp and power is crumbling into dust—that the present life is scarcely deserving of a single thought excepting as it forms the introduction to another,

and that he alone acts either a prudent or a rational part, who frames his plans with a direct reference to that future and endless state of being. Sin has so blinded the understanding, and perverted the will, and debased the affections, that men never fail to invest some temporal good with fancied perfection, and idly imagine that the attainment of it would satiate the desires and fill the capacities of the immortal spirit. Vain thought! how little they know themselves! The soul is not "of the earth," and they will strive in vain to chain it to the dust. Though its native strength has been impaired, and its purity tarnished, and its "glory changed," it will always be a prisoner here. Send it forth, if you will, to range through the whole material universe; and, like the dove dismissed from the ark, it will return without finding a single place of rest; for it has no resting place but *the bosom of God*.

From The London Times, Sept. 23.

FATE OF SIR JOHN FRANKLIN'S EXPEDITION.

RETURN OF CAPT. M'CLINTOCK, R. N.

The Fox screw discovery vessel, Captain M'Clintock, R. N., which had been sent to the Arctic Regions, at the expense of Lady Franklin, to discover traces of the missing expedition, arrived off the Isle of Wight on Wednesday. On landing, Capt. M'Clintock at once came on by train for London, bringing with him two cases containing relics of the long missing expedition of Sir John Franklin.

We have been favored by the Secretary of the Admiralty with the accompanying letter:

"YACHT FOX, R. Y. S.

"SIR: I beg you will inform the Lords Commissioners of the Admiralty of the safe return to this country of Lady Franklin's final searching expedition, which I have had the honor to conduct.

"Their lordships will rejoice to hear that our endeavors to ascertain the fate of the 'Franklin Expedition' have met with complete success.

"At Point Victory, upon the N. W. coast of King William Island, a record has been found, dated April 25, 1848, and signed by Capt. Crozier and Fitzjames. By it we were informed that her Majesty's ships Erebus and Terror were abandoned on April 22, 1848, in the ice, five leagues to the N. N. W., and that the survivors, in all amounting to 105 souls, under the command of Capt. Crozier, were proceeding to the Great Fish River. Sir John Franklin had died on June 11, 1847.

"Many deeply interesting relics of our lost countrymen have been picked up upon the western shore of King William Island, and others obtained from the Esquimaux, by whom we were informed that (subsequent to their abandonment) one ship was crushed and sunk by the ice, and the other forced on shore, where she has ever

since remained, affording them an almost inexhaustible mine of wealth.

"Being unable to penetrate beyond Bellot Straits, the Fox wintered in Brentford Bay, and the search—including the estuary of the Great Fish River, and the discovery of 800 miles of coast line, by which we have united the explorations of the former searching expeditions, to the north and west of our position, with those of James Ross, Dease, and Simpson, and Rae to the south—has been performed by sledge journeys this Spring, conducted by Lieut. Hobson, R. N., Capt. Allen Young and myself.

"As a somewhat detailed report of our proceedings will doubtless be interesting to their lordships, it is herewith enclosed, together with a chart of our discoveries and explorations: and at the earliest opportunity I will present myself at the Admiralty to afford further information, and lay before their lordships the record found at Point Victory.

"I have the honor, &c.,

"To the Secretary of the Admiralty."

(Signed) "F. L. M'CLINTOCK, Captain R.N.

Inclosed are copies of original papers found by Captain M'Clintock on Prince of Wales Island: — of May, 1847.

Her Majesty's ships Erebus and Terror wintered in the ice in lat. 70 deg. 5 min., lon. 98 deg. 23 min. W.

Having wintered in 1846—7 at Beechey Island, in lat. 74 deg. 43 min. 28 sec. N., 91 deg. 39 min. 15 sec. W., after ascending Wellington Channel to lat. 77 deg., and returning by the west side of Cornwallis Island.

SIR JOHN FRANKLIN.

Commanding Expedition

Whoever finds this paper is requested to forward it to the Secretary of the Admiralty, London, with a note of the time and place at which it was found, or if more convenient, to deliver it for that purpose to the British Consul at the nearest port.

The same in French.

The same in Spanish.

The same in Dutch.

The same in Danish.

The same in German.

Left the ships Monday the 24th of May, 1847, the party consisting of two officers and six men.

G. M. GORE, Lieutenant.

CHAS. F. DES VŒUX, Mate.

The words "Wintered in 1846—47 at Beechey Island," should be "in 1845—46," as in 1846—47 they were beset in the ice, and ships abandoned in April, 1848. The same mistake occurs in both papers.

Admiralty, Sept. 22.

From the London Critic.

SIR JOHN FRANKLIN.

"It is now established beyond possibility of question that Sir John Franklin died on the 11th

of June 1847; that the ships were abandoned on April 22d, 1848, and were left in the ice by one hundred and five—the survivors of the crews—who attempted, under the command of Captain Crozier, to reach the Great Fish River. During the researches, Captain M'Clintock met with an intelligent old Esquimaux woman, who informed him that in the fall of 1847 one of the ships was forced ashore, and that 'many of the white men dropped by the way as they went toward the great river.' Of this fact the discovery party came upon evidence too cogent to admit of doubt; for, on the 24th of May, when about ten miles eastward of Cape Herschell, they came upon a bleached skeleton, around which lay fragments of European clothing, and beneath the snow was a small pocket-book, containing fragments of letters decayed but yet to be deciphered. Judging from the remains of his dress, this unfortunate young man was a steward or officer's servant, and his position exactly verified the Esquimaux's assertion that he 'dropped as he walked along.' All this, however, is as nothing to the discoveries of Lieut. Hobson, on the 6th of May last. This officer happened to pitch his tent beside a large cairn upon Point Victory, when, looking about among the loose stones which had fallen from the top of the cairn, he found a small tin case, which, upon examination, was discovered to contain the record of the horrible sufferings sustained by the lost crew. The following is said to be a brief abstract of this tale of hardship and woe: 'This cairn was built by the Franklin Expedition upon the assumed site of James Ross's pillar, which had not been found. The Erebus and Terror spent their first winter at Beechey Island, after having ascended Wellington Channel to latitude 77 degrees north, and returned by the west side of Cornwallis Island. On the 12th of September, 1846, they were beset in latitude 70.05 N. and longitude 98.23 west. Sir John Franklin died on the 11th of June, 1847. On the 22d April, 1848, the ships were abandoned, five leagues to the north north west of Point Victory, and the survivors, a hundred and five in number, landed here under the command of Captain Crozier.'

"This paper was dated 25th April, 1848, and upon the following day they intended to start for the Great Fish River. The total loss by deaths in the expedition, up to this date, was nine officers and fifteen men. A vast quantity of clothing and stores of all sorts lay strewed about, as if here every article was thrown away which could possibly be dispensed with—pickaxes, shovels, boats, cooking utensils, iron work, rope, blocks, canvas, a dip circle, a sextant engraved 'Frederick Hornby, R. N.,' a small medicine chest, oars, &c. A few miles southward, across Back Bay, a second record was found, having been deposited by Lieut. Gore and M. des Vœux,

in May 1847. It afforded no additional information. When in lat. 69 deg. 09 N., and long. 99. 27 W., Capt. M'Clintock came to a large boat, discovered by Lieut. Hobson a few days previously. It appears that this boat had been intended for the ascent of the Fish River, but was abandoned, apparently, upon a return journey to the ships, the sledge upon which she was mounted being pointed in that direction. She measured twenty-eight feet in length by seven and a half feet wide, was most carefully fitted, and made as light as possible; but the sledge was of solid oak, and almost as heavy as the boat. A large quantity of clothing was found within her, also two human skeletons. One of these lay in the after part of the boat, under a pile of clothing; the other, which was much more disturbed, probably by animals, was found in the bow. Five pocket watches, a quantity of silver spoons and forks, and a few religious books, were also found, but no journals, pocket-books, or even names upon any article of clothing. Two double barrelled guns stood upright against the boat's side, precisely as they had been placed eleven years before. One barrel in each was loaded and cocked; there was ammunition in abundance, also 30lbs. or 40lbs. of chocolate, some tea and tobacco. Fuel was not wanting; a drift tree lay within one hundred yards of the boat.

"As there can be no doubt that this statement is strictly and literally true, the dark mystery of Sir John Franklin's fate is finally and conclusively solved. There is no longer room for doubt. Those fond hopes which have been perseveringly adhered to by a few are now without the slightest foundation, and the names of Franklin and his crew must be finally enrolled among that noble army of martyrs who have died in the cause of scientific adventure.

GONE.

BY JOHN G. WHITTIER.

Another hand is beckoning on,
 Another call is given;
 And glows once more with angels' steps
 The path which reaches Heaven.

One young and gentle friend whose smile
 Made brighter summer hours,
 Amid the frosts of autumn time,
 Has left us with the flowers.

No paling of the cheek of bloom,
 Forewarned us of decay,
 No shadow from the silent land
 Fell round our sister's way.

The light of her young life went down
 As sinks behind the hill
 The glory of a setting star—
 Clear, suddenly and still.

As pure and sweet her fair brow seemed—
 Eternal as the sky;
 And like the brook low sung her voice—
 A sound which could not die.

And half we deemed she heeded not
 The changing of her sphere,
 To give to Heaven a shining one,
 Who walked an angel here.

The blessings of her quiet life
 Fell on us like the dew;
 And good thoughts where her footsteps pressed
 Like fairy blossoms grew.

Sweet promptings unto kindest deeds
 Were in her very look;
 We read her face as one who reads
 A true and holy book.

The measure of a blessed hymn
 To which our hearts could move,
 The breathing of an inward psalm,
 A canticle of love.

We miss her in the house of prayer,
 And by the hearth fire's light;
 We pause beside her door to hear
 Once more her sweet "Good-night."

There seems a shadow in the day
 Her smile no longer cheers;
 A dimness in the stars of night,
 Like eyes that look through tears.

Alone unto our Father's will
 One thought hath reconciled;
 That He whose love exceeded ours
 Hath taken home His child.

Fold her, oh Father! in Thine arms,
 And let her henceforth be
 A messenger of love between
 Our human hearts and Thee.

Still let her mild, rebuking, stand
 Between us and the wrong,
 And her dear memory serve to make
 Our faith in goodness strong.

And grant that she who trembling here
 Distrusted all her powers,
 May welcome to her holier home
 The well beloved of ours.

A FATHER TO HIS MOTHERLESS CHILDREN.

BY L. H. SIGOURNEY.

Come, gather closer to my side,
 My little smitten flock,
 And I will tell of him who brought,
 Pure water from the rock:
 Who boldly led God's people forth
 From Egypt's wrath and guile,
 And once a cradled babe did float
 All helpless on the Nile.

You're weary—precious ones—your eyes,
 Are wandering far and wide:
 Think ye of her who knew so well
 Your tender thought to guide;
 Who could to wisdom's sacred lore
 Your fixed attention claim!
 Ah! never from your hearts erase
 That blessed Mother's name.

'Tis time to sing your evening hymn—
 My youngest infant dove,
 Come press thy velvet cheek to mine,
 And learn the lay of love;
 My sheltering arms can clasp you all,
 My poor deserted throng—
 Cling as you used to cling to her,
 Who sings the angel's song.

Begin sweet birds, the accustom'd strain—
 Come warble loud and clear—
 Alas! alas! you're weeping all,
 You're sobbing in my ear.
 Good night—go say the prayers she taught,
 Beside your little bed:
 The lips that used to bless you there
 Are silent with the dead.

A father's hand your course may guide
 Amid the thorns of life;
 His care protect these shrinking plants
 That dread the storms of strife;
 But who upon your infant hearts
 Shall like that mother write?
 Who touch the springs that rule the soul!—
 Dear mourning babes, good night.

GOD OUR STRENGTH.

"Man in his weakness needs a stronger stay
 Than fellow-men, the holiest and the best;
 And yet we turn to them from day to day
 As if in them our spirits could find rest.

"Gently untwine our childish hands, that cling
 To such inadequate supports as these,
 And shelter us beneath thy heavenly wing,
 Till we have learned to walk alone with ease.

"Help us, O Lord! with patient love to bear
 Each other's faults, to suffer with true meekness;
 Help us each other's joys and griefs to share.
 But let us turn to Thee alone in weakness."

NOTHING LOST.

(Concluded from page 479.)

It would be scarcely possible, even if worth while, to determine whether the animal or the vegetable kingdom furnishes the larger amount of useful refuse; suffice it to say, that the vegetable contributions are almost endless in variety. Let us begin with the fibres, the great material for textile clothing. When the cotton-spinners are engaged in working up the hundreds of millions of pounds of cotton which our Liverpool and Glasgow merchants buy yearly, there are five kinds of waste which become scattered about the mill—"strippings," "flyings," "droppings," "blowings," and "sweepings;" all are carefully collected, not only for the sake of health and cleanliness in the work-rooms, but because they have a money value. The "cotton-waste dealers" will give for the strippings and flyings about half or two-thirds the value of new cotton; and for the other three kinds, a price about one-eighth or one-tenth of the original value. It is supposed that there is little less than 50,000 tons of this waste produced in Great Britain annually; it is worked up into coarse sheeting and bed-covers, or is sold to the manufacturers of printing paper, to be mixed with linen rags. In the United States, the cotton-waste is worked up into papier mache for tea-trays and other articles. Linen rags, besides their more prominent use in paper making, are largely made into lint for surgeons during war time. Coir, the fibrous husk of the cocoa, is employed as a ma-

terial for matting, sacking, rope, and other articles, especially where the power of resisting the attacks of insects is needed. Moss, from the woods of the Mississippi region, is extensively used for making the bags or bales in which cotton is shipped; and when this service is rendered, paper making affords a further resource. Sea-weed is employed in France for a great variety of purposes: it is made into paper; it is used for a lining material for ceilings and walls, on account of its incombustible properties and its power of resisting vermin; and it is employed by manufacturing chemists as a substance whence iodine and acetic acid can be obtained.

The minor uses of the numerous other components of the vegetable world are singularly varied. Rapeseed, linseed, and cotton seed, after the oil has been pressed out of them, present the form of husky cakes, which, both in themselves, and in the portion of oil which they still contain, are valuable as cattle food, for which they have very fattening qualities. It affords a curious instance of the discreditable adulterating practices of our day, that there are many factories in which the husks and refuse of rice are worked up into a substance called "shude," sold in thousands of tons, to adulterate oil-cake, to which it is made to bear a considerable resemblance—wanting, however, in the oleaginous properties of the latter. Grape husks, when charred, are employed in making the intensely black ink with which bank notes are printed. The raisin stalks and skins which accumulate on the hands of British wine makers form the very best filter for the use of vinegar manufacturers; and hence arises a certain advantage in carrying on both those processes in one establishment, as is done by the celebrated firm of Beaufoy, at Vauxhall. Rice husks, and the delicate pellicle which encloses the grain, are largely employed as a litter for stables, as a substitute for saw-dust, and as a food for live stock and poultry. The bran or refuse from the grinding and bolting of corn is useful as a food for cattle, as a material in tanning, as a cleanser in calico printing and tin plate making, and as a stuffing for cushions and dolls. Brewers' and distillers' grains are much sought after as fattening food for live stock. The bread-rasplings from rolls and over-baked loaves are used as a coating for hams, and in some districts by poor persons as a substitute for coffee. In Paris, such of these rasplings as have been carbonized to blackness are pounded, sifted, and sold as tooth powder. Beet root fibre, after the root has had the juice pressed from it for sugar making, is eagerly bought by the continental farmers as a fertilizer; while the skinnings from the boiling of the sugar are added to the food for cattle. This same sort of fibre will work up well with other substances as a material for paper, and for papier-mache tea-trays, &c. The

"trash" or fibre of the sugar cane, after the juice is expelled, is used by the West India planters as fuel; although chemists tell them that it still contains a great deal of valuable sugar, which might be more profitably applied. The molasses which is left as a residue in beet root sugar making can be distilled to yield a spirit, and then made to yield a useful amount of potash. Tan-pit refuse, a complex mixture with much vegetable and a little animal substance, is employed in hot-houses and forcing-stoves, and also for making a peculiar kind of charcoal. Maize, in America, besides supplying an important article of food for man, is brought into requisition in a great variety of ways: the grain is made to yield a spirit and an oil; the stalk has sugar and molasses extracted from it; the cob is an acceptable food for cattle; and the husk is employed for packing oranges and cigars, for stuffing mattresses, for making paper, and as a cheap substitute for horsehair. The cuttings of cork are used as a piston-packing for steam-engines, as a stuffing for beds and pillows, as a buoyant material for safety-boats and garments, and—when mixed with asphalt—as a road material for suspension bridges; the elegant new suspension bridge at Battersea Park furnishes an example of the last named kind. Rotten potatoes, damaged grain, and refuse rice, are sources whence excellent starch is obtained. Horse chestnuts, which used to be valueless, except as an occasional food for sheep, are now ground, mixed with a little carbonate of soda, to neutralize the bitter principle, washed to whiteness, and employed in making meal, starch, vermicelli, and macaroni. The brick tea made from the spiked leaves and stalks of the tea plant, is a cheap and portable substitute for regular tea; but the lie-tea, made from the refuse of the tea plantations, and from the sweepings of the Hong storehouses at Canton, is too often sold as an unfair adulterant. Acorns are roasted and ground for coffee in France. Malt "comings," the refuse of the kiln, is one of the too numerous adulterants of coffee, while as a more honest application, it is a valuable manure. Pea shells are carried in van-loads from Covent Garden Market to the dairies in the vicinity of the metropolis, as a food for milch-cows; in France, they are made to yield a little spirit by distillation, and are used also in paper making. Saw-dust and shavings have a multiplicity of useful applications: from mahogany, they are used in smoking fish; from boxwood, in cleaning jewelry; from cedar, in making "otto of cedar wood;" from sandal wood, in filling scent-bags; from deal, in packing bottles and ice, in stuffing dolls, cleansing metals, and sprinkling floors. Tobacco ashes, procured by burning damaged tobacco in the custom-house kiln or "Queen's Tobacco pipe" at the London Docks, are sold to tooth powder makers. In Savoy, walnuts are pressed

for walnut-oil; and the residue oil cake is eaten by children and poor persons. Palm oil, which is shipped to the extent of 50,000 tons annually from the west coast of Africa, for the manufacture of soap and candles, is made from a pellicle which surrounds the nut or kernel: this kernel used to be thrown away as a useless residue; but another kind of oil is now expressed from it. It has been estimated that there must be 10,000,000 bushels of nuts to yield the 50,000 tons of palm-oil; that the kernels from this enormous quantity ought to yield the more delicate oil—something like cocoanut oil—to the value of £3,000,000 annually; and that there would remain 112,000 tons of oil cake, worth £500,000 as cattle food.

Turn we finally to the mineral kingdom, which presents its own peculiar list of "waste" or refuse now applied to useful purposes. The screenings and siftings at our coal pits, once allowed to remain valueless, are now become a marketable commodity, either by themselves, or mixed with other substances to form artificial fuel. At the gas works, after the gas and the coke have been made from coal, there are many residual substances which, in the early history of the manufacture, were regarded as troublesome encumbrances; but now they nearly all become useful. From the liquid left in some of the pipes are manufactured sulphate of ammonia for manure, sal ammoniac for soldering and for calico printing, ammonia for dyers, and as one component in orchil and eudbear. A kind of oil useful as manure is obtained from the shale of the coal. Coal tar (of which 300,000 tons are among the annual residue of our gas works) is used in the preparation of printers' ink, lamp-black, asphaltic composition for pavements, disinfectants, artificial fuel, and for yielding a magnificent straw color dye for silk. There were days when naphtha, now used for artificial illumination, benzole, now used as a lubricator, and paraffine, now used for a variety of purposes, were all thrown away as waste. Ashes and small cinders form a well known ingredient in bricks; and soot is worth sixpence per bushel as manure, even if chemists make no use of it for the charcoal it contains. Argol, the sediment of wine casks, is imported to the extent of a thousand tons yearly; when purified into "cream of tartar," it is used as a medicine, and also as a mordant by dyers. One thousand tons of broken bottles, instead of being thrown away, are, in London alone, yearly consigned to the glass-furnace, to commence a new career of usefulness. Horseshoe nails, picked up by the grubbers about the streets, and the scraps of steel from needle factories, are eagerly bought up by the Birmingham gunmakers, as the best of all materials for the barrels of muskets and rifles. Steel pen waste is bought back by the Sheffield steel makers at £10 per ton; Birming-

ham brass filings fetch half the value of new brass; and steel filings are valuable to chemists and apothecaries. Jewellers' and goldbeaters' sweepings are rated at a very high value; the sweepings of the benches are always preserved for sale; the clothing and aprons have a sufficient number of particles of gold in and about them to give them a marketable value; the older they are, of course, the better. A goldbeater can generally obtain a new waistcoat for an old one; and sometimes a *very* old waistcoat will be bought by a refiner at a price almost fabulous. In all such cases, everything extraneous is burnt away, leaving precious gold as a residue. Tin plate cuttings, in hundreds of tons, are awaiting the result of experiments now being made to separate the tin from the iron, and thus render both again serviceable; meanwhile the scraps are applied to a few useful purposes. The old-iron shops, which are supplied by dustmen, street grubbers, mud larks, and other persons, in their turn supply the captains of American ships with battered and broken old kettles, sauce-pans, frying-pans, gridirons, candlesticks, tea-trays, shovels, boilers, corrugated roofing, &c.; these odds and ends serve as a cheap kind of ballast for ships going away with light cargoes.

Enough. Readers of any experience could easily add to this curious list of proofs that nothing is valueless—that there is good in everything.

ITEMS OF NEWS.

AFRICA—THE LIVINGSTONE EXPEDITION.—We have just been favored with the following copy of a letter from Dr. Livingstone, so recent as the 30th of July. The letter is addressed to Sir George Grey, and tells his own tale as follows:—

Kongou Harbor, July 30th, 1859.

Dear Sir George, We are now about to deliver our letters to H. M. S. Persian, and though I know that she has one on board for you of May last, I add a few words to that, as we are now sending some buarge seeds and living plants of the motsikiri. Dr. Kirk will write Mr. McGibbon as to how they are to be disposed, and I have now to beg your good offices for speedy transmission to their destination. The buarge will do well in Natal, in localities where other cultivation is impossible. Should it grow, no care is required for an annual crop, (a comfortable fact for all Hottentots, English, Dutch and African,) for it is simply pollarded when the fibre is mature in the inner branches. The seeds yield a paint, or drying oil. Some are for India and others for Natal; and we shall send more when we can. There are plants, too, of motsikiri, a tree, the seed of which yields a fat and an oil valuable in commerce. It is exported from Whambane. We have sent home a report, the joint productions of Dr. Kirk and myself, on the African fever; and we think our experience of it has rendered it a less formidable disease than heretofore. This will probably be published.

We have been able to furnish a report on the navigation of the Zambesi, after seeing all the changes to which it is annually liable. From what we have observed in an unusually dry year, a vessel, drawing two feet, such as they are obliged to use on the Mississippi,

could ply the whole of ordinary years. During four or five months each year large vessels could ascend the Tette. There the river is 964 yards from bank to bank, about three times the width of the Thames at London bridge; at the broadest parts it is about three miles, and divided into five or six channels. A tide pole put up at my suggestion by Major Sheard, showed a gradual rise above low-water mark of 8 feet, then a variation from 8 to 95 feet during some months, then a gradual decrease to 3½ feet. The low-water mark adopted was the surface of that in which from 18 inches to 24 inches were found in certain crossings from one channel to another. The channels then contained reaches, miles in length, of 8 to 10 feet, but in the crossings we had much difficulty; the vessel of 31-3 inches being what is called the "Niger canoe or pot-bellied shape," and so weak an engine as to be unable to help us in the difficulty. She was only 1-16th of an inch thick in the beginning, and is now like an old copper kettle, full of holes in one part. We are about to try Nyinyesi from the Shire, if she will only stick together so long. The Shire is more easily navigated than the Zambesi, as we have two or three fathoms constantly and can steam by night. We are in hopes, after surmounting a thirty mile difficulty, of getting on the lakes of Eastern Africa, and then we go to the Makololo country either afloat or afoot.

(Signed) DAVID LIVINGSTONE.

From the Cape Town Mail.

NURSERY TREES.—The Rochester (N. Y.) *Union* says of the nursery trade in Monroe county: "When we state that contracts are made by single individuals for trees to the amount of \$30,000, and even \$40,000, the reader can readily form an idea of the magnitude of the trade. These buyers come from all parts of the United States, the most, however, from the West. If we say that one million dollars' worth of trees will be sent from this county this fall, we do not think the figures are too high. And perhaps half of this sum is expended here for labor.

CHEMISTRY AND STREET DIRT.—The New York *Courier des Etats Unis* states that an ingenious French chemist at Lyons has just hit upon an expedient which promises to make the "dirty highway" a dream of the past. It has already been tried with great success in two of the leading thoroughfares of the city of Lyons. It consists in sprinkling hydrochloric acid on the macadamized way. After a baptism of this sort in the morning, the soil of the Place Bellecour, at Lyons, although very light and gravelly, is found at high noon to remain as solid and moist as if it had just been abundantly watered, and the wind fails to fan it into that fine dust which is the Egyptian plague of all great cities in hot weather. Nor does it appear to be necessary that the application should be very often renewed. Once thoroughly saturated with the acid, the ground shows each morning very much the firmness and neatness which follows a hoar frost.

INTERNAL NAVIGATION.—The commercial men of Oswego are agitating a new enterprise. It is proposed to construct a vessel of about one thousand tons burden, with a view to a direct trade with Europe. It is the largest size vessel that will pass the St. Lawrence Locks, and about double the size of the present lake craft. Carrying the cargoes of two vessels of the present size, she would require only about two extra men to sail her. Should the undertaking prove feasible, it is thought it will inaugurate a new era in transatlantic trade.

PATENT GRATE.—Lemuel Bangs, of this city is now introducing an improved grate for fire-places or open stoves, which is so constructed as to produce more

intense heat with less draught than the ordinary grate, whereby a slow fire insures perfect combustion and a great amount of radiation. It appears to be equally well adapted to burning anthracite and bituminous coals, and must economize both fuel and attendance.
—*N. Y. Tribune.*

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market is without change. Sales are confined to the wants of the home trade at \$5 a 5 25 per barrel for superfine; 5 37½ a 5 50 for extra, and 5 62½ a 6 75 for extra family and fancy lots. Rye Flour and Corn Meal continue scarce;

GRAIN.—The price of Wheat is hardly maintained; sales of 3200 bushels at \$1 24 a 1 25 per bushel for red, and white at 1 30 a 1 35. A sale of 700 bushels Southern Rye at 86c. and a lot of Penna. at 90c. Corn is more active; sales of 6200 bushels yellow at 92 a 93c. afloat, closing at the latter rate. Oats are in request, and 3000 bushels Southern sold at 44c. afloat.

CLOVERSEED is coming forward freely and is in good demand; sales of 2 a 300 bus. fair and prime quality at \$5 50 a 5 70 per 64 lbs. Timothy is worth \$2 25 a 2 50 per bus., and Flaxseed 1 52 a 1 55.

GENESEE VALLEY SEMINARY will be re-opened for the reception of pupils of both sexes, on the 1st of 11th month next, and continue five months. The course of instruction will embrace all the branches of a liberal English education.

This school is situated at Scottsville station, on the Genesee Valley Railroad, ten miles south of Rochester, N. Y.

Terms \$50 per term of five months, one half payable in advance. For a circular containing further particulars address

STEPHEN COX, Proprietor,
10 mo. 1—4 t. North Rush, Monroe co., N. Y.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The Winter Session of this institution will commence on the 14th of 11th mo. next, and continue twenty weeks.

Terms \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address

HENRY W. RIDGWAY,
Crosswicks P. O., Burlington Co., N. J.
9th mo. 24—3 m.

EATON ACADEMY, KENNETT SQUARE, Chester Co., Pennsylvania.

The Fourth Term of this Institution, under the charge of the present proprietor, will open for the reception of pupils of both sexes, on Second day, the 31st of 10th mo. next, and continue in session twenty weeks.

The course of instruction will embrace all the branches of a thorough English education, the higher Mathematics, Natural Sciences illustrated, the Latin, Greek, French and German Languages, and Drawing.

For terms and particulars, see Circulars, which will be forwarded to the address of every person requesting the same, upon application to

WILLIAM CHANDLER, Principal & Proprietor.
or to WILLIAM A. CHANDLER, Principal Instructor.

RUTHANNA JACKSON,
or to MAGGIE B. JACKSON,
CHARLES B. LAMBORN, } Assistants.

9mo. 10, '59,-2m

LONDON GROVE BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—It is intended to commence the next Session of this Institution on the 1st of

11th month, 1859. Terms \$60 for 20 weeks; no extras, except for the Latin and Greek Languages, which will be \$5 each. For Reference and further particulars inquire for Circular of

BENJ. SWAYNE, Principal,
London Grove P. O., Chester Co. Pa.

9 mo 3, 2 m.

ELDRIDGES HILL BOARDING SCHOOL FOR YOUTH OF BOTH SEXES, will open its Winter Session 11 mo 1st.

Terms \$70 per session of 20 weeks. For particulars address the Principal for a circular.

ALLEN FLITCRAFT,
Eldridges Hill Salem County, N. J.

8 mo 27 3 m.

THE BANKSDALE BOARDING SCHOOL FOR GIRLS, will be reopened the 14th of 11th month, and be continued twenty weeks. The course of study will comprise the usual English branches and Drawing. Terms \$60.

For further information apply to ELIZA HEACOCK, Jenkintown, Montgomery Co. Penn.

8mo. 27 3m.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

GEO. A. NEWBOLD,
Purcellville, Loudon Co., Va.

8th mo. 6, 1859.—6m.

BYBERRY BOARDING SCHOOL, FOR GIRLS.

The ninth session of Byberry Boarding School, taught by Jane, Anne and Mary S. Hillborn, will commence on the first Second-day of Tenth month, 1859, and continue forty weeks without intermission, (including two terms of 20 weeks each.) The course of instruction embraces all the branches of a liberal English education.

Terms \$60 per session of 20 weeks, one half payable in advance. For circulars containing further particulars address

JANE HILLBORN,
Byberry P. O., Philada., Pa.

8th mo. 7—3m.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates.

Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Pencilling, and Pellis work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; reading, Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M.

Attleboro', Bucks Co., 5th mo., 28, 1859. 6m.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, TENTH MONTH 29, 1859.

No. 33.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,

No. 324 South Fifth Street,

PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

A CHAPTER FROM JANNEY'S HISTORY OF FRIENDS.

In one of the most secluded and picturesque regions of Cumberland, there is a rocky eminence called Pardshaw Crag, which overlooks a natural amphitheatre. Tradition still preserves among the neighboring inhabitants an account of the immense concourse of people who, in the days of George Fox, met in the open air to worship at this place. Taking his stand upon the crag, that great minister of the gospel would lift his clear and powerful voice so as to be heard throughout the vast assembly; and wonderful were the effects produced by his persuasive and heart-searching ministry.

At these meetings many hundreds were convinced of the principles of Friends, and there is reason to believe that among them was John Burnyeat, who became an eminent minister of the gospel. He was born in the parish of Loweswater, in the county of Cumberland, about the year 1631. In his early years, being brought under the influence of divine grace, his heart was inclined to goodness, and he read diligently the Sacred Scriptures, in order to obtain the knowledge of heavenly things. Being earnestly desirous of advancing in the spiritual life, he went from teacher to teacher, but found no true satisfaction, until it pleased the Lord to send his ministers to turn his mind to the invisible word of life, which he gladly received, and waited in humiliation to feel its operation in the secret of the soul.

In relating his religious experience, he states that in the year 1653 it pleased the Lord to send his servant George Fox into the county of Cumberland, as a messenger of the gospel of

peace; and through his ministry thousands were directed "unto the light and appearance of Christ Jesus their Saviour, in their own hearts, that they might come to know him and the glory of the Father through him, in his appearance, and so come to believe in him with the heart, and with the mouth to confess him unto salvation."

While listening to these spiritual truths, John Burnyeat felt the judgment of the Lord upon the transgressing nature in his own soul; he was brought into deep affliction and sorrow of heart; and he perceived that all his profession of an imputative righteousness would not avail him while he lived in the practice of sin. It was then that the spiritual warfare began, and the state described by Paul was known: "To will is present with me, but how to perform that which is good I find not." . . . "O wretched man that I am! who shall deliver me from the body of this death?" He found a law in his members, warring against the law in his mind, and bringing him into captivity to sin. Then all his "high conceit," and his "notional faith," and "his hopes of justification thereby, were overthrown."

When the light of divine truth broke in upon him, he found that he, and others professing with him, had been feeding upon the tree of knowledge, endeavoring to sustain the soul by merely talking of that which the holy men of old possessed and enjoyed. While in this state they could not have access to the tree of life, so as to be healed by its leaves and sustained by its fruit; but as there was a coming under the sword of the spirit, which Christ brings to slay the carnal nature in man, there was an arising of the soul in newness of life. They who would reign with Christ must suffer with him; "for," says the apostle, "if we have been planted together in the likeness of his death, we shall be also in the likeness of his resurrection."

John Burnyeat being, through suffering, made willing to bear the cross, was brought into a state of humble obedience and entire reliance upon that inspeaking Word which redeems from sin, and gives assurance of eternal life. Being associated with others who were passing through the same fiery baptism, they found it their duty to withdraw from that formal and lifeless worship in which they had been engaged, and to meet together in silence to hear the voice of the true Shepherd of souls. Sometimes not a word was heard in their meetings for months,

but all who were faithful waited upon the living Word in their hearts to know sanctification thereby, and great was the joy they experienced when partaking of that heavenly food which sustains the soul.

During four years from the time of his conviction, he remained mostly at home attending to his temporal affairs; but he diligently attended meetings for divine worship, and occasionally visited Friends who were imprisoned for their religious testimonies. So great was the satisfaction he derived from the public worship of God, that when meeting was over, he longed for the coming of the next meeting-day, in order that he might, in company with his friends, partake of that spiritual communion which is the highest and purest of all enjoyments.

In this serene and peaceful state of mind, he was content and willing to abide; but the Lord, who had dealt so mercifully with him, began to show him that he must go forth in the power of his Spirit to bear testimony against the hireling shepherds, who fed themselves and not the flock. Accompanied by a Friend, he went, under a sense of religious duty, to a house of worship at Aspetry, where a clergyman named Warwick was preaching. On seeing the Friends come in, Warwick put forth some questions to provoke them to speak, but they held their peace; then he called on the constable to put them out, but that officer bade him go on with his sermon, saying, "They do not disturb us." When the service was ended, John Burnyeat began to speak to the people, during which the priest got away without allowing him a full opportunity to discharge what he considered his religious duty. The Friends then retired, and proceeded homewards, but John Burnyeat became greatly distressed under an apprehension that he had failed in his duty by sparing the priest whom he was sent to reprove.

Being greatly humbled and contrited before the Lord, he arose with boldness, and went back with speed till he came to the same house of worship, during the time of service in the afternoon. Having stood in silence till the service was ended, he spoke to the priest what he believed the Lord required of him, and then, after speaking to the people and clearing his conscience fully, he returned home with great peace of mind. In the year 1657, he went to Brigham, to speak to a priest who had brought many false accusations against Friends; and after waiting, as usual, until the service was ended, he fulfilled what he believed to be his duty, but immediately some of the congregation fell upon him and beat him severely, after which he was taken before Lanceolot Fletcher, who committed him to prison in Carlisle, where he remained twenty-three weeks.

In Cumberland, the meetings of Friends continued to increase, and among those added to

their number in the year 1654 was John Banks, who has left on record some account of his religious experience.

He was born at Sunderland, in the county of Cumberland, in the year 1638, and in early life removed with his parents to the neighborhood of Pardshaw. Through the judicious care and counsel of his pious mother, he was preserved from the corrupting influence of bad examples, and being sent to school early, he became a diligent and exemplary student. At fourteen years of age his father put him to teach school at Des-sington, and the following year he taught at Mosser Chapel, near Pardshaw, where he read the Scriptures and the homilies of the Church of England to those who attended the chapel on First days. He also joined with them in singing psalms and public prayer. "For this service," he says, "my wages from the people was to be twelve pence a year from every house of those who came to hear me, and a fleece of wool, and my table free; besides twelve pence a quarter for every scholar I had, being twenty-four." Among those who attended the chapel was John Fletcher, a good scholar, but a drunkard. He took John Banks aside and told him he read very well for a youth, but did not pray in proper form, offering at the same time to teach him. His instructions for praying were sent in a letter, which, coming to John while at the chapel, he went out to read. No sooner had he read it than his mind became convinced, through the immediate operation of divine grace, that a qualification for gospel ministry and acceptable prayer can only come by "the revelation of Jesus Christ;" and the language arose in his heart, in relation to the written instructions he had just been reading, "Thou hast this prayer from man, and art taught it by man, and he one of the worst of many." Under the solemn feelings then experienced, he determined never more to pray in that formal manner; and an impression at the same time attended his mind, saying, "Go to the meeting of the people in scorn called Quakers, for they are the people of God." Being at Pardshaw meeting the next First-day, "the Lord's power," he says, "so seized upon me in the meeting, that I was made to cry out in the bitterness of my soul, in the true sight and sense of my sins, which appeared exceeding sinful; and the same evening, as I was going to an evening meeting of God's people, scornfully called Quakers, by the way I was smitten to the ground with the weight of God's judgment for sin and iniquity, which fell heavy upon me, and I was taken up by two Friends. Oh, the godly sorrow that took hold of me that night in the meeting, so that I thought in myself every one's condition was better than mine! A Friend, who was touched with a sense of my condition, and greatly pitied me, was made willing to read a paper in the meeting, which was so suitable to

my condition that it helped me a little, and gave some ease to my spirit."

He was then about sixteen years of age, and at the end of the year when he was to receive compensation for reading at the chapel, he could not accept it, nor did he ever again read prayers to the congregation. For some years he continued under deep religious exercise, which so affected him, both in body and mind, that he had to relinquish his school. He then engaged in husbandry, and assisted his father in business, being doubtless convinced that useful industry promotes physical health and serenity of mind. At length, he says, "I overcame the wicked one, through a diligent waiting in the light and keeping close to the power of God—waiting upon him in silence among his people, in which exercise my soul delighted." "Oh, the comfort and divine consolation we were made partakers of in those days! and in the inward sense and feeling of the Lord's power and presence with us, we enjoyed one another, and were near and dear one unto another. But it was through various trials and deep exercises, with fear and trembling, that thus we were made partakers. Blessed and happy are they who know what the truth hath cost them, and hold it in righteousness!" . . . "My prosperity in the truth I always found was by being faithful to the Lord in what he manifested, though but in small things, unfaithfulness in which is the cause of loss and hurt to many in their growth in the truth."

About six years after his conviction, being in the year 1660, he appeared in the gospel ministry. "The Lord," he says, "opened my mouth with a testimony in the fresh spring of life, that I was to give forth to his children and people." "Oh! then a great combat I had through reasoning that I was but a child, and others were more fit and able to speak than I. But the Lord by his power brought me into willingness, and with fear and trembling I spoke in our blessed meetings."

At one time, as he was sitting in silence at a meeting on Pardshaw Crag, his mind was deeply exercised under an apprehension of religious duty to go to the parish house of worship at Cockermonth. Although much in the cross to his own will, he yielded, and went. When he entered the house, the minister was preaching; who cried out, "There is one come into the church like a madman, with his hat on his head. Churchwardens, put him out." They immediately thrust him out; but after awhile he went in again, and waited till the service was ended. Then he said to the priest, "If thou be a minister of Christ, stand to prove thy practice, and if it be the same as the apostles and ministers of Christ, in doctrine and practice, I will own thee; but if not, I am sent of God this day to testify against thee." The priest immediately departed, and a great uproar ensued, some of the people

being disposed to maltreat John Banks, and others endeavoring to protect him. At length he was hauled out of the house, but found an opportunity in the yard to address the congregation, opening to them the truths of the gospel of Christ, after which he came away in the enjoyment of "sweet peace and spiritual comfort."

EXTRACTS FROM A MEMOIR OF
ELIZABETH T. KING.

(Continued from page 499.)

Extracts from a letter to an aunt:—

BALTIMORE, 8th mo., 1854.

* * * I felt that the first inquiry every morning should be, "Lord, what wilt *Thou* have me to do?" and to that, the first attention and prime of my strength should be given, letting other things have their subordinate place, trusting that ability will be given for what is needful.

Sometimes there seems to be an accumulation of necessary duties, but I believe it is the enemy who piles them up, and that the single eye would not see so many.

A few days since, the questions seemed to come to me with such force and solemnity—What are we doing with our time, our talents, and our money? Is every thing done to the glory of God, or to minister to our own pride and love of ease?

If not to His glory, what excuse have we? Not of ignorance, surely, the written law without, and the Witness within, have taught us plainly.

Not of want of ability, for that is promised, and will be given to all who seek it.

We say we will throw ourselves upon the mercy of God, but are we not abusing that mercy by continuing in those things against which His Spirit has a controversy?

I can not tell thee how these questions have impressed me.

To one of her sisters:—

BALTIMORE, 9 mo., 1854.

If we are only favored to keep in the right way and the right spirit, nothing will befall us which will not conduce to our advancement; and this comfort always remains, that the *foundation standeth sure*.

It has seemed to me, that many difficulties arise, in the first place, from leaving the individual work, and if rightly improved they will drive us back to it; while nothing will be permitted to harm us if we are "followers of that which is good."

There is a rest which remaineth for the people of God, which nothing shall disturb—the way may be long and weary, but sooner or later the end will be attained. We may disquiet ourselves too much about events we can not control, and the faults of others which we can not mend. Having done our duty, in humility and sincerity,

there are many things which we must leave to Him who holdeth in His hand the hearts of the children of men and can turn them as He will.

10 mo., 1854.

My mind has been very much impressed with the duties we owe our servants, in watching for their souls as they that must give an account. They are placed, by the providence of God, under our care, that we may do them good, though this is not always so much by direct instruction, as by the influence of our daily lives and conversation, and our prayers on their behalf.

11 mo., 28th, 1854.

I have been very much impressed with the injunction to show piety at home. It is poor religion—is it not?—which can not bear little trials, and keep in a meek and quiet spirit under petty provocations and discouragements! And yet how many fail! How I do!

12 mo., 1854.

I quite agree with thee in thinking that some of these outside things must be cut off. Let those take them whose place it is, let every stone have its right place in the temple, but let us wait patiently and humbly for the great Master-builder to put us in the one we are to occupy. No matter if He seems to leave us comparatively useless for a long time, perhaps we want long chipping, and squaring, and polishing, before we are fit to be placed at all.

BALTIMORE, 1 mo., 1855.

I have suffered much from letting myself out into reading [naming some writings with which in early life she was much engrossed,] which tends to rouse up the old inhabitants of the land, who promised to be servants and now want to take the mastery again. My dear, thou dost not know how hard it is for me to lay down this crown; it is truly like parting with a right eye. Is it not sorrowful that it should be so hard to give up after long struggles, and when I really thought they were dead which sought the young child's life? Do let us try to be faithful and watchful, and beg earnestly for the precious fruits and gifts of the Spirit. We do have such answers to prayer when we are truly concerned, that we ought to be encouraged. I do not think that I have ever asked that it has not been given, both spiritual and temporal blessing, but it is needful to get very low, to dwell in the spirit of true prayer."

It must not be understood that she was opposed to mental cultivation, or considered the talents bestowed by our heavenly Father were not all to be improved. This was by no means the case, but it was her desire that everything should be kept in its place, entirely subservient to the one thing needful.

In a letter written in the early part of her religious experience, she thus makes the distinction:

I like thy distinction between mental *improve-*

ment and mental *excitement*. It is the latter which is so fascinating, that I am growing afraid to trust myself in any degree to my former habits and pursuits. M. J. Graham says in her memoirs, "Study has been, to me, like the stuff of Achan, beneath which was concealed the accursed thing." It seems to me rather more of a snare than an assistance, to any who would be likely to pursue it "for its own sake," as some say it ought to be, just as if we had any right to pursue any earthly enjoyment "for its own sake."

1 mo., 1855.

It seems to me that we are called to great watchfulness in our conduct toward all, avoiding even the appearance of evil, and careful not to crush the least scruple in the little ones of the flock.

We ought also to take heed that our speech be always "with grace seasoned with salt," that it may minister grace to the hearers. To redeem the time, not only from our pleasures, but also from our lawful and necessary cares, which too often absorb so much of our time and attention as not to leave us ability for the service which our blessed Master would call us into. Thus, though the days are evil, if we dwell so near our dear Saviour, we shall be favored to make our refuge under the shadow of the Almighty, till these calamities are overpast.

2 mo., 19th, 1855.

But we need not be discouraged.

"He who hath helped us hitherto
Will help us all our journey through;"

and this lesson of suffering, of nothingness, of poverty, and desertion, is no doubt our most profitable discipline.

Is it not a comfort to take every cup directly from the hands of our tender Father, appealing to Him—"Thou knowest all things, Thou knowest that I love Thee?"

I was shown yesterday that the word to those who were perhaps too anxiously inquiring—"Lord what wilt thou have me to do?"—was "Rest in the Lord, and wait patiently for Him," and that in quietness and confidence should be their strength. That, however desirous they may be to journey forward, they must wait until the cloud is lifted from the tabernacle, and the word is given, and "Though it tarry, wait for it, because it will surely come, it will not tarry."

To a Sister:

BALTIMORE, 3 mo., 11th, 1855.

We must find out our own work. The only safe way for me, I find, is to wait day by day, to have my work given me, and not be looking out too much, or even too anxiously, for something to do. It is surprising how, in this waiting state, the way opens sometimes; and how it is closed up at others; but if I try to move in the dark I mostly stumble, so then I have to keep quiet. It is

difficult to understand why, with the inclination and the apparent ability to do, we should ever be commanded to keep quiet, when there is so much to be done; but our ignorance is the first lesson to be learned; and, alas! has to be often repeated. Prayer, however, is our great weapon; we truly never ask aright for anything which is not granted.

Do not the repeated tidings of sickness and death among our friends, which have reached us lately, make thee feel very solemnly the uncertainty of every thing, the unreality of this life? As we grow older, one after another must drop away, until we go too. How strange it is that we will persist in being so solicitous about the accommodations and enjoyments on this short journey!

(To be continued.)

An Address on the subject of Burials, issued by the Monthly Meeting of Friends, held at Green Street, Philadelphia, to its Members.

Dear Friends,—The manner in which our funerals are now conducted, the unnecessary expense and parade that attend them, have been cause of much exercise to this meeting; and desiring the preservation of our members in that simplicity and moderation which becomes our profession, we are induced to address you.

Death, that certain messenger, is continually removing from among us those who are dearly beloved. We are fully sensible that at such seasons the tenderest feelings of our nature are sorely tried; and we desire that our attempt at kindly admonition may not be considered an undue interference with the private rights of individuals.

We have had unitedly to admit there is among us at this time a wide departure in practice from the simplicity of Truth; and believe a closer adherence to the recommendations of our discipline, would in great measure remove the cause of the concern under which Friends now suffer.

With this view we recommend that on the occasion of a funeral there should be punctual observance of the hour appointed, and that Friends refrain from conversation, and endeavor to gather into solemn silence, that such opportunities may prove seasons of divine favor.

The obsequies should end when the time arrives for the removal of the remains, which may be accompanied to the place of interment by a few carriages, for the accommodation of members of the bereaved family, or friends chosen by them. Such a course would, we believe, be consistent with that Christian testimony against vain parade, which as a Society we profess to uphold; and would not detract from due respect to the dead.

It is advised that Friends generally, and especially those in affluent circumstances, should be careful in the observance of true Christian

moderation in arraying the bodies of their deceased friends for interment, and in all points pertaining to funeral arrangements; that they may not, by indulging in costly habits, set a hurtful example to those of more limited circumstances.

If it be the wish of the family that their friends should assemble at the Meeting House on these solemn occasions, we would encourage Friends to pursue the course prescribed by discipline; it being our judgment that it contemplated such religious meetings.

Signed on behalf of the meeting.

SAMUEL W. BLACK, }
ELIZABETH WHITELOCK, } Clerks.

Philadelphia, 9 mo. 22, 1859.

From the London Friend.

MENTALLY POOR, BUT SPIRITUALLY RICH.

At a public meeting lately held at Cheddar, Somerset, by a minister of our Society, he alluded to the case of an idiot of that village, who, notwithstanding his mental imbecility, appeared to have been "born from above, and made divinely wise." The case excited much interest in the mind of the writer, and he was led to believe that some information respecting it would not be unacceptable to the readers of *The Friend*. The following particulars were obtained, by inquiry, from the sister of the lad, excepting the account of a visit paid him by a Friend, which is given in the words of the latter, as kindly furnished by him to the writer.

William Hill was from childhood of very weak intellect, incapable of learning to read or to reckon. He had some correct idea of the relative value of different kinds of money, distinguished as brown, white and yellow. His ability as a field-laborer was limited; he could not dig straight, but was very persevering in his his work—setting himself a task, and resolutely performing it, wet or dry.

Lavater, inspeaking of Fuseli, alludes to the disproportion which often exists between the will and the mental power. "A copious proportion of will, he states, is sometimes assigned to minds whose faculties are very contracted; while frequently, with the greatest powers, there is associated a will feeble and impotent. William Hill was an instance of the former; for, with very contracted faculties, he possessed so strong a will, that one of his nearest relatives was afraid to encounter it. Though he was what the Scotch call "an innocent," his soul's enemy found means to put evil thoughts in his heart and sinful words in his mouth; for, in addition to his violent temper, he was at one time addicted to swearing. He felt particularly jealous of the rich, and did not understand how God could justly make such a difference in the lot of mankind, saying, "Why not make all alike?"

The shadows of the picture are now mostly laid in; the lights are soon to follow. Soon do we see the day dawn, and the dayspring arise in the heart of this poor imbecile.

In the earlier part of the illness which eventually proved fatal, he was very irritable. The abscesses with which he was afflicted were enough to account for this. On a faithful minister of the Gospel informing him that it was likely these abscesses would carry him off, and on his being seriously spoken to on the subject of death, he was quite affronted, saying, "Massa W— think he know everything; why don't he mind his own business? He know no more than anybody else."

The sequel, however, showed that the warning given led eventually to a care for his soul. During his illness his feelings and words underwent a marked change; his irritability almost left him; his jealousy of the rich was turned into prayer for them. He could now take a just view of their case, saying, "The Lord only lend, not give;" and that where they did not give to the poor, "he shouldn't like to stand in their shoes."

On one occasion, he spoke in a striking manner to a young person on the need of having the blind eyes opened, saying it was no use to kneel down to say prayers, but pray for the Spirit to come into the heart; and that, till the Lord opened his blind eyes, he had "no hope heaven." The clergyman of the parish having kindly called and read a prayer to him, William Hill in turn prayed for the former after he had left, and said he hoped he should meet him in heaven.

He could not see the need of praying by book, saying, "Why not pray from heart? Lord want no fine words." When very ill, hearing that a Friend was coming up stairs to see him, he was much pleased—indeed so excited, that his sister tried to compose him, fearing he would hurt himself; but he exclaimed, "I must tell — what the Lord has done for my poor soul." Subjoined is the Friend's own account of the interview:—

"*Third Month 24, 1847.*—Visited William Hill, of Cheddar, an idiotic young man, who has been for some time confined to bed by illness. On my asking how he was, he replied, 'Very poorly, but happy—happy in the Lord.' One of the remarks which he made to me was, 'I can see into it now; the Lord opened my blind eyes.' And again, 'The Lord teaches poor sinners. I can't read, but the Lord puts it into my mind.' On my coming away, he said, 'Twill be a happy day when we meet together to sing alleluia to the Lamb.' He died soon after in much peace.

He suffered much at last from a complaint both painful and loathsome, and longed to be gone. Still he felt that his stay would not be delayed beyond the right time, and was firm in

his faith as to the end saying, "The Lord have me tight, he never let me go; the Lord done all things well. Devil tell me I not go to heaven sometimes; but no good, Lord got me tight," &c. He soon strove to lessen the feeling of his own sufferings by comparing them with those of Job, and the Saviour's pains on the cross—his nailed hands and pierced side.

A few hours before his death he appeared to be contemplating some brilliant sight, and strove to make his sister enter into it. He said, "The sun shine so bright all round a Lord's house, and I soon be there now." He thought he heard some one in the next room, and on being assured that no one was there, he said, "Well, then, the Lord send spirit after me. I go soon." His last breath was drawn without a struggle.

Thus was fulfilled the declaration of the psalmist, "The opening of thy word giveth light, it giveth understanding to the simple;" and the more recent saying was exemplified, "If Christ thou knowest, thou knowest all things."

E.

A VICTORY OF PATIENCE.

Among the numerous families who were driven from France by the revocation of the Edict of Nantes, was one which emigrated from the town of Uzès, in the department of the Gard, and established itself at Geneva. One of the members of this family, at that time a child, but who subsequently distinguished himself as a philosopher and sage, was named Firmin Abausit. This youth was educated by his parents in the severe principles which characterized the religious confessors of that age, and gave early promise of an honorable career—a promise which was afterwards amply fulfilled. As he grew up into life, he devoted himself to the study both of natural and moral philosophy, and visited some of the principal countries of Europe, where he made the acquaintance of the most learned and illustrious men of his time, such as Bayle, Sir Isaac Newton, etc. On his return to Geneva, he received the appointment of city librarian, and was also, without solicitation, invested with all the rights and privileges of a citizen of the republic. He now continued his favorite pursuits, and published many pieces (which were reprinted in London in 1773) on history, criticism, and theology, among the last being two which are especially worthy of notice, namely, the treatises entitled, "The Knowledge of Christ," and "The Honor which is due to Him." Meanwhile, his life was so blameless, that he became no less distinguished among his fellow-citizens for his virtues than for his knowledge; and so great was his reputation at Geneva, that in after years he was compared by one of the most celebrated of her sons, Jean Jacques Rousseau, to Socrates.

Unlike most philosophers, whose wisdom is to

be found only in the discourses which they make, or the books which they publish, Abausit endeavored to illustrate his teachings by his life, and thus to recommend their adoption by those around him. It seems to have been one of his principal aims to inculcate patience and resignation; and it is said that he was never known to abandon, even for a moment, that serenity of spirit which he wished to see universally cultivated and enjoyed. The following anecdote, which is related of him, furnishes evidence of this; and, as it is in *little things* that a man shows what he really is, we may reasonably infer from it the great amiability of his character.

Two foreigners, who were on a visit at Geneva, hearing of the imperturbable placidity which characterized Abausit, concerted with some of his most intimate friends to provoke him to some manifestation of displeasure, or, perhaps, even of anger. They immediately set to work to discover the weak point in Abausit's character, in order that, by directing their attack thither, they might the more certainly succeed in their attempt.

Having made some inquiries about the personal and domestic habits of their intended victim, they learnt that he lived alone with an old housekeeper named Jeanneton, with whom they soon proceeded to place themselves in communication. From her they received the unwelcome information that, during the thirty years which she had spent in his service, he had never departed, in all his relations with her, from that unchangeable gentleness for which he was distinguished. She, however, added that, when she committed one of those slight inadvertencies to which even the best servants are sometimes liable, her master, assuming a more grave manner than usual, mildly directed her attention to it, and, when addressing her on the subject, cut off a syllable from her name, calling her Jeanne instead of Jeanneton—a punishment which never failed to produce the desired effect.

The two strangers, a good deal disappointed by what they had just heard, which did not augur well for the success of their enterprise, then endeavored to interest the housekeeper in it, and even tried to purchase her co-operation. The old domestic at first refused their offers. Seducing as they were, the apprehension of exciting the anger of so good a master sufficed to counterbalance them for a time. But, alas! the prospect of gratifying the two gentlemen who were seeking her aid, coupled with that love of money which is the curse of the human race, at length decided her to take part in the execution of the measures which were to be contrived against him. Of all the plans which were proposed, none appeared to Jeanneton to have the slightest chance of success; and, at length, growing impatient at her persistence, the visitors begged her to tell them what were the inadvertencies on her part,

which had sometimes produced the change in her master's deportment, of which she had informed them. It was with much hesitation and confusion that she at length avowed that Abausit was very particular about having his bed well made, so as to be quite soft and easy. A hard, ill-made bed, then, was the weak point—the vulnerable heel, so to speak, of this moral Achilles, whose patience rendered him proof against all other kinds of ill. The bed was, accordingly, badly made by the faithless Jeanneton. The voluntary negligence to which she had given way assumed in her eyes all the appearance of a crime; and if, when night came, her master rested uneasily in his neglected bed, she rested no less uneasily in hers, afflicted by the thought of what she had done. The next morning, Abausit having risen earlier than usual, contented himself with saying, in the graver tone which he was wont to employ on such occasions, "Jeanne, my bed was not made," and then went out for his accustomed early walk. Soon after, the visitors made their appearance, in order to learn the result of their scheme, and were much disappointed to find that it had signally failed. However, they insisted that the unfortunate housekeeper should try it again. "You see," they said, "that your master has made the first step towards losing his temper; the battle is half won, and to-morrow we shall, no doubt, succeed."

These artful words persuaded her a second time to leave the bed unmade; and Abausit, when he retired at night, found it in that state, and of course more uncomfortable still than it had been the night before. But what was the surprise and emotion of Jeanneton when her master, as he was going out the following morning, stopped before her for a moment, and said in a gentle and affectionate tone: "My poor Jeanneton, you are growing old; feebleness and suffering, no doubt, render the task of preparing my bed too difficult for you. Well, do not trouble yourself about it; I will make up my mind to be less comfortable in that respect, for, after all, the inconvenience is not great, and I am beginning to get accustomed to it."*

On hearing these unexpected words, the poor woman fell on her knees, and with tears revealed not only the plot which had been contrived to shake his equanimity, but also the way in which she had lent herself to it, and what she was to have gained in case of success. Abausit kindly assisted her to rise, and assured her of his forgiveness; almost thanking her for having given him an opportunity to overcome his tendency to self-indulgence, and half apologizing for having prevented her from gaining the promised reward.

And now, my readers, I ask you to imagine

* "Le mal n'est pas grand; je commence a m'y faire." These are the very words used by Abausit.

if you can, how soft that bed was ever after, and how carefully it was prepared by Jeanneton from day to day, as a sort of expiation for the fault of which she had been guilty.—*Leisure Hour.*

FRIENDS' INTELLIGENCER.

PHILADELPHIA, TENTH MONTH 29, 1859.

TO CORRESPONDENTS.—The account of the Yearly Meeting of 1821, sent us for insertion, is so similar to that of the previous year, which was published in a former number, that we omit it.

MARRIED, According to the order of the Society of Friends, in Austerlitz, Columbia co., N. Y., on Fourth-day, the 21st ult., WILLIAM B. COFFIN, of Chatham, to SUSAN, daughter of Henry Robinson.

—, at East Nottingham Meeting House, according to the order of Friends, on 3d day the 18th of 10th mo. 1859, SAMUEL LIPPINCOTT, of Woodbury, New Jersey, to HANNAH B. KIRK, of Chester County, Pennsylvania.

—, on the 15th of 10th mo., by consent of Fall-creek Monthly Meeting, WARNER M. TRUEBLOOD, of Washington Co. Ind., to NARCISSA, daughter of Daniel and Eliza Allen, all of Henry Co. Ind.

—, on Third day evening the 25th inst., at the residence of Samuel Caley, by the approbation of Philadelphia Monthly Meeting of Friends, held on Race St., SAMUEL B. HAINES, of New York, to REBECCA M. ROWLAND, of Philadelphia.

DIED, On the 7th inst., at his residence, Cross-wicks, N. J., after several weeks of intense suffering, PETER ELLIS, a member of Chesterfield Monthly Meeting, in the 72d year of his age, making a peaceful close of a life of marked integrity.

—, on the 19th inst., in the 80th year of his age, ENOCH ALLEN, an esteemed member of Philadelphia Monthly Meeting. His life was marked by innocency and uprightness.

—, on the 19th inst., by the accidental discharge of a gun, CHARLES P. son of Edward and Amy P. Middleton, in the 15th year of his age.

INFANCY.

(Continued from page 502.)

The incidental conveyance of general knowledge during the early period of education, generally takes its rise from two kinds of occasions, namely, in the first place, from the occurrence of words and phrases, in reading or conversation, of which a child asks an explanation; and, secondly, from the occurrence of phenomena—ordinary or rare—which may chance to excite his curiosity. And these two occasions of imparting knowledge easily run one into another; as when, for instance, the meaning of a word is asked—Evaporation; and the thing is exhibited, by the holding a damp newspaper before the fire. On the contrary, if the disappearance of the dew on the window has been observed, the technical

term may opportunely be connected with it, in the way of elliptical interrogation:—What you see going on is?—Evaporation.

Some advantage may result from allowing an interval of time to pass between the one sort of explanation and the other; for the mind always holds more firmly that which it seizes by a rebound, as thus—What does this word evaporation mean?—The turning of water, or of other fluids, into steam, or vapor, by the application of heat.—Anything damp is dried by?—Evaporation. After the lapse some days, the steam arising from a gravel walk, in a sunny aspect, after a warm shower, is noticed; and the question is briskly put—The rain that is fallen on the path is turning into vapor;—what is this called? The answer, if given correctly, at a distance of time, is likely to fix itself indelibly in the memory: and the next step, with an intelligent child, will not improbably be some spontaneous effort of generalization; as when a bottle of wine, brought from the cellar, is seen first to be bedewed, and then to dry in the heated dining-room—Is not this too—evaporation? And this will lead further:—Can nothing but water and liquids be evaporated? Yes, we might say, a solid body, such as a lump of metal, or of brimstone, is evaporated, when it is converted into gas heat; but then we use another word, and call it—sublimation.

Yet in all such incidental conveyances of particles of scientific information, we should keep in view our real intention; which is by no means that of imparting a certain amount of scientific knowledge, at a certain age; for this is a point of no consequence;—but what we mean is to make a commencement of intellectuality—to keep the mind in alliance with reason and nature; and, if anything further need be regarded, to familiarize, a little, the terms and the facts of philosophy, so as to facilitate the arduous studies of a later period.

In truth, if this sort of desultory, and yet well-directed initiation in science is constantly pursued, the more systematic instruction which must at length follow, may be so much the longer delayed; and meantime that fresh bloom of the faculties may be preserved, which is always more or less impaired by laborious studies.

A very slender apparatus of amusement is found to be enough, where children are accustomed, on the one hand, to much active sport abroad; and on the other, are intelligently conversed with, at all hours, by their teachers. Munificent grandmamas, and affluent aunts, will, spite of remonstrances, continue to be good customers at the toy-shop; but those who have actually had to do with children, are well aware of the fact that no delight is so brief as that caused by the possession of an elaborate and costly toy; in truth, the pleasure, as to its continuance, seems generally to be in inverse pro-

portion to the sum that has been lavished upon the gift. And often, in consideration of the kind donor's feelings, a little artifice has to be used in order to make it appear that the splendid article has not become an object of indifference or disgust, the very next day after its arrival.

A crooked stick of his own finding—the handle of a broom—the gardener's cast-off pruning-knife; or a tin mug without a bottom, will be hoarded by a child, and mused over, and converted to twenty whimsical purposes, day after day, perhaps for weeks, and certainly until after the toy which cost what would have fed a poor family as long, has been consigned to the lumber-room.

The real charm of a toy, or of any implement of amusement, is derived from the power it possesses to excite the *CONCEPTIVE FACULTY*; and hence it is that the more it leaves to be filled up by the imagination—the ruder it is—so much the keener and the more lasting is the pleasure it affords. On the contrary, an elaborate and a representative toy, although it may excite a momentary amazement, quickly loses its power to please, and is discarded. When carving, and gilding, and painting have done their best to make it the very image of reality, the mind of the child, unconsciously, but in fact, resents the officiousness of the artist, who has encroached so far upon its own province; and it turns with fondness (often to the wonder of bystanders) to the most misshapen symbol of man, or dog, or horse, or horse, or cart, and, by the very means of the glaring imperfections of this image, finds scope for the exercise of its own creative and imaginative powers.

It is an error, teeming with practical mistakes, to think of children as if they were sensual, chiefly, in their tastes. In truth, the disproportion between sense and soul, between matter and mind, is usually much greater with the same individual, in childhood, than it is at an adult age. The want of culture, or the long-continued pressure of necessity, or the indulgence of sensual propensities, often obliterates the intellectuality and the moral sensitiveness which had belonged to the child, so that the man at thirty is, in a philosophic sense, much less remote from the brute, than he had been at four or at five. The vivid pleasure derived by children from the objects that surround them, instead of indicating the prevalence of the animal part of our nature, is directly a proof of the vivacity and supremacy of its intellectual elements. A child's happiness is the happiness of the *SOUL*, much more than of the body;—his joys, instead of staying in the sense, go through and through him; and just as a babe of three months old smiles all over, when it smiles at all, and kicks with merri-ment; so does a child enjoy what he enjoys, with a throb of his every faculty.

Far more use might be made of this means of quickening the mind than is often attempted; and let me be allowed to remind young mothers that, in practical value, the ability to sketch rapidly all sorts of common objects, in a characteristic manner, vastly outweighs some of those accomplishments to which years are devoted in youth, and which are usually laid aside, and lost, when the duties of domestic life are entered upon. Prints, it is true, may be purchased; but besides many objections to which they are liable, and their cost, if provided in sufficient number and variety; it is found that a fresh sketch, adapted to the occasion, and suited to a child's age and taste, imparts more pleasures, and subserves better the ends intended.

A mother, qualified to use her pencil in this manner, may, without labor, bring all the most familiar and the most striking forms of nature and of art before the eye of a child; and thus, not merely impart various information (a secondary object) but feed and furnish the earliest developed of the faculties—the *conceptive*; and at the same time bring into action the powers of observation and discrimination; and all this may be done without in the slightest degree stimulating or straining the faculties: the brain is not worked in any such amusements.

By the same simple means, the kindly emotions and placid sympathies of a child's heart may be set a-going, if a mother's pencil is equal to the task, and it is not a very difficult one, of roughly sketching the employments, incidents and accidents of common life—the trades and occupations of men, and the domestic drama, if the phrase may be used, and the mishaps and catastrophes of the sailor, the traveller. A folio of such sketches, swelled from year to year by daily additions, would be an invaluable treasure in a family, and might descend to the mammas of several generations; and how much more creditable to the hand that produced it, than the painted albums, and the bristol-board frippery, that so often load a drawing-room table!

There can be no doubt that poetry should be employed as a principal means of intellectual and moral culture, during the first period of education; and by *POETRY*, as adapted to infancy and early childhood, I intend, severally—rhyme—rhythm—ornamented description of familiar objects, and condensed moral sentiment. Each of these elements has its peculiar use for the purpose now in view; but it need not be said that the higher elements of poetry, that is to say, whatever the adult mind regards as constituting its paramount excellence, are excluded when we are speaking of verse for children. Not indeed as if poetry for children should be *unpoetic*, or should be of cheap manufacture; but that it should tread flowery meads, rather than climb the mountain path, or soar to the skies.

No one who has had to do with children can

need to be told that both rhyme and rhythm are of great utility, considered only as organic means of fixing certain series of words and sentences in the memory. This is understood in every nursery; nor does there appear to be any backwardness in applying so obvious and easy a means to all purposes of instruction. I would, for my own part, largely employ the rhythmical medium for conveying whatever has any manifest analogy with pleasurable imaginative sentiments: but then, and for the very purpose of securing to it its greatest possible effect, on this its proper ground, I would (notwithstanding certain specious reasons of convenience) entirely refrain from the use of rhyme and metre as a mere implement of memory, and for the conveyance of dry facts;—such as terms of science, dates, and the abstract rules of grammar, or the like. These seemingly useful devices—the jingling grammars—the jingling geographies—the doggerel histories and chronologies, such as—

Charles the First was his son, and martyr made;—
Charles the Second, his son, was comical blade:

or stanzas interrogative—such as—

And who was by an arrow slain,
While chasing the fleet stag in vain,
And left his brother next to reign?

are to be rejected because they vitiate the taste; while although to a very limited extent this species of doggerel aids the memory, it quashes the mind, and obstructs that intelligent grasp of facts which is really of importance; while the lodgment of facts in the memory may readily be secured by more fit means. For example, after history has been read, (and it is of no use at all previously,) and when distinct ideas are attached to names, then the series of persons and succession of events may, with great ease and clearness, be fixed in the mind by frequent references to a well-constructed home-made chronological chart; and an intelligent child—intelligently dealt with, will then spurn the toy history-book, as fit for babies only; and if we are thinking of babies, they had much better listen to the—Who did kill cock Robin? than the—Who killed king Rufus?

Infancy, as I have said, is emphatically Nature's season; and parents may be well content, so far, who see their children reach the verge that separates infancy from childhood in blooming health—happy in habit as in temper; with transparent dispositions—with a curiosity alive—with a moderate command of language; and, if I may be allowed the figure, with a lap full of the blossoms of philosophy, unsorted and plucked as they have come to hand.

One might say even less than this; and yet affirm that the period of infancy has passed auspiciously, if only the cheek be ruddy, the eye sparkling, the sympathies prompt and kind, and the habit of implicit obedience thoroughly form-

ed. Happy are the parents who are devising the more elaborate processes of education, and are just commencing what may be called the business of instruction, with children of seven and eight years old, of whom as much as has now been stated might be affirmed—and nothing more.

In a word, if the anxious inquiry of some parents in relation to infancy and early childhood is—What are the most effectual means of development? the inquiry which I would substitute for such a question is of this sort—How shall we best pass over the same period without any development but what is wholly spontaneous?

WHAT KNOWLEDGE IS OF MOST WORTH.

(Continued from page 504.)

The author then treats of the remaining divisions of human life, which includes the relaxations, pleasures and amusements filling leisure hours. The range he takes on these subjects is wider than seems to us safe, considering how fascinating mere amusement is to the youthful mind. It is true that he regards *science* as necessary, even in the cultivation of æsthetics, but were a taste for the *natural* sciences cultivated, it would no doubt supersede the taste for artificial excitement. He goes on to speak of science in connection with poetry.

The current opinion that science and poetry are opposed is a delusion. It is doubtless true that as states of consciousness, cognition and emotion tend to exclude each other. And it is doubtless also true that an extreme activity of the reflective powers tends to deaden the feelings; while an extreme activity of the feelings tends to deaden the reflective powers: in which sense, indeed, all orders of activity are antagonistic to each other. But it is not true that the facts of science are unpoetical; or that the cultivation of science is necessarily unfriendly to the exercise of imagination or the love of the beautiful. On the contrary, science opens up realms of poetry where to the unscientific all is a blank. Those engaged in scientific researches constantly show us that they realize not less vividly, but more vividly, than others, the poetry of their subjects. Whoever will dip into Hugh Miller's works on geology, or read Mr. Lewes's "Sea-side Studies," will perceive that science excites poetry rather than extinguishes it. And whoever will contemplate the life of Goethe will see that the poet and the man of science can co-exist in equal activity. Is it not, indeed, an absurd and almost a sacrilegious belief that the more a man studies Nature the less he reveres it? Think you that a drop of water, which to the vulgar eye is but a drop of water, loses anything in the eye of the

physicist who knows that its elements are held together by a force which, if suddenly liberated, would produce a flash of lightning? Think you that what is carelessly looked upon by the uninitiated as a mere snow-flake, does not suggest higher associations to one who has seen through a microscope the wondrously varied and elegant forms of snow-crystals? Think you that the rounded rock marked with parallel scratches calls up as much poetry in an ignorant mind as in the mind of a geologist, who knows that over this rock a glacier slid a million years ago? The truth is, that those who have never entered upon scientific pursuits know not a tithe of the poetry by which they are surrounded. Whoever has not in youth collected plants and insects, knows not half the halo of interest which lanes and hedge-rows can assume. Whoever has not sought for fossils, has little idea of the poetical associations that surround the places where imbedded treasures were found. Whoever at the sea-side has not had a microscope and aquarium, has yet to learn what the highest pleasures of the sea-side are. Sad, indeed, is it to see how men occupy themselves with frivolities, and are indifferent to the grandest phenomena—care not to understand the architecture of the Heavens, but are deeply interested in some contemptible controversy about the intrigues of Mary Queen of Scots!—are learnedly critical over a Greek ode, and pass by without a glance that grand epic written by the finger of God upon the strata of the Earth.

We find, then, that even for this remaining division of human activities, scientific culture is the proper preparation. We find that æsthetics in general are necessarily based upon scientific principles; and can be pursued with complete success only through an acquaintance with these principles. We find that for the criticism and due appreciation of works of art, a knowledge of the constitution of things, or in other words a knowledge of science, is requisite. And we not only find that science is the handmaid to all forms of art and poetry, but that rightly regarded, science is itself poetic.

Thus far our question has been, the worth of knowledge of this or that kind for purposes of guidance. We have now to judge the relative values of different kinds of knowledge for purposes of discipline. This division of our subject we are obliged to treat with comparative brevity; and happily, no very lengthened treatment of it is needed. Having found what is best for the present end, we have by implication found what is best for the other. We may be quite sure that the acquirement of those classes of facts which are most useful for regulating conduct, involves mental exercise best fitted for strengthening the faculties. It would be utterly contrary to the beautiful economy of Nature, if one kind of culture were needed for the gaining of information and another kind were needed as a mental gymnastic.

Everywhere throughout creation we find faculties developed through the performance of those functions which it is their office to perform; not through the performance of artificial exercises devised to fit them for these functions. The Red Indian acquires the swiftness and agility which make him a successful hunter, by the actual pursuit of animals; and by the miscellaneous activities of his life, he gains a better balance of physical powers than gymnastics ever give. That skill in tracking enemies and prey which he has reached by long practice, implies a subtlety of perception far exceeding anything produced by artificial training. And similarly throughout. From the Bushman, whose eye, which being habitually employed in identifying distant objects that are to be pursued or fled from, has acquired a quite telescopic range, to the accountant whose daily practice enables him to add up several columns of figures simultaneously, we find that the highest power of a faculty results from the discharge of those duties which the conditions of life require it to discharge. And we may be certain *a priori*, that the same law holds throughout education. The education of most value for guidance, must at the same time be the education of most value for discipline. Let us consider the evidence.

One advantage claimed for that devotion to language-learning which forms so prominent a feature in the ordinary *curriculum*, is, that the memory is thereby strengthened. And it is apparently assumed that this is an advantage peculiar to the study of words. But the truth is, that the sciences afford far wider fields for the exercise of memory. It is no slight task to remember all the facts ascertained respecting our solar system; much more to remember all that is known concerning the structure of our galaxy. The new compounds which chemistry daily accumulates, are so numerous that few, save professors, know the names of them all; and to recollect the atomic constitutions and affinities of all these compounds, is scarcely possible without making chemistry the occupation of life. In the enormous mass of phenomena presented by the Earth's crust, and in the still more enormous mass of phenomena presented by the fossils it contains, there is matter which it takes the geological student years of application to master. In each leading division of physics—sound, heat, light, electricity—the facts are numerous enough to alarm any one proposing to learn them all. And when we pass to the organic sciences, the effort of memory required becomes still greater. In human anatomy alone, the quantity of detail is so great, that the young surgeon has commonly to get it up half-a-dozen times before he can permanently retain it. The number of species of plants which botanists distinguish, amounts to some 320,000; while the varied forms of animal life with which the zoologist deals, are estimated at some two

So vast is the accumulation of facts of science have before them, that by dividing and subdividing their labors can they deal with it. To a complete knowledge of his own division, each adds but a general knowledge of the rest. Surely, then, science, cultivated even to a very moderate extent, affords adequate exercise for memory. To say the very least, it involves quite as good a training for this faculty as language does.

But now mark that while for the training of mere memory, science is as good as, if not better than, language; it has an immense superiority in the kind of memory it cultivates. In the acquirement of a language, the connexions of ideas to be established in the mind correspond to facts that are in a great measure accidental; whereas, in the acquirement of science, the connexion of ideas to be established in the mind correspond to facts that are mostly necessary. It is true that the relations of words to their meaning is in one sense natural, and that the genesis of these relations may be traced back a certain distance; though very rarely to the beginning (to which let us add the remark that the laws of this genesis form a branch of mental science—the science of philology). But since it will not be contended that in the acquisition of languages, as ordinarily carried on, these natural relations between words and their meanings are habitually traced, and the laws regulating them explained; it must be admitted that they are commonly learned as fortuitous relations. On the other hand, the relations which science presents are casual relations; and when properly taught, are understood as such. Instead of being practically accidental, they are necessary; and as such, give exercise to the reasoning faculties. While language familiarizes with non-rational relations, science familiarizes with rational relations. While the one exercises memory only, the other exerts both memory and understanding.

(To be continued.)

THE JUVENILE ASYLUM.

A very interesting company of about thirty boys and girls were sent out this week to Illinois by the Erie Road, under the care of the Indenturing Agent of the Juvenile Asylum, who looks after them at short intervals to see that they are well cared for and heedful of their guardians. These children were selected from some four hundred now in the Asylum. Another company, now undergoing careful training and culture, will be sent out as soon as their outfits can be procured. There are not less than 10,000 children in this city of the class which the Juvenile Asylum aims to benefit. Four companies of fifty each are sent off each year, and yet the institution is more thronged at the present time than ever before. Last year, of 700 children

received, 82 were committed by friends for the purposes of discipline; this year, of 630 received 200 were of this character.—*N. Y. Tribune.*

Selected.

THE PRODIGAL.

Brother, hast thou wandered far
From thy father's happy home,
With thyself and God at war?
Turn thee, brother, homeward come!

Hast thou wasted all the powers
God for noble uses gave?
Squandered life's most golden hours?
Turn thee, brother, God can save!

Is a mighty famine now
In thy heart and in thy soul?
Discontent upon thy brow?
Turn thee, God will make thee whole!

He can heal thy bitterest wound,
He thy gentlest prayer can hear;
Seek Him, for He may be found;
Call upon Him; He is near.

LEAD THOU ME ON!

Send kindly light amid the encircling gloom
And lead me on!

The night is dark, and I am far from home,
Lead Thou me on!

Keep Thou my feet: I do not ask to see
The distant scene; one step enough for me.

I was not ever thus, nor prayed that Thou
Shouldst lead me on;
I loved to choose and see my path; but now
Lead Thou me on!

I loved day's dazzling light, and spite of fears,
Pride ruled my will: remember not past years!

So long Thy power hath blessed me, surely still
'Twill lead me on

Through dreary doubt, through pain and sorrow, till
The night is gone,
And with the morn those angel faces smile
Which I have loved long since, and lost awhile.

THE POOR MAN'S DAY.

BY EBENEZER ELLIOT.

Sabbath holy!
To the lowly!

Still thou art a welcome day;
When thou comest, earth and ocean,
Shade and brightness, rest and motion,
Help the poor man's heart to pray.

Sun-waked forest!
Bird, that soarest
O'er the mute empurpled moor!
Throstle's song, that stream-like flowest!
Wind, that over dew-drop goest!
Welcome now the woe-worn poor.

Little river!
Young forever,
Cloud, gold bright with thankful glee!
Happy woodbine, gladly weeping!
Gnat, within the wild rose keeping!
Oh, that they were blessed as ye!

Sabbath holy!
 For the lowly
 Paint with flowers thy glittering sod!
 For Affliction's sons and daughters
 Bid thy mountains, woods and waters,
 Pray to God—the poor man's God!

Pale young mother!
 Gasping brother!
 Sister toiling in despair!
 Grief-bowed sire, that life-long diest!
 White-lipped child, that sleeping sighest!
 Come and drink the light and air.

Still God liveth!
 Still he giveth
 What no law can take away;
 And, on Sabbath! bringing gladness
 Unto hearts of weary sadness,
 Still thou art "The Poor Man's Day!"

ARITHMETIC.

The properties of numbers are so singular that our readers will extract amusement from the following extracts from a "Key to Pleasant Exercises, a London Manual;" and in some it may awaken a spirit of curiosity and philosophical inquiry, gratifying to themselves, and perhaps useful to others.

However many nines may be added together, or by whatever number or numbers it may be multiplied, the line of figures forming the sum or product may be added together, and it will consist of an amount equal to one or more nines. For instance, twice 9 are 18; the 1 and 8 are 9. Four times 9 are 36; the 3 and 6 are nine. A learner finds some amusement in increasing the amount, as if he expected a variation might be found, but when he gets to 11 times 9, he finds the product is only 99; two nines. And at the next step higher, namely, 12 times 9, he obtains only 108, or one and 9.

Then he may be shown the fact that the nine digits, 1 2 3 4 5 6 7 8 9, amount to a large number of nines, namely, five 9's or 45; and he may be taught that if, instead of adding the line up, he will multiply the middle figure by the last figure, namely 5 times 9, he will find the value of the whole most readily; and this is upon a principle of taking averages, which he will have occasion to resort to in higher departments of the science.

He may then be directed to notice the effect of adding together two lines formed of the nine digits, but in reversed order. For instance:

123456789
 987654321

111111110

There is something striking to the eye in such a product, for the wonderful number recurs again in nine ones; and it may serve to induce thinking. Or let the one line be subtracted from the other in this way:

987654321

123456789

864197532

In this result the odd and even numbers become curiously arranged; the whole of the nine digits are there, as in the upper lines; there is no surplus or repetition; there is only one figure of a kind; and of course they amount to five nines!

Would the pupil wish to see a sum in multiplication, the product of which shall contain several figures, but all alike! Tell him to set down all the digits except the 8, and if he would like the product to be all ones, let the line be multiplied by one 9.

12345679
 9

111111111

And here again is the faithful number, for the products presents nine ones.

If the product of two's would please him, let him multiply the line with two nines or 18, and so on with 27, 36, &c., until by multiplying by nine nines or 81, he will have a product of all nines, and nine of them!

12345679	12345679	12345679
18	45	81
98765432	61728395	12345679
12345679	49382716	23456789
22222222	55555555	99999999

The pupil may try the intermediate numbers, to produce threes, fours, sixes, sevens and eights. There will be found nine of each, and the figures in each product, added together, will be of equal value to each respective multiplier.

If the number nine be multiplied in 8 places in a line, by 2 and all the other digits, up to 9 inclusive, the whole line of results will be arranged alike, from left to right, and from right to left; that is from *a* to *a*, reading figures in either direction.

9	9	9	9	9	9	9	9	9
2	3	4	5	6	7	8	9	
α18	27	36	45	54	73	72	81α	

And the first figure in each couple, from either end, is in simple rotation from one to eight.

A COLD WINTER PREDICTED.

About ten days ago a tremendous drove of gray squirrels, numbering hundreds of thousands, suddenly made their appearance on the Meramac, covering the trees and water like a pall. Thousands of them were afterwards found dead in the

river and on the ground. They crossed the Mississippi at that point, and worked their way down the river, until on Wednesday they reached Cape Girardeau, crossing the river at that point in countless myriads. The citizens turned out en masse, and killed them by hundreds. Every tree and bush in that vicinity swarmed with them until night, when they all disappeared, and have not been heard of since. Their route was marked as by a devastating storm. Trees were girdled and fields destroyed. Old French settlers predict a very severe Winter, as it was noticed in 1834 and 1852 that immense droves of squirrels suddenly made their appearance, followed by intensely severe weather.—*St. Louis Express, 24th.*

TRANSPLANTING LARGE TREES.

A Paris correspondent of the *Boston Traveller* gives the subjoined account of a mode of transplanting large trees now in use there :

“Large trees are daily seen riding through the Champs Elysees, which are to take the place of old and decayed ones. It is a strange sight to see a tree fifty or sixty feet high, with a trunk two feet (!) in diameter, in full foliage, moving up through the Boulevards on wheels. I have been astonished at the size of some of those trees that I have seen riding by me, and my curiosity led me about a mile outside of the city to see the process of taking them out of the ground, which is as follows : A circle is cut round the tree about three feet from the trunk and at a depth of about five, through roots and earth. The earth which adheres to the root is covered and bound with brush and ropes to keep all together, then large chains are passed under the whole, and the ends brought up above the surface of the ground. It now being ready to be removed, two heavy, strong planks are laid down outside of the hole to receive the wheels of the wagon, which is made of solid iron, and a skeleton body of only two side pieces, which connect the fore and aft wheels ; the front wheels having an axletree passing from one side to the other, while the hind wheels are hung like those upon many railroad cars, having one open space, and strengthened by a heavy cross-piece of iron, which can be removed at pleasure. Over each wheel is a windlass to hoist by crank. Now, being ready to take up the tree, the heavy cross-piece behind is removed, and the vehicle is backed upon the planks, and the trunk of the tree now stands up through the middle of the skeleton body ; the ends of the chains are made fast to the windlasses, and eight strong men, two at each crank, wind up the chain and swing the tree, roots and earth, to the wagon, put in the cross-piece behind, attach from four to six horses, and drive off. The tree is lowered into the earth in the same manner that it is taken out.”

DEATH OF A TRAVELLER IN THE GLACIERS.

A correspondent of the *London Times*, writing from Zermatt, August 18, gives the following thrilling narrative :

“It appears that on Friday morning, August 12, a Russian gentleman, named Edouard de Grotte, left the Riffelberg Hotel to cross the pass of the Weissthor. He was a very fine, powerful man, about six feet three inches high, and had a somewhat wild and unsettled look on his face. He had no Alpenstock (which was indispensable for such an expedition), and sharply refused an offer of the landlord to supply him with one.

“He started with two Zermatt guides, and safely crossed both the Weissthor and Monte passes, arriving in the evening at Matmark, a village in the valley of Saas. He appeared to be very confident in his own physical powers, and to be inclined to despise the difficulties and dangers occasionally met with in the higher regions of the Alps.

“On Saturday morning he left Matmark with his two guides (still without an Alpenstock, and carrying only a walking stick in his hand). He retraced his steps of the previous day as far as the top of the Weissthor Pass ; from there, instead of turning to the left and descending by the usual route along the Gorner Glacier to the Riffelberg, he descended by the Fendelin Glacier, which slopes from the pass directly down into the valley of Zermatt, and affords a shorter, though much more perilous, route to the town than the Gorner Glacier.

“The three were fastened together by a rope ; the traveller being in the middle ; the rope was tied round his body, but was not, as it should have been, tied round the guides also ; it was only held on the left arm of each by a large loose loop. In this way they passed over the greater part of the glacier, and were within a few minutes of leaving it altogether, when they came to the large patch of snow, which the guides, according to their own account, proposed to pass round, but which the traveller insisted on crossing. Accordingly the first guide crossed in safety. The traveller then followed him, but when he had reached the middle, the snow gave way under his feet, and he sank into a hidden *crevasse*. Having no Alpenstock he could not break his fall in the usual way, by holding it across the chasm, and so his whole weight was thrown with a sudden jerk upon the rope, which broke instantly on both sides of the *crevasse*, down which the unfortunate man consequently fell. His voice was soon heard calling for assistance, which the guides were not skilful enough to render. The *crevasse* was a peculiar one, being narrow at the top, and widening downwards for some distance, after which it narrowed again till its sides met at a depth of about 200 feet. This circumstance rendered it impossible to reach him without a rope ; he appeared to be about sixty feet from

the top, wedged between the sides of the crevasse; and they had no rope excepting the two ends that remained with them, of about a yard each, so they determined that one of them should go to the nearest *chalet*—a two hours' walk—for ropes. The idea of trying to make a rope, by cutting up their coats and shirts, and especially their leathern knapsacks, seems, most unaccountably, never to have occurred to them. Thus the unfortunate M. de Grotte received no assistance for four hours, during which he frequently spoke to the guide above. He was, he said, in a sloping position, with his head lower than his feet, and with his right arm free, but he was constantly sinking lower. After three hours, the flow of blood to his head and the intense cold had very much weakened him; he spoke seldom, saying only that he was being frozen to death.

“At last, after four hours, the guide returned from the Fendelin *chalet* with assistance; the rope was lowered, but was found to be twelve feet to short to reach him. Now, it will scacely be credited, but it is a fact, that when the rope was found to be too short, nothing more was done, but men were sent for more rope to Zermatt, a distance of four hours, so that the unhappy man was condemned by the helpless clowns above him to pass eight hours more in his icy prison. He had endured the most dreadful agony, for at first the warmth of his body, dissolving the ice next him, caused him to sink lower; but as the vital heat departed, the cold gradually regained its superiority, so that he was frozen in tightly between the walls of ice, which, as their wetted surfaces congealed and slightly expended towards each other, crushed him between them with irresistible force.

“About the end of the fifth hour the poor man died. He had fallen in between noon and one p. m., and he died about five p. m. At midnight more ropes came from Zermatt, and his corpse was pulled up; it was found at the depth of seventy-two feet. It was handed over to the authorities, by whom an inquest was held and an examination instituted.”

ITEMS OF NEWS.

CALIFORNIA.—The overland California mail, from San Francisco, via St. Louis, furnishes us with the following items.

The Pacific Railroad Convention had adopted resolutions favoring a central route, and appointed committees to mature plans to be recommended to the State Legislature and Congress.

A small steamer, capable of ascending the Amoor river 2,000 miles, had been launched at Nicolauski, by a company of Americans who have the privilege of navigating the river.

The Russian officials show the greatest favor to American enterprises, and encourage the immigration of American mechanics.

Nearly the whole town of Monte Christo was destroyed by fire on the 19th ult. The loss amounted to \$92,000.

COCHIN CHINA.—News from Cochin China up to the 18th of 9th mo., has been received by the way of Manilla. The treaty of peace between France and the Emperor of Anam was not signed at that date. The telegraph has since announced its conclusion. It is said to comprise four important points; the exercise of the Christian religion in the Empire of Anam; a treaty of commerce, the first that has ever yet been agreed to by the Court of Hué; the concession to the French of the magnificent town of Saigon and its territory, and the recognition of the right of the French to the bay of Tourane.

THE COST OF WAR.—The cost of the Italian war has been estimated as follows:

Austria.....	\$100,000,000	Russia.....	\$6,000,000
France.....	100,000,000	England.....	4,400,000
Piedmont.....	20,000,000	Germany.....	25,600,000
Italian States.....	4,000,000		
Total.....			\$260,000,000

ARTESIAN WELLS.—There are within the limits of the city of Selma, Alabama, fourteen artesian wells, which have an average depth of about four hundred feet, several of them throwing volumes of water to the extent of six hundred gallons per minute.

FRANCE.—During the present Napoleon's reign the French have constructed railways to the extent of more than 7000 kilometers, or about 4500 miles, and they have spent not less than three milliard francs, or \$120,000,000, upon the task.

EXPLOSION AT DUPONT'S POWDER MILLS—SEVEN PERSONS KILLED.—About 11 o'clock on the morning of the 20th, four of Dupont's powder mills at Wilmington exploded, killing seven of the workmen. They were loading a cart with powder-dust at the time, but it is not known whether the fire originated in one of the mills or at the cart. The horse attached to the cart was also killed.

GREAT BRITAIN.—The Great Eastern left Portland at 4 o'clock on the afternoon of the 8th inst., and anchored at Holyhead at 4 o'clock on the 10th inst. The distance run in forty-eight hours is computed at something over five hundred and fifty miles. The average speed for the whole trip was a little over thirteen knots, but during the greater part of the trip the engines were not run at over half speed. The paddles averaged ten and the screw thirty-eight revolutions per minute, working at pressure of twenty pounds of steam. The greatest speed attained was over fourteen and a half knots, or nearly seventeen miles per hour.

This was accomplished without special exertions by the engines, but there was considerable canvass spread. The weather was squally, and at times there was a long heavy ground swell, causing, according to some authorities, a good deal of pitching and rolling, while others say that the motion at all times was most slight, and the ship under the most perfect control. It is reported that she would remain at Holyhead ten or twelve days, and then proceed to Southampton. She is to have her boilers thoroughly repaired in accordance with the requirements of the Board of Trade.

INSURRECTION.—At Harpers' Ferry on the 17th inst. a party of men, partly whites and partly blacks, headed by John Brown of Ossawatomie, Kansas, took possession of the United States Army and the bridge across the Potomac, seized the Pay Office, stopped the trains and cut the telegraph wires. Great alarm was felt lest the outbreak might be followed by an insurrection of the slaves. Troops were speedily sent to the spot, under orders from the War Department and the Governor of Virginia, and after a determined resistance

the rioters were taken. Legal proceedings will be instituted against the leaders.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—There is but little shipping demand for Flour, and the transactions are confined to 4a500 barrels superfine, at \$5 a 5 25 per barrel. There is a fair home consumption demand at \$5 12½ a 5 25 for superfine; 5 31½ a 5 50 for extras; 5 62½ a 6 50 for extra family, and 6 75 a 7 for fancy lots. The market is bare of Rye Flour and Corn Meal; the former is worth \$4 25 and the latter \$4 per barrel.

GRAIN.—Wheat is in demand at a further advance of 1 a 2 cents per bushel. Sales of 5000 bushels, mostly Southern, at \$125 a 127c for good red, and 138 cents for white. Sales of Delaware Rye at 86 cents. Corn is active; sales of 2000 bushels yellow at 96c, afloat, and 95c in store, damaged at 92c. Oats are dull; sales of 5000 bushels prime Southern at 41 a 41½c. afloat, and 1000 bushels Pennsylvania at 44c. in store.

The demand for Cloverseed continues good; sales of 200 bushels fair and prime quality at \$5 50 a 5 70 per 64 lbs. No change in Timothy. Flaxseed is taken at \$1 55 a 1 60 per bushel.

WANTED—A situation as teacher, by Mary Emma Satterthwaite. Address
10 mo. 29—4 t. Denton, Caroline co., Md.

TWO YOUNG WOMEN, members of the Society of Friends, are desirous of situations as teachers in families where they would make themselves otherwise useful, or would engage as assistant teachers in established schools. Apply at the office of the Intelligencer.
10th mo. 29—2m.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The Winter Session of this institution will commence on the 14th of 11th mo. next, and continue twenty weeks.

Terms \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address

HENRY W. RIDGWAY,
Crosswicks P. O., Burlington Co., N. J.
9th mo. 24—3 m.

EATON ACADEMY, KENNETT SQUARE, Chester Co., Pennsylvania.

The Fourth Term of this Institution, under the charge of the present proprietor, will open for the reception of pupils of both sexes, on Second day, the 31st of 10th mo. next, and continue in session twenty weeks.

The course of instruction will embrace all the branches of a thorough English education, the higher Mathematics, Natural Sciences illustrated, the Latin, Greek, French and German Languages, and Drawing.

For terms and particulars, see Circulars, which will be forwarded to the address of every person requesting the same, upon application to

WILLIAM CHANDLER, Principal & Proprietor.
or to WILLIAM A. CHANDLER, Principal Instructor.

RUTHANNA JACKSON,
or to MAGGIE B. JACKSON, } Assistants.
CHARLES B. LAMBORN, }
9mo. 10, '59, -2m

LONDON GROVE BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—It is intended to commence the next Session of this Institution on the 1st of

11th month, 1859. Terms \$60 for 20 weeks; no extras, except for the Latin and Greek Languages, which will be \$5 each. For Reference and further particulars inquire for Circular of

BENJ. SWAYNE, Principal,
London Grove P. O., Chester Co. Pa.
9 mo 3, 2 m.

ELDRIDGES HILL BOARDING SCHOOL FOR YOUTH OF BOTH SEXES, will open its Winter Session 11 mo 1st.

Terms \$70 per session of 20 weeks. For particulars address the Principal for a circular.

ALLEN FLITCRAFT,
Eldridges Hill Salem County, N. J.
8 mo 27 3 m.

THE BANKSDALE BOARDING SCHOOL FOR GIRLS, will be reopened the 14th of 11th month, and be continued twenty weeks. The course of study will comprise the usual English branches and Drawing. Terms \$60.

For further information apply to ELIZA HEACOCK, Jenkintown, Montgomery Co. Penn.
8mo. 27 3m.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

GEO. A. NICHOLS,
Purcellville, Loudon Co., Va.
8th mo. 6, 1859.—6m.

BYBERRY BOARDING SCHOOL FOR GIRLS.

The ninth session of Byberry Boarding School, taught by Jane, Anne and Mary Hillborn, will commence on the first Second-day of Tenth month, 1859, and continue forty weeks without intermission, (including two terms of 20 weeks each.) The course of instruction embraces all the branches of a liberal English education.

Terms \$60 per session of 20 weeks, one half payable in advance. For circulars containing further particulars address

JANE HILLBORN,
Byberry P. O., Philada., Pa.
8th mo. 7—3m.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Pencilling, and Pellis work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; reading, Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M. Principal.

Attleboro', Bucks Co., 5th mo., 28, 1859. 6m.

Merrihew & Thompson, Printers, Lodge st., N. side Penn'a Bank

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, ELEVENTH MONTH 5, 1859.

No. 34.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,

No. 324 South Fifth Street,

PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

A CHAPTER FROM JANNEY'S HISTORY OF FRIENDS.

(Continued from page 515.)

It was not long before he experienced the common lot of nearly all the Friends of that day; being taken in a religious meeting held on a common at a place called Howhill, in Cumberland, he and three other Friends were committed to prison at Carlisle. Being unwilling to pay the prison fees demanded by the jailor, they were kept in the common jail for several days and nights without food, drink, or bedding, and their friends were denied the privilege of supplying their wants. The jailor, finding that he could not effect his purpose by this means, removed them into a room in his own house, where several Friends were imprisoned for the non-payment of tithes. After about two weeks' confinement they were tried at the quarter sessions, and set at liberty; but a considerable amount was taken from them by distraint of their goods for the payment of fines.

John Banks was a devoted and efficient minister of the gospel, whose labors and sufferings will again claim our notice.

After the examination of George Fox at Lancaster, and his triumph over the priests, as related in the preceding chapter, he continued his religious labors, and about the beginning of the year 1653 came to Swarthmore. While there he heard that great threats had been made in Cumberland, that if ever he came into that county, they would take his life. Feeling a concern to go into the very parish where these threats had been made, he went accordingly, and found that his adversaries had no power to touch him. On his return he came to Colonel West's, where he received a message from Swarthmore, to meet,

at that place, Anthony Pearson, a justice of the peace, who had been an opposer of Friends. In compliance with the request he went, and was instrumental in confirming the good impressions made on the mind of Justice Pearson the preceding year at Appleby sessions. He was convinced of the principles of Friends, and became a valuable member of the Society. He wrote a work against the tithe system of England, in which he evinced much ability and research.

George Fox, in the prosecution of his religious labors, came to Carlisle, in Cumberland, where he had a meeting in the Abbey, with a congregation who were mostly Baptists, another in the Castle among the soldiers, and a third at the Market-cross. In these meetings he gained many proselytes, and, though threatened with violence, received no injury. On the following First-day he went to the parish house of worship, where, after the minister had done, he began to preach. The magistrates desired him to depart, but he told them he came to declare the way of the Lord to them, and so powerful was his ministry, that the people began to tremble, and some of them thought the house itself was shaken. At length the rude populace raised a riot, which was quelled by the soldiers, some of whom took George by the hand and conducted him away. The next day, the magistrates being assembled in the Town Hall, issued a warrant for his apprehension, and he, hearing of it, went up to the Hall, where he found many false accusations had been made against him. He had much discourse with the magistrates, and pointed out to them the fruits of their priests' ministry. After a long examination, they committed him to Carlisle prison, as a "blasphemer, a heretic, and seducer." While he lay in jail a report went abroad that he was to be hanged, which caused many persons to visit him, among whom were some ladies of rank, and many priests.

When the assizes came, the judges refused to bring him to trial, whereupon Anthony Pearson, on his behalf, wrote them a letter, remonstrating against his illegal imprisonment, and claiming for him a lawful trial, a copy of his charge, and the privilege of answering for himself. In this letter he says, "To my knowledge he utterly abhors and detests every particular, which by the act against blasphemous opinions is appointed to be punished, and differs as much from those people against whom the law was made, as light

from darkness. Though he be committed, judgment is not given him, nor have his accusers been face to face, to affirm before him what they have informed against him; nor was he heard as to the particulars of their accusation, nor doth it appear that any word they charge against him is within the act."

This remonstrance was unavailing; the judges refused to try or liberate the prisoner, leaving him to be dealt with by the magistrates, who ordered the jailer to put him down among the felons, which he did accordingly. In this noisome prison he was compelled to associate with the most depraved characters of both sexes, but such was the influence of his pure spirit and Christian demeanor, that even these neglected and hardened criminals evinced their love and respect for him, and some of them, being convinced of sin, embraced the offers of redeeming love.

The under-jailer was exceedingly abusive, and sometimes beat with a great cudgel both George Fox and the Friends who came to see him. He says in his journal, "While he struck me I was moved to sing in the Lord's power, which made him rage the more. Then he fetched a fiddler and set him to play, thinking to vex me; but while he played I was moved in the everlasting power of the Lord God to sing, and my voice drowned the noise of the fiddle, struck and confounded them, and made them give over fiddling, and go their way."

At length Anthony Pearson prevailed on the governor of the castle to go with him and inspect the prison. They found it so exceedingly filthy that "they cried shame upon the magistrates for suffering the jailer to do such things." Calling the jailers before them they made them give surety for their good behaviour; and the under-jailer who had been so cruel they cast into the dungeon among the felons.

In the Spring of the year 1653, Oliver Cromwell, having found the Long Parliament inimical to his ambitious designs, dissolved it by military force, and a few months afterwards he summoned a legislative body consisting of a hundred and thirty-nine of his own partisans, nominated by himself and his council of officers. This assembly was popularly known by the appellation of Barebones' Parliament, on account of one of its members, a leather-seller of London, whose name was Praise God Barebones.

This Parliament, on hearing a report that a young man, imprisoned at Carlisle, was to die for religion, caused a letter to be written to the sheriff and magistrates concerning him. It was probably this inquiry that caused the justices to liberate George Fox, for they must have been conscious that his detention was illegal.

His imprisonment, which continued seven months, had the usual effect of promoting the cause it was intended to obstruct. Among the

proselytes he then made were James Parnel and John Stubbs, both of whom became valuable ministers in the Society of Friends.

James Parnel was born at Retford in Nottinghamshire, and enjoyed the advantage of a good education. From his own account of his religious experience, it appears that, in his early youth, he came under condemnation for sin, but was not then aware of the heavenly nature of that pure light which in secret reproved him. Being brought into a serious consideration of his sinful condition, he resolved to amend, and sin no more; but this resolution being made in his own will, without a reliance upon divine aid, did not stand in the hour of temptation, and he was again, through unwatchfulness and disobedience, brought under suffering. The judgments of the Lord being experienced, he was led to sincere repentance, and through divine grace an effectual change was wrought in his heart, by which he became a vessel of honor, sanctified for the Master's use. In this condition, being no longer able to conform to the vain customs and formal worship prevailing around him, he became a subject of wonder and offence to his acquaintance, and even his relatives became his enemies. For his testimony to the truth, he encountered obloquy and reproach, but even at the early age of fifteen years, through divine aid, he was strengthened to bear the cross, and despise the shame.

A few miles distant from the town where he lived, he met with a people "whom the Lord was gathering out of the dark world to sit down together to wait upon his name," and with them he felt unity of spirit; but they soon found themselves the objects of reproach and persecution. Afterwards, he felt himself called to visit some Friends in the north of England, with whom he says "he had union in spirit before he saw their faces." It is probable that, during this visit in the year 1653, he met with George Fox, then in prison at Carlisle, who says in his journal: "James Parnel, a little lad about sixteen years of age, came to see me, and was convinced." From this visit James returned to his home, and pursued his temporal vocation. In his eighteenth year he was impelled, by a sense of religious duty, to visit Cambridge, not knowing the service that might be required of him, but fully aware of the danger that awaited him, for he had heard before of the cruelty exercised upon two of his friends.

When he arrived there, he found a Friend in prison for bearing a testimony against the wickedness which prevailed in that seat of learning and licentiousness. When James Parnel had remained in Cambridge fourteen days, he was committed to prison by the Mayor for publishing two papers against the corruption of the magistrates and of the priests. He was kept in prison during two sessions, and then he was tried on a charge of publishing scandalous and seditious

papers; but being acquitted by a jury, the magistrates again sent him to prison for three days, and then banished him from the city.

It was not long until he again came to the city, where he preached the gospel freely, as also in the counties adjacent, during the space of six months, and many embraced the principles he taught, for his ministry was accompanied by that unction and power which the spirit of Christ confers upon his dedicated servants.

John Stubbs was a soldier in Cromwell's army, and being in garrison at Carlisle while George Fox was imprisoned there in the year 1653, became acquainted with him, and through his ministry was convinced of the doctrines held by Friends. He had received a liberal education, and was skilled not only in Latin, Greek, and Hebrew, but in the Oriental languages.

In the year 1654, when Oliver Cromwell took the government into his own hands, and required of the soldiers an oath of fidelity, John Stubbs, not being willing to take it, retired from the army. As he continued to follow the leadings of Divine Truth, he grew in religious experience, and having received a gift in the gospel ministry, he became instrumental in the conversion of many.

Among those who, about this time, embraced the principles of Friends, George Whitehead claims particular notice, on account of the conspicuous place he long occupied in the Society. He was born about the year 1636, in the parish of Orton, and county of Westmoreland, of reputable parents, who gave him a good education. From his own narrative, it appears that in his youth he attended divine worship among the Presbyterians; but when about fourteen years of age he became dissatisfied, under an impression that in religious experience and practice they did not come up to their professions, and he was induced to seek among others a more refined, spiritual religion.

After a short time he heard of the "people called Quakers, who trembled at the word of God," and observing how they were reviled and reproached by loose and wicked people, he felt his heart drawn toward them before he had been at any of their meetings, or heard any of their ministers. At that time, good desires were raised in his mind by the secret touches of divine grace; but he was often led away through levity of disposition and a fondness for music and mirth. After these deviations, the Lord was graciously pleased to follow him with judgment and reproof, exciting renewed desires for holiness; but he knew not then that it was the light of Christ which shone in his heart to manifest the sins of his youth.

As in the beginning, darkness was upon the face of the deep, and the Spirit of God moved upon the waters, saying, "Let there be light, and there was light," so in that great work of

divine power by which man is created anew in Christ Jesus, the Spirit of God moves upon his heart, and the light of heavenly truth shines there, to manifest the formless void, and by successive steps of creative power, to bring it into order and beauty.

The first meeting of Friends which George Whitehead attended, was at Sunny-Bank near Grayrig chapel, in Westmoreland. After a short time of silence, a Friend named Thomas Arey spoke of the spiritual deliverances, travels, and progress of the Lord's people, alluding to Israel's deliverance out of Egypt from under Pharaoh and his task-masters. All this was understood by George Whitehead as spiritualized by the speaker, but that which most struck his attention was the appearance of "a great power of the Lord in the meeting, breaking the hearts of some into great sorrow, weeping, and contrition, which he believed was a godly sorrow for sin, in order to unfeigned repentance. He particularly noticed a young woman, who, on leaving the meeting, sat down upon the ground, with her face towards the earth, as though she regarded no one present, and moaning bitterly, she cried out, "Lord, make me clean! O Lord! make me clean!" This evidence of deep emotion had more effect upon his feelings than all the ministry he had ever heard, and was to him a certain evidence that her contrition, as well as the trembling and sorrow he beheld in others, arose from a real work of divine power.

(To be continued.)

Men have different spheres. It is for some to evolve great moral truths, as the heavens evolve stars to guide the sailor on the sea and the traveller on the desert; and it is for some like the sailor and the traveller, simply to be guided.

EXTRACTS FROM A MEMOIR OF
ELIZABETH T. KING.

(Continued from page 517.)

From her journal:—

5 mo. 15th, 1855. I want to crave a blessing on my study of the Bible, that my eyes may be opened that I may behold wondrous things, out of the law of God, for I am deeply sensible that unless I am shown the true meaning by the Spirit which gave it forth, I can not perceive it.

8 mo. 30th., Our longing for holiness is sometimes a selfish, indolent weariness of the conflict. If our wills were entirely subdued, we should be satisfied to remain in the furnace as long as our good Master sees fit, and endure the fight of temptations, which sometimes seems so terrible. Ah, we want faith, faith that our tender and omnipotent Father is able and willing at all times to help us.

To her husband:—

NEW YORK, 9 mo., 1855.

I had a very delightful visit at Burlington. On First day we attended meeting, and afterward went to see Stephen Grellet, who was just able to come down stairs. He is extremely feeble, can not speak above a whisper, but in a most heavenly state of mind. I asked him how he felt. "Very feeble," he said, "but my good Master takes care of me; I can trust Him; He doeth all things well." After a while, we fell into silence, and, although his voice was so very weak, he addressed us at some length, encouraging us to trust in the good Shepherd, who not only took care of the sheep, but the lambs—who taketh them in His arms, and carrieth in His bosom, and gently leads those who are under burdens and exercises, and when they have been wounded in their wanderings over the barren mountains and desolate places, He makes them to lie down by the still waters, and in the green pastures, and restores their souls. This testimony to the goodness and mercy of our compassionate Lord, from the aged saint who had had so long experience of them, was very impressive. Altogether it was a visit which I think I shall never forget, and which I shall probably never repeat, he seemed so very feeble. I was received everywhere with the greatest kindness, which always surprises me, but it shows how Christian love and charity cover a multitude of sins.

To one of her sisters:—

BALTIMORE, 9 mo., 1855.

I don't know what is to become of us as a Society; it seems as if every thing which can be shaken is to be removed; but it is an abiding comfort that all this—though it may, and indeed must, cause suffering—need not hinder the individual work; that the little ones, and the weak ones are just as much cared for as ever by the great Shepherd, who still gathers the lambs in His arms, and carries them in His bosom. The power of the Almighty Father is still over all, and under the shadow of His wings we may make our refuge until these calamities be overpast; and the great comfort is, that it is because of our weakness and poverty, our utter helplessness, that we may come; not for our righteousness, but for His great mercies, that we have the claim.

BALTIMORE, 11 mo. 20th, 1855.

I feel quite well now, only it seems to me I am experiencing something of what a friend says; "That the vessels, after having been used, require purifying," which is not an operation pleasing to the love of ease and comfort natural to us.

I am feeling very seriously this morning that while we have seen the disadvantage of formality and narrowness of spirit, which refuses to be introduced into that liberty which is the privilege

of the reconciled children of our tender Father; it is very needful to keep watch that the enemy does not lead us quite as far from the right path, though in a contrary direction, into self-indulgence, and a liberty which is not of the Truth. "No man that warreth, entangleth himself with the affairs of this life, that he may please Him who hath chosen him to be a soldier," and yet a proper attention to our outward concerns is necessary, that we may not give occasion to the adversary to speak reproachfully.

To a sister:—

BALTIMORE, 12 mo. 22d, 1855.

My duties are very much contracted; there is not much perplexity about them, but we well know that *our work* is what our Father gives us to do, not what we in our own wisdom may think needs attention.

I have been led to consider the beauty of love and the necessity of it, and the folly and wickedness—though it may be unconsciously so—of going about finding fault with people, though we may cloak it under the appearance of a zeal for the truth and an abhorrence of sin. As if the government were upon *our* shoulders! I don't mean that we are not to feel grieved when things go wrong—sin must trouble us if we view it rightly—but our grief should be without bitterness against the sinner.

The time was now approaching in which He who had called and fitted her for His service, was pleased to say, "It is enough," and take her to Himself. During this winter her health gradually failed, and although those to whom she was so dear fondly hoped that one so well qualified for usefulness in the militant church would not be removed, her own impression was, that her days would be few.

This feeling, far from causing sorrow, seemed only to increase her desire to be in readiness to resign her stewardship, whenever the summons should come. She had, for more than a year past, been a member of the Ladies' Committee of the House of Refuge, and much interested in this object, and earnest in her endeavors to benefit the inmates.

She was exceedingly desirous of paying another—and, as it proved, a final—visit to this institution, but her health seemed unequal to the effort. A little increase of strength was however given, and this act of duty was performed.*

* The following extract from the Report of the Managers of that Institution, will show how her labors were appreciated:—

"Our committee can not close this report without adverting to the sad bereavement we have met with in the death of Mrs. Elizabeth Taber King. She was one of the first selected by your Board, and in losing her, the House of Refuge met with no common loss. But God, in His wisdom, saw best to call her to a better sphere. She was taken from us, but we trust that the remembrance of her holy life, her usefulness, and the lovely graces of her Christian character, will re-

During this winter she experienced severe bodily suffering at times, and deep mental conflicts were also permitted, but He whom she had chosen in her youth, and to whom her health and strength had been devoted, did not forsake her. Remembering that we are but dust, He condescended to her weakness, and in seasons of depression His arms bore her above the waves, that they might not overwhelm.

BALTIMORE, 2 mo. 6th, 1856.

I hope, my dear——, thou wilt not feel sorry, if thou art surprised, at receiving a little messenger from me, for I have been thinking of thee more particularly of late, with much tender and affectionate interest, and very earnest desires that thou mayest be strengthened to do the *whole* will of our heavenly Father, experiencing as the result of it, a portion of that peace which flows from this perfect acquiescence, and which is truly "not as the world giveth." I so often think of the remark of a Friend, that "Our Master gives large wages for very poor service." Where *all* is offered up, it is so graciously accepted, even if, in our poverty, we can only bring "a pair of turtle-doves or two young pigeons." Do not think, my dear friend, that I speak feeling as if I am any thing, or know any thing of myself. I am the veriest child—poor, weak and ignorant, inexpressibly so—but I can not refrain from bearing testimony to the power of that grace which, as it is submitted to, will cleanse, and teach, and strengthen, until "old things are done away, and all things become new and all things of God."

I have been very feeble since thou wast here, and, until last First day, have not been able to attend meeting since we were there together. But I have had a good deal of quiet enjoyment, in spite of the physical suffering; and have mostly been enabled to fix my eyes so entirely upon my numberless blessings as to lose sight of every thing else. "Oh, that men would praise the Lord for His goodness, and for His wonderful works to the children of men." * * *

I do not feel, my dear friend, that I can express as I wish all that I feel with regard to thee—but I do earnestly crave for us both an entire and unreserved dedication of our *all* to the will and service of our blessed Master, that we may be favored to keep *very close* to Him, and follow Him *whithersoever He leadeth*. I believe I have been brought into sympathy with what may have been at times the struggles and sorrows of thy spirit, and much desire that we may be favored

main with us as a guiding light, still shedding its sweet influences around us on earth, while it lifts our thoughts heavenward, to that happy refuge home, provided by God for those who love Him, where there is no sin, nor sorrow, no more pain, nor sickness, nor death."

to yield that unreserved obedience which will alone bring us peace.

In much tender affection I am thy friend.

(To be continued.)

If a man is rich and powerful, he comes under that law of God by which the higher branches must take the burning of the sun, and shade those that are lower; by which the tall trees must protect the weak plants beneath them.

"THE BLESSING OF THE LORD MAKETH RICH."

There are riches that consist not in houses and lands, gold and silver, but in a condition of mind and heart; riches that all can acquire, and which nothing can take away; riches that death cannot unloose from the detaining grasp.

One cannot fail sometimes to inquire if the hurrying crowds around the marts of business have other thoughts than those which relate solely to worldly prosperity; if there come occasionally questionings whether there is not something else in God's economy worthy of serious consideration. That a man toil faithfully in his vocation is a part of Christian duty, since he can do nothing well without; for the time being bending thereto all his energies; but is there not something to be satisfied save bodily wants and the means of bodily enjoyment?

How rare it is to see upon the human face an expression of content; of peace that has welled up from the deep places of the spirit and bedewed eye, lip, brow, with its holy baptism! Everywhere one marks the lines of care, of discontent, of over-anxiety, and reads traces of a mind which has found, after all its searchings, no real treasures; and why is this?

Because man keeps no place within free from contact with the world, no holy of holies wherein an enshrined Deity resides, sanctifying and ennobling, where that blessing of God that maketh rich is never implored and welcomed; he does not stop to inquire if the gold he covets is all that is necessary for his well-being, if to rest in that as an end will not bring disappointment and loss.

Now, it is impossible for a human being to be happy who neglects the cultivation of a part of his faculties; as well might he expect health, if he doom a part of his animal functions to inertia. Health consists in the equal balance of the system, and the neglected organ sooner or later has its revenge; and so with that wonderful mechanism, the human mind, the unused portion becomes an avenging minister. It can be crowded out of sight, over-laid, but not annihilated.

The secret discontent that consumes the half of mankind is the striving of conscience pleading in God's name for wronged human nature. This great treasure-house, the world, with its beauty and mystery, invites man everywhere to study

and reflection. In it is garnered up more knowledge than has yet been revealed, awaiting patient search to yield itself in abundant streams. The sky, the air, the water, teem with instruction, and there is no man so chained to life's task-work but can sometimes turn from it to refresh himself at these pure fountains.

He can sometimes, too, pause and think, where does all this labor tend? My brother, who yesterday fought by my side in the battle of life, has left his implements, his gains; and his late lithe form rests with the silent sleepers in the city of the dead. He lives yet, that of him which could not die, but what carried he away? There is the wealth for which he struggled, God's angel refused that; and if he took not the riches of God's blessing with him, what language can describe his poverty?

Let us strive with all due diligence for the attainment of whatever goal we have marked as ours,—wealth, fame, power; but never lose sight of the fact that there are other riches which come through God's blessing, and which will comfort us in sorrow, strengthen us in temptation, disrobe death of its terrors, and cling to us when we are called to cross the threshold of eternity.

These riches are purity, strength, gentleness; they cannot abide with jealousy, suspicion, envy, or with vice in any of its hideous forms, and no gold can buy them.

He who is wise will never surrender himself to the mammon of this world, because he will realise that he is of more value than all perishable things combined, and that he must not starve his faith, his hope, his charity.

As we get farther from the dazzling light of childhood, how insignificant does all else seem beside a noble character. Without this, all is hollow decay within, like the fabled fruit of the Dead Sea. Money, accomplishments, a showy exterior, what are they but a lie, a cheat, while there is a crippled soul within?

How noble, how much to be revered are they, who keep a loving and a trusting heart, an unsullied purity, amid the conflict of temptations; and O, how dark their doom who weakly throw away the respect, the love of their fellows, and basely betray themselves to the polluting contact with sin!

God grant that, by determined will and patient endeavor, we may receive the riches of His blessing, so that life may be useful and happy, and life in heaven be awarded us when in His good time He may take our labor from our hands, and welcome us to the rest for which we sometimes yearn so imploringly.—*N. E. Farmer.*

If we strive to do the Lord's work with our own tools, he will reject our doings, and be they ever so hidden, make them manifest to our confusion.

WHAT KNOWLEDGE IS OF MOST WORTH.

(Continued from page 524.)

Observe next that a great superiority of science over language as a means of discipline, is, that it cultivates the judgment. As, in a lecture on mental education delivered at the Royal Institution, Professor Faraday well remarks, the most common intellectual fault is deficiency of judgment. He contends that "society, speaking generally, is not only ignorant as respects education of the judgment, but is also ignorant of its ignorance." And the cause to which he ascribes this state is want of scientific culture. The truth of this conclusion is obvious. Correct judgment with regard to all surrounding things, events, and consequences, becomes possible only through knowledge of the way in which surrounding phenomena depend on each other. No extent of acquaintance with the meanings of words, can give the power of forming correct inferences respecting causes and effects. The constant habit of drawing conclusions from data, and then of verifying those conclusions by observation and experiment, can alone give the power of judging correctly. And that it necessitates this habit is one of the immense advantages of science.

Not only, however, for intellectual discipline is science the best; but also for *moral* discipline. The learning of languages tends, if anything, further to increase the already undue respect for authority. Such and such are the meanings of these words, says the teacher or the dictionary. So and so is the rule in this case, says the grammar. By the pupil these dicta are received as unquestionable. His constant attitude of mind is that of submission to dogmatic teaching. And a necessary result is a tendency to accept without inquiry whatever is established. Quite opposite is the attitude of mind generated by the cultivation of science. By science constant appeal is made to individual reason. Its truths are not accepted upon authority alone; but all are at liberty to test them—nay, in many cases, the pupil is required to think out his own conclusions. Every step in a scientific investigation is submitted to his judgment. He is not asked to admit it without seeing it to be true. And the trust in his own powers thus produced, is further increased by the constancy with which Nature justifies his conclusions when they are correctly drawn. From all which there flows that independence which is a most valuable element in character. Nor is this the only moral benefit bequeathed by scientific culture. When carried on, as it should always be, as much as possible under the form of independent research, it exercises perseverance and sincerity. As says Professor Tyndall of inductive inquiry, "it requires patient industry, and an humble and conscientious acceptance of what Nature reveals. The first condition of success is an honest receptivity and a willingness to abandon all preconceived

notions, however cherished, if they be found to contradict the truth. Believe me, a self-renunciation which has something noble in it, and of which the world never hears, is often enacted in the private experience of the true votary of science."

Lastly we have to assert—and the assertion will, we doubt not, cause extreme surprise—that the discipline of science is superior to that of our ordinary education, because of the *religious* culture that it gives. Of course we do not here use the words scientific and religious in their ordinary limited acceptations; but in their widest and highest acceptations. Doubtless, to the superstitions that pass under the name of religion, science is antagonistic; but not to the essential religion which these superstitions merely hide. Doubtless, too, in much of the science that is current, there is a pervading spirit of irreligion; but not in that true science which has passed beyond the superficial into the profound.

"True science and true religion," says Professor Huxley at the close of a recent course of lectures, "are twin sisters, and the separation of either from the other is sure to prove the death of both. Science prospers exactly in proportion as it is religious; and religion flourishes in exact proportion to the scientific depth and firmness of its basis. The great deeds of philosophers have been less the fruit of their intellect than of the directions of that intellect by an eminently religious tone of mind. Truth has yielded herself rather to their patience, their love, their single-heartedness, and their self-denial, than to their logical acumen."

So far from science being irreligious, as many think, it is the neglect of science that is irreligious—it is the refusal to study the surrounding creation that is irreligious. Take a humble simile. Suppose a writer were daily saluted with praises couched in superlative language. Suppose the wisdom, the grandeur, the beauty of his works, were the constant topics of the eulogies addressed to him. Suppose those who unceasingly uttered these eulogies on his works were content with looking at the outsides of them; and had never opened them, much less tried to understand them. What value should we put upon their praises? What should we think of their sincerity? Yet, comparing small things to great, such is the conduct of mankind in general, in reference to the Universe and its Cause. Nay, it is worse. Not only do they pass by without study, these things which they daily proclaim to be so wonderful; but very frequently they condemn as mere triflers those who give time to the observation of Nature—they actually scorn those who show any active interest in these marvels. We repeat, then, that not science, but the neglect of science, is irreligious. Devotion to science is a tacit worship—a tacit recognition

of worth in the things studied; and by implication in their cause. It is not a mere lip-homage, but a homage expressed in actions—not a mere professed respect, but a respect proved by the sacrifice of time, thought, and labor.

Nor is it thus only that true science is essentially religious. It is religious, too, inasmuch as it generates a profound respect for, and an implicit faith in, those uniform laws which underlie all things. By accumulated experiences the man of science, acquires a thorough belief in the unchanging relations of phenomena—in the invariable connection of cause and consequence—in the necessity of good or evil results. Instead of the rewards and punishments of traditional belief, which men vaguely hope they may gain, or escape, spite of their disobedience; he finds that there are rewards and punishments in the ordained constitution of things, and that the evil results of disobedience are inevitable. He sees that the laws to which we must submit are not only inexorable but beneficent. He sees that in virtue of these laws, the progress of things is ever toward a greater perfection and a higher happiness. Hence he is led constantly to insist on these laws, and is indignant when men disregard them. And thus does he, by asserting the eternal principles of things, and the necessity of conforming to them, prove himself intrinsically religious.

To all which add the further religious aspect of science, that it alone can give us true conceptions of ourselves and our relation to the mysteries of existence. At the same time that it shows us all which can be known, it shows us the limits beyond which we can know nothing. Not by dogmatic assertion does it teach the impossibility of comprehending the ultimate cause of things; but it leads us clearly to recognise this impossibility by bringing us in every direction to boundaries we cannot cross. It realizes to us in a way which nothing else can, the littleness of human intelligence in the face of that which transcends human intelligence. While toward the traditions and authorities of men its attitude may be proud, before the impenetrable mystery of things, its attitude is humble—a true pride and a true humility. Only the sincere man of science (and by this title we do not mean the mere calculator of distances, or analyser of compounds, or labeller of species; but him who through lower truths seeks higher, and eventually the highest)—only the genuine man of science, we say, can truly know how utterly beyond, not only human knowledge, but human conception, is the Universal Power of which Nature, and Life, and Thought are manifestations.

We conclude, then, that for discipline, as well as for guidance, science is of chiefest value. In all its effects, learning the meanings of things is better than learning the meanings of words.

Whether for intellectual, moral, or religious training, the study of surrounding phenomena is immensely superior to the study of grammars and lexicons.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, ELEVENTH MONTH 5, 1859.

JANNEY'S HISTORY OF THE SOCIETY OF FRIENDS.—In a former number we announced that this work was in press, and last week we commenced the publication of one of the chapters, which has been kindly furnished, with the privilege of transferring it to our columns. Perhaps there is no religious body that possesses more abundant material for authentic history than the Society of Friends. We are informed by the author that in "the year 1708 a catalogue of Friends' books was published by John Whiting, which contains the names of five hundred and twenty-eight writers, and gives the titles and dates of about two thousand eight hundred books and tracts.

The author says in his preface, "Some of these writings being of a controversial nature, their interest has in great measure passed away with the occasions that called them forth, and others among them being written in a style not attractive to modern readers, are seldom consulted now, except by historical inquirers. The matter contained in these old neglected volumes is often very instructive. They may be compared to a collection of ancient coins possessing much intrinsic value, but not adapted to general circulation until they shall have passed through the mint and received the impress of modern coinage."

While the author has availed himself of these sources of information, and also of the labors of Sewell and Gough, he has been able to collect much that is valuable, which is not contained in their works, and to present it in a manner which we think will be attractive to every reader of ecclesiastical history, and more especially to the members of our own religious Society.

DIED, On the 18th of 10th month, at Pedricktown, N. J., HANNAH GARWOOD, at an advanced age.

—, On the same day, at Mullica Hill, N. J., of putrid sore throat, MARY MURPHY, aged 14 years, resident and much beloved child in the family of Joshua and Mary Engle.

—, On the 21st of 10th month, THOMAS CLARK, of Woodbury, N. J.

DIED, On the 25th of 10th month, MARY LIPPINCOTT, wife of Nathan Lippincott, a member of Woodstown Meeting, N. J.

—, On the 28th of 10th month, LYDIA WHITE, aged 53 years, a member of the same Meeting.

—, On the 26th ult., after a lingering illness, MARIA M., wife of Joseph D. Folwell, and daughter of Seth Matlack, in the 40th year of her age.

AN INDIAN COMMONWEALTH.

The St. Louis *Republican* of the 21st inst. publishes in full the message of JOHN ROSS, President of the Cherokee Nation, transmitted to "the National Committee and Council, in National Council convened," of that nation, on the 3d of October. The *Republican* states that the message is set up from the MS. of the Chief, written in a clear, round hand, and that his signature is a beautiful piece of chirography. The message is one of the best-written public documents we have ever read, and very few of the messages of the white Governors of the Union equal it in style or in the propriety and wisdom of its suggestions. Mr. Ross advocates, in forcible and eloquent language, the adoption of measures for the diffusion of education, morality, and temperate and industrious habits among the Cherokees. He addresses to his dusky legislators a warning which might with much propriety be addressed to many of the white legislators of the country, by telling them that "As individuals you can do much, by example and precept, to inculcate harmony, sobriety, purity, and patriotism, in your respective neighborhoods and districts. As legislators you can do more to advance the public good, by rising above personal considerations, enacting judicious laws, and providing the necessary means and the proper men to execute them. I speak thus pointedly because I think you will agree with me that the times demand it.

Among the most serious evils felt in the Territory, to which he specially directs attention, are the disasters caused by the inefficient manner in which the liquor laws are enforced, and he suggests that greater penalties should be imposed upon solicitors and sheriffs where they fail to enforce them.

The Territory appears to be defective in prisons, and until the "national jail," which is now in contemplation, is constructed, he suggests that criminals should be condemned to hard labor on some work of public utility. The national debt of the Territory is about one hundred thousand dollars, for which he proposes to provide either by taxation, or by ceding what is termed the "neutral land" to the Government of the United States. Upon this land it appears that some American citizens have "squatted," cut down its timber, and removed its lead and coal deposits, of which Mr. Ross justly complains. He also

complains of the course of the United States marshals in entering the country at pleasure and making arrests of Cherokee citizens; and he recommends the appointment of a delegation to proceed to Washington city, there to settle, by negotiation, all questions pending between the Cherokees and the United States Government. He refers to the report of the Superintendent of the Public Schools, from which it appears that a large number of children are in attendance upon them, and that they are almost entirely under the instruction of native teachers. He complains that much of the public land is monopolized by whites, who claim the rights of Cherokees by virtue of marriage with natives, and who are gradually obtaining possession of large portions of the Territory with a view to speculation. He also complains of the loss of time and property which results from the adjudication of disputes between Cherokees and citizens of the United States by United States agents, or judicial tribunals which reside at a great distance from the places at which difficulties occur. He suggests that "the right to levy and collect taxes from traders and others, who reside in the country, and to hold them accountable for a violation of our civil rights, is so manifestly just in itself, that I am inclined to believe it would not be denied by the Government."

The condition of the Cherokee nation is well calculated to elicit the sympathies of the people of the United States. They have made the only experiment, which possesses a remote chance of success, of establishing and continuing a civilized republican form of Indian government. No other numerous body of the original owners of this continent will be at all likely to resist the destructive influences of white associations upon the ill-fated aborigines. If their experiment fails it will evidently be through no want of intellectual endowments on the part of their chief; and for the sake of humanity, and the credit of our Government, it is to be hoped that it will pursue throughout, towards those unfortunate red men, a wise and liberal policy, and spare no pains to render the perpetuation of their race as feasible as possible.—*The Philada. Press.*

From the Anti-Slavery Standard.

A LEAF FROM THE BOOK OF REAL LIFE.

I have by me much of my mother's early correspondence; many letters addressed to her when quite a girl; letters filled not with common-place trifling, but with thoughts and things worth preserving. Among these are some written by a lady, of whose peculiarly interesting history I have often heard my beloved parent speak, and which I shall relate as given me by her.

The ancient town of D——, one of the Cinque Ports of England, celebrated for its old castle and for towering cliffs, is in the south-eastern part of the island. Here lived one whose life,

in its very opening, had, as we should perhaps say, been blighted. Engaged, in the bloom of youth, to a man of fine talents and pure morals, with the approval of friends and the fresh full love of a first betrothal, she had, within a few weeks of her intended nuptials, been suddenly stricken down by a mysterious paralytic affection, from apparently perfect health, to be, life-long, a bed-ridden and suffering invalid. All power in the lower extremities being annihilated, she lay, from about her twenty-fifth year, prostrate on her couch, never more to arise from it. Her nervous system was liable to sudden and singular spasmodic attacks, upon the least unusual physical or mental stimulus; and thus a condition of perfect quiet seemed almost essential to her very existence. Shattered, however, as was its earthly environment, "strong through the ruins rose the the mind"; seemingly purer and more elevated for passing through a furnace of peculiar intensity. In her isolation from the world, she was not called upon to endure that deeper isolation which must have fallen upon her, had he to whom her truth had been pledged broken his, and held himself henceforth free of the tie that bound them to each other. The partner of his *home* she could not be; the partner of his *heart*, in all its joys and griefs, she still remained. He was a physician, his residence being in the city of C——, about twenty miles from D——; and in these days facilities of conveyance were few and slow. Yet once in two weeks his visits to her were undeviatingly made, and their intervals brightened by frequent and animated correspondence. His portrait hung ever at the foot of her bed, veiled by a little green curtain, to be drawn aside only in the hours most sacred to thoughtfulness and love—and to a few chosen friends sometimes unveiled. And when some amiable stranger, whose nature seemed sufficiently in affinity with her own to draw forth her confidence, entered Miss R——'s room, she would gently say, "Have you ever seen my C——?" and then the little picture was for a few moments unveiled.

The cultivated, the excellent, came around her; strangers were attracted to her room by the beautiful spirituality and gentle, submissive piety of its inhabitant. Gifts were continually brought her, of such character as her pure and refined taste most delighted in. The earliest spring blossoms filled her flower vases; the choicest seaweeds from her native beach replenished her little basket; delicate materials for the various little works of art in which she delighted and excelled were sent to her; new volumes of elegant literature were ever lying on her table. When not engaged with her beloved books, her busy fingers were employed either in tracing, in letters to her friends, her own happy thoughts, or in keeping in exquisite order her own wardrobe and that of other members of her family, or in executing

some little decorative work of fancy, as an offering to a friend.

At this period, my mother, then a girl of eighteen, on a visit to D——, was introduced to Miss R——'s room, and, having herself a mind capable of appreciating the beautiful and good, was soon won toward her, as was Miss. R——, in return, toward my mother. And on the return of the latter to her own home began that correspondence of which I have spoken, in which both my mother and my mother's mother bore a part.

Not long after, a lady, who had wealth and benevolence, became earnestly interested in the subject of my little story. She saw that the ceaseless bustle of D——, a garrisoned town, constantly the seat of military parades and martial music, was painfully distressing to the nervous system of the interesting sufferer, whose father, being established in a prosperous business there, was not able to leave it for another vicinity. This lady, Mrs. B——, proposed to build and furnish, a few miles out of town, such a residence as should ensure complete seclusion from every external excitement. Physicians pronounced the experiment a hazardous one; but added, if the fatigue of a removal could be sustained by the patient, such a change would secure to her thereafter a probable melioration of the more painful paroxysms of her disease. The offer was made, and accepted; the cottage was built, and fitted up with every little refinement that a delicately cultivated taste could suggest. Hither Miss R—— was carried, accompanied by one favorite sister, younger than herself, who had long made her her own especial charge; and though for a season her frail tabernacle was shaken almost to its foundation by the requisite effort, yet under the tender care of affection, she soon regained her ordinary condition. The noble friend settled on her an income adequate to her support, and presented to her the cottage as her own. There she passed her remaining years, living in this spot from middle life till seventy-eight years of age. And he, whose tenderly unselfish attachment deepened, not weakened, in proportion as it became to her her sweetest earthly dependence, loved on, and loved forever. For more than *forty years* their beautiful intercourse was prolonged on earth, till, at the age of three score and ten, he preceded his beloved to the spiritland. Some years after his death, thus wrote to me an aunt of mine across the broad Atlantic:

"I have entered the fairy cottage; it is fitted up in exquisite taste, expressly for dear A—— R——'s habitation, and is exactly one of those sweet romantic cottages which one reads of, but seldom sees. Jessamine and roses cover the front, and other sweets abound; all was well adapted to suit her pure and elegant taste, and the interior equally so. When she converses,

still blest with all her faculties clear and strong as ever, her countenance has all the expression of youth, after having kept her bed between fifty and sixty years. So it is the *soul* illuminates the face!"

There are those on the other side of the wide ocean whose eyes, chanced they to light on this little narrative, would perhaps moisten as they recognized the life picture thus simply and slightly sketched, and which has been given as an introduction to a few extracts from the many beautiful letters lying in my drawer, that appeared to me worthy of meeting other eyes than mine. Her epistles contain frequent and discriminating allusions to the literature of the day; but I have preferred selecting passages which most particularly shadow forth some of the beautiful traits of her own affectionate, refined and devotional nature.

From a letter to my mother (then Miss W——).

"It is only when my friends are ill that I feel the misfortune of wanting health. When they are well, my animated delight and gratitude to Providence give me the most pure gratification; and I have sometimes thought that to be in health myself, and see them so, were happiness too perfect for this probationary state. The infinite wisdom and mercy of Providence are conspicuous in His gracious support of me, and surely, my love, I must be the most senseless and ungrateful of beings were I to be a murmur, when the loss of one blessing is so amply compensated by the possession of many others. All the endearing comforts of the social and friendly affections are mine in their highest degree. Oh, yes! and though my feeble person is confined to one little space, my active mind is free, looks out and tastes happiness unbounded by space, and over which neither time nor death can have power. It is only for their present happiness that I view with such exquisite delight the excellencies of my friends; my mind builds on the blissful hope of renewing with them in a future state the most durable, perfect and pure attachment; where, with enlarged minds and perfected hearts, sorrow and pain can never come."

To the same.

My darling E—— and myself are making a collection of marine plants, from which we find much amusement. Our shores and rocks produce great variety, and some of them are beautifully minute in their fibres, others of a charming color. They require much time, care and patience to preserve to advantage, but, when completed, give ample recompense in the entertainments they present to a curious observer. I am myself fond to enthusiasm of the wonders of nature; and, were my ability equal to my wish, and could I indulge such a wish without breach of any important duty, would have a charming collection not only of marine plants, but also of

the fields and gardens. Beholding the wonders of nature, we are led to contemplate the attributes of God."

From a letter to my grandmother, Mrs. W——.

"I cannot tell you, my beloved friend, how much your kind congratulations on my abated sufferings gratified me. To possess the esteem and good wishes of the worthy is the first of human pleasures—a pleasure for which my heart has panted ever since it felt the power of reason and the love of virtue. To those who know not the temper of my mind, it might seem very strange that I should confess a grateful pleasure in the continuance of life, conscious as I am that its prolongation must be marked by the increase of personal infirmity; but to the being whose mind expands to the social affections, to the pure joys of religion, it will not seem surprising. Convinced of the wisdom and mercy of the Creator, how is it possible I should feel inclined to murmur at His decrees? That Power which created me what I am, shall He not best judge of the part I am able to sustain? Painful though it seem, I feel assured of His protecting care and tender mercy, and submit in humble confidence to His disposal. It is true, when I think myself on the verge of the grave, I hail the hour with a sentiment of joy which proves I am not insensible to the misfortunes which have occurred to me in this life; but when, contrary to my expectation, I again find myself a sojourner in this scene of care, I cannot but hope there will arise future bliss from present trial. I strive to live to the use and comfort of those friends whose tenderness makes up the dearest and most delightful source of my happiness; and when I behold the care-worn countenance of a dear and venerable mother brighten into joy, as she blesses God for my continuance with her—when I feel the pressure of my darling sister's lips, as she paints to me the joy of her innocent heart, so tenderly attached to me—and when, in the language dictated by the heart of the most constant and virtuous of friends, my C——, I trace the gratitude and happiness he experiences, in my returning life—what unutterable emotion fills my mind! how grateful I feel for such blessings, how ardently I long to deserve them, no power of language can paint."

I prolong no farther these little extracts; but will simply add that, a few years since, there came to me, from a relative in England, a newspaper, in which the death of her who had been the friend of my mother and of my mother's mother was thus simply announced: "Died, May 10, at B—— Cottage, near B——, Kent, Miss A—— R——, whose exemplary patience and cheerfulness under suffering had endeared her to a large circle of friends, aged seventy-eight."

Thus, after a short parting, were she and her best loved friend eternally united in a world

which itself could hardly heighten the elevated purity and constancy of their earthly love. Her nurse and sister, her "darling E——," followed her in a year or two. Those to whom her letters were addressed have all passed away; and the heart that *dictated* and the hearts that *welcomed* them have now, doubtless, to use her own words, "renewed in a higher state, the most durable, perfect and pure attachment."

Salem, N. J., September, 1859.

A. W. M.

For Friends' Intelligencer.

Abstract of the last Annual Report of the Committee of Management of the Library Association of Philadelphia.

The Report chronicles the *twenty-fifth* anniversary of the organization of the Institution, and expresses the belief, "that the purpose for which the Library was established is being attained, and that its usefulness is steadily advancing."

"And yet, when we look upon the large number of members of the Society of Friends resident in this city, the choice selection of books our shelves contain, and the facility with which these can be obtained, we are sometimes ready to fear that the importance of the Institution is not sufficiently appreciated."

"The increase of the Library during the past year has been *two hundred and forty-two volumes*, comprising *one hundred and twenty-seven works*, of which *nine* volumes were donations, exclusive of *ninety* volumes purchased with a donation of cash made some months since, making the whole number of books now in the Library *five thousand one hundred and ninety-nine*, classified as follows:

Abridged and Juvenile	787
Scientific	635
Religious	1181
Voyages and Travels	574
History and Biography	905
Miscellaneous	1717
Total	5799

Catalogues of which, completed up to the present time, can be procured of the Librarian at the low price of twenty-five cents.

"Among the books introduced since last report, will be found an *English copy* of the ANNUAL REGISTER, a scarce and valuable historical work, bound in a very superior manner, commencing with the year 1758, continuing down to 1836 inclusive, with a copious index and numbering *eighty-one* volumes; also an ancient manuscript copy of the Discipline of the Society of Friends, and the records of the Yearly Meeting held in the year 1681, in Burlington, N. J., for the province of Pennsylvania and New Jersey; forming a large folio volume substan-

tially bound, kindly donated by Dr. John D. Moore, of Burlington, New Jersey. It has been decided to keep this work in the Library Room for reference, fearing it might receive damage from general circulation."

"The committee deem this a proper opportunity to acknowledge the kindness of other individuals who have borne our institution in like remembrance."

The circulation of the Library during the past twelve months has been nearly *five thousand volumes*, viz :

2899 vols. on 1237 applications from Females
1933 " 832 " " Males.

The *entire number* of individuals using the Library during that period has been

253 Females
176 Males

making a total of 429 individuals.
of which, sixty-ix are believed to be under the age of fifteen years.

"The Librarian reports but one book out over time, at present, and that nine have been lost since last annual report, and that the department of visitors is generally entirely satisfactory."

The Treasurer's account settled to the 12 inst., shows the receipts to have amounted to \$428 56
Expenditures during the same period 404 30

Leaving a balance on hand of \$21 26

The Library is now open as heretofore, on *Fourth* and *Seventh-day* evenings, for the accommodation of Friends generally, and on *Seventh-day afternoons* for the *exclusive accommodation of females*.

"Lest the terms of membership of the Association may not be understood by some, it may be well to remark, that any member of the Society of Friends contributing annually to its funds thereby becomes a member—the amount of such contribution being entirely optional with the donor. It does not, however, *require* a subscription to entitle an individual to the use of the Library."

"Standard works, such as *should be* placed on our shelves, are frequently brought to the notice of the Committee, who are compelled to decline their purchase on account of their cost; and while they desire not to be too importunate, the lively interest they feel in this important concern prompts them to remind Friends, that the greater the amount of funds placed at their disposal, the better able will they be to extend its usefulness, by increasing the number of volumes for circulation."

"A small annual contribution from Friends generally in this city, would speedily effect all that could be desired in this particular."

By direction of the Committee.

JACOB M. ELLIS, *Clerk*.

THE CRADLE SONG OF THE POOR.

Hush! I cannot bear to see thee
Stretch thy tiny hands in vain;
I have got no bread to give thee,
Nothing, child, to ease thy pain.
When God sent thee first to bless me,
Proud, and thankful too, was I;
Now, my darling, I, thy mother,
Almost long to see thee die.
Sleep, my darling, thou art weary;
God is good, but life is dreary.

I have watched thy beauty fading,
And thy strength sink day by day;
Soon, I know, will Want and Fever
Take thy little life away.
Famine makes thy father reckless,
Hope has left both him and me;
We could suffer all, my baby,
Had we but a crust for thee.
Sleep, my darling, thou art weary;
God is good, but life is dreary.

Better thou shouldst perish early,
Starve so soon, my darling one,
Than live to want, to sin, to struggle
Vainly still, as I have done.
Better that thy angel spirit
With my joy, my peace were flown,
Than thy heart grow cold and careless,
Reckless, hopeless, like my own.
Sleep, my darling, thou art weary;
God is good, but life is dreary.

I am wasted, dear, with hunger,
And my brain is all opprest,
I have scarcely strength to press thee,
Wan and feeble, to my breast.
Patience, baby, God will help us,
Death will come to thee and me,
He will take us to his heaven,
Where no want or pain can be.
Sleep, my darling, thou art weary;
God is good, but life is dreary.

Such the complaints that, late and early,
Did we listen, we might hear,
Close beside us,—but the thunder
Of a city dulls our ear.
Every heart, like God's bright angel,
Can bid one such sorrow cease;
God has glory when his children
Bring his poor ones joy and peace!
Listen, nearer, while she sings
Sounds the fluttering of wings!

A. A. PROCTOR.

THE ANGEL OF DEATH.

Why shouldst thou fear the beautiful angel, Death,
Who waits thee at the portals of the skies,
Ready to kiss away thy struggling breath,
Ready with gentle hand to close thine eyes?

How many a tranquil soul has passed away,
Fled gladly from fierce pain and pleasure dim,
To the eternal splendor of the day;
And many a troubled heart still calls for him.

Spirits too tender for the bustle here
Have turned from life, its hopes, its fears, its charms;
And children shuddering at a world so drear,
Have smiling passed away into his arms.

He whom thou fearest will, to ease thy pain,
Lay his cold hand upon thy aching heart;
Will sooth the terrors of thy aching brain,
And bid the shadows of earth's grief depart.

He will give back what neither time, nor might,
Nor passionate prayer, nor longing hope restore,
(Dear as to long blind eyes, uncovered sight,
He will give back those who are gone before.

O, what were life, if life were all? Thine eyes
Are blinded by their tears, or thou wouldst see
Thy treasures wait thee in the far off skies,
And Death, thy friend, will give them all to thee.

A. A. PROCTOR.

LETTER FROM SAMUEL J. MAY TO THE SYRACUSE STANDARD.

Mauchline, Aug. 22d, 1859.

My dear Friend: Here I am, not only in the land of Robert Burns, but in the very village near which he lived, and which was the birth-place of a number of his poems. I am here alone, an utter stranger to all about me. And I cannot occupy myself, while waiting and resting for the train that is to carry me back to Glasgow, so agreeably as in writing to you, who, I know, are ready to receive most graciously any reports I may find to make of my tour.

I left Glasgow this morning at 7 o'clock, in company with my late fellow-travellers, Miss E. H., of Concord, Mass., and Mr. and Miss J., whose last home in our country was near Syracuse. A ride, upon the railroad, of forty miles, brought us, in two hours, to Ayr—the land of Burns—whither, as to a sacred spot, hundreds, perhaps thousands, of pilgrims yearly wend their way.

At the railroad station we took a carriage (which they hear call a *machine*) and drove out of the town a little more than two miles, to a long, one-storied, white-washed stone cottage, standing hard upon the road side. Our driver stopped his horse and announced the "*Birth-place of Burns.*" Another "*machine*" just then drove with a party from the door, making room for us to enter the humble, but now illustrious, house. A kindly-looking, neatly-dressed old woman, and her *cannie* daughter, received us in an entry about four feet square, on either side of which was a room fourteen feet square, the kitchen on the left hand, and the *spence*, or sitting-room, on the right. We were ushered first into the former, which we were assured was kept very much in the condition in which it was when Burns' parents occupied it. A tall old clock stood close by the door at which we entered. The opposite side of the room was more than half engrossed by an old-fashioned stone fire-place. On the left hand side of the room was a small window, and, opposite, the right hand side was occupied by dressers and a cupboard. Between the cupboard and the clock was a curtained recess, seven feet long and four feet deep, completely filled by a neat bedstead and bed. That, we were told, was especially the spot where his mother gave birth to the immortal poet.

We then went into the *spence*. It was a dark,

dingy room—the walls, the tables, the chairs, literally covered with names inscribed or deeply graven by some of the thousands who wished it to be known that they had been attracted to the place by the fame of "*Scotia's favorite bard.*" Having furnished ourselves with pictures of the room in which Burns was born, and fac-similes of the original manuscript of his "*Cotter's Saturday Night,*" we took our coach again and drove a mile further. Passing the "*Alloway Kirk,*" a few rods, we alighted on the opposite side of the road, at the gate of the enclosed mound upon which stands a monument to Burns. It is a circular, temple-like stone building, about twenty-five feet in diameter and sixty feet high, with a dome-like top. Inside there is a room, perhaps fifteen feet in diameter. Opposite to the door stands a marble bust of the poet, which looked to me much more beautiful, intellectual, spiritual, than any picture of Burns I had ever before seen. In the centre of the room, upon a pedestal, there is a glass case containing the Bible, in two small open volumes, which he gave to his Highland Mary. Upon the fly-leaf of one of them is fastened a lock of her hair, and upon that of the other a favorite text of Scripture, which, I am ashamed to say, I have already forgotten. There are, also, in the case several autographs of the poet and two rings, sent thither by his son, one of them containing some of his hair, the other some of his wife's; also a handsome copy of the poet's works, and a snuff-box made from the wood of Alloway Kirk.

After gazing at these relics as long as our time would allow, we ascended a narrow staircase within the walls, to a balcony at the base of the columns which support the dome of the monument. From this we had a fine view of the beautiful country in which was nurtured that tender, graceful and yet manly genius, whose effusions are on the tongue of every Scotchman, and have commanded the admiration of all people who can read the language in which they were poured out. Just below us, a few rods beyond the thick hedge which fences the enclosure of the monument, we saw the *bonnie Doon*, running as it used to do in the days when Burns delighted himself in its "*banks and braes.*" And not an eighth of a mile off, there still stood the old stone bridge where the witch pulled off the tail of Tam O'Shanter's mare. So we hurried down, that we might tread upon the spot made so memorable by the Ayrshire bard. The gardener took us to a small grotto at the south side of the enclosure, in which were the inimitable statues of Tam O'Shanter and Souter Johnnie. Having laughed heartily, as we always must, at such homely wit and honest good nature, we were kindly permitted to take from the shrubbery, around the base of the monument, sprigs of myrtle, holly and the Scotch yew, as mementoes of our visit; and then went down as romantic a lane as poet could wish to

see, along the bank of the Doon, to the famous old bridge that spans it. We went over the bridge and back again; looked up and down the beautiful stream; wished we could stay longer; but, heeding the admonition of one of our party, whose time was limited, we came reluctantly away from the enchanting spot. Retracing our steps up the lane, and passing by the monument, we came, in a few minutes, to "Alloway's auld haunted Kirk," and the crowded grave-yard which surrounds it. The old building is, and 'tis said has long been, roofless; but the walls are entire, and the bell still hangs in its place at the east end. The wood-work has all been carried off to make canes, snuff-boxes and other memorials of this celebrated spot. The area of the church has long been appropriated, by Lord Alloway and others, as burial places. So we were not admitted into it; but we could look through a small window, and see where Tam O'Shanter saw the witches dancing.

There was an old Scotchman on the ground, whose office it evidently was (by appointment or assumption) to show it to strangers. He was competent to the duty, for he had long lived in the neighborhood; he had seen Robert Burns; he knew Tam and Souter Johnnie; and had often told the stories which visitors wish to hear; and had much of the poetry of the immortal bard at his tongue's end, which he repeated with that broad Scotch accent that makes it doubly enchanting. He showed us the grave of Burn's father and Souter Johnnie, and a number of the poet's friends, and pointed us to several spots in the adjoining fields, made memorable by some allusions to them in Burns's poems. But we could not stop to hear all he had to tell us, and, as we paid him a good fee, I suppose he did not grieve much that we spared him a part of the recital.

From Alloway Kirk we drove through the town of Ayr, where is still standing, and in good repair, the Inn which Tam O'Shanter loved to frequent, and where, in front of the church, is a well-wrought statue of Robert Burns, and not far therefrom another of William Wallace. Scotia nourishes the memory of her heroes.

We hurried on, over a fine road, twelve miles through a beautiful country, to this village—Mauchline—where is a station on the Glasgow and Carlisle railroad, upon which my travelling companions had planned to go into Westmoreland. But we came here rather than to another station because Mauchline is the village in which Burns found his wife, and where he was married, and near which is still standing the house where he lived, and the fields that he cultivated three or four years, and where he wrote his principal poems. *Mossgeil* is the name of the place. Of course we went out to it, and were permitted, as all well-behaved visitors are, to look into and about the house and yard and barns, as much as our

sense of propriety would allow us to. Our driver showed me (for I rode outside with him) things and spots made memorable by what Burns had said or done respecting them. He gave me an account, too, of the celebration of the centennial birthday last January, which, here and at Ayr, as well as Glasgow, Edinburgh and London, was most enthusiastic. I asked which was the greatest favorite with the people of Scotland, Burns or Walter Scott? "O, Burns," he exclaimed with great earnestness.

Well, he brought us back to the village, and to this very neat, cosy inn, in time for us to take some much-needed refreshment. That done, Mr. J. hurried off to look after the "luggage" of the party, and get their tickets for Carlisle. I walked part way to the station with the ladies, and at the turn of the road, a most beautiful street, bade them "good-bye." It was hard to part from them. They had contributed very much to the pleasure and profit of my tour. One of them, in particular, had been my travelling companion from Venice, through Austria, Bohemia, Saxony, Bavaria, Switzerland, Belgium, to Paris. But she had determined to return home by the steamer of the 27th, and so was obliged to hurry on more rapidly than my plans would allow. We met unexpectedly at Rome, in St. Peter's Church, under the dome; we have parted here, in the land of Burns.

Here let me take the occasion to say that I have been exceedingly fortunate in the companions that I have had. They have been persons of my own and of other nations, but from each and every one I have received kindnesses that have made me their debtor forever. I wish particularly to report that I have uniformly found the English people with whom I have travelled, or met transiently, courteous, obliging and social. I desire to record this because I was often told that I should find them the reverse. In several instances they have made the first advance; have proffered me some favor, and have taken pains to oblige me.

I have felt sad and lonely enough the last two hours, but writing to you has cheered me somewhat; but now it is time to go to the station and return to Glasgow, where I shall soon find some zealous anti-slavery persons, who will seem to me like old friends.

Glasgow, Aug. 23d.

The train did not come up until fifteen minutes after I reached the station. So I took out my fac-simile of the original of the *Cotter's Saturday Night*, and in full view of the beautiful hills and valleys of Ayrshire upon which the eye of Burns had so often dwelt with delight, I read this, which is one of the most exquisite poems, with a deeper enjoyment of its beauties than ever before.

In order that I might see more of the Scotch people, and at the same time save a couple of dol-

lars, I took a seat in a third-class car. It was filled with well-behaved persons of various social positions. Two young country squires rode with us fifteen or twenty miles, having their dogs, and their bags, full of grouse, under their seats. Not far off sat a well-dressed pretty lassie, of seventeen, with a large frame, containing, I supposed, a picture she had just finished at some school. But, alas! right before me sat two Highlanders, in full costume, each with a bagpipe, upon which they played most of the time with stentorian lungs, making music about as agreeable as that of a large locust in a hot summer's day, accompanied by a stout boy blowing a squash vine trumpet. Nevertheless, I am alive and well, and truly yours,
S. J. MAY.

GENIUS AND LABOR.—Alexander Hamilton once said to an intimate friend:—"Men give me some credit for genius. All the genius that I have lies just in this: When I have a subject in hand, I study it profoundly. Day and night it is before me. I explore it in all its bearings. My mind becomes pervaded with it. Then the effort which I make is what the people are pleased to call the fruits of genius. It is the fruit of labor and thought.

No tree bears fruit in autumn, unless they blossom in the spring. To the end that our age may be profitable, and laden with ripe fruit, let all endeavor that our youth may be studious, and flowered with the blossoms of learning and knowledge.

ITEMS OF NEWS.

EUROPE.—A recent mail from Europe brought advices respecting the present unsettled condition of affairs in Europe, by which it appears that none can foresee how the difficulties attendant on the Italian question can be settled, or what will be the result of the Zurich Conference. It is evident that the various sovereigns are alarmed, being apprehensive of a general war. England, it is said, has no Power to depend on, excepting Germany, and being favorable to the Reform movement in Italy, she knows not how to act between the two, as she is fearful of losing the friendship of the one in the advocacy of the cause of the other. Russia, who, since the Crimean war, has had no more Continental alliances, awaits events, before coming to a decision as to what part she will take; and, with the view of acting intelligently, the Emperor has ordered his Ministers from the principal Courts to join him at Warsaw, in order to give him ample information on the state of the respective countries to which they are diplomatically assigned.

INDIANS.—The Commissioner of Indian Affairs, has returned to Washington, after an absence of six weeks, during which time he made arrangements for treaties with the Sacs and Foxes, of the Mississippi, and with the Kaw Indians, of Kansas. He also visited nearly all the Indian tribes in Kansas and Nebraska. He expresses gratification at the result of his numerous interviews with them, and says they are anxious to adopt the customs of civilized life, as they can no longer depend on the chase.

CHINA.—The China mail had reached England, and the details of the news state that the American Minister had been courteously received at Peking, and expected to be able to send home the ratified treaty by the next mail.

PERSIA.—It is stated in proof that the Persian Government is inclined to introduce the improvements for European civilization; that workmen have begun to pave the streets of Teheran.

ASTEROIDS NEAR MERCURY.—M. Leverrier, the discoverer of Neptune, has been engaged lately in studying aberrations of the planet Mercury. He finds that they must be due to the existence of small asteroids, and he calls on his brother astronomers to assist in discovering them. The total eclipse of the sun in July, 1860, will afford an extraordinarily favorable opportunity for this. Photography affords a means of recording instantaneously whatever phenomena may appear.

ACCIDENT.—A terrible accident happened at 7 o'clock, on the 26th inst. in the evening, to the steamer New World, of the People's Line, while on her way from this city to Albany. She was opposite Tubby Hook, about twelve miles from New York, when the engineer was startled by the ringing of the alarm bell. He was in the fire room at the time, and, instantly springing towards the machinery, saw that it was out of order, and, stopping the engines, gave orders to the firemen to put out the fires, but before this could be done the walking beam broke, and in its course took the piston rod along with it. These carried the rest of the machinery with them, which fell, breaking through the bottom of the steamer with a heavy crash.

FURTHER DETAILS.—The steamer New World still lies pretty nearly in the same position that she did when the accident of Wednesday evening occurred.

She is floating a little and fastened by anchors, and up to the present time, (1½ P. M.) a large number of men and several steam tugs have been engaged in attempting to raise her. As far as heard from, no lives have been lost; and it is not believed by the company that any person was injured.

The injury to the steamer is not so great as was at first supposed, and it is expected that in a few days the men engaged will have succeeded in placing her on the dry dock for repairs. She will not run again this fall.

Numbers of persons called at the office of the company during yesterday, to ascertain what had become of certain of their acquaintances whom they had not heard from. A great many of these have since been reported all right and unharmed. There remain a few cases, however, not yet cleared up.—*N. Y. Post.*

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—There is but little shipping demand for Flour. Sales of 200 barrels of good superfine at \$5 25 per barrel, which is now the general asking rate. There is a fair home consumption demand at \$5 25 up to 5 75 for common and extra brands; \$5 75 a 6 50 for extra family, and 6 50 a 7 for fancy lots. Nothing is doing in Rye Flour or Corn Meal, and little or none to operate in.

GRAIN.—Wheat is in demand. Sales of good Pennsylvania and Southern Red at \$1 30 a 1 32, and white at \$1 39 a 1 40. Rye is in good demand at 90 cents for Pennsylvania and 86 cents for Delaware Corn is active; sales of 2000 bushels yellow at 96c, and 95c in store. New Corn is selling at 75 a 80 cts. Oats—1200 bushels Southern sold at 42 cents afloat. No change in Barley or Barley Malt.

The demand for Cloverseed continues dull; sales of fair and good quality at \$5 25 per 64 lbs. No change in Timothy or Flaxseed.

NOTICE.—A Friend in Maryland has a tract of upwards of one thousand acres of Land, about one half of which is cleared, the balance in wood, mostly chestnut. Said land lies in Prince George's county, Md., about 22 miles from the city of Baltimore, and 18 miles from Washington City, D. C.

The Washington and Baltimore Rail Road runs for more than a mile within $1\frac{1}{2}$ miles from the tract, in which distance there are two Depots or Switches—Contees and Muirkirk. The village of Laurel is about 2 miles east of the tract; Sandy Spring Meeting is about 7 miles north; and Indian Spring about 8 miles south. The neighborhood is remarkably healthy—the water being most excellent.

There are very few slaves in this part of the county. The owner is willing to dispose of this property on *very favorable terms* to a body of eight or ten young Friends who may want a farm in an improving part of the country. It will be expected that the Friends produce certificates of industrious and thrifty habits, *none else will suit.* For further information enquire of

8 mo 27 3 m.

THE BANKSDALE BOARDING SCHOOL FOR GIRLS, will be reopened the 14th of 11th month, and be continued twenty weeks. The course of study will comprise the usual English branches and Drawing. Terms \$60.

For further information apply to ELIZA HEACOCK, Jenkintown, Montgomery Co. Penn.

8mo. 27 3m.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

GEO. A. NEWBOLD,
Parcelville, Loudon Co., Va.

8th mo. 6, 1859.—6m.

BYBERRY BOARDING SCHOOL, FOR GIRLS. The ninth session of Byberry Boarding School, taught by Jane, Anne and Mary S. Hillborn, will commence on the first Second-day of Tenth month, 1859, and continue forty weeks without intermission, (including two terms of 20 weeks each.) The course of instruction embraces all the branches of a liberal English education.

Terms \$60 per session of 20 weeks, one half payable in advance. For circulars containing further particulars address

JANE HILLBORN,
Byberry P. O., Philada., Pa.

8th mo. 7—3m.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Pencilling, and Pellis work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; reading, Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M.

Principal.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, ELEVENTH MONTH 12, 1859.

No. 35.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,

No. 324 South Fifth Street,

PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

A CHAPTER FROM JANNEY'S HISTORY OF FRIENDS.

(Continued from page 531.)

Believing that the Lord was about to raise up a people to worship him in spirit and in truth, George Whitehead ceased to attend on the ministry of the priests, and resorted to the meetings of Friends, which brought upon him reproach and opposition from his relatives and others. In his account of his "Christian Progress," he says, "Some time after I was fully convinced, and my mind turned to the light, I was persuaded and resolved to persevere among Friends, before I heard our dear Friend, George Fox. The first time I heard him minister was at an evening meeting at Sunny-bank, at Captain Henry Ward's house. I was then very low, serious, and intent in my mind, willing to see and taste for myself, for my own inward satisfaction; and I saw and felt his testimony was weighty and deep, and that it proceeded from life and experience, and did bespeak divine revelation, and tended to bring to an inward feeling and sense of the life and power of Christ, and sanctifying operation thereof in the heart. His speech was not with affecting eloquence, or oratory, or human wisdom, but in the simplicity of the gospel, *to turn the mind to the light and life of Christ*, and the Lord abundantly blessed his ministry to many." . . . "After some time that I was conversant among our Friends, and frequented the meetings to which I belonged, both in Westmoreland and Yorkshire, chiefly between the years 1652 and 1654, being much inwardly exercised in waiting upon the Lord among them, where we had little preaching, but our meetings kept much and often in *silence*, or but few words declared, the Lord was pleased some-

times, by his power and word of life, both to tender and open my heart and understanding, so that he gave me, (among some others,) now and then a few words livingly to utter in some meeting, to their and my comfort in Him who opened our hearts, in great love one to another, which then increased and grew among us; blessed be the Lord our God for ever."

"It was out of these, and such our frequently *silent meetings*, the Lord was pleased to raise up and bring forth living witnesses, faithful ministers and true prophets, in early days in Westmoreland and other northern parts, in the years 1654 and 1655. . . .

"The Lord gradually brought us to experience what he said of old to his holy prophet, 'Keep silence before me, O Islands, and let the people renew their strength; let them come near, *then let them speak*; let us come together in judgment.' Isaiah, xli. Oh! thus keeping silence before the Lord, and thus drawing near to Him in a true silent frame of spirit, to hear first what the Lord speaks to us before we speak to others, whether it be of judgment or mercy, is the way for renewing our strength, and to be his ministers to speak to others only what he first speaks to us. Oh! that the people truly minded this; Oh! that they would seriously consider hereof, then would they not run after or follow such as their ministers, priests or prophets, who run, and God never sent them, who say, 'Thus saith the Lord,' when God hath not spoken to them, and who shall not profit the people at all." Jer. xxiii.

In the early part of his religious experience, George Whitehead was convinced that tithes ought not to be required nor paid under the gospel dispensation; because Christ's ministry is free; he said to his disciples: "Freely ye have received, freely give;" and moreover, "because Jesus Christ, the one offering, and great apostle and high-priest of our Christian profession, hath by one offering and sacrifice of himself put an end to tithes, and oblations, or offerings, and the priests' revenues, together with that priesthood and first covenant, under which they were upheld and maintained."

From his youth George Whitehead had been accustomed to reading the Scriptures, and though he did not then understand the spiritual nature of Christ's kingdom, yet he acknowledged that he derived benefit from the sacred volume, and, when further advanced in religious experience,

as the Lord opened to him, through the operations of his grace, the truths recorded by holy men of old, the passages treasured in his memory were sweetly revived in his secret meditations, and became a source of comfort and encouragement.

Being fully persuaded that God would reveal to all his dedicated servants that which Paul said was a "mystery among the Gentiles," but made known to the saints, even Christ in them the hope of glory, he waited in humility for that divine visitation which sanctifies the heart and enlightens the conscience. As he thus waited, he received ability, and was called to go forth on a gospel mission, although he was then less than eighteen years of age.

Having acquainted some Friends with his prospect of visiting some counties to the south of his residence, he left Westmoreland in the summer of 1654, having for his companion Edward Edwards, a young man who afterwards appeared in the gospel ministry. Travelling on foot, they first went to York, and attended Friends' meeting; thence to the southern part of the county, where they met with George Fox and other Friends, and "were comforted together." George Whitehead had a testimony to bear in two "steeple-houses," and he writes that he "met with no hard usage *except haling out.*" Having parted with Edward Edwards, he was joined by Thomas Ralison, and they went into Lincolnshire, where a burden came upon George Whitehead to go and bear testimony for the truth in two "steeple-houses," and he says: "I had no harm nor violence at either, except pulling or pushing out," but Thomas Ralison was much abused and beaten.

George Whitehead, having again parted with his companion, travelled alone, on foot, to Cambridge, where he was kindly received by Alderman Blakeling and his wife, and the few Friends living in that city.

From Cambridge, being accompanied by Thomas Lightfoot, he went to Norwich and visited Richard Hubberthorne, who was there in prison. Several persons having been convinced of Friends' principles, through his testimony and sufferings, they came to the prison, and were much affected under the tendering influence of Divine Truth.

The most noted and serviceable man in that city was Thomas Symonds, a master weaver, who entertained travelling Friends. He was an honest, exemplary man; received a gift in the gospel ministry, and having been faithful in life, he died the death of the righteous.

At his house George Whitehead had several meetings, in which the gospel was preached with authority and success. At one of them, an Antinomian preacher, named Scarfe, attended, who maintained that sin must continue through life, even in the best of saints; and, "yet, though they continue sinners in themselves, they are

not under the law, but under grace, and reckoned righteous in Christ." George withstood and confuted this dark, sin-pleasing doctrine, showing that the work of Christ was "to destroy sin, and save his people from transgression."

At another meeting, a company of Ranters attended, to whom sound doctrine was preached against "the lust of the flesh, the lust of the eye, and the pride of life;" showing that they who lived in such things, professing, at the same time, to make the righteousness of Christ a cloak for their sins, must suffer condemnation. Some of them were reached by the word of life, and being convinced of their danger, experienced repentance and reformation.

Among those convinced by the ministry of George Whitehead, in the year 1654, were John Lawrence and his family, Joseph Lawrence and his wife, and William Barber and wife, who became useful and exemplary Friends. William Barber afterwards suffered imprisonment in Norwich castle twenty years for the non-payment of tithes, which he bore with patience and resignation.

At Mendlesham, in Suffolk, a meeting of Dissenters had been kept for some time at the house of Robert Duncan, and several preachers usually attended. To this meeting George Whitehead came on the first day of the week, and they sat together for a while in silence; but the preachers becoming uneasy, manifested a desire for vocal service; whereupon Robert Duncan spoke a few words to this purpose: "That peradventure they had been too much in words, or depending on men's teaching; therefore God now might see it meet to bring them into silence, that they might come more to depend upon him for teaching." Some of the preachers were for putting forward one or another of them to prayer, during which George Whitehead bore patiently with "their voluntary devotions," until at length the Lord opened in his heart the springs of life, and he was enabled to speak in the authority of truth, "To turn their minds to the true light, that they might know the immortal seed and birth which is from above." His ministry was effectual in bringing many of them to a state of silent waiting upon Christ, and a Friends' meeting was established there. Some of their teachers left them for a time, but afterwards returned; among whom was Edward Plumstead, sen., who became a minister among Friends.

George Whitehead having returned to Norwich, went on a lecture day to a place of worship "called Peter's church," where, after the sermon was ended, he began to speak, but was violently hauled out and abused. He was taken before the mayor, who examined him, chiefly on the subject of water baptism, and then committed him to the city jail, where James Lancaster was also imprisoned for exhorting the people to repentance in the market at Norwich.

At the next sessions they were tried before Judge Cock, who was incensed at their not putting off their hats before him, which he considered a contempt of the court. He was informed that they were actuated by conscientious motives, as they could not pay that mark of homage to any but the Supreme Being. They were again committed to prison, where they lay eight weeks, in the winter season, and suffered much from cold and hard usage.

George Whitehead, after his release from prison, continued to travel in Norfolk and Suffolk, holding meetings and bearing testimony to the spiritual nature of Christ's kingdom.

At Mendlesham meeting, held at Robert Duncan's, in the year 1655, he was instrumental in convincing of the principles of Friends, George Fox the younger, an inhabitant of Suffolk. This Friend took the appellation of the younger, because he considered himself less advanced in religious experience than his more distinguished cotemporary of the same name. He had been several years in the Parliament army; but after he became a Friend, he received a gift in the gospel ministry, and proved to be a valiant soldier in the Lamb's warfare. He was remarkable for his undaunted courage in bearing witness against the corruption of priests and rulers, as well as for his patient endurance of much suffering for the cause of truth.

At Charsfield, where George Fox the younger then lived with his father, George Whitehead had a memorable meeting, which was held in an orchard. He says in his journal: "I was wonderfully assisted and enlarged in my testimony for Christ Jesus and his blessed gospel truth, insomuch that I was enabled to stand upon a joint stool, though slippery, near five hours that day, preaching the truth and opening the things which concerned the kingdom of Christ." A considerable portion of this long meeting was probably occupied in answering objections; for it appears that John Burch, a Baptist minister, put some questions in relation to water baptism, which were answered so satisfactorily that he was convinced, and some years afterwards became an acceptable minister among Friends.

In the latter part of the same meeting several Independent ministers, who were present, charged Friends with denying the Holy Scriptures and the ordinances of Christ; which accusations were answered by George Whitehead, and the truths of the gospel were so fully set forth that many were convinced, and a meeting of Friends was soon after settled at that place.

George Whitehead being subsequently joined in his religious labors by Richard Hubberthorne, they were instrumental in spreading their principles in the counties of Suffolk and Norfolk, where many meetings of Friends were established.

In the Fifth month, 1655, George Whitehead being joined by Richard Clayton, they travelled

into Essex, where they visited James Parnel, then in prison at Colchester; from thence they proceeded on foot towards London, but meeting George Fox and Amos Stoddard on the way, they concluded to stay with them and attend some meetings in Essex. In these meetings they heard George Fox earnestly engaged in gospel ministry, exposing the corruptions that existed in the world, and opening the truths of spiritual religion.

George Whitehead and Richard Clayton, accompanied by John Harwood of Yorkshire, held a meeting in a barn at South Halstead, which was well attended, and greatly blessed with the evidence of divine life. They then proceeded on their way, and passing through a town called Buers, in Suffolk, Richard Clayton posted on the door of the parish house of worship a paper in which he showed that priests who preach for hire and divine for money are testified against in the Scriptures. This paper giving offence, they were summoned before a justice of the peace, who caused Richard Clayton to be whipped and sent out of the town, while George Whitehead and John Harwood, who had no share in the transaction, were committed to prison at Edmundsbury. About a month afterwards, George Rofe was committed to the same prison for no other offence than asking a question of a clergyman after he had ended his sermon. These three Friends, being brought to trial at the quarter sessions under false accusations, were pronounced guilty, and sentenced to pay a fine of twenty nobles each, in default of which they were detained in prison.

On the day of their trial, George Fox the younger admonished one of the justices to repent of his unjust proceedings; and for this reproof he was committed to prison with his brethren.

About the same time, Henry Marshall, for speaking to a clergyman after his sermon was ended, was also committed to Edmundsbury prison.

The five Friends, thus committed to prison, were at first confined in an upper room, for which the jailer required them to pay rent; but they, having a prospect of a long imprisonment, determined not to comply with his demand. They were then thrust into the common ward among felons, which is described as a low, dungeon-like place, their lodging being on straw spread upon the damp earthen floor. The jailer kept a bar-room, to supply the prisoners with beer, and some of the felons being frequently drunk, scenes of violence and profanity ensued, which were extremely painful to the Friends. These patient sufferers bore a faithful testimony against the wickedness of the other prisoners, and abstained from the use of intoxicating drinks, which disappointing the jailer of his expected profits, he became exceedingly abusive, and encouraged the felons to commit acts of violence upon them.

Frequently they were subjected to severe blows upon the face, causing the effusion of blood; and in more than one instance a drunken prisoner threatened to kill them. These wanton insults and blows they endured with Christian meekness, but when one of the criminals, rendered furious by drink, attempted to kill his own child, a boy about ten years of age, that was in prison with him, four of the Friends held him securely by the hands and feet for a full hour, until his frenzy subsided, and thus they frustrated his murderous intention.

(To be continued.)

“From the beginning I educated myself to speak along the line, and in the current of my moral convictions; and although in later days it has carried me through places where there were some batterings and bruising, yet I have been supremely grateful that I was led to adopt this course. I would rather speak the truth to ten men than blandishments and lying to a million. Try it, ye who think there is nothing in it; try what it is to speak with God behind you—to speak so as to be only the arrow in the bow which the Almighty draws.”

EXTRACTS FROM A MEMOIR OF
ELIZABETH T. KING.

(Continued from page 533.)

To one of her young friends:—

BALTIMORE, 2 mo., 6th, 1856.

I suppose I shall be an unexpected correspondent, dear ———, but I hope not an unwelcome one, as I have been thinking of thee lately with so much affectionate interest that I would like to give some expression to it.

I have been very feeble this winter; and until last First day have been able even to attend meeting but once in about two months; nevertheless I have had a very nice time at home; sometimes, but not often, feeling a little worn by the pressure of long-continued suffering and debility, but mostly enabled to look on the bright side so entirely as to lose sight of any other. I have had rather more time for reading than ability, but have been looking over Macaulay's History a little, rather more for the fascination of his narratives than dependence upon either his facts or conclusions. Setting aside natural preferences, I don't like his attacks on Friends. I think that—even if he disapproved of their doctrines, and in some instances of their actions, which would be very natural—he might do justice to the purity of their lives, to their self-denying and heroic adherence to what they believed to be right, and to the high standard which they raised in that dark time—a standard to which the Christian world, as it advances in purity and spirituality, is constantly coming nearer. I am

not at all sectarian, but I do like to see a man capable of real, honest, earnest appreciation of goodness, and of elevation of feeling and character, wherever he meets it, and not going about with a Mephistopheles-sneer of his countenance, at every thing which is at variance with policy and conventionalism.

I have been quite interested in a little I have read of Mitchell's Lectures on Astronomy. The vastness of the field opened is startling. I like Mitchell's enthusiasm, too—I like any one to go heart and soul into whatever they undertake. There is something, so ennobling in the study of all the works of the Creator, and then when we turn from the overwhelming views of the might, majesty, and power displayed in them, of which the utmost stretch of our intellect can not conceive—to the feeling that *He is our Father*—that He cares even for the sparrows—that He numbers the very hairs of our heads—how the soul is bowed in the deepest humiliation, while it may be animated by the most perfect trust.

I had such a sweet dream the other night. I thought I was at meeting, of which privilege I have been much deprived, and that an exhortation was given to trust in the Saviour at all times, to lean upon Him in all our hours of trial, concluding with the words, “and then shall we be enabled, in all truth and sincerity, to acknowledge, that ‘He doeth all things well.’” I can not express to thee the force and sweetness with which this dwelt upon my mind for a long time, and is constantly recurring. * * *

Her watchful care over her own spirit still continued, as the following extract from her diary will show:

2 mo. 26th, 1856. I believe it is not safe for me to be trusted with health and strength, under some plea or other I am so apt to use them for my own purposes. Lately I have lost my hold on the pearl; in my attempts to promote the comfort of my family, the quiet of my spirit has been disturbed. Some of this is doubtless owing to physical weakness, but with every temptation, there is a way of escape; there is *never* any need to sin.

Another thing I have suffered loss from—entering into the business of the day, without seeking to have my spirit quieted and directed. So many things press upon me, this is sometimes neglected; shame to me that it should be so.

Some things I must bear in mind: 1st, Always to seek this daily retirement, and earnestly search into my faults. 2d, To talk less, and carefully to weigh my words, so that they may minister grace to the hearer. Let me be careful, without display or pretension, when I do speak, to do some good, if it is only to manifest kind feeling toward others. 3d, and this is of great importance, to watch carefully—now I am so weak—not to over fatigue myself, because then I

can not contribute to the pleasure of others; and a placid face and a gentle tone will make my family more happy than any thing else I can do for them. Our own will gets sadly into the performance of our duties sometimes. 4th, Almost above every thing else, to agonize for a loving spirit toward all.

To a sister:—

BALTIMORE, 2 mo., 1856.

Last First day I went to meeting, a privilege I had not before enjoyed in two months. Much to my astonishment, I felt called upon to supplicate for those who felt themselves only to be penitent sinners, to beseech that we might all be bound together, so as to know what it is to *dwell* in love, being so deeply penetrated with a sense of our own infirmities, that we might not dare to look on those of others with any other feeling than that of compassionate love.

This was the last time she was able to attend meeting, and thus was her testimony borne to the necessity of that "charity which thinketh no evil," which she had so long endeavored to exemplify in her daily life.

To one of her young friends she sent the following note:—

BALTIMORE, 3 mo. 1st, 1856.

Do not think me intrusive, dear ———, if I venture to tell thee that I have been thinking of thee for some days past with very tender and earnest solicitude for thy well-being in every way, and, particularly, that by implicit obedience to the dictates of the Holy Spirit in thy own heart, thou mayst become altogether what thy tender Father, thy compassionate and loving Saviour would have thee to be, even thoroughly conformed to His precepts—thoroughly submissive to His will in all things—thoroughly regenerated, so that neither the love of the world, nor of any thing in it, may draw thy mind away from His love—but that thy affections may truly be set on things above.

I do fully acknowledge, dear ———, that I feel myself to be weaker than the weakest, and less than the least. I am humbled in the very dust, under a consciousness of falling very far short of the standard to which I desire and strive to attain; but I have craved for thee, as for my own soul, that we may be found very diligent in waiting daily upon the Lord for light and strength, and be strictly obedient to what He shows us to be our duty in the smallest particular, and that, feeling, as we must, our utter inability to do any good thing, we may seek most earnestly, most diligently, for the help which He will assuredly give.

I can not express the tender love with which my mind is drawn out in these earnest desires for that which will secure not only thy eternal welfare, but promote thy happiness here; for truly there can be no enjoyment on earth comparable to that which is vouchsafed to the obedient chil-

dren of our heavenly Father, who truly realize, amid all the trials which are inseparable from this life; that "in His presence is fulness of joy, and at His right hand there are pleasures for evermore."

May we seek to experience this, dear ———; may we be found constantly watching and waiting to know His will, and constantly striving to fulfill it, that we may glorify Him here, and finally be received into His everlasting peace.

And again to another, for whose best interest she felt solicitous:—

BALTIMORE, 3 mo. 16th, 1856.

Thou hast been brought before my mind, I humbly trust, by the good Remembrancer, with very earnest desires that thou, and I, and all of us, may know what it is to experience a *growth* in the Truth—that we may in no degree slacken our diligence, but press forward until we attain that perfect stature in Christ Jesus, that thorough purification from the spirit of the world and the love of self which the holy Head of the Church requires of us, so that we may be heartily willing to become fools for His sake.

In thinking of thee this morning, the injunction of the Apostle was brought to my mind, and perhaps I may revive it for thy encouragement: " *Watch ye ; stand fast in the faith : quit you like men ; be strong .*"

(To be continued.)

"As flowers never put on their best clothes for the Sabbath, but wear their spotless raiment and exhale their odor every day, so let your Christian life, free from stain, ever give forth the fragrance of the love of God."

"HIS TENDER MERCIES ARE OVER ALL HIS WORKS."

When, upon summer's retreating footsteps, autumn came silently and laid her finger upon leaf and flower, and beckoned the cool winds from the north, and wooed frosts from the clear blue skies, and the eye reluctantly witnessed the departure of what had made earth so lovely, the heart received a lesson such as pen never transcribed or man's wisdom dictated,—a lesson of time's passage and its changes, an admonition that here there is no rest, no secure abiding.

As instinctively as the heart expands with hope in the spring-time, and throws itself in perfect abandonment into the lap of summer, so naturally does it pause in autumn and look back, half regretfully, and forward without exultation; and as naturally into its quiet chambers come weighty thoughts of life, death and eternity.

If, with the opening leaf and flower, our duties and cares and expectations receive new coloring, so with the drooping of the leaf and the withering of the flower do we receive intimations that life's consequences are more serious than the

thoughtless acknowledge, or the wise fully understand.

Love and gratitude to God are instinctive when the glad sunshine flickers through the trees, and the birds vie with each other in their glorious bursts of song, and the perfumed winds move to their own music, and the sea murmurs of the heaven it reflects, and the mountains wrap themselves in the purple and gold of the benignant skies; then, by a natural impulse, the soul experiences "His tender mercies are over all His works!"

But not the less will the devout heart see God in the crisp leaf, the toy of the unruly blast, in the gray clouds that hang over earth's faded glories; not the less will it hear his voice in the silence of the deserted wood, in the rougher music of the fretted waves, in the hoarse complaining of the strong, chill winds.

His tender mercies have regarded each spot, and from the root of the dead, unsightly plant, another spring will call another growth to gladden the eye and expand its perfume; and in His perfect wisdom it was planned that earth should have her Sabbath rest to renew her strength and reassemble her forces. In His unseen laboratory He prepares for the coming year her beautiful garments of green, and her jewels, such as no Eastern queen counts among her priceless ornaments.

Though He sends the singing birds from our borders, He makes deeper and more tender the voices of love in our home; though He withdraws the countless hues of the garden, He paints the sunset skies with a brilliant beauty that leaves the heart nought to sigh for; and over the bare brown meadows and marshes He throws a mantle of white pure as the heights from which it falls.

Though sometimes in His wisdom God lays a heavy hand upon his child, and permits the hopes that made the brightness of his life to perish, still faith assures us that His tender mercies have suffered no change, but that somewhere and in His good time, the burden will be lifted off, the darkness be dispelled. As the wise parent withholds the seeming but deceptive good for the child's ultimate advantage, so our Heavenly Father deigns to care for us, and disappoints and chides and grieves us, that in the end our souls may attain to a higher grade of excellence than would be possible without His previous discipline.

God's tender mercies! They greet us in the smile of infancy, in the joyousness of youth, in the glory of ripe age, in the peaceful decline of life. They speak to us from the death-bed of the saint and the flower-strewn grave of the child. We read their record all over the teeming land, the heaving, mysterious ocean, the star-sprinkled canopy of heaven. We feel them in our souls, imploring us to be true, faithful, pure;

to put our trust beyond earth's perishing things; to become God's ministers of good on earth, and so best merit His Divine approbation.

God's tender mercies! Remember them, O tried and tempted and sorrowing heart, for they cradled your infancy and guarded your youth, and will never forsake you, however long and dark and stormy the path may seem; and when all else drops away at the portals of the tomb, they will support you through the gloom, and open for you the golden gates of the city that needeth no sun or moon, since it basketh eternally in the smile of God.—*New England Farmer.*

RELIGION WITHOUT SELFISHNESS.

True it is, while we are in this worldly sanctuary, being gotten no farther, we may do many external good actions, as to ourselves and other men; and also good in themselves, and be very conversant, strict, and devout in all religious outward duties; but they are not done for this end, to shew forth the virtues of him, that has called them, nor to glorify their Father that is in Heaven, but it is to glorify themselves, and to set up themselves, either for praise or esteem, or else for fear of hell, or judgments, or for hope of advantage, or reward, &c. They "serve not God for nought," as the Devil said of Job, ch. 1. 9; not for love of holiness, not for that excellency, that is in itself, but to get something by it. They use it frequently, it is true, but it is as men do a bridge, to carry them over to some desired place, to some self-happiness or advantage they have propounded to themselves, they may get to this same Heaven that is so talked of, but very little known; and were it not for these, the man were dead, and you should find, if the heart were searched thoroughly, and that these ends, these hopes and fears were removed, the man would stand stone-still; but the other man, he who is ascended and gotten within the veil, he works freely and naturally, for love to holiness, and he cannot do otherwise; though there were neither fear of hell or punishment, or hope of the reward, yet he must work, and he will work, and he cannot but work, and that for the love of goodness. This is that I still say: Let but the heart be set to rights, let the man be regenerate, and be but a partaker of the divine nature, and then with such a man you need not keep such a stir as you do, with laws and precepts, rules and disciplines. He hath that within him which will not only inform and teach, but reform and compel to do, and that by the power of love, for, saith the apostle, "the righteous are a law to themselves." I will warrant you, ye may turn this man loose, ye need never fear him.

And beloved! this is the service indeed, this is the service God loves; he loves a cheerful giver; he cannot abide that which cometh forced,

unnatural and grudgingly, like a forced, imposed task, that by sinister respects they must be held to it, but I say, this man needs no such thing; but turn him loose at all turns, he hath an informer and a reformer in him. "Those that are led by the Spirit, are not under the law," Gal. v. 18, but under grace, and under the power of love, and a free mind; for the law is not made for a righteous man, but for the lawless and disobedient. This man is no longer under the law, but is dead to the law, that he may live to God and not unto himself; for self is (in him) conquered and dead, and Christ now is alive and exalted, and set in his throne to reign for ever and ever."

From the Examiner, 18th June.

NEW AFRICAN DISCOVERY.

A very crowded and very interesting meeting of the Geographical Society, under its new president, the Earl of Ripon, took place on Monday last, the subject being the recent discoveries on the eastern side of Africa, by Captains Burton and Speke. These intrepid and scientific travellers, conquering a thousand difficulties, succeeded in penetrating the continent between latitudes four degrees north, and eight degrees south, to the depth of six hundred miles over land that foot of European never trod before. The most remarkable of the discoveries made, consisted of vast fresh water lakes, those of Ujiji and Nyanza, the bare existence of the first of which only had been known, while that of the last, by far the largest, had not even been suspected.

We shall confine our notice to the lake Nyanza, as the most important. This was visited by Captain Speke only, his companion having been prevented by heavy sickness from accompanying him. It was found to lie three thousand seven hundred feet above the level of the sea, and hence above three times higher than the lake of Geneva. Its breadth was estimated from forty to ninety miles, and its length conjectured at three hundred, which would give it an area equal to that of two-thirds of Ireland. This mighty inland sea is conjectured by Captain Speke to be the true and long sought for source of the Nile, a question which has puzzled civilized men for two thousand years, and is still unsettled. The subject, of course, gave rise to much discussion at the meeting. In our own judgment the question is more one of words than substance. Every great river has many sources, and it depends on the nomenclator to which of several contributing streams he may give the name which practice has assigned to the main trunk formed by their conjunctions. The Nile itself has three main branches before it enters Nubia and Egypt, to two of which we give the name Nile, distinguishing them as the Black and the White, according to the color of their waters. It would prevent confusion to give specific names to each affluent

distinct from that of the main river; and this, indeed, is what is done in the case of a larger river than the Nile, the Indus, which takes this name only after the junction of its five contributors.

We have, however, no doubt but that the water of the lake Nyanza does contribute largely towards feeding the classic stream, the inundation of which is the source of the fertility of that Egyptian valley which for thousands of years has exercised so large an influence on the civilization of man. Over the extensive table land in which the lake lies, and which often rises to the height of five and six thousand feet above the level of the sea, the rainy monsoon extends for the six months from November to May, and it is difficult to imagine any other source than this of the Nile and its periodical inundation. The lake Nyanza may be considered as the natural reservoir of the long and heavy rains of this equatorial region, to which it may be added that it lies in the same meridian as the Egyptian valley. The season of the rains, it may be objected, does not correspond with the commencement of the inundation of the Nile, which begins in June and extends to September, but the difference is explained by the absorption of water over one thousand five hundred miles of arid land in a country where it hardly ever rains.

By some writers the melting of winter snows by the heats of summer have been considered as the real cause of the inundation of the Nile, and for the accumulation of the snow in question they have imagined the existence of a certain mountainous range of great height near the equator, which they have called "the mountains of the moon," and might just as well have been called "mountains in the moon," since no reliable traveller has ever seen them, and assuredly not our present travellers, to whom they must have been in sight had they been within two hundred miles of them. The theory, too, is not tenable, for this obvious reason, that in the neighborhood of the equator, there being no distinction of summer and winter, there could be no material melting of snows. In such latitudes the line of congelation would be at the height of some eighteen thousand feet above the level of the sea, and here not rain, but snow or sleet, would fall.

Of the country and people seen by our enterprising travellers we have but a few words to say. The land is evidently less favored by nature than that of the western side of the continent, and negroes are physically and perhaps even mentally inferior. The eastern side possesses no navigable rivers leading to the sea, as does the western, nor has it the gold or the valuable palm oil of the latter. Its crops consist of millet and of maize, the last received from America through India. With apparently abundant facilities for irrigation, not a grain of rice, the main cereal of the tropics, is grown by the rude and

stupid inhabitants. The only valuable product is coffee, still, however, in the wild state only. This is a peculiar indigenous plant of this part of Africa, although we call it Arabian, because we first derived it in its cultivated state from that country. The common fowl and oxen, the latter used only for their flesh and small milk, but not for labor, are the only animals which have been domesticated. The horse is unknown, and so is the hardy ass, unless to a few Arabian settlers. Man, then, has here no help in his toil, without which any respectable progress towards civilization is impossible. A hardy coarse cotton is grown, and the art of weaving a fabric of corresponding quality is understood. So is the art of making malleable iron, the highest stretch of negro civilization in this part of Africa. Letters are unknown to the negroes of the eastern coast, as indeed they are to all African negroes. The staple exports consist of the bodies of the inhabitants in bondage, and of the tusks of slaughtered elephants. The imports correspond in value. It would be but to deceive the public to promise a beneficial commerce with such a country and such a people.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, ELEVENTH MONTH 12, 1859.

The religious excitement now prevailing in some parts of Ireland, principally in the province of Ulster, appears to be nearly allied to that which has scarcely yet subsided in our own country, although presenting some aspects to be accounted for from the greater ignorance, superstition and excitability of the class among whom it has appeared.

There was much in the "Revival" so called, here, which marked it as likely to be evanescent, and yet we are far from believing that it has not been productive of good. We may hope that some who have been induced through fear of future punishment, and under excitement, to forsake their evil ways, if they return not again like the sow that has been washed to wallowing in the mire, may at length learn to love goodness, and to experience that though "the fear of the Lord is the *beginning* of wisdom," it is *but* the beginning.

There is, in that view of religion, which makes the signs of regeneration to consist in faithfulness, purity and watchfulness, rather than in religious emotion, much that is calculated to discipline and deepen the character. And although those who are thus trained from early childhood,

may talk but little of their religious feelings, and may not be able to point to the day or the hour when they were born into the spiritual life, yet, in the gradual growth and development of the good seed, there will be seen the test announced by Jesus, "by their fruits ye shall know them." In a religious community holding these views, no "Revivals," technically speaking, are likely to occur; but its progress will be marked not by spasmodic effort, but by healthy growth.

Stopford, Archdeacon of Meath, who is spoken of as a person of remarkable intelligence and deep religious feeling, after a minute and patient investigation of the phenomena exhibited in Ireland, has published a pamphlet on the subject in which he pronounces "hysteria" to be a concomitant of every case of those "struck," which is the term applied to a particular stage of conversion. The archdeacon goes into a physiological explanation of the disease, and characterizes it as one in which the natural order of our compound being is inverted, and the *will* subjugated to the physical system. It is moreover propagated by sympathy.

The following is from the Examiner of 9th mo. 10th:

"Under the name of a general revival in religion, a system of intense excitement has been organized throughout the districts above referred to, pastors and congregations seeming to be equally moved by a common impulse, unlike any thing we have been accustomed to witness in these countries, and comparable only to what was some years ago not unfrequent in the less civilized States of America. The ordinary method of teaching is on the one hand laid aside by the minister, and a system of vehement excitation to 'escape and begone' from the pending wrath to come is substituted, until the tragic iteration of the appeal has wrought in the minds of the hearers a sort of spiritual panic, amounting to something little short of delirium. On the other hand, the congregation being prepared by the intensity of individual self-consciousness, gives way, on the first suggestion, to frenzied movements and exclamations. Far from restraining either, the minister earnestly encourages both. The men, who seldom wholly lose their self-possession, serve to swell the chorus of terror; but the women become more easily physical victims of their fears. With spasmodic gesticulations and piteous cries for mercy, they fall down in a kind of cataleptic fit. Then it is the triumphant pastor breaks forth into thanksgiving, as for a direct manifestation of divine power. The con-

gregation are then told to pray for the repetition of the miracle in other instances; and the fervid anticipation thus created, as a matter of course, realizes itself. Half a dozen helpless women have been thus 'smitten' in the course of a single hour. It is announced beforehand that adjacent apartments await their reception, and that persons are in attendance to remove them thereto. Dr. Stopford narrates the particulars of several scenes of the kind which he witnessed. He followed the 'possessed' to the places prepared for them during their state of trance, watched them during its continuance, and conversed with them at their awaking. Far from casting any doubt upon the reality of what he saw, or imputing any admixture of deceit or vanity to those concerned, he bears the strongest testimony to their sincerity, and does not shrink from saying that he entirely believes them when they describe their mental state to be subsequently one of unearthly happiness. They declare themselves to be unalterably assured of Paradise, and to have ceased to care about the ordinary ills and sorrows of their present mortal state. He tells us also that for a certain period, usually a brief duration, the features of the 'smitten' wear the glow of supernatural beauty; but he does not fail to add that this ecstatic illumination of the countenance commonly gives place to very different appearances. He finds in the blotched and murky skin, the unnaturally fixed expression of the eye, the incipiently decrepit gait, and above all, the helpless susceptibility to emotion, the unmistakable symptoms of hysteria. He does not question the sincerity of motives in those whose preaching renders their hearers peculiarly liable to, even when it does not actually drive them into, this condition, but he says plainly, that it is a state of bodily disease which is not and cannot be the true or just means of effecting moral regeneration. In a word, he deprecates strongly all idea of treating it as imposture, but he manfully strives to wrestle with it as a fearful delusion.

"It does seem hardly credible, yet unfortunately we know it to be true, that disinterested persons of education and worth should at the present moment be actively engaged in endeavoring to inculcate the community on this side of the Channel with this humiliating and deplorable disease. Persons, both lay and clerical, have gone from hence to the places where it is known to prevail, and have returned possessed with the idea that it is their duty to bring all within their reach under its expanded influence. At Manchester, Woolwich, and other places, vast gatherings have been held within the last week avowedly for this purpose; and we are sorry to observe that so far from any warning being given against factitious physical excitement, expectations are openly held forth, and prayers actually offered that God would make himself miracu-

lously manifest by the same tokens as it is supposed he has shown elsewhere!"

FRIENDS READING ASSOCIATION.

It has been concluded to continue these interesting meetings during the present season. The first meeting was held on the evening of the 7th inst., and friends are invited to meet the association on Second-day evening of each week, in the Library room on Race St., above 15th, at 7½ o'clock.

CORRECTION.—In abstract of Library Report in the *Intelligencer* of last week, in place of "nine" books have been lost, read *none* have been lost. Justice to the vigilance of the Librarian requires the correction of this typographical error.

J. M. E.

MARRIED, On Fifth-day, the 13th of 10th mo., 1859, at the residence of Jonathan W. Gillam, with the approbation of Middletown Monthly Meeting, JOHN COMLY, of Byberry, to SARAH CADWALADER, of Middletown.

—, On the 17th of 10th mo., 1859, at the house of Reuben Haines, Pipe Creek, Carroll co., Md., according to the order of the Society of Friends, THOMAS R. SMITH, of Goose Creek, Loudon co., Va., to ELLEN HAINES, daughter of Reuben and Sarah Haines.

—, At the same time and place, and in the same manner, WILLIAM G. SMITH, of Goose Creek, Loudon co., Va., to PORTIA HAINES, daughter of Nathan and Beulah Haines of Carroll co., Md.

DIED, on the 5th of 10th month last, after an illness of five weeks, of typhoid fever, at the residence of her mother, in Huntington County, Indiana, SARAH J. daughter of Benjamin and Rebecca J. Mason, aged nearly 19 years. The deceased was a member of Maple Grove Monthly Meeting, and was much beloved and respected by a large circle of friends and acquaintances.

—, At the residence of her brother, New London, Chester County Pa., on the 26th of 10th month, 1859, ELIZABETH FELL, in the 69th year of her age.

—, At his residence, in Fourth street, near Green, on Third-day, the 1st inst., JOSEPH WARNER, aged 76 years.

—, In Newtown, Bucks co., Pa., on the 1st inst., JOSHUA WOOLSTON, aged 66 years, 3 months and 19 days, a member of Makefield Monthly Meeting.

—, In Attleboro, Bucks co., Pa., on the 3d inst., MARGARET WILSON, aged 75 years, 3 months and 23 days, a member and formerly an elder of Middletown Monthly Meeting.

—, On the 1st inst., at his residence, Cold Spring, Putnam Co., New York, JAMES TRUMAN, in his 42d year, eldest son of Joseph M. Truman, of Philadelphia.

A DINNER FOR THE POOR.

WILLIAM FOX, of Nottingham, was a member of the Society of Friends, and he was one of the true old school of Friends. His sympathy for

the poor was deeply excited by serving in the office of overseer, and, seeing how poor some were who had to pay the poor rates, he resolved to economize the parish funds and thus prevent their miseries as much as possible. It was the custom then in many parishes for the overseers and the committee who attended the weekly payments of the paupers to have good a dinner at the close of their day's labor, and this was paid for out of the poor-rates; but as it was a manifest abuse, he determined to put an end to the practice. He, therefore, hastened away before the close of the weekly payment to the dining-room, and thus addressed the master of the workhouse: "Is the dinner ready?" "Yes, sir." "Then bring it in." "Are the gentlemen ready, sir?" "Never mind the gentlemen; I say bring it in." And this was done. "Now, call all the poor people,—now call the poor people. Dost thou not hear what I say?" "This dinner is for the gentlemen." "For the gentlemen; oh! who pays for it then, do the gentlemen?" The workhouse master, staring most amazingly, said, "Why, no, sir, I reckon not; it's paid for out of the poor-rates." "Out of the poor-rates; to be sure it is, thou art right. The rates are for the poor men, and not for the gentlemen. Poor-rates, oh! I think we have no gentlemen's rates, so fetch in the poor at once and look quick."

The workhouse master went, and William Fox went too to see that he did as he was ordered, and not to give the alarm to the gentlemen, and in a few seconds was hurried in a whole host of hungry paupers who had not for years set eyes on such a feast as that. They did not wait for a second invitation to place themselves at table, and William Fox bade them help themselves, and at once there was a scene of activity that for the time it lasted justified the name of the house. It was a workhouse, indeed. William Fox all the time stood cutting and carving and handing good pieces of pudding and meat to such as could not get seats; in a few minutes there was a thorough clearance of the table. Scarcely had William Fox dismissed his delighted company when another company presented themselves, and these were the gentlemen, who stood in amazement. "Why," exclaimed they, "what is this, why is the table in this state, where is the dinner?" "I found a very good dinner ready, and as I know that none but the poor had a right to dine out of parish funds, I have served it out to the poor accordingly; but if any of you is in want of dinner, he may come home with me and I will give him one." The gentlemen knew well the character they had to deal with, and never attempted to renew the practice of dining at the public charge during William Fox's year of office.—*English Paper.*

He who bears and forbears is always a useful member of a community.

DON'T APOLOGIZE.

No, good housewife, don't apologize! What if your visitors do find you busied with household affairs? What if the children have not their best clothes on, or your apartments are not in apple pie order? It is not to be supposed that your lady friends call on you for the purpose of criticising your housekeeping, but rather to enjoy a few moments of social intercourse. Don't throw a damper upon the interview by exhibiting an embarrassment that chills all conversation.

Don't apologize! It is bad policy. It shows a want of tact. Excuse is self-accusation. Little matters which would be overlooked in the flow of talk, are brought into unnecessary prominence by apologetic reference to them. This "making calls" is a bore at the best. It is doubly so, when the whole interview is spent in uttering and disclaiming apologies. We have known ladies to apologise for their appearance, for their occupation, and even for the lack of elegant furniture in their apartments! Oh, the vanity of such apologies. Dear lady, *don't* apologize.

If your callers catch you at an inopportune moment, don't let them know it. Don't call their attention to little deficiencies by apologies. We have known ladies to persist in resisting all attempts to introduce pleasant topics; ever returning to some little sore spot and applying the salve of apologies. It is all vanity and vexation of spirit. It vexes you and it vexes your visitors. They go away saying:—"We'll never call *there* again.

Meet your friends kindly and cordially. Ignore all domestic deficiencies; talk yourself and your friends into good humor, and on leaving, they will tell you how much they have enjoyed their call, entirely ignorant of anything *mal apropos* in your domestic affairs. There is nothing like pleasant conversation for making time pass agreeably, and sinking out of notice all things that need not be noticed.

We are supposing all along that there are really some little matters, in your appearance or your apartments, that are not exactly as you would like them appear in the eyes of visitors. But some ladies, when everything is to their mind, enter upon a course of apologies, in order to draw attention to their fine appearance! Such perversity deserves the cut direct. Leave at once—and don't apologize.

But again—don't take your visitors into a cold and formal parlor, because it happens to contain the best furniture in the house. One can see all such things at the upholsterer's and the furniture warehouse. Take them into your *living* room, where the babies and babies' playthings are about the floor, and where the evidences of occupation give an air of sociability and life to the apartment. Here topics will suggest themselves—but who can talk in a stiff and stately unused parlor, where you are chilled by the for-

mality of everything about you, and by the knowledge that the *lady in waiting* will desert it immediately upon your departure. If you value your friends and wish to retain their acquaintance, don't make them feel, by attending them in a cold room, that you are only waiting for them to depart, in order to return to your accustomed avocations; but take them at once where they will feel at *home*, and can enjoy their call. Do this, and don't apologize.—*Portland Transcript*.

REMAINS OF A ROMAN CITY IN ENGLAND.

We learn from the *London Times* that the Duke of Cleveland has let to the Committee of Excavations four acres of ground at Wroxeter, the two on which the excavations have hitherto been carried on, and two additional acres adjoining, to be kept permanently open to the public, and not be filled up again. Four acres of the buildings of a Roman town in Britain, ruined in the fifth century, will truly be an interesting monument. The recent excavations prove beyond a doubt that the whole mass of the ancient Roman city—that is, the floors and lower parts of the walls—exist underground, and also that a better place could not have been chosen for excavating than that selected. The southern, and, apparently, the western limits of the great building containing the hypocausts, and believed to be an establishment of public baths, have been found, and it appears to have formed a very extensive parallelogram. The space between it and the ancient street to the west, which occupied the site of the present Watling-street-road, was covered with smaller buildings, including the supposed market-place or bazaar, which are in great part now excavated. The southern wall of the great building is found to have bordered on another transverse street, and buildings are found to the south of this street also. The streets of *Uricouium*, in this part of the town at least, ran at right angles to each other. The more recent excavations have added considerably to the contents of the Museum at Shrewsbury. Portions of columns have been found, which, like all the large hewn stone found here, have the "lewis" hole for lifting them, and some have what appear to be masons' marks, which, if they are so, would be a curious discovery. A perfect quern, or hand-mill for grinding corn, has also been found, and a considerable number of personal ornaments (two of silver), with abundance of coins. Also fragments of a new description of pottery which has not been met with before. Among the animals' bones recently found is a very large head of an ox with its horns perfect. The bones of animals found in the excavations, which are very numerous, and have been all kept together, deserve well to be carefully examined by an experienced comparative anatomist.

For Friends' Intelligencer.

Review of the weather, &c. for Tenth month.

	1858.	1859.
Rain during some portions of the 24 hours,	8 days	7 days.
Rain all or nearly all day,	2 "	0 "
Snow,	0 "	3 "
Cloudy without storms,	7 "	7 "
Ordinarily clear,	14 "	14 "
	31	31

TEMPERATURES, RAIN, DEATHS, &c.

Mean temprature of the month at Penna. Hospital,	59 deg.	52 50 deg.
Highest do. during month do.	85 "	80 "
Lowest do. do do do.	36 "	32 "
RAIN during the month,	1.84 in.	3.12 in.
DEATHS, during month, counting five current weeks for each year,	802	783
DEATHS, in New York during the first week in Tenth month of each year,	407	420
Do. in Philadelphia during the same period	200	154
The average of the mean temperatures of this month for the past 70 years is	54.35 deg.	
Highest do. during that entire period, 1793,	64 "	
Lowest do. do. do. 1827,	46 "	

From the above it will be seen that the temperature of the month just closed was about two degrees lower than the average for the past seventy years, and six and a half degrees lower than last year.

A lower degree of temperature for any corresponding month has only occurred four times since 1816 inclusive, viz: 1816, 1826 and 1843—each 52 degrees, and 1838, 50 degrees.

The snow storm of the 26th of the present year was remarkable for its severity, so early in the season—the ground retaining some two inches or more in this city; while some little distance out of town, from four to six inches were reported—small patches of it were to be seen here, in shady places, as late as the evening of the 30th, showing a decidedly cool state of the atmosphere.

The journal of the weather at the Pennsylvania Hospital, which was commenced in 1825, records nothing to equal to it; while in Pierce's record, from that time back to 1790 inclusive, no mention is made of a similar storm in any Tenth month.

The record of rain for the ten months just closed, as compared with the two previous years, stands thus:

1857.	1858.	1859.
41.26	30.17	50.78

The compiler of these reviews has, of latter times, frequently referred to the increase in the quantity of rain in this section of the country during the present year. Such, however, appears not to have been the case everywhere. In

the "Illustrated London News," in an interesting article on "the diminution of rain," we find the following:

"In the quarterly report of the Registrar General ending with June, it is stated that the deficiency in the fall of rain from the beginning of the year, is $1\frac{1}{2}$ inch. The deficiency in the year 1854, 1855, 1856, 1857, 1858, amounted to the average fall of one year, viz: 25 inches. From a careful examination of the fall of rain (year by year) from the year 1815, it would seem that the annual fall is becoming smaller, and that there is but little probability that the large deficiency will be made up by excess in future years. Should this statement, made by Mr. Glaisher and adopted by the Registrar-General in a document issued by authority, be confirmed, it will constitute one of the most important discoveries ever made by meteorologists. Undoubtedly it needs to be verified by observation in many quarters; and now that attention is directed to the subject, the registers of rain-fall, which have been kept in many places for a number of years, will, on being referred to, soon confirm or disprove it. We venture to say at once, however, that it appears highly probable—because consistent with many other phenomena—that the quantity of rain which falls on the earth is very slowly and gradually diminishing."

A theory that has recently been started is then quoted in endeavoring to account for the fact, if such it be, which, however interesting it may be, is too lengthy to incorporate in this article.

It may however be well to say, that it assumes that the earth is continually increasing in size, and that as the population on the earth increases, the conversion of the fluid into solid matter also increases. And further—that "as the space covered by water on the surface of the globe diminishes, evaporation will be *protanto* diminished. There will be less water taken up and less will fall," &c., &c.

Philadelphia, 11th mo. 1st, 1859. J. M. E.

From the Anti-Slavery Standard.

TO THE SPIRIT OF MY FATHER.

"Who knows but the beings that bound us
With tenderest ties to this world,
Tho' unseen, may be hovering round us,
With their cherub-like pinions unfurled?"

When opes the cheerful "eye of day,"
Alone I go upon my way,
And Morn's inspiring beauty drink,
And sally forth, to feel, and think.
Am I alone? ah, no! ah, no!
A presence by my side doth go:
Dear Father! still thou seemest here,
I feel thy love—I deem thee near.

I rove along the hedgerow green,
And where the apple trees are seen,
Through whose bright blossoms thou and I
Lov'd to look up into the sky.
Daily I pass the well known door,
Yet daily enter in no more:

Pass, too, the open window by,
Where watch'd for mine thy loving eye:
But door and window are to me
Now as dear friends long ceas'd to be.
When western clouds are in their glow,
Along another path I go:
Upon our fav'rite bridge I stand,
And, musing, seem to clasp thy hand
As I was wont to do, and gaze
Where sunset's golden glory plays.
In those sweet walks, in those sweet hours,
What tender fellowship was ours!
While, talking of the things that lie
Beyond the ken of human eye,
We spoke of worlds to come, where we
Should learn Death's mighty mystery,
And meet again, on happier shore,
Each other, and our "gone before."

I follow Mem'ry's winding way,
Back to still earlier moments stray,
And live my infant joys and tears,
And seem an infant still, in years.
Thy child remembers when we stood
By grand old castle, cliff, and flood,
And when the vast Cathedral pile*
We enter'd by the long, dark aisle
At evening, while the color'd light
Fell from the gorgeous window's height:
And thou her little footsteps led
Where pilgrim knees of old ('tis said)
Have left recordings of their own
Upon the grey insensate stone.
She treads again the garden way
Where her first little flow'r-bed lay;
The primrose-bank again she sees,
Its gentle scent is on the breeze,
The drooping bluebells hang their head,
The daisied meadow is outspread,
Till rustles back Life's real *Now*,
Then, where am I—and where art thou?
Ah! seest thou my good or ill?
And seekest thou to bless me still?

What didst thou leave me, Father dear?
Earth's honors? gauds and greatness here?
Oh no! but I *did* learn from thee
The greatness of Eternity.
Early thou taughtest me to look
Observingly on Nature's book:
Thou taughtest me that all was nought
Save the high gifts of soul and thought:
Thou taughtest (little understood!)
That *Virtue* is Life's crowning good.
From Nature's stores thy spirit drew
Thoughts—hopes—refreshments—ever new:
Creation all, each sentient thing,
For thee with joy was blossoming:
A childlike innocence of heart,
Too poor to act the worldling's part,
That could not plan for earthly pelf,
Nor cater cunningly for self,
These, these were thine: and, better still,
The soul that yields to God's its will.
The veil which covers from our sight
Life's future in abyss of night,
Thy trustful soul could ever see
As woven by Benignity.
Oh! I have seen thee sorely tried,
Yet learn'd Faith's lesson at thy side.
On thee no doubt did e'er intrude
That God—thy God—was ever good:
From thee no murmur'ing accent fell;
Thou saidst—"He doeth all things well!"

* Canterbury Cathedral.

My Father! 'tis thy natal day;
 When gift and flower I us'd to lay
 Within thy hand, 'mid smile and tear,
 Thy loving, widow'd heart to cheer.
 And still this day thy child would make
 Sacred forever, for thy sake:
 To thee *this* little gift she brings,
 On thy low grave *this* flower she flings
 Take it, dear Father!—let it be
 A link, ev'n now, 'twixt me and thee.

Salem, New Jersey, June 29, 1859. A. W. M.

A FRAGMENT.

BY MARY FRANCES TYLER.

Thou knowest, oh my God!
 All the steep places where my feet e'er trod;
 And many they have been; and oh, so rough,
 That I at times bethought me 'twere enough
 To bow the bravest down! Yet sank I not,
 Crushed and o'erburned with my weary lot,
 For thy dear arm sustained me; and I go
 Henceforth rejoicing, for I know—I know
 That thou art with me always!

Once 'twas mine
 To bow me down, and bitterly repine,
 Even Father, at thy workings.

Then Faith shed
 Her sweet baptismal waters on my head,
 And, lo! the shade
 Wherein my feet had strayed
 Vanished before me.

Now I see how vain
 And sinful 'tis for mortals to complain,
 And murmur at the will
 Of Him who said unto the waves, "Be still."

THE BEAUTIFUL PATCH.

We picked up a newspaper, on which were these words, "Don't be ashamed, my lad, if you have a patch on your elbow; it speaks well for your mother."

This was suggestive. Up came recollections of a beautiful patch which we admired when four years old. A little girl stood in "Aunt Fanny's" door, with a pretty new patch on the waist of her green calico gown. We wished we could have a dress so patched. To us, it was a beautiful patch; and we looked up to the little girl, who, like ourself, was a four-year-old. That patch, with its neat outline and the pretty figure printed on the calico, is clear and bright in our memory.

We like to see a neat patch on a working dress; it is especially indicative of sterling qualities in both the wearer and the article worn, to say nothing of the niceties of the artist in adapting it to the new relation. Yes, that patch was a beautiful one.

Then, when two years older, we were made supremely happy by a darn in our holiday dress. It was the handsomest darn in the world. We see now every fine, beautiful stitch which made the garment better than new. It was the best darning ever seen—we thought. We were proud of it. That dress was ever after sacred in our

estimation. Whenever it was put on, our eyes sought the darn, and rested on it with satisfaction. We wished all children had their dresses so prettily darned. But we were sure their mothers could not mend so nicely, and so pitied them.

That dress of fine buff cambric, so handsomely darned—it hangs unrumpled in memory's press; perhaps it will remain there till after this material body it then clothed shall have been exchanged for a celestial one. The recollections of children that somehow become deposited in the storehouse of memory are simple, like the white chips which they gather as they fall from the chopper's axe, for some peculiarity of coloring or form a child's eye only notices or appreciates.

Ashamed of a patch? No, my boy, never be ashamed of a patch—*never!* In respect to dress, be ashamed of nothing but unnecessary dirt and slovenliness. If your clothes are as clean, and as neatly put on as circumstances admit of, nobody either loves or respects you the less because they are coarse or patched. We said nobody—let the expression be unmodified. It is true.—*Life Illustrated.*

NEVER TOO OLD TO LEARN.

Cato, at eighty years of age, thought proper to learn the Greek language. Many of our young men, at thirty, and forty, have forgotten even the alphabet of a language, the knowledge of which was necessary to enter college, and which was made a daily exercise through college. A fine comment upon their love of letters, truly!

Plutarch, when between seventy and eighty, commenced the study of Latin. Many of our young lawyers, not thirty years of age, think that *nisi prius, scire facias*, &c., are English expressions; and if you tell them that a knowledge of Latin would make them appear a little more respectable in their profession, they will reply that they are *too old* to think of learning Latin.

Franklin did not fully commence his philosophical pursuits till he had reached his fiftieth year. How many among us of thirty, forty and fifty, who read nothing but newspapers, for the want of a taste for natural philosophy! But they are *too old to learn.*

Accorso, a great lawyer, being asked why he began the study of law so late, answered that indeed he began it late, but he should therefore master it the sooner. This agrees with our theory, that healthy old age gives the man the power of accomplishing a difficult study in much less time than would be necessary to one of half his years.

Dryden, in his sixty-eighth year, commenced the translation of the Iliad; and his most pleasing productions were written in his old age.

We could go on and cite thousands of examples of men who commenced a new study and struck out into entirely new pursuits, either for

livelihood or amusements, at an advanced age. But every one familiar with the biography of distinguished men will recollect individual cases enough to convince him that none but the sick and indolent will ever say, *I am too old to study.*

SALT LAKE.

Greeley in one of his letters to the *Tribune*, from Utah, gives the following concerning this remarkable body of water :

That this Lake should be salt is no anomaly. All large bodies of water into which streams discharge themselves, while they have severally no outlet, are or should be salt. If one such is fresh, that is an anomaly, indeed. Lake Utah probably receives as much saline matter as Salt Lake; but she discharges it through the Jordan and remains herself fresh; while Salt Lake, having no issue save by evaporation, is probably the saltiest body of water on earth. The ocean is comparatively fresh; even the Mediterranean at Leghorn is not half so salt. I am told that three barrels of this water yield a barrel of salt; that seems rather strong, yet its intense saltiness, no one who has not had it in his eyes, his mouth, his nostrils, can realize. You can no more sink in it than in a clay bank, but very little of it in your lungs would suffice to strangle you. You make your way in from a hot, rocky beach, over a chaos of volcanic basalt that is trying to the feet, but at a depth of a yard or more, you have a fine sandy bottom, and here the bathing is delightful.

The water is of a light green color for ten or twenty rods; then "deeply, darkly, beautifully blue." No fish can live in it; no frog abides in it; few birds are ever seen dipping into it. The rugged mountains in and about it—just such scraped and seamed and gullied precipices as I have been describing ever since I reached Denver—have a little fir and cottonwood, or quaking ash, in their deeper ravines or behind their taller cliffs, but look bare and desolate to the casual observer; and these cut the Lake into sections, and hide most of it from view. Probably less than one third of it is visible from any single point. But this suffices.

THE EARL AND THE FARMER.

A farmer once called on the late Earl Fitzwilliam to represent that his crop of wheat had been seriously injured in a field adjoining a certain wood, where his lordship's hounds had during the winter frequently met to hunt. He stated that the young wheat had been so cut up and destroyed, that in some parts he could not hope for any produce. "Well, my friend," said his lordship, "I am aware that we have done considerable injury; and if you can produce an estimate of the loss you have sustained, I will repay you." The farmer replied, that anticipa-

ting his lordship's consideration and kindness, he had requested a friend to assist him in estimating the damage, and they thought, as the crop seemed quite destroyed, £50 would not more than repay him. The Earl immediately gave him the money. As the harvest, however, approached, the wheat grew, and in those parts of the field which were most trampled, the grain was strongest and most luxuriant. The farmer went again to his lordship, and being introduced, said, "I am come, my lord, respecting the field of wheat adjoining such a wood." His lordship immediately recollected the circumstances. "Well my friend, did not I allow you sufficient to remunerate you for your loss?" "Yes, my lord, I find that I have sustained no loss at all, for where the horses had most cut up the land, the crop is the most promising, and I have, therefore, brought the £50 back again." "Ah!" exclaimed the venerable Earl, "this is what I like; this is as it should be between man and man." He then entered into conversation with the farmer, asking him some questions about his family—how many children he had, etc. His lordship then went into another room, and returning, presented the farmer with a check for £100, saying, "Take care of this, and when your eldest son is of age, present it to him, and tell him the occasion that produced it." We know not which to admire the more, the benevolence or the wisdom displayed by this illustrious man; for while doing a noble act of generosity, he was handing down a lesson of integrity to another generation.—[*British Workman for September.*]

LIBERIAN COTTON.

We take the following extract from the Report of the Committee of Adjudication of the last National Fair of the Republic of Liberia. It will be found well worthy of attention :

Cotton, sugar, and coffee, which give fair promise of soon becoming the staple products of our country, were some of the articles that claimed our special attention. Knowing that our farmers had engaged more largely in the cultivation of these than at any former period, we naturally expected to see them largely represented. Although the demands of the act were fully answered, the lateness of the dry season prevented the maturity of the crops, and the severer competition which would have otherwise followed. There were more than a dozen specimens of cotton, but only one that in weight reached the amount required by law. Those lots which were less than fifty pounds were the best cleaned and ginned, exhibiting several qualities, some of a coarser and finer texture, some a long and silky staple. We regret that our limited knowledge of testing these qualities would enable us to commend with certainty only the best markets

ble specimens. There were some good specimens exhibited from stocks of American seed planted seven or eight years ago, the same trees producing good cotton for eight successive years. Other specimens of cotton were shown from American seed planted last year. But the principal lots were of native African cotton, and several twenty yards pieces of cotton cloth were manufactured by our citizens from this kind, as well as many socks and stockings. Mrs. Martha Rix, formerly Mrs. Zion Harris, showed some very fine specimens of silk cotton socks made from the cotton of the large silk cotton tree, which grows wild in our forest from 80 to 100 feet high. This is perhaps the first time that any one has attempted to apply this species of cotton to any practical purpose. Of the common stock of African cotton there are several varieties, from which the native population of the interior manufacture annually many thousands of country cloths, which, they constantly bring to our market for sale or exchange, thus showing that in less than one hundred miles in the interior large quantities of cotton are grown by native industry, which by a little effort on the part of our merchants and capitalists, might be thrown into our market in the raw material for exportation. We think it has been fully proved the last year to the satisfaction of the Americo-Liberian population that cotton, being indigenous to this part of Africa, and perennial for seven or eight years, may be grown to an indefinite extent in any part of our territory. The only point next to settle to insure success is, whether we can obtain cheap labor and cheap goods, so as to afford a good article of well-ginned and marketable cotton at five or six cents per lb. The growing of cotton as a staple product we regard as of primary importance; we shall not only recommend it as an experiment to our population, but contribute our individual quota next year to the national stock.—*Col Herald.*

ITEMS OF NEWS.

EUROPE.—The terms of the Zurich Treaty have been made public, and are much the same as those agreed upon at Villa Franca. Lombardy is transferred to Piedmont, and, at a Conference of the leading European Powers (not the usual Five Powers), the final settlement of the Italian Duchies' question will be made. Victor Emmanuel, meanwhile, calls for a loan of \$100,000,000, which is a large sum to want or solicit under existing circumstances. But what the ruler of Piedmont and Sardinia might find it difficult to obtain, is not so difficult to him who now has fertile Lombardy annexed to his dominions, with a pretty strong chance of also obtaining the Duchies before twelve months pass over his head.

GREAT EASTERN.—The directors of the Great Eastern held a meeting on the 19th ult., and it is authoritatively announced that the departure of the vessel has been postponed *sine die*, and orders given that all passage-money received be returned. No time will be fixed for the transatlantic voyage, until good progress has been made in fitting out the ship in thorough seagoing completeness, and, according to some authori-

ties, there is no likelihood of the voyage being made before next spring. The ship would remain at Holyhead about ten days longer, and then go to Southampton, to complete her fittings, after which a trip to Lisbon is spoken of. It is stated that in her present condition the directors will not accept the ship from Scott Russell.

RAILROAD ACCIDENT.—A terrible accident occurred recently, on the Chicago and Northwestern Railroad. A train, consisting of thirteen cars, filled with excursionist from Fond du Lac for Chicago, ran off the track at Johnson's creek, eight miles south of Watertown, Wisconsin. Eight persons are reported killed, and a number badly injured. The accident was caused by the running over an ox on the track.

At a recent meeting of the New York Sanitary Association a series of statistics were read relative to the number of persons who do business in the city, but who reside in the adjoining cities and towns. The aggregate of arrivals in the departures from the city were for one year, computed to be 87,255,610, an average of 265,000 a day.

ADULTERATION IN COTTON.—A rather numerous party of cotton buyers sailed from Liverpool for New York, in the Persia, who purpose to concert measures with the most respectable houses in the United States to put an end to the system of adulterating that article which has of late years been resorted to upon a constantly increasing scale. Sand is the ingredient used, and New Orleans is said to have disgraced itself more than any other port.—*Manchester Examiner.*

NEW POSTAGE ARRANGEMENTS.—A Telegram from Washington brings the intelligence that the Postmaster General has concluded an arrangement with the Canadian Post Office Department, by which the mails are to be transported for the sea postage, weekly, between Detroit and Liverpool, via Portland in the winter, and via the River St. Lawrence in the summer. The service to commence by the trip of the first steamer outward from Portland, on 26th inst. It is intended to have the mails, or such of them as may be thereby expedited for and from the Northwestern, and probably some of the Southwestern States, sent in closed mails between Chicago and Detroit on the one side, and Liverpool and London on the other, and for this purpose the assent of the British Post Office Department has been requested to constitute Chicago and Detroit exchange offices for the United States and British mails. On the side of Great Britain, Cork may also be constituted an exchange office. The schedule time between Portland and Chicago to be forty-eight hours, and when the service commences there will be an unbroken line of railway the entire distance. This will be a very direct line from the far West to Europe.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market continues dull, but holders manifest no disposition to accept lower quotations. There is but little shipping demand, and only a few hundred barrels of at \$5 25 per barrel, for superfine, and \$5 75 for extra. There is a steady inquiry for the supply of the trade from our lowest quotation up to \$7 for fancy lots. Nothing is doing in Rye Flour or Corn Meal, and no change in prices.

GRAIN.—Wheat is held less firmly, sales of 4,000 bushels prime Pennsylvania and Southern Red at \$1 27 a 1 30, and a small lot of White at \$1 42. Rye is steady at 90 cents for Pennsylvania, and 86 cents for Southern. Corn has again declined; sales of 2000 bushels yellow at 90c, and 75c for new. Oats are steady at 40 a 42 for Delaware; 200 bushels prime Pennsylvania sold at 43 cents.

Cloverseed of prime quality is in good demand; sales of 200 bushels at \$5 12½ a 5 35 per 64 lbs. A lot of Flaxseed sold at \$1 55 a 1 60.

NOTICE.—A Friend in Maryland has a tract of upwards of one thousand acres of Land, about one half of which is cleared, the balance in wood, mostly chestnut. Said land lies in Prince George's county, Md., about 22 miles from the city of Baltimore, and 18 miles from Washington City, D. C.

The Washington and Baltimore Rail Road runs for more than a mile within 1½ miles from the tract, in which distance there are two Depots or Switches—Contees and Muirkirk. The village of Laurel is about 2 miles east of the tract; Sandy Spring Meeting is about 7 miles north; and Indian Spring about 8 miles south. The neighborhood is remarkably healthy—the water being most excellent.

There are very few slaves in this part of the county. The owner is willing to dispose of this property on very favorable terms to a body of eight or ten young Friends who may want a farm in an improving part of the country. It will be expected that the Friends produce certificates of industrious and thrifty habits, none else will suit. For further information enquire of

THOMAS B. LONGSTRETH, &
DILLWYN PARRISH,
Philadelphia.

WANTED—A situation as teacher, by Mary Emma Satterthwaite. Address
10 mo. 29—4 t. Denton, Caroline co., Md.

TWO YOUNG WOMEN, members of the Society of Friends, are desirous of situations as teachers in families where they would make themselves otherwise useful, or would engage as assistant teachers in established schools. Apply at the office of the Intelligencer.
10th mo. 29—2m.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The Winter Session of this institution will commence on the 14th of 11th mo. next, and continue twenty weeks.

Terms \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address

HENRY W. RIDGWAY,
Crosswicks P. O., Burlington Co., N. J.
9th mo. 24—3 m.

LATON ACADEMY, KENNETT SQUARE, Chester Co., Pennsylvania.

The Fourth Term of this Institution, under the charge of the present proprietor, will open for the reception of pupils of both sexes, on Second day, the 31st of 10th mo. next, and continue in session twenty weeks.

The course of instruction will embrace all the branches of a thorough English education, the higher Mathematics, Natural Sciences illustrated, the Latin, Greek, French and German Languages, and Drawing.

For terms and particulars, see Circulars, which will be forwarded to the address of every person requesting the same, upon application to

WILLIAM CHANDLER, Principal & Proprietor.
or to WILLIAM A. CHANDLER, Principal Instructor.

RUTHANNA JACKSON,
or to MAGGIE B. JACKSON,
CHARLES B. LAMBORN, } Assistants.

9mo. 10, '59,—2m

LONDON GROVE BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—It is intended to commence the next Session of this Institution on the 1st of

11th month, 1859. Terms \$60 for 20 weeks; no extras, except for the Latin and Greek Languages, which will be \$5 each. For Reference and further particulars inquire for Circular of

BENJ. SWAYNE, Principal,
London Grove P. O., Chester Co. Pa.

9 mo 3, 2 m.

ELDRIDGES HILL BOARDING SCHOOL FOR YOUTH OF BOTH SEXES, will open its Winter Session 11 mo 1st.

Terms \$70 per session of 20 weeks. For particulars address the Principal for a circular.

ALLEN FLITCRAFT,
Eldridges Hill Salem County, N. J.

8 mo 27 3 m.

THE BANKSDALE BOARDING SCHOOL FOR GIRLS, will be reopened the 14th of 11th month, and be continued twenty weeks. The course of study will comprise the usual English branches and Drawing. Terms \$60.

For further information apply to ELIZA HEACOCK, Jenkintown, Montgomery Co. Penn.

8mo. 27 3m.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

GEO. A. NEWBOLD,
Parcelville, Loudon Co., Va.

8th mo. 6, 1859.—6m.

BYBERRY BOARDING SCHOOL, FOR GIRLS. The ninth session of Byberry Boarding School, taught by Jane, Anne and Mary S. Hillborn, will commence on the first Second-day of Tenth month, 1859, and continue forty weeks without intermission, (including two terms of 20 weeks each.) The course of instruction embraces all the branches of a liberal English education.

Terms \$60 per session of 20 weeks, one half payable in advance. For circulars containing further particulars address

JANE HILLBORN,
Byberry P. O., Philada., Pa.

8th mo. 7—3m.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Penciling, and Pellis work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; reading, Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M.

Principal.

Attleboro', Bucks Co., 5th mo., 28, 1859. 6m.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, ELEVENTH MONTH 19, 1859.

No. 36.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,

No. 324 South Fifth Street,

PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

A CHAPTER FROM JANNEY'S HISTORY OF FRIENDS.

(Continued from page 548.)

During this protracted and painful imprisonment, many Friends came a considerable distance to see them, but were often denied access by the cruel jailor. Among these sympathizing visitors was William Dewsbury, whose words of counsel and encouragement were peculiarly grateful. After they had been detained more than twelve months, their unjust imprisonment and barbarous treatment were represented to Cromwell through the intervention of Mary Saunders, a member of his household, and an order was obtained for their release.

It is remarked by George Whitehead, that Mary Saunders "was a sober maid and a good example" in Cromwell's family; she afterwards married a worthy Friend, named Henry Stout, of Hertford, and continued to the end of her days in true Christian faith and love to Friends.

In pursuance of the Protector's order, the imprisoned Friends were, in the year 1656, released by Sir Francis Russel, who kindly furnished them with an order or warrant to produce in their defence if they should be molested in their travels.

Their fidelity and patience were the means of convincing many of their religious principles; and the divine support they experienced during their imprisonment is gratefully acknowledged in the Journal of George Whitehead. "I am," he says, "still truly and humbly thankful to the Lord our God in remembrance of his great kindness to us; how wonderfully He supported and comforted us through and over all these our tribulations, strait confinement, and ill usage, and preserved us in bodily health. In the com-

fortable enjoyment of His glorious divine power and presence, several of us have often been made to sing aloud in praise to His glorious name; yea, His high praises have been in our mouths oftentimes, to the great amazement and astonishment of the malefactors shut up in the same ward with us. When walking therein, our hearts have been lifted up in living praise to the Lord, often for several hours together, with voices of melody." . . . "O my soul! still bless thou the Lord, and for ever praise His excellent name, for the true inward sense and experience thou hast often and long had, and still hast, of His divine power and unspeakable goodness! Glory and dominion unto our God and to the Lamb that sits upon the throne for ever and ever. Let the praise be unto Him in whom is our help, salvation, and strength."

The first meetings of the Society of Friends held in the city of London were in the early part of the year 1654, and the first messengers were Isabel Buttery and a female companion. Taking with them a printed Epistle of George Fox, addressed "To all that would know the way to the kingdom," they distributed this tract among those who were willing to receive it, and they held private meetings at Robert Dring's house in Watling street, and in Simon Dring's in Moorfields, where they sometimes spoke a few words in gospel ministry. The distribution of Friends' books being considered by the Mayor an offence deserving punishment, Isabel Buttery was committed to Bridewell, which is the first instance on record of Friends' sufferings for conscience' sake in London.

In the memoirs of William Crouch, he says, "In the Fifth month of this year, 1654, it pleased God to send two of his faithful messengers and able ministers to the city of London, viz., Francis Howgill and Edward Burrough, who were the first that declared Truth *publicly* there, whom He made instruments in His hand for the gathering of many, who, like good old Simon, were waiting for the consolation of Israel." . . . "The Lord was pleased to visit a tender seed in and about the city of London by these His chosen instruments; and as He opened the hearts of a remnant to receive the word of life and believe in it; such opened their doors for meetings in their houses, and for some time, it so continued, that they met from house to house."

John Audland, John Camm, Richard Hubberthorne, and Anthony Pearson, soon after visited the metropolis, and in conjunction with the two faithful ministers already mentioned, they were instrumental in making many proselytes.

The establishment of Friends' meetings in London being a subject of much importance in the history of the Society, some passages from the correspondence of those who were engaged in the work are deemed sufficiently interesting to be worthy of insertion.

In a letter from Edward Burrough and Francis Howgill to Margaret Fell, dated London, 29th of Sixth month, [Eighth month,] 1654, they write: "We have three meetings or more every week, very large, more than any place will contain, and which we can conveniently meet in. Many of all sorts come to us, and many of all sects are convinced,—yea, hundreds do believe; and by the power of the gospel declared amongst them is the witness for God raised which shall never die. There are some brought under the power exceedingly, which strikes terror into the hearts of many; and many lie under true judgment, and a true love is raised up in many, and the time of redemption to many is drawing nigh." "Our dear brethren, John Audland and John Camm, went from us the last Sixth-day out of this city towards Oxford, to be there the last First-day; our hearts were broken in separating one from another, for our lives are bound up in one, and we partake of one another's sufferings and of one another's joy. We receive letters every week from the prisoners at Chester; the work of the Lord goes on gloriously in that county; there is precious seed; and Anthony Pearson writes to us of the like in the county of Bishoprick, [Durham;] it is even our reward to hear that the Lord is raising up that in power, which was sown in weakness: to the Lord of glory be glory for ever!"

About a month later, Francis Howgill writes to Robert Withders:

"DEAR BROTHER:—E. B. [Edward Burrough] and I stay still in this city; large is the love of God to us, and the work of the Lord prospers in our hands; eternal, living praises [to Him] for ever more. We are here among this great people in much weakness; and when we see such multitudes, we are often put to a stand where one might get bread to satisfy so many. But the wisdom and power of God hath been with us, and there are hundreds convinced, but not many great or noble do receive our testimony; yet there are many put to a stand and brought into silence, and many are under deep judgment and true power." . . . "Miles Halhead and James Lancaster were here, and came to visit us; they staid one First-day, and so were moved towards Cambridge. We are much refreshed; we receive letters from all quarters; the work goes on

fast everywhere; eternal living praises to Him for ever!"

In the Twelfth month, 1654, [equivalent to Second month, 1655,] George Fox was arrested by Colonel Hacker, and sent to London under charge of Captain Drury, one of Cromwell's life-guards. He was lodged at the Mermaid inn, near Charing Cross, and being informed that the Protector required him to promise that he would not take up a carnal sword against him or the government as it then was, he gave no immediate answer; but the next morning he addressed a letter to Cromwell, stating that "he did, in the presence of the Lord, declare that he denied the wearing or drawing a carnal sword, or any other outward weapon against him or any man." And furthermore, "That he was sent of God to stand a witness against all violence, and against the works of darkness, to turn people from darkness to the light; to bring them from the occasion of war and fighting to the peaceable gospel; and from being evil-doers, which the magistrates' sword should be a terror to."

This letter being handed to Cromwell, he required the attendance of George Fox, who was brought before him, at Whitehall, on the 19th of Twelfth month, 1654. In the interview that ensued, Cromwell conducted himself moderately, and George Fox, with his usual frankness, avowed his principles, declaring against the mercenary character of the clergy, and showing that Christ's ministers preached freely. As he was about to withdraw, the Protector took him by the hand, and with tears in his eyes, said, "Come again to my house; for if thou and I were but an hour of a day together, we should be nearer one to the other;" adding, "that he wished him no more ill than he did to his own soul." As George Fox passed through the palace, he was brought into a hall, where the gentlemen of the household were to dine, and he was, by the Protector's order, invited to dine with them. But he told them to inform the Protector, that "he would not eat of his bread nor drink of his drink." When Cromwell heard this, he replied: "Now I see there is a people risen that I cannot win with gifts, honors, offices or places; but all other sects and people I can."

In a letter from Alexander Parker to Margaret Fell, dated London, 10th of First month [Third month], 1655, he alludes to another interview with the Protector, as follows: "Our dearly beloved one, George Fox, is set free by Oliver Cromwell, to go whither he pleaseth; he was never under any restraint, but had liberty to pass among Friends. On the 6th day of this instant he was brought before the Protector, and was with him a pretty while in his chamber at Westminster; he was very loving to him, and wished him to come again to him; and afterwards set him free, to go whither he pleased. So we are yet in this city, and for a while continue

in it; there are many Friends come up, as Francis Howgill and Edward Burrough, Thomas Salthouse, Miles Halhead, William Caton, John Stubbs, and several others; but I believe we shall disperse after to-morrow."

During the sojourn of George Fox in the metropolis, he was much engaged in religious services, having conferences with Friends and others, and holding large meetings in which he preached the gospel with remarkable success.

The crowds who attended his meetings were often so great, that it was with difficulty he reached the houses where they were held.

It appears from the letters of some of the Friends then in London, that they had a large house for public meetings, which they called their *threshing-floor*; and several other places of meeting for those who were convinced of their doctrines. In these more private meetings they could enjoy their silent devotions, or receive counsel adapted to their conditions, while at their "threshing-floor," the multitudes who flocked to hear Fox, Howgill, and Burrough, were reached and contrited by their powerful and persuasive ministry.

EDWARD BURROUGH AND FRANCIS HOWGILL TO MARGARET FELL.

London, 27th of First mo., [Third mo.,] 1655.

DEAR SISTER, who art a fruitful branch in the living vine, and a pleasant plant in the garden of God. We have been in this city nearly three weeks in great labor and service. G. [G. Fox,] with many more of our brethren, was here when we came. We all staid over one First-day after we two came into the city. G. was that day in private with Friends; and we two were in the general meeting-place among the rude world, threshing and plowing; and the rest of our brethren were that day at several meetings, some at one and some at another, and some among the Baptists and gathered people; and great service there was that day. Then, shortly after that First-day, the brethren separated into the fields [the country] to reap and gather in. Richard Cleaton and Thomas Bond went towards Norwich and into Suffolk and that way, and are in great service there. John Stubbs and William Caton went towards Dover. We have received one letter from them since they went to Dover; the mayor and the officers strictly examined and charged them to keep the peace; they were with some gathered people, and at some steeple-houses, and had little persecution. Miles Halhead and Thomas Salthouse went towards Plymouth; they had a great meeting one First-day in Reading; and many, they wrote, were convinced. G. F. is at present in Bedfordshire; Alexander Parker is with him; there is a people that way. John Audland was here with us, but goes towards Bristol shortly for aught we know. James Lancaster was with us in this city, but is gone to George. R. Hubleerthorne is yet in

prison. John Camm is at or near Bristol. We believe that G. [Fox] will return to this city again. We two are too few in this city for the service, for truly it is very great; at present many come in daily to the acknowledgement of the Truth. Friends are so many that not one place can hold them on the First-days, where we can peaceably meet, for the rude people; for since we came they have been very rude,—very oft to pull us down when we have been speaking. G. [Fox] was at the great meeting-place two First-days before we came, and his voice and outward man was almost spent amongst them.

We have thus ordered it since we came,—we get Friends on the First-days to meet together in several places out of the rude multitude, &c., and we go to the great meeting place which we have, which will hold a thousand people, which is always nearly filled [there] to thresh among the world; and we stay till twelve or one o'clock, and then pass away, the one to one place, and the other to another place, where Friends are met in private, and stay till four or five o'clock.

* * * *

E. B., F. H.

Francis Howgill and Edward Burrough embraced every opportunity that offered to advocate the cause of truth. An anecdote is related by Sewel, which illustrates the zeal of those undaunted reformers. It was then the custom in London, during the summer season, for many tradesmen, when they left off work in the evening, to resort to the Fields, in order to try their skill, and strength in wrestling. On one occasion, as Edward Burrough passed by the place where they were wrestling, he saw standing in the ring a strong and dexterous man, who had already thrown three others, and was waiting for the fourth champion to present himself. None being bold enough to venture, Edward Burrough stepped into the ring, and, having looked upon the wrestler with a serious countenance, began to preach the gospel, greatly to the surprise of all present.

He spoke with heart-piercing power, declaring that "God had not left himself without a witness, but had given to man a measure of his grace, and enlightened every one with the light of Christ." This unexpected and earnest address was so effectual that some of the spectators were convinced of the doctrines he preached.

By a letter from Alexander Parker to Margaret Fell, dated London, 10th of 3d month, 1655, it appears that George Fox still remained in the city; that seven or eight meetings of Friends were held every First-day, and that many were daily convinced of their doctrines. The following passage from this letter will show the deference paid to George Fox by the Friends of London, who had recently become acquainted with him: "Here are in this city many precious Friends, and they begin to know George, though at the first he was strange to them, and one

thing they all take notice of, that if George be in the company, all the rest are, for the most part, silent, which they did much wonder at."

A letter from Francis Howgill, written in the same month, says: "The work is great in this city, but even few are fitted for it. The last First-day there were ten meetings in the city, and the work lieth upon George Fox and us two [F. Howgill and E. Burrough]; here are a precious people, [they] grow in wisdom and life, and many are added. All the priests and all the gathered congregations in the city preach against us, and are bent in great rage, and print lies and incense people much. Edward Burrough and I have ordinarily two public disputes with the heads of them, and they lose their members so fast, that they know not what to do; yet the city is pretty calm and quiet, and wisdom begins to grow among Friends, and divers are moved to go forth in the ministry. Two young men and two young women are moved to go to Barbadoes, out of the city, and another young man, a Scotchman, is moved to go to Scotland; and other two women are gone to Wales, and other two to Oxford—all these are citizens."

(To be continued.)

TEACH YOUR CHILD as lovingly to accept different forms of religion among men, as their different languages, wherein there is still but one human mind expressed. Every genius has most power in his own tongue, and every heart in its own religion.—*Jean Paul Richter.*

Proceedings of the Committee of the Monthly Meeting of Philadelphia, appointed the 28th of 3d mo., 1788, to call upon the black people within that district, to encourage and excite them to circumspection in their conduct, and to keep their children diligently at school, &c.

James Pemberton,	Elizabeth Rodgers,
David Bacon,	Mary Elliott,
Thomas Rodgers,	Sarah Hornor,
James Cresson,	Phebe Pemberton,
Caleb Attmore,	Sarah Parrish,
Owen Biddle,	Rachel Drinker,
Samuel Clark,	Jane Foulke,
Arthur Howell,	Ann Emlen, jr.,
Robert Cox,	Elizabeth Dawson,
Huson Longstreth.	

3d mo. 31st, 1788.—Eight men and six women of the said Committee met, and after a conference on the business of their appointment, adjourned to Fifth day next, the 3d of 4th mo., at 3 o'clock in the afternoon. In the mean time Samuel Clark is desired to procure a list of the names of the negroes residing within this district, for consideration of the mode most proper to proceed to fulfil the service entrusted to us.

4th mo. 3d.—Pursuant to adjournment, nine men and eight women of the above Committee

attended at the meeting house in Fourth street, and a list of the names of the blacks residing within this district being produced by Joseph Clark, who attended, and the names of the Committee being affixed to certain parts and places in four classes, Robert Coe and Samuel Clark, with the assent of Joseph Clark, are desired to make out a copy for each class of the names and places of residence of the families of blacks to be visited, and send the same to one of the Friends in each class. Then adjourned, to meet again on the Fourth-day of the same week of our next Monthly Meeting, 3 o'clock in the afternoon.

Pursuant to adjournment, nine men and eight women of the Committee met on the 23d of 4th mo., 1788.

An account was given of a beginning being made in the business of our appointment, which affords encouragement to proceed in it with a hope of some service proceeding from the concern and care of Friends for the welfare of these people, of which Thomas Rodgers and Sarah Parrish are appointed to make Report to our men and women's Monthly Meeting, on Sixth-day next.

Then adjourned to meet again on the Fourth-day of the same week in which our Monthly Meeting is held next month, at 3 o'clock in the afternoon, and in the mean time the respective classes are requested to give attention to the business under their care.

5th mo. 28th.—Present eight men and six women of the Committee.

An account was given by a Friend of each of the classes who have performed the service for which the Committee was appointed by the Monthly Meeting, from which it appears that about sixty-five families of blacks have been visited, all of whom, (except in a very few instances of individuals are free persons) and such counsel and advice adapted to their respective circumstances the visitors have been enabled to administer* for the promotion of their moral and religious improvement, as there is ground to hope may be attended with some good to the parents and children, the visits being received with civility and respect, expressions of gratitude for this extension of the care and concern of Friends for them, and the Committee had the satisfaction to observe that in general they appeared to live comfortably and decently in their dwellings, which indicated a proof of their industry and capacity to support themselves with a good degree of reputation, though in a very few instances of aged infirm persons there seemed to be an occasion of attention to them for their better accommodation; and upon the whole the Committee are favored with an evidence of satisfaction of mind in the performance of the service they have been engaged in, of which it is agreed to make report to the Monthly Meeting, on Fifth-day next, in writing, to the above,

and that it be signed by David Bacon and Phebe Pemberton.

The following is the Report :

To the Monthly Meeting of men and women Friends of Philadelphia.

The Committee appointed to fulfil the concern of this meeting for the welfare of the black people residing within this district, to encourage them in a circumspect conduct, and due care in the education of their children, and that the opportunity offered them for their instruction in school learning may not be neglected, having performed that service, now acquaint the Meeting that they have visited about sixty-five families, all of which, except in a very few instances of individuals, consist of persons who are possessed of their just rights to freedom, to whom such counsel and advice adapted to their various circumstances hath been administered as we were enabled for the promotion of their moral and religious improvement, which we have ground to hope may be attended with some benefit to the parents and children, our visits being received by them with much respect and expressions of gratitude for this exercise of care and concern for their good; and we have had the satisfaction to observe, that in general they appear to live comfortably and decently in their dwellings, which to us is a proof of their industry and capacity to support themselves with reputation, though in a few instances of aged and infirm there appeared occasion of assistance for their better accommodation and relief; and upon the whole, the Committee are favored with an evidence of satisfaction in the performance of this service, believing also that the continuance of occasional care towards those poor people, whose predecessors as likewise many of themselves have suffered long bondage and oppression, may prove useful for their right improvement of the freedom in which through the favor of Divine Providence they are now placed.

Signed on behalf and by desire of the Committee, at a Conference held 5th mo. 28th, 1788.

D. BACON,
PHEBE PEMBERTON.

At the Monthly Meeting the Committee were continued to furnish a copy of their Report to the Northern and Southern Districts Monthly Meetings, and several of their number attended, and were directed "to use their endeavors to promote a due consideration thereof, agreeably to the concern of the Yearly Meeting and of the Monthly Meeting."

"Our most exalted feelings are not meant to be the common food of daily life. Contentment is more satisfying than exhilaration; and contentment means simply the sum of small and quiet pleasures. We ought not to seek too high joys. We may be bright without transfiguration.

The even flow of constant cheerfulness strengthens, while great excitement driving us with fierce speed, both rack the ship and end often in explosions. If we were just ready to break out of the body with delight, I know not but we should disdain many things important to be done. Low measures of feeling are better than ecstasies for ordinary life. God sends his rains in gentle drops, else flowers would be beaten to pieces."

EXTRACTS FROM A MEMOIR OF
ELIZABETH T. KING.

(Concluded from page 549.)

Very shortly before her decease she rode into the city, with some effort, to see her husband's only sister, to whom she was much attached, and spent the morning with her; giving the most detailed directions as to the education of her three daughters in case she should be taken from them. Little did she then suppose that she to whom she was in some measure intrusting the care of her beloved offspring would, within a few weeks, also be called away in the bloom of life. The following is the last record in her sister's diary, and will show the feeling which subsisted between them.

My heart bleeds at the sad record I here make of my beloved sister's death, which took place on First day last, the 23d inst., after giving birth to a son, who survived her but a few days. What else can we say but that "the Lord gave, and the Lord hath taken away; blessed be the name of the Lord?"

She sought the Lord who bought her with His own blood, and obeyed Him through life, doing even that from which her timid nature shrank. Her sweet, angelic countenance, even amidst intense suffering, can never be forgotten; and, oh! may her example and all her excellent precepts be an incentive to me to walk in the same path, and to mind the same things; and in view of the uncertainty of my own life, may my thoughts be so directed, and a preparation so made, that, come life or death, I may be fitted for the message, and have no fears, but my mind be kept in perfect peace because it is stayed on Thee.

The following is the last entry in her journal:—

3 mo. 23d, 856. I have an humble hope that the day is dawning that the Sun of Righteousness will arise, with healing in His wings.

Oh, to be kept little, and low, and loving, self kept out of sight, "made of no reputation;" and to feel that love, which has at times made hard things easy, and bitter things sweet, when I have felt the everlasting Arms underneath.

Is not the injunction now given, "Fear not thou worm Jacob?" Enable me, I beseech Thee, dearest Father, to look solely at the blessings wherewith Thou hast blessed me so abundantly;

enable me to trust, that, as Thou carest for the sparrows, and feedest the ravens, Thou wilt also care for me; and, oh! enable me to bear, in patient and trusting submission, all Thou seest meet to lay upon me.

She was taken more unwell on the same day, but the suffering was soon relieved, and all danger seemed to be over. On her husband going to her bedside, and expressing his thankfulness that she was doing so well, she shook her head, and told him that within the past hour she had seen heaven, "and what," she added, with a sweet smile, "if I tell thee, that I feel as if nothing can draw me back but thee and the children?"

She was very soon taken alarmingly ill, and continued to grow weaker until she gently breathed her last, while a solemn but sweet stillness pervaded the room, as if those who watched over her were permitted to accompany the ransomed spirit to the entrance of the Heaven of Rest

And now, having followed her through life, having seen her living desire to be conformed to her Master's will—her fervency of spirit, and diligence in performing whatever was required—may we be encouraged to place our trust in the Lord who supported her, and who will supply *all* the need of those who trust in Him.

In conclusion, we will adopt her own words, in speaking of the death of Stephen Grellet:—

I do sympathize with thee, and with all, in the great loss which has been sustained, but my mind has been so full of the unspeakably blessed and glorious change to our departed friend, that I have been scarcely able to bear the heavenly vision. No more change, no more sorrow for him!—for ever with the Lord—satisfied on awaking in His likeness—no longer beholding Him through the veil of fleshly infirmity, but "face to face"—free to mingle with the spirits of the just made perfect—no longer compelled to bear with the imperfections even of the good—no longer wounded with the sins or the sufferings of others—but at rest on the bosom of the Saviour, where God himself shall wipe away all tears from his eyes. I was thinking of Christian's passage over the river; but what a convoy must have awaited the release of this purified spirit;—with what triumphant notes the golden harps must have welcomed his entrance into the Eternal City! Now let us seek to mourn him as he would wish to be lamented, by looking not at our loss, but at his gain—by seeking after that earnest dedication of which he was so bright an example, that we may be enabled, in our measure, to glorify Him who did such great things for our beloved friend, and is ready to grant us, also, the good gifts of His Holy Spirit, as we are concerned to seek them as earnestly, and employ them as faithfully, as was the case with him.

EDUCATION.—Thewald thought it very unfair to influence a child's mind by inculcating any opinions before it should have come to years of discretion and be able to choose for itself. I showed him my garden, and told him it was my botanic garden. "How so?" said he, "it is covered with weeds." "Oh," I replied, "that is because it has not yet come to its age of discretion and choice. The weeds, you see, have taken the liberty to grow, and I thought it unfair in me to prejudice the soil in favor of roses and strawberries."—*Coleridge*.

THE BRIGHT SIDE.

Look on the bright side. It is the right side. The times may be hard, but it will make them no easier to wear a gloomy and sad countenance. It is the sunshine, and not the cloud, that makes a flower. There is always that before or around us, which should cheer and fill the heart with warmth. The sky is blue ten times where it is black once. You have troubles, it may be. So have others. None are free from them. Perhaps it is as well that none should be. They give sinew and bone to life—fortitude and courage to man. That would be a dull sea, and the sailor would never get skill, where there was nothing to disturb the surface of the ocean. It is the duty of every one to extract all the happiness and enjoyment he can, without and within him; and above all he should look on the bright side of things. What though things do look a little dark? That lane will turn, and the night will end in broad day. In the long run, the great balance rights itself. What is ill becomes well—what is wrong, right. Men are not made to hang down either heads or lips, and those who do, only show that they are departing from the paths of true common sense and right. There is more virtue in one sunbeam than a whole hemisphere of clouds and gloom. Therefore, we repeat, look on the bright side of things. Cultivate what is warm and genial—not the cold and repulsive, the dark and morose.—*Anon.*

NATURAL HISTORY

Is now engaging the attention of more persons in this part of the country than at any former time. Nor is the study of this interesting and important department of science confined to any particular class of persons or to adults. We are glad to observe that neighbors and friends who are beginning their investigations, are forming societies for the purpose of mutual aid in their studies, and that the members of some of these organizations are manifesting that enthusiasm which has ever characterized the true disciple of nature. The Middlesex Journal has a report of the last meeting of the Woburn Natural History Association, which was attended by Prof. Agassiz, who occupied the time by a famil-

iar and exceedingly interesting lecture, in which he pointed out the proper fields and modes of observations for the naturalist here and now. We copy the following report of his observations :

Prof. Agassiz remarked that the country or region affording comparatively few specimens, is the most favorable for the advancement of science, as those few specimens will be the more carefully studied and the better understood. He instanced Sweden as strikingly illustrating this fact. He said that an Association in Massachusetts must not expect to find many undescribed specimens in any department of Natural History. Indeed he placed the ambition merely to discover something new, very low in the scale of merit. He remarked, however, that the field for observation was almost limitless. He instanced birds—when they leave us—when they return—the time of their moulting—mating—where they build their nests—how they construct them—how many eggs they lay—the duration of incubation—how long the young birds are fed from the bill of the parent birds—how soon they are able to fly, &c., &c.,—as but little understood, and worthy of careful observation. Similar observations were needed respecting many species of the mamalia, and the other classes of living animals. He frankly admitted that there were many things touching their habits of which he was yet entirely ignorant. Observation in favorable localities was needed, continued for a long time, to establish facts. This a small association could make successfully if proper care was observed. When we commence the study of a specimen we should exhaust it, learn all about it; no, that would be impossible—the human mind can never *fully* understand the works of the Infinite Creator.—*Boston Transcript*.

VENTILATION.

The ventilation of individual rooms and habitations forms the most important question connected with sanitary improvements. These are the places where the great mass of mankind spend the larger portion of their time; where they are born and where they die; there they generally spend the period of their infancy and childhood, their days of suffering and sickness, and recruit their daily strength with food, and by reposing from their labors. A vitiated atmosphere at home corrupts the condition of the blood more than any other cause, inasmuch as it has a more continuous power of operation. The effect of each individual inspiration is indeed trifling, but when repeated twelve hundred times an hour for days, and months, and years, and brought in direct action upon the blood itself in the lungs, it is to be expected that it will soon affect every fiber of the living frame.

In studying the ventilation of individual rooms

and habitations, the rotatory movements of air in a confined atmosphere should be examined when an inequality of temperature is induced, and that these movements should be rendered palpable by chemicals producing heat and smoke. Franklin has made use of this expedient, and had it been more generally attended to, ventilation would have made much more progress than it has done. In the external atmosphere the general ventilation of the globe depends on such movement. In the smallest space that man can examine they can likewise be traced. Bearing in mind the fact that the living body, unconsciously to the individual, ventilates itself when this operation is not opposed by an air-tight or ill-constructed apartment, an aperture for the ingress and egress of air in a proper position, and of the right dimensions, is the great desideratum. While a window serves this purpose, and a porous curtain diffuses the entering and out-going air, it takes a long time to carry conviction of the importance of additional resources in the comparatively air-tight structures of modern times, charged with products of combustion from gas and respiration, as well as other varying impurities. But when it is recollected that a thousand different circumstances arising from the peculiar position, form, structure, arrangement, furniture, and occupation of rooms, as well as their aspect in relation to the sun, prevailing winds, local influences acting on the air, the position of doors and windows, constitutional peculiarities, and many other details that might be enumerated, in addition to the changes of the season, the time of day or night, and the number of persons present, all contribute to modify the effect required, it will be obvious that the window alone is not sufficient for every ordinary apartment.

The great desiderata, in addition to the window, at least in rooms subject to a great variety of occupation, are the following :

1. A special flue, from the highest portion of the room, for the discharge of vitiated air.

2. A special aperture for the ingress of a warmer or colder atmosphere, when the external temperature, dust, noise, or any other cause, renders a supply by the windows objectionable.

3. The means of extending the diffusion of the entering air so that it shall not impinge offensively on any individual.

4. The means of applying a force or power to the ventilating flue (heat is the most available for all ordinary purposes), which shall increase the discharge to any required extent, and cause fresh air to enter by any channel provided for this purpose.

5. The exclusion of all vitiated air from the basement of the building, or any other source, either by the action of a ventilating flue or other equivalent measures.

These objects can, in general, be attained with facility and economy in building a new structure,

without interfering with the usual details of construction to any objectionable extent. It forms a most important addition when the passages and staircases can be converted into means for the general supply and discharge of vitiated air, warming the air by an apparatus placed there at the lowest available level, and introducing a large internal window above every door communicating between the passage or staircase and individual rooms. These, when open or shut to the required degree, allow the air in the passages and staircases to be used as a milder climate, whether in the heat of summer or the severity of winter—a perpetual ingress of fresh air and discharge of vitiated air being constantly maintained in the hall, passages, or staircase.

The shaft or flue for the escape of vitiated air should always be constructed so that external wind shall have no effect in producing a back current. No external top is better for this purpose than that recommended by a committee of the American Academy of Sciences at Boston. It differed from the cone in common use in this country, in having an addition above the top of this cone which expanded the aperture slightly above the line of the ordinary discharge. The ordinary form of cone of Mr. Emerson has the advantage of being more simple, though not so powerful in producing a draught. It ought to be recollected, however, that such terminations to ventilating shafts or flues are principally important in counteracting the influence of wind. They have no power in a calm. If heated by the sun, they would promote ventilation; if cooled by the state of the atmosphere below the temperature within doors, they would retard ventilation.—*Reid's Smithsonian Lectures.*

FRIENDS' INTELLIGENCER.

PHILADELPHIA, ELEVENTH MONTH 19, 1859.

We publish this week the proceedings of a Committee appointed by the Monthly Meeting of Philadelphia, in 1788, which have been furnished by a Friend of this city.

It is a pleasant reminiscence of our colonial history, that while Friends exercised a control in the government, their influence was always exerted in ameliorating the condition of the oppressed, and when they ceased actively to participate in governmental affairs, they continued to labor for the same end, in this associated capacity, as a Monthly Meeting. From the minutes of this Committee, we learn that they visited sixty-five families of colored people within the district of the Monthly Meeting, and we can believe that such an engagement was blessed, not only to the immediate objects of the concern, but

to their children and descendants. Notwithstanding the marked improvement which education and intelligence have made in the colored population of this city, much yet remains to be done by those who are interested in their advancement. Several weeks ago, we called attention to the fact that the Managers of some of the Passenger rail roads of this city had adopted regulations excluding colored people from seats in their cars, on account of their complexion, and we hope all interested will embrace every proper means to produce a change in this, and other respects, where the just rights of this oppressed class are disregarded.

FREE LABOR GOODS.

A sample of syrup made in this city, from the African Imphee, by steam in vacuo-pan, has been sent us by George W. Taylor. This syrup is of a light color and as rich in flavor as any we have seen manufactured from other varieties, of the sugar cane. It is now ascertained that excellent sugar and molasses can be obtained from the Chinese and African sugar cane, and we hope the two establishments now in operation in the vicinity of this city will meet with sufficient encouragement to enable them to sell the products of their manufacture at the standard market prices.

We have occasionally reverted to the consistency of bearing our testimony against Slavery by refraining from the use of the products of oppression, and we again call the attention of our friends or such as may feel the importance of the subject, to the good assortment of Dry Goods and Groceries now offered for sale at the Free Produce Store, corner Fifth and Cherry streets.

MARRIED, With the approbation of Darby Monthly Meeting of Friends, at the house of John and Mary H. Child, on Fourth-day, the 9th inst., SAMUEL S. ASH, of Philadelphia, to SALLIE J. SCHOFIELD, of Darby, Pa.

—, At the residence of George Craft, Upper Greenwich, Gloucester co., N. J., on Fifth-day, the 10th inst., after the manner of the Society of Friends, Dr. JAMES E. GARRETSON, of Philadelphia, to BEULAH, eldest daughter of George and Mary B. Craft.

DIED, Suddenly of apoplexy, at his residence in Frankford, MARLON MURPHY, in the 73d year of his age, a member of the Monthly Meeting of Friends, held at Green street, Philadelphia.

—, At the residence of her brother, David Fell, New London, Chester county, Pa., on the 26th of 10th mo, last, ELIZABETH FELL, in the 79th year of her age.

[The above is inserted on account of an error in the former notice.]

Extracts from the Minutes of the Yearly Meeting, held in Baltimore, by adjournments, from the Thirty-first of the Tenth Month to the Third of the Eleventh Month, inclusive, 1859.

At a Yearly Meeting of Friends held in Baltimore for the Western Shore of Maryland, and the Adjacent parts of Pennsylvania and Virginia, by adjournments, from the 31st of the 10th month, to the 3d of the 11th month, inclusive, 1859.

Certificates and Minutes for the following named Friends, who are acceptably in attendance with us at this time, from within the limits of other Yearly Meetings, were received and read, viz :

Deborah F. Wharton, a minister, Spruce St. M. M., Philadelphia.

Henry W. Ridgway, a minister, Chesterfield M. M., New Jersey.

Samuel C. Thorn, a minister, Westbury M. M., Long Island.

Sarah T. Betts, a minister, Abington M. M., Pennsylvania.

Acceptable Epistles from our brethren of Philadelphia, New York, Genessee, Ohio and Indiana Yearly Meetings, were received and read, and their contents were strengthening and encouraging to our minds.

A Committee was appointed to prepare Essays of Epistles, as way may open therefor, to these several Yearly Meetings, and report to a future sitting.

The Committee on Indian Concerns produced the following interesting report, which was read, and was satisfactory. The Committee was continued and encouraged to persevere in the good work in which they have been long and arduously engaged for the welfare of these people, viz :
To the Yearly Meeting, now sitting :—

The Committee on Indian concerns report, that no visit has been made by us to the Indians at Cattaraugus since our last Yearly Meeting, but several communications have been received from them, requesting our advice and assistance, which have been extended to them when desired.

By the accounts transmitted to us, it is represented, that those Indians who have been under the care of the Yearly Meetings of New York and Baltimore, continue to be gradually improving in their domestic and social habits and comforts ; and it appears a considerable number of them, who are become industrious farmers, now occupy good houses, and having a sufficient number of horses and cattle, and agricultural implements to cultivate their farms, are enabled to provide the necessary support for their families ; but they represent that they are in great need of aid to assist them in the education of their youths, and more especially to enable them to continue to support their Orphan Asylum, which Institution during the past year had, and now has fifty-four destitute children under its care.

In a communication recently received from the United States Interpreter at Cattaraugus, who is an intelligent educated Seneca, referring to the present condition of many of the Indians on that Reservation, he says:—" They cannot be considered or looked upon as inferior to their white neighbors around them, in the management of their farms, but all this improvement must, in a great measure, be attributed to the good people of the land, and to the *true Friends* of the Indian, for their patient endurance and perseverance in endeavoring to instruct them in learning and agriculture. It was they who established among them Schools for the education of their children, that they might no longer be brought up in ignorance, but be instructed in learning, and hence the value of education is becoming more and more important among them.

" There are now upon the Cattaraugus Reservation, seven Schools in operation, and the whole number of attendants is about three hundred. These Schools, for the most part, are in a flourishing condition, and they would compare favorably with the white Schools in the adjacent localities. Under these circumstances, we have reason to believe they are constantly increasing, and are improving in morals and industry, and that in proportion as they become enlightened, they will, provided they continue to pursue the same course they have for the last fifteen years, surely reap the rewards of their industry."

" These Indians no longer rely upon the chase for their sustenance, but by the sweat of their brows, and the labor of their hands, are faithfully fulfilling the edict pronounced to man upon his creation, " in the sweat of thy face shalt thou eat bread."

" The Crops of all kinds upon this Reservation look fine, but the corn has been somewhat injured by the frost ; yet it is hoped that there will be no suffering for want of provision."

The Committee also report, That upon information being laid before the Commissioner of Indian Affairs, at Washington, in relation to the present condition and necessities of the Orphan Asylum, at Cattaraugus, he contributed and forwarded \$500 for the aid of that Institution ; and further, that on the Commissioner being likewise informed that an Indian of good character, who had, by a regular apprenticeship, acquired a sufficient knowledge of the blacksmith trade, was desirous to establish a shop and carry on that business at the Cattaraugus Reservation, but needed the sum of \$104 to enable him to procure the requisite Tools and Implements, he promptly contributed that sum for him, and directed this amount to be forwarded to him.

Signed on behalf and by direction of the Committee, by
SAMUEL M. JANNEY,
DEBORAH H. STABLER.

Baltimore, 10th mo. 30th, 1859.

The condition of some of our Indian brethren

now residing west of the Mississippi, having been feelingly brought before the view of the Meeting, our Committee on Indian Concerns was authorized, in conjunction with the Committee of the New York Yearly Meeting, if they feel a willingness to act therein, respectfully to invite the attention of the General Government of the United States to the subject, as way may open therefor, with the view to an improvement of the condition of those Indian Tribes, inasmuch as the evidence of their capability of civilization is afforded by our experience at Cattaraugus.

The Standing Committee on the Fair Hill Boarding School Property produced the following report, which was read and was satisfactory, viz :

To the Yearly Meeting, now sitting :—

The Standing Committee in charge of the Fair Hill Boarding School Property, report, That the School and Farm continue in a favorable condition. The productiveness of the Farm is greatly increased since it has been in charge of its present occupants, at least one hundred acres of land being now under productive cultivation, which previously yielded little or nothing of value. The buildings and fences are kept in good condition, and the progress of the pupils in their different branches of study has been satisfactory to their parents and to the Committee. The two Yearly Meeting Scholarships have been filled for the present term, and it is very gratifying to the Committee to know, that several of the young women who have, in previous years, availed themselves of the opportunity thus afforded them by the Yearly Meeting, to increase their qualifications for usefulness as teachers, are successfully engaged as instructors of youth. Application for these Scholarships for the next term should be made to Richard T. Bentley, Sandy Spring P. O., Md., previous to the annual meeting of the Committee on the 6th month next.

Signed on behalf of the Committee,

BENJAMIN P. MOORE,
WM. JOHN THOMAS,
MARTHA E. TYSON,
LYDIA JEFFRIES.

Baltimore, 10th mo. 31st, 1859.

Our Quarterly Meetings were directed to have a census taken of the number of families and parts of families belonging to each of their respective Monthly Meetings, on the first day of Fifth month next, or as near thereto as practicable, the number of male, and the number of female adults, and the number of male, and the number of female minors, and forward the result thereof in their report to our next Yearly Meeting.

1st of the 11th month and 3d of the week.

The meeting having entered upon the consideration of the state of Society, as exhibited by the answers to the Queries from our several Quarterly Meetings, and proceeded therein as

far as the Third Query, inclusive, under a covering of precious solemnity, which gave comfortable evidence of the blessed presence of the Great Head of the Church, and under which much salutary and encouraging counsel was handed forth, adjourned to 3 o'clock in the afternoon.

Upon assembling in the afternoon, the Meeting resumed the consideration of the state of Society, and proceeded through the remainder of the Queries, with the answers thereto.

The Committee appointed at a former sitting to prepare Essays of Epistles to the several Yearly Meetings with which this corresponds, now produced one, embodying the minute on the exercises of this meeting, which was approved, and the Clerk was directed to have it transcribed, to sign it on behalf of this meeting, and forward it to the Yearly Meetings of Philadelphia, New York, Genessee, Ohio, and Indiana, respectively.

The Clerks produced a minute embodying some of the exercises of the meeting during the consideration of the state of Society, which was read, and was satisfactory. It is as follows viz :

On entering upon the consideration of the state of Society, we were reminded of the necessity of our knowing a proper qualification, rightly and availingly to administer to those wants and weaknesses which continue to exist amongst us ; and we have been made deeply sensible that it is only as we endeavor to draw near the source of all true wisdom, and there seek for ability, that we can become qualified to labor successfully in promoting the cause of truth and righteousness. As we thus become humbly divested of all disposition to act in our own wills and sincerely desirous to abide under the influence of the Holy Spirit, we shall witness preservation from the unhappy consequences resulting from putting forth the hand to the work unbidden, even though it be ostensibly to steady the Ark of the Covenant.

The duty of attending all our meetings, both for worship and discipline, was renewedly felt to be a concern of deep and lasting importance to the welfare and prosperity of Society, and the advancement of the cause of truth and righteousness in the earth. It is thus that we afford an evidence to the world, of our love to God, which is enjoined upon us as paramount to all other considerations ; and, in proportion as this love abounds in our hearts, will this public manifestation of its benign effect, be visible. An earnest solicitude was expressed, that we might more and more experience this love of the Father, to root out the love of the world, and of the things of the world, making all things subservient to this Holy and Divine Power. It was clearly shown that the true love of God could not exist in that mind in which the love of the world is its chiefest joy. Friends were therefore earnestly and

fectionately encouraged, to be faithful in attending all our religious meetings; not in a formal manner, or from habit, but from a living desire to be benefitted by the influences of the Spirit of Truth upon our hearts, begetting in us faith in the promises of our Heavenly Father that "He will teach His people Himself." Not only would our testimony against a hireling ministry be faithfully borne by our thus assembling ourselves together under the teachings of the "Minister of Ministers," holding all our meetings in the authority of Truth, and feeling after the Spring of Divine life in the soul, but we would then hold out the most effectual encouragement to others to come and sit with us, that *they*, too, through obedience to the manifestations of the Holy Spirit, may become partakers of the blessings which He has promised to all those who seek Him. "God is a Spirit, and they that worship Him must worship Him in Spirit and in Truth." Now this acceptable worship in which we are called to engage, consists in bringing every desire of the heart, every feeling of the soul, into strict obedience to His holy will; in laying every crown at His foot-stool; in looking to Him for every consolation and help, and feeling Him to be truly the chiefest among ten thousand to our humbled and contrited souls. This deep and abiding desire to be pleasing in His holy sight, will urge us to do every thing in our power, which we believe will please Him, to love and do good to all His children, and be kind and gentle to the whole family of man. In a heart so circumstanced, there can be no envy, no jealousy, no anger, no revenge, nothing that could lead to speak evil of brother, or indeed of any one; but the whole heart would be brought into that state of love and joy in which it would breathe the angelic anthem, "Glory to God in the highest, peace on earth, and good will to men." For a careful examination of the condition of our hearts in respect to this spiritual worship, and an effort to attain a higher and higher state of perfection our silent meetings are peculiarly favorable, and a deep concern was felt that this may be the happy experience of all our members.

In the primitive Christian church, there were diversities of gifts proceeding from the operation of the Holy Spirit, and among these the gift of the Gospel ministry was one of the most efficient in promoting the growth of the body. This precious gift, we believe, has not been withdrawn from the militant Church, but through obedience and notification of the spirit, a qualification may yet be experienced to "minister of the ability which God giveth." We apprehend, however, that the simplicity and purity of the Christian religion have been greatly obscured, by the vain efforts of speculative theology, and that a ministry deviating its call, qualification, and reward from its original, too generally prevails throughout Christendom.

It is therefore our earnest desire, that all our members may be faithful in bearing a testimony against such a ministry as cannot profit the hearers, but may, on the contrary, weaken our confidence in that Holy anointing, which alone can strengthen and purify the soul.

We were cautioned at the same time to remember, that our testimony is against the *principle* of making merchandise of the Gospel, and not against those who may be engaged in its exercise.

It is believed that we can bear our testimony against a hireling ministry in no way better, than by manifesting our ability to maintain our religious organization, in all its completeness and requirements, without such aid.

Hence the more united we are as a Society, the more those who are regarded as the leaders of the people are led to speak the same language, to walk by the same rule, and to mind the same thing; and the more we all become clothed with uprightness, justice, truth, and universal toleration, love, and charity, the greater will be the evidence afforded by us that we have no need of a man-made ministry, but that we may safely rely on that anointing of the Holy Spirit, in which our Society rests its faith.

A lively concern has been felt for the younger members of our religious Society, that they may be enabled to withstand the many temptations to which they are exposed and be led in the paths of purity and peace. A state of preservation can only be experienced by humble reliance upon Divine aid, accompanied by watchfulness and prayer. We are assured that how great soever may be the temptations and trials permitted to attend us in this state of probation, they may, through divine grace, be made instrumental in promoting our spiritual growth; for to the watchful and obedient soul, the promise will be fulfilled, that "God is faithful, and will, with the temptation, also make a way to escape."

Among the various seductive influences to which young and inexperienced minds are exposed, none are more deleterious than the reading of those pernicious publications, so abundant in the present day, which have a tendency to excite the imagination, inflame the passions and corrupt the heart. In order to avoid the evils which flow from this source, parents and guardians were encouraged to provide their children with such books as will not only store the mind with useful knowledge, but invigorate the benevolent affections, and impress the heart with reverence and love for that Almighty Benefactor, who has so abundantly supplied us with the means of happiness.

The reading of the Scriptures has been earnestly recommended as an efficient means of promoting our spiritual progress; they being "profitable for doctrine, for reproof, for correction, for instruction in righteousness, that the man of God

may be perfect, thoroughly furnished unto all good works."

This Society has from its rise, held the Scriptures to be a way-mark in the road that leads to Christ, believing, as we read therein we shall find that "they are they that testify of Him."

But we have been reminded that they can only be made availing to our instruction, by a reliance upon the Spirit of Truth from which they proceeded; for no other power can open to us the treasures of wisdom which they contain.

While we thus acknowledge the importance of frequently reading the Holy Scriptures, it is felt to be of even higher consequence, that we *all* be faithful in the practice of the blessed Truths and teachings of those precious writings. Then we shall be led into deep humility, love, charity, tenderness one towards another, and all those virtues that so adorn a Christian. Then will the spirit of contention in regard to these writings cease, and no one endeavor to make his own views the standard for others, but all will be encouraged to use them in the best way they can, as a most valuable outward help for the advancement of their spiritual journey, and give God the glory.

The meeting having been favored in its different sittings to transact the important business that claimed its attention, in a spirit of love and condescension becoming Christian brethren, in which all were united, as with the heart of one man, in desires to promote the glorious cause of the Great Head of the Church, for which favor we have been humbled in deep gratitude to the Giver of all good, and we trust, strengthened to thank God, and take fresh courage for the faithful performance of all our duties, it adjourned, to meet again at the usual time next year, if consistent with the Divine will.

BENJAMIN HALLOWELL.

"There are many who know not yet what fruit they shall bear; may the gracious Husbandman take care of all their tender shoots, and buds of Spring. And there are those who are in the Summer of their growth, and who spread abroad their leaves and expand their blossoms; may God grant them the gracious rains of heaven, that they may be nourished, and sustained, and brought to all perfection. And there are those who stand in Autumn, with clustering fruits and glowing colors; may He minister to them all the influences which are needful for the Autumn of the experience, and bring them gloriously to the end of the harvest. And there are those who are in life's Winter, and whose leaves have fallen, and through whose unclad boughs the sunlight shines. O Thou who art the God of Winter as well as of Summer, be very near to them till Thou dost take them to the land where no Winter comes!"

AUTUMN.

Leaf by leaf the roses fall,
Drop by drop the springs run dry;
One by one, beyond recall,
Summer's beauties fade and die;
But the roses bloom again,
And the spring will gush anew,
In the pleasant April rain
And the Summer sun and dew.

So in hours of deepest gloom,
When the springs of gladness fail,
And the roses in the bloom
Droop like maidens wan and pale,
We shall find some hope that lies
Like a silent gem apart,
Hidden far from careless eyes
In the garden of the heart.

Some sweet hope to gladness wed,
That will spring afresh and new,
When grief's Winter shall have fled,
Giving place to rain and dew—
Some sweet hope that breathes of Spring,
Through the weary, weary time
Budding for its blossoming,
In the spirit's glorious clime.

THE LOVED AND LOST.

BY L. G. BARBER.

In the silent, silent night,
When the stars are overhead,
And asleep the city lies,
Then I think upon the dead.

Of the lost whom I have loved,
Sisters, parents, dear to me;
And their faces look at mine
With a sad intensity.

Thus to commune with them, fills
All my heart with holy trust—
Thus I know the soul shall live,
When this poor frame falls to dust.

ON PRAYER.

I.

Lord, what a change within us one short hour
Spent in thy presence will avail to make!
What heavy burdens from our bosoms take!
What parched grounds refresh, as with a shower!
We kneel, and all around us seems to lower;
We rise, and all, the distant and the near,
Stands forth in sunny outline, brave and clear;
We kneel, how weak! we rise, how full of power!
Why, therefore, should we do ourselves this wrong,
Or others—that we are not always strong—
That we are ever overborne with care—
That we should ever weak or heartless be,
Anxious or troubled—when with us is prayer,
And joy, and strength, and courage are with Thee

II.

When hearts are full of yearning tenderness
For the loved absent, whom we cannot reach,
By deed or token, gesture or kind speech,
The spirit's true affection to express;
When hearts are full of innermost distress,
And we are doomed inactive by
Watching the soul's or body's agony,
Which human effort helps not to make less;
Then like a cup capacious to contain
The overflowings of the heart, is prayer;

The longing of the soul is satisfied—
The keenest darts of anguish blunted are ;
And though we cannot cease to yearn or grieve,
Yet have we learnt in patience to abide.

R. C. TRENCH.

INSTINCT OR PRESENTIMENT.

In Schubert's *Spiegel der Natur* (Mirror of Nature) the author relates in his chapter on instinct, the following facts as proofs of a certain vine impulse in men :

A gentleman, an acquaintance of the celebrated French authoress, Mme. Beaumont, was about making a pleasure trip on the river with a party of friends. Everything was ready, and he was about entering the boat, when his sister, a deaf mute, came suddenly and most anxiously running up, and seizing her brother's arm and coat, endeavored to keep him back ; but finding this unavailable, she threw herself at his feet, and taking hold of his knees, expressed by the most imploring gestures, her wish that he should desist from going on the water.

Touched by the painful, entreating expression of the face and posture of the deaf mute, several persons joined in the prayers of the poor unfortunate girl, and her brother finally yielded to her wishes. It was fortunate he did so, for the boat had gone but a short distance on the river, when a sudden gust of wind made it capsize. Several of the company found a watery grave, and he, who could not even swim, would, doubtless, have met with the same fate, if his sister by some divine presentiment, had not prevented his going.

Once, on an evening, a rich and benign farmer, by some sacred impulse, impelled to send, at a late hour, some articles of food to a poor family in the neighborhood. "Wherefore so late ; cannot this be done as well to-morrow ?" said those around him. "No," replied he, "it must be done now." While insisting, the worthy farmer did not know what a blessing his benevolent action was just then to the tenants of the poor hut, for there the father—he who had to provide and sustain the family—had fallen sick ; the mother was infirm already, and the children had been crying for bread for more than two days ; the youngest was nearly dead from hunger. As their most pressing wants were at once relieved and perhaps some lives saved.

Another gentleman, living near some coal mines in Silesia, awoke one night from his sleep with an irresistible impulse to go down in his garden. He arose, went down ; the same impulse led him to the back gate of his garden into the fields, where he arrived just in time to save the life of a miner, who, in climbing up a ladder, missed his footing and fell down the shaft into a coal mine, which his son was at that time winding up, and by the increased weight was unable to do so any more alone.

A venerable clergyman in England once felt, likewise, an unexpected desire to pay, late at night, a visit to a friend of his, whom he knew to be of a very melancholy turn of mind. Though extremely tired by the cares and labors of the day, and though the distance to his friend's house was very great, the venerable gentleman could not resist his secret impulse. So he went, and, strange to say, arrived there just in time to prevent his friend from taking his own life. The nightly visit and friendly exhortations had such a wholesome effect on the depressed spirits of his friend, that he never again attempted to commit suicide.

Prof. Buchner, at Marburgh, being once in very pleasant company, felt a strong desire to go home and remove his bed from its old place to another corner of his bed-room. He yielded to the impulse. Having done so, he felt again at ease and went back to his friends. During the night a large portion of the ceiling in the room, just at the spot where his bed formerly stood, crumbled down, and would no doubt have crushed him to death had it not been removed from there.

—*Boston Transcript.*

NEVER BE CAST DOWN.

Never be cast down by trifles. If a spider breaks his web twenty times, twenty times will he mend it again. Make up your minds to do a thing, and you will do it. Fear not if trouble comes upon you ; keep up your spirits though the day may be a dark one—

"Troubles never last forever.

The darkest day will pass away."

If the sun is going down, look up to the stars ; if the earth is dark, keep your eyes on heaven. With God's presence and God's promise, a man or a child may be cheerful.

"Never despair when fog's in the air,

A sunshiny morning will come without warning."

BRING UP YOUR CHILDREN TO DO SOMETHING.

A great aim in family discipline, remarks the *Philadelphia North American*, should be to provide for each of the juveniles some line of pursuit which will give them a sense of their usefulness and necessity to the household. This feeling, properly instilled into their minds, will make them members of society valuable to others and happy in themselves. The Creator, who makes nothing in vain, does not in vain send human beings into the world, if only they would find their places and fill them. Idle men and women are the bane of any community. They are not simply clogs upon society, but become, sooner or later, the causes of its crime and poverty, its folly and extravagance. In plain English, every family motto should read, "Be somebody. Do something. Bear your own load."

THE UMBRELLA BIRD.

The next morning my hunter arrived, and immediately went out in his canoe among the islands, where the umbrella birds are found. In the evening after dark he returned, bringing one fine specimen. This singular bird is about the size of a raven, and is of a similar color, but its feathers have a more scaly appearance, from being margined with a different shade of glossy blue. It is also allied to the crows in its structure, being very similar to them in its feet and bill. On its head it bears a crest, different from that of any other bird. It is formed of feathers more than two inches long, very thickly set, and with hairy plumes curving over at the end. These can be laid back so as to be hardly visible, or can be erected and spread out on every side, forming a hemispherical or rather a hemiellipsoidal dome completely covering the head, and even reaching beyond the point of the beak; the individual feathers then stand out something like the down bearing seeds of the dandelion. Besides this, there is another ornamental appendage on the breast formed by a fleshy tubercule, as thick as a quill and an inch and a half long, which hangs down from the neck, and is thickly covered with glossy feathers, forming a large pendant plume or tassal. This also the bird can either press to its breast, so as to be scarcely visible, or can swell out so as almost to conceal the fore part of its body. In the female the crest and the neck plume are less developed, and she is altogether a smaller and much less handsome bird. It inhabits the flooded islands of the Rio Negro and the Solimoes, never appearing on the main land. It feeds on fruits, and utters a loud hoarse cry, like some deep musical instrument; whence its Indian name, Ueramimbe—"trumpet bird." The whole of the neck, where the plume of feathers springs from, is covered internally with a thick coat of hard, muscular fat, very difficult to be cleaned away—which in preparing the skin must be done, as it would putrify, and and cause the feathers to drop off.—*Wallace's Travels on the Amazon.*

A BURNING WELL IN BUREAU COUNTY, ILL.

We had the pleasure of meeting a few evenings since, at the American House in this city, Mr. David Yapple and family, from Erie county, Pa., who were on their way to visit some relations about fifty miles south of Pekin. From them we gather some interesting facts relating to a burning well, accidentally discovered a short distance from Boyd's Grove, in Bureau county. A well, near a dwelling, had been dug, about forty feet, when the operator struck a spring so powerful that he got frightened and ran away. On reaching the surface he called for a little girl to light a candle for the purpose of letting it down in the well, when, as she opened the door

of the house with it in her hand, the atmosphere around seemed to take fire, but after one flash the blaze was confined to the vicinity of the well reaching to the height of fifteen feet and upwards. The little girl was badly burned upon the arm and other parts of the body; the man who had escaped from the well, had one side of his face completely blistered, while another workman making the only three who were present, was also considerably injured by the sudden flash.

Such occurrences were formerly quite frequent in the vicinity of Muskingum river and other portions of Ohio, as well as other western States but the finding of such a reservoir of inflammable gas in this section of Illinois is somewhat remarkable. There were those in attendance here who, not able to account for it, supposed that the end of the world had come, while not a few imagined that an entrance had been made into the lower region where no thermometer is kept to regulate the extremes of heat supposed there to prevail during all seasons.—*Tazewell (Ill.) Register.*

TEA AND COFFEE.

Taking into account the habits of the people tea and coffee, for supper and breakfast, add to human health and life, if a single cup be taken at either meal, and is never increased in strength frequency, or quantity. If they were mere stimulants, and were taken thus in moderation and with uniformity, they would, in time, become either inert, or the system would become so habituated to their employment, as to remain in the same relative position to them, as if they had never been used; and, consequently, as to themselves they had better never have been used, as they are so liable to abuse. But science and fact unite in declaring them to be nutritious, as well a stimulant; hence, they will do a new good to the system every day, to the end of life, just as bread and fruits do: hence, we never get tired of either. But the use of bread and fruits is daily abused by multitudes, and dyspepsia and cholera morbus result; yet, we ought not to forego their employment on that account, nor should we forego the use of tea and coffee because their inordinate use gives neuralgias and other ailments.

But the habitual use of tea and coffee, at the last and first meals of the day, has another high advantage, it is productive of incalculable good in the way of averting evils.

We will drink at our meals, and if we do not drink these, we will drink what is worse—cold water, milk, or alcoholic mixtures. The regular use of these last will lead the young to drunkenness; the considerable employment of simple milk, at meals, by sedentary people—by all, except the robust—will either constipate, or render bilious; while cold water largely used, that is to the extent of a glass or two at a meal, especially

in cold weather, attracts to itself so much of the heat of the system, in raising said water to the temperature of the body—about one hundred degrees—that the process of digestion is arrested; in the meanwhile, giving rise to a deathly sickness of stomach, to twisting pains, to vomitings, and sudden death; which things would have been averted, had even the same amount of liquid, in the shape of simple hot water, been used. But any one knowing these things, and being prejudiced against the use of tea and coffee, would subject himself to be most unpleasantly stared at, and questioned, if not ridiculed, were he to ask for a cup or glass of hot water. But, as tea and coffee are now universal beverages, are on every table, and everybody is expected to take one or the other as a matter of course, they are unwittingly the means of safety and of life to multitudes. They save life, where a glass of cold water would have destroyed it. So that the use of these beverages is not merely allowable, it is politic, it is a necessity.—*Hall's Journal of Health.*

PRAYER.

In Flacourt's History of Madagascar, is the following beautiful prayer, said to be used by the people whom we call savages:

"O Eternal! have mercy upon me, because I am passing away. O Infinite! because I am weak. O Sovereign of Life! because I draw nigh to the grave. O Omniscient! because I am in darkness. O All Bounteous! because I am poor. O All Sufficient! because I am nothing.

ITEMS OF NEWS.

EUROPE.—Recent steamers bring the melancholy intelligence of the loss of the Royal Charter, a splendid vessel, from Australia. She was wrecked on the 26th ult., in Muffared bay, near Bangor, Wales. It is stated that the vessel struck at 2 o'clock A. M. The train being too great for her cables, one heroic sailor swam ashore and made fast a hawser, by which several lives were saved, and more might have been rescued had not the vessel parted in two with a dreadful crash.

The passengers and crew were either killed by the falling masts or perished in the waves. Four hundred and seventy persons were lost, and thirty-one saved. All the women and children perished.

Gerrit Smith has been sent to the lunatic asylum at Utica, having become seriously deranged.

The report published of his insanity was received by many with a degree of incredulity. The report, however, is fully confirmed, and the *Utica Herald* states that the symptoms of insanity are of so marked a character that an attendant keeps constant watch over him to prevent his doing violence to himself, as he has exhibited a disposition to commit suicide. It further stated that he has a hereditary predisposition to insanity. His father, though possessed of an immense estate, was subject to fits of mental depression, during which he imagined that he was threatened with want, and would die a beggar. It is also said that

Gerrit's brother, Peter Sken Smith, now deceased, was for some time an inmate of a lunatic asylum. It is supposed that the Harper's Ferry affair greatly disturbed Gerrit Smith's mind, and that the agitation developed the sad disease under which he now suffers.—*The Press.*

HARPER'S FERRY PRISONERS.—The trial of John Brown, at Charlestown, Va., was concluded on the 2d inst., and he was sentenced to be hung on the 2d of 12th mo. On the 10th inst., John E. Cook, Edwin Coppie, Shields Green, and John Copeland, were also condemned and sentenced to be hung on the 16th of next month.

SALT MANUFACTURED IN EAST TEXAS.—We learn that at the Salt Saline, in the northern part of Cherokee county, (on the Neches,) salt is being manufactured of a good quality and in great abundance, thus furnishing to the inhabitants of a densely populated part of our State, one of the indispensable means of living at a cheap rate. That part of the State is, at present, some two hundred miles from market.—*Texas Paper.*

AN EXTRAORDINARY SPRING.—There is a spring on the route of the overland mail, about two hundred miles east of El Paso, which is said to be one hundred and fifty feet in diameter, which has been sounded to the depth of nine thousand feet without finding bottom. The surface is as smooth as that of a mountain lake. The water is slightly impregnated with alkali, and contains five varieties of fish. It is called the "Leon Hole."

A party of nearly fifty boys left New York, recently, under the charge of C. O'Connor, one of the agents of the Children's Aid Society for the West. Some fine boys from the News-boys' Lodging House, were mingled in the party. They were well dressed, looked happy, and anticipative of the pleasant change in their fortunes which a settlement in the West involves. Philadelphia should organize such a society, and not only send West the city's surplus of idle boys, but also those of every town and village in the State.

TOBACCO.—It is estimated that there are in the city of New York about 200,000 smokers, each using two segars daily, making 400,000 segars every day. These, at an average of two cents each, make the enormous sum of \$8,000, or \$2,920,000 annually, consumed in smoke, in New York alone. There are some 900,000,000 segars manufactured in that city annually, which, at the same price, amount to \$1,800,000.

The Russian Government has just commenced a rail road to connect Kiev to Odessa. It will take fifteen years to build it, and will involve more difficulties and heavier outlay than would a road from St. Louis to San Francisco.

Six iron bridges are being constructed upon the eastern end of Lieut. Beale's route to the Pacific ocean, under an appropriation of money made by Congress for that purpose at its last session. They were manufactured in Philadelphia. One is to cross the Poteau near Fort Smith, Arkansas; the second, Red Bank creek, near Scullville; the third, the Little Sans Bois; the fourth, the Big Sans Bois; the fifth, Longtown, or Frenchman's creek; the last four in the Choctaw Nation, and the sixth, Little river, in the Creek Nation. The abutments of all the bridges are built, with the exception of those for the Poteau; Red Bank bridge is completed.

WILLIAM H. SEWARD.—The latest advices from W. H. Seward are from Jaffa, in the Mediterranean sea.

He has completed his journey up the valley of the Nile to ancient Thebes, had surveyed the pyramids, and he was about to proceed to Jerusalem, and thence by Damascus to Constantinople.

CHINA AS A COTTON GROWING COUNTRY.—Sir John Bowring expresses the opinion that China is able to solve the great cotton problem which now disturbs the manufacturers of Great Britain. The fact that a very large proportion of the Chinese are clad with garments made of cotton produced in China, is one to which he attaches much significance, as bearing upon the matter. A few years ago the silk harvest was in peril, and one of the most important of British manufactures was believed to be in a state of danger; but in two years China was enabled to send ten millions sterling of silk, fitted and prepared for the English market. The Chinese are very sagacious, and when taught to sow a better seed, and the arts of cleaning and preparing for market, China will be entitled to be reckoned, more than she has been reckoned hitherto, as an important source of cotton supply.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market is steady, with a fair inquiry both for export and home consumption. The sales for shipment comprise 500 barrels at \$5 12 a 5 25, and 800 barrels good superfine at about \$5 62½ per bbl. Sales to the retailers and bakers within the same range, and fancy lots from \$6 00 to 6 75. Rye Flour and Corn Meal are extremely quiet at \$4 25 for the former and 3 88 for the latter.

GRAIN.—The market is poorly supplied with Wheat, and sales of 2000 bushels good and prime red at \$1 25 a 1 29 per bushel, and small lots of white at \$1 38 a 1 40. Rye commands 90 a 91 cts. for Penna. and 86 for Delaware. Corn—Small sales of new yellow at 69 a 74 c; small lots of old yellow at 90 cts. Oats—A cargo of prime Delaware sold at 41 cts. per bushel, and a lot of Pennsylvania at 43 a 43½ cents.

There is a fair amount of Cloverseed coming forward, but the demand for it is limited. Sales of 300 bushels at \$5 00 a 5 12½ per 64 lbs. A lot of Flaxseed sold at \$1 57 per bushel. Timothy is worth \$2 27½ a 2 50.

WANTED—A situation as teacher, by Mary Emma Satterthwaite. Address
10 mo. 29—4 t. Denton, Caroline co., Md.

TWO YOUNG WOMEN, members of the Society of Friends, are desirous of situations as teachers in families where they would make themselves otherwise useful, or would engage as assistant teachers in established schools. Apply at the office of the Intelligencer.
10th mo. 29—2m.

NOTICE.—A Friend in Maryland has a tract of upwards of one thousand acres of Land, about one half of which is cleared, the balance in wood, mostly chestnut. Said land lies in Prince George's county, Md., about 22 miles from the city of Baltimore, and 18 miles from Washington City, D. C.

The Washington and Baltimore Rail Road runs for more than a mile within 1½ miles from the tract, in which distance there are two Depots or Switches—Contees and Muirkirk. The village of Laurel is about 2 miles east of the tract; Sandy Spring Meeting is about 7 miles north; and Indian Spring about 8 miles south. The neighborhood is remarkably healthy—the water being most excellent.

There are very few slaves in this part of the county. The owner is willing to dispose of this property on

very favorable terms to a body of eight or ten young Friends who may want a farm in an improving part of the country. It will be expected that the Friends produce certificates of industrious and thrifty habits, none else will suit. For further information enquire of

THOMAS B. LONGSTRETH, &
DILLWYN PARRISH,
Philadelphia.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The Winter Session of this institution will commence on the 14th of 11th mo. next, and continue twenty weeks.

Terms \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address
HENRY W. RIDGWAY,
Crosswicks P. O., Burlington Co., N. J.
9th mo. 24—3 m.

ELDRIDGES HILL BOARDING SCHOOL FOR YOUTH OF BOTH SEXES, will open its Winter Session 11 mo 1st.

Terms \$70 per session of 20 weeks. For particulars address the Principal for a circular.

ALLEN FLITCRAFT.
Eldridges Hill Salem County, N. J.

8 mo 27 3 m.

THE BANKSDALE BOARDING SCHOOL FOR GIRLS, will be reopened the 14th of 11th month, and be continued twenty weeks. The course of study will comprise the usual English branches and Drawing. Terms \$60.

For further information apply to ELIZA HEACOCK, Jenkintown, Montgomery Co. Penn.
8mo. 27 3m.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

GEO. A. NEWBOLD,
Purcellville, Loudon Co., Va.

8th mo. 6, 1859.—6m.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Pencilling, and Pellis work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; reading, Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M.

Principal.

Attleboro', Bucks Co., 5th mo., 28, 1859. 6m.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, ELEVENTH MONTH 26, 1859.

No. 37.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

A CHAPTER FROM JANNEY'S HISTORY OF FRIENDS.

(Continued from page 564.)

In the Autumn of the same year, Alexander Parker, writing from London to Margaret Fell, says: "The Truth in this city spreads and flourishes; many large meetings we have, and great ones of the world come to them, and are much tendered. James [Nayler] is fitted for this great place, and a great love is begotten in many towards him. Our dear one, George Fox, doth purpose this week to pass into the country northward, but how far north I cannot tell."

In the Summer of the year 1655, Francis Howgill and Edward Burrrough visited Ireland, and on their return to London, early in the Autumn of 1656, they wrote as follows:

DEAR BRETHREN:—Our care is great; the harvest is great; who are sufficient for these things? Here are fields white unto harvest, and much of the power of God hath been with us. Great hath been our burden, and our work since we came here, and our reward is great. Much have we been drawn out to administer in power and wisdom. We have exceeding great meetings of all sorts, and we labor and travail until Christ be formed in them. Pray for us, that we may be kept in His power [that] reigneth over all: by the power of the Lord the mouths of lions are stopped, kings are bound in chains; eternal living praises for evermore to Him who rides on conquering in power and great glory! Many are brought under great judgment and true power, and many have learned their own condemnation."

The meetings of Friends in London were at first held in private houses, but the number in attendance having greatly increased, in the year

1655 they took, for a meeting-place, a part of a large house near Aldersgate. Another part of the same building having been used for an inn, with the sign of the Bull and Mouth, occasioned the meeting-house to be known by this name.

Stated meetings for worship were also held on First-days, and near the middle of the week in the following places, viz:

At Sarah Yates', in Aldergate street.

At Humphrey Bache's, Tower street.

At Gerard Roberts', Thomas Apostle's street.

At William Woodcock's, in the Savoy.

At the house of Captain Brock, Stepney.

Besides these stated meetings, others were held occasionally at private dwellings.

Near the same time a meeting was established at Horsleydown in the house of a widow, and the number of Friends increasing, a piece of ground was procured, and a meeting-house built.

At Westminster, meetings were held in the house of Stephen Hart, until a house was taken, and a meeting established there.

About the year 1656, a meeting was set up in John's street, called the Peel meeting, and another called the Wheeler street meeting. The last of these meetings was first held at the house of John Oakly, in an upper room, and the number of attendants increasing, another room was added; but the place still being too small, a canvas tent was used in the garden until a meeting-house was erected.

Among the Friends in London, Ann Downer was the first who was called to the gospel ministry. Many others were subsequently engaged in the same service, among whom were Richard Greenway, John Giles, Sarah Blackberry, Ann Gold, Rebecca Travers, Mary Booth, William Bayly, William Crouch, and Gilbert Latey. The last three of these Friends having been eminently serviceable, and some account of their religious experience having been preserved, a brief notice of each is here subjoined.

William Bayly was born in the borough of Southampton; but the date of his birth is not stated. In a paper of his, entitled, "A short relation or testimony of the working of the light of Christ," he informs us, that while he was yet a child his soul thirsted for the water of life, and at ten years of age he was drawn to seek for retirement, in order to wait upon God; but when he was about fifteen years old, not heeding

the true guide, he entered the army in time of war, and served nearly two years as a soldier.

Through the example of wicked companions, and the corrupting influence of a military life, his heart became hardened, until he even "took delight in swearing and drunkenness." Yet oftentimes when he had withdrawn from his companions, he was brought into awful condemnation by the witness for God in his own soul, being seized with horror, and tormented with visions of death and perdition.

The army being disbanded, he was discharged, and, about the same time, he "was so smitten by God's witness, the light in his conscience," that he began to leave off his wicked practices, and profane company became burdensome to him. He now began to hunger for spiritual food, and in order to obtain it, he resorted to the priests, who, he supposed, could, by their learning, open the mysteries of the heavenly kingdom. He found, however, that they fed him upon husks, being destitute of that true bread which comes down from heaven, and, while he was famishing, the cry of his soul was: "Give me food, or else I perish."

"In those days," he says, "my soul was awakened by the witness of God, feeling the burden of sin, and was often afraid of death and misery without end; but knew not how to get out from under the power of sin and death, nor to escape the wrath to come, being ignorant of him that saveth from it, which is Christ, the power of God, that lighteth every man that cometh into the world, which condemns sin in the flesh." Finding he could derive no help from the priests, he left them, and sought for retirement and quietude at home, which was a great cross to his wife and nearest relatives. But although he had from a sense of duty, withdrawn from attendance on the mercenary teachers of religion, he was induced by motives of expediency, and through the persuasion of others, to frequent their meetings again, for which he was brought into condemnation and deep distress by the Searcher of hearts.

Being in want of employment, he made two voyages to France, and became deeply interested in the study and practice of navigation, by which he was so much fascinated, that his attention was, for a time, withdrawn from the pursuit of spiritual good, "the spirit of the world came in upon him like a flood, and gross darkness covered his soul." Yet he was so far restrained by the witness for God,—the light in his conscience, that he durst not return to his former course of wickedness. Although he was preserved from gross immorality, yet the love of the world had a strong hold in his heart, and the love of righteousness had greatly declined.

While in this condition, he indulged many vain imaginations of honor and renown; but suddenly his mind was arrested by a divine visita-

tion,—a cloud came over his prospects of worldly glory, and a season of calm reflection ensued, during which he saw that he wearied himself for things that would perish with the using, and that "like a fool he might leave them in the midst of his days." Being now like one awakened from sleep, and hungering for food, he began to look around for that which would satisfy the longings of his soul. He went among the Anabaptists, hoping to find rest and peace; for he often felt the love of God extended to him, and thence concluded that he was one of the elect, for he did not then know that there is "a seed in man to which the promises and the blessings belong, and the elect is before the foundation of the world." The promise of election was to Christ the true seed, and to all those who, through obedience, become united to him in the covenant of life. William Bayly entered into communion with the Anabaptists, and received the rite of water baptism. He observes: "Before I was dipped in water they called me not brother, but suddenly after, they did; yet I was the same every way as before." He did not find the peace and joy he expected; and he longed for that spiritual food which alone can satisfy the soul.

Having heard a book read concerning the sufferings of the people called Quakers, his heart was touched with tenderness and pity towards them, and he was led to believe they suffered innocently for conscience' sake.

Afterwards he heard one of their ministers, who preached the word of life, and he rejoiced in hearing it, being convinced that it was the very truth. He became satisfied that there is no other way to know God, but by walking in the light which comes from Christ the Saviour, and leads all who follow it out of the evil that is in the world. He who "was glorified with the Father before the world was," is the substance of all the types, figures, shadows, and ordinances. "He redeems man by his blood—the life—out of the earth, into which man was driven by transgression," and brings him again into union and communion with God.

As the mind of William Bayly was turned to the true light, many passages of Scripture were revived and opened to him, by which he was confirmed in the doctrines of Friends. A change was then begun in him, and "he was made to weep and lament, seeing all the religion in the world to be but a fading leaf, without the pure life and power of God, which alone can save from sin and bring into unity with him." While in this troubled condition, he was followed day and night by many Anabaptists, endeavoring to persuade him out of it; looking upon him as deluded, some resorted to prayers, some to flatteries, and others to railing words, telling him that he was fallen from grace, and was become under the law, making the blood of Christ of none effect. Their efforts were not without success,

for he knew not then "the blood to be the life, and that the light is the life of men." Though he was convinced in his conscience, yet his understanding being darkened by listening to their counsels, he was drawn away from a reliance upon "the law written in the heart—the sure word of prophecy," to which he should have been faithful.

In order to obtain relief from trouble, he was persuaded to join again with them more zealously than before, and having become a minister, he encouraged others to follow their strong imaginations from the letter of Scripture, looking for a Saviour without us, though the Scripture saith, "Christ in you the hope of glory," and "Know ye know that Christ is in you, except ye be reprobates?"

He found, however, that all his efforts to obtain peace of mind by outward observances were in vain; he was brought under severe condemnation for his dereliction of duty, and finally he withdrew from fellowship with the Anabaptists, and joined in membership with Friends.

He was convinced by the ministry of George Fox, in the year 1655, being then a resident of Pool, a seaport in Dorsetshire. Believing it his duty to testify publicly to the spiritual truths he had embraced, he went to the parish house of worship for that purpose, but was hauled out with violence. He suffered imprisonment for conscience, sake at Southampton in the year 1657, and at Hartford he was some years a prisoner, being committed in 1663. It does not appear at what date he settled in the city of London; but in the year 1662, while quietly standing in the street, near the Bull and Mouth meeting-house, he was taken by soldiers and carried before Richard Brown, alderman, who treated him with violence, and then committed him to Newgate prison. Again in 1670, being found preaching in Grace-church street meeting, he was taken before the mayor and committed to prison. He was a patient sufferer for the cause of truth, and a powerful minister of the gospel.

(To be continued.)

ON TEMPTATIONS.

I know of but two resources against temptations. One is, faithfully to follow the interior light in sternly and immediately cutting off everything we are at liberty to dismiss, and which may excite or strengthen the temptation. I say everything which we are at liberty to dismiss, because we are not always permitted to avoid the occasions of evil. Such as are unavoidably connected with the particular position in which Providence has placed us, are not considered to be within our power.

The other expedient consists in turning towards God in every temptation, without being disturbed or anxious to know if we have not already

yielded a sort of half consent, and without interrupting our immediate recourse to God. By examining too closely whether we have not been guilty of some unfaithfulness, we incur the risk of being again entangled in the temptation. The shortest and surest way is to act like a little child at the breast; when we show it a frightful monster, it shrinks back and buries its face in its mother's bosom, that it may no longer behold it.

The sovereign remedy is the habit of dwelling continually in the presence of God. He sustains, consoles, and calms us.

We must never be astonished at temptations, be they never so outrageous. On this earth all is temptation. Crosses tempt us by irritating our pride, and prosperity by flattering it. Our life is a continual combat, but one in which Jesus Christ fights for us. We must pass on unmoved, while temptations rage around us, as the traveller, overtaken by a storm, simply wraps his cloak more closely about him, and pushes on more vigorously towards his destined home.

If the thought of former sins and wretchedness should be permitted to come before us, we must remain confounded and abashed before God, quietly enduring in his adorable presence all the shame and ignominy of our transgressions. We must not, however, seek to entertain or to call up so dangerous a recollection.

In conclusion, it may be said that in doing what God wills, there is very little to be done by us; and yet there is a wonderful work to be accomplished, no less than that of reserving nothing, and making no resistance for a moment, to that jealous love, which searches inexorably into the most secret recesses of the soul for the smallest trace of self, for the slightest intimations of an affection of which itself is not the author. So, on the other hand, true progress does not consist in a multitude of views, nor in austerities, trouble and strife; it is simply willing nothing and everything, without reservation and without choice, cheerfully performing each day's journey as Providence appoints it for us; seeking nothing, refusing nothing; finding everything in the present moment, and suffering God, who does everything, to do his pleasure in and by us, without the slightest resistance. O how happy is he who has attained to this state! and how full of good things is his soul, when it appears emptied of everything!

THE BEST INVESTMENT.—Dr. Franklin, speaking of education, says: "If a man empties his purse into his head, no man can take it away from him. An investment of knowledge always pays the best interest."

It is our own fault, if our greatest trials do not turn out to be our greatest advantages.

MEMOIR OF GHARRET VAN HASSEN.

Gharret Van Hassen, an ancient Friend of Dublin, born in Holland, about the year 1695, was a signal instance of the mercy and long forbearance of a gracious God; having been favored with a Divine and powerful visitation, about the fortieth year of his age, and thereby reclaimed from a state of unregeneracy and sin, witnessing true repentance. He joined in society with Friends, and his relation of this event may be given in his own words, the reader making allowance for the language, learned late in life: "It came to pass in the fortieth year of my age, that I left Holland, and came to England, in order to take shipping at London for Philadelphia, there to settle. The week I intended to set out, I was taken with the gout, which I had never had; and before I was recovered, the ship went out, and left me behind. Within two weeks after, it was in the newspapers that this same ship was lost, and all that were in it. Oh! that such a deliverance may be as a seal upon my mind. From London I removed to Colchester and there settled, working at my trade, which was wool-combing. I joined with a Dutch Society, which was in this place, where the minister preached in my own language. And it came to pass, one day, after our Society broke up, in the way towards my lodging I came near the meeting-house of the people called Quakers; and seeing people standing in the yard with their hats off, I went in and stood amongst them, as near to the door as I well could, and heard the voice of a woman in prayer; which so affected me, that I wept bitterly, and in that frame went to my lodging. The next morning I went to the minister of our Society, and said to him, 'Sir, something is the cause of my coming to you.' He asked me what it was? Then I said: 'Sir, I never remember to have shed a tear under all your doctrine; and yesterday I heard a woman, not understanding a word she said, yet it made such an alarm in the book of my conscience, that if I was to die this night, I fear I am not fit for God nor His kingdom. What, sir, (said I,) can be the meaning of this?' To which he replied: 'The woman is a witch, and has bewitched you.' Upon this I asked what these people were? Then he asked me if I had a mind to be a Quaker? I answered: 'Nay, God forbid; but before I go to heaven I must be a good Christian.' To which he replied: 'Then you must not go among them, for they are not Christians.' Then immediately that text of Scripture came before me, 'Men love darkness rather than light, because their deeds are evil.' He parted from me in great anger; and the succeeding week I went to the Quakers' meeting, when a public Friend, called Sarah Lay, stood up and spoke a few words. But I could not understand one word, being a stranger to the language; neither did what she said affect me. And so I came back

out of the meeting, concluding in my mind to go the next week; but if the woman was not then there whose voice affected me the week before, I resolved never to go again. The next week, according to intention, I went again; and in a short time, Mary Wyatt, then unknown to me, came in, and soon after kneeled down to prayer. Then, being greatly affected, I cried in secret: 'What a pity it is that all the world is not of one language! If so, I should know what this woman saith.' From henceforward I have continued amongst Friends, and am now, at the time of writing this, in the fifty-eighth year of my age; about eighteen years from the time of my conviction."

Being through faithfulness led in the paths of piety and love to God and men, he became a minister, and was a fervent laborer, zealous in his testimony against the inordinate love of the world, affectionately tender to the youth, and solicitous for their preservation from the temptations incident to their time of life.

In the year 1737, Gharret Van Hassen came to Ireland; and for the most part of his remaining time resided in Dublin. He visited the meetings of Friends in Great Britain; and in the year 1747 performed a visit to most, or all the families of Friends in Ireland, and also to such as had incurred the censure of the Society; in which labor he was well received, for his heart overflowed with charity.

Simple in his manners, and unassuming; industrious and independent; living alone, and with great neatness, though in very limited circumstances, he was respected as well as beloved. It is related of him, that travelling alone in Scotland, during the hostilities exercised in 1745, he was stopped by military men, who inquired: "What king are you for?" The answer to this question was hazardous; but the honest-hearted man replying, "I am for the King of heaven," he was suffered to proceed unmolested on his way.

During the latter part of his life, he was greatly afflicted with bodily infirmities, disabling him, in a great measure, for public service: but he still retained his love to God and man, and at or near the time of his conclusion, had the comfortable assurance of his approaching removal to a better state; saying, "I am going to your Father and my Father; to your God and my God. I die daily, nevertheless I live, yet not I, but Christ liveth in me." He departed this life the 30th of Sixth month, 1765, aged about seventy; a minister upwards of twenty-eight years.

EVIL PERPETUATED.—Scratch the green rind of a sapling, or wantonly twist it in the soil, and the scarred and crooked oak will tell of thee for centuries to come. How forcibly does this beautiful figure teach the lesson of giving right instead of wrong tendencies to the young mind.

MENDIP ANNALS.

Many of your readers have doubtless become acquainted with the remarkable labors of Hannah More and her sister among the Mendip villagers, as portrayed in the Memoirs of Hannah More; and the journal of Martha More, which has been recently published under the above title, must have tended to renew a feeling of interest in the subject. Having had many opportunities of witnessing the beneficial effects produced by the ministrations of these devoted women, I am desirous of bearing testimony, through the medium of your pages, to their value and importance.

My acquaintance with the Mendip villages did not commence until after Martha More had been called from works to rewards. Hannah More had also, for a long time, been laid aside from her active engagements, and confined to the seclusion of two rooms. It was, however, my privilege as a child, to be frequently taken by my parents to call upon her in her delightful retreat at Barley Wood, and afterwards at her Clifton home. And well do I remember the brightness and beauty of the evening of her life. She was wont to express the comfort it was to her to think that she should leave the world better than she found it. And whilst, as regarded the part which she had herself been called to act, her acknowledgment was that of an unprofitable servant, she could rejoice in the remembrance that she had been enabled, however unworthily, to confess her Lord, and to proclaim His truth alike to the rich and to the poor. I once heard an aged Friend say, that if he were to seek to promote missionary operations, he should be disposed to send missionaries first to St. James' and next to St. Giles'; and such was in effect the plan pursued by Hannah More. My present purpose is, however, to speak of the effects produced by the labors which she and her sister bestowed on the poor. What those labors were, is sufficiently described in the memoir and journal to which I have referred. Some of the ideas on which the laborers describe themselves as having acted, may doubtless be considered as belonging to the last, rather than to the present century. The very limited course of instruction given in the schools—the objection to teaching which was at first felt—the bribe of a shilling, accompanied by beef and peas at Christmas, held out to those who regularly attended the workhouse services, and the *patronizing* sort of notion which ran through the whole of the efforts employed, would now be regarded as altogether out of place by many of the more active and successful laborers in the same field. But we must not judge the men and women of the eighteenth, (any more than those of the seventeenth,) by the standard of the nineteenth century. We have only to remember the character of the age in which Hannah More and her sister

lived, to see that they were, on the whole, far in advance of their time; and that they did much to pave the way for what may in many respects be considered a better state of things. And again, in considering the narrow views and feelings which led them to look with suspicion on the proceedings of some of their fellow-laborers of other denominations, we can hardly make sufficient allowance for the tendency of the high and dry Church sentiment in which they were nurtured. It is to be regretted, indeed, that the editor of the *Mendip Annals*, whilst giving insertion to extracts from Martha More's journal in which unfavorable mention is made of the Wesleyan Methodists, should have failed to notice the fact, that the labors of that useful body of Christians co-operated with those of Hannah More and her sister in bringing about the beneficial results described, and that the Cheddar schoolmistress, the most efficient of all their teachers, had received her training for the work of an evangelist, as the "leader" of a Wesleyan "class." The fact is, that the ladies of whom I am speaking were wont to display much more liberality towards Christians of other denominations, than would be imagined by those who know them only through the accounts which have been published respecting them. They did not scruple to read sermons published by a dissenting minister (among others) to their evening congregations. Dissenters of various denominations were welcomed to their house, and had the privilege of becoming acquainted there with men belonging to the Established Church whom they had no difficulty in recognizing as brethren. The late Richard Ball, of Bridgewater, used to relate, how, in calling at Barley Wood, on his return from a Bristol Quarterly Meeting, he found himself sitting on the same sofa with Hannah More and the then Bishop of Litchfield and Coventry. I well remember hearing her speak of the bond which the anti-slavery cause had formed between herself and the Society of Friends; and a similar bond was established between herself and other Christians by the operations of the British and Foreign Bible Society. Of Elizabeth Fry, Hannah More once said, "I honor her above all women."

But again I must recall my wandering pen to the results of the labors to which I have referred. And one of the most important things to be noted in reference to them is their *permanence*. Nearly seventy years have passed away since William Wilberforce was so affected with the condition of Cheddar, on his going thither with Hannah More to visit the cliffs for which that village is so celebrated, that he left the cold chicken and wine provided for his refreshment untouched. Through his encouragement and liberal assistance, his kind-hearted hostesses were enabled to commence, without delay, their long series of labors in that place. And it may most

truly be said that the fruit remains unto this day. I have conversed with more than one of the older villagers who were able from their own recollections to verify, *in the main*, the descriptions given by Hannah More and her sister of the state of Cheddar, when they first visited it. The only place of worship was at that time so poorly attended that less than twenty persons (in a parish of 2,000 inhabitants) often formed the congregation. The children were allowed to remain uninstructed, and the Bible was almost an unknown book. There can be no mistake as to the contrast presented by that and the present state of things in these respects. There are now three places of worship, all of them well attended, and with a Sabbath-school attached to each. The national school established by Hannah More continues to exist, and there is also a British school attended by a considerable number of children. I was once present at a gathering of 1,200 children belonging to schools situated within six miles of Cheddar. These were schools conducted, indeed, by Dissenters, but in regard to some of them it would be easy to show something more than an *indirect* connection between them and the labors of Hannah More. Of her endeavors to give circulation to the Bible, it may be said, that they have been carried forward until few, if any, families are left destitute. I might speak also of the permanent effects produced upon *individuals* who shared in the instructions thus imparted, and of many who were, I believe, enabled to hold the beginning of their confidence steadfast unto the end. The remark was once made to me by the clergyman of a village in which these good ladies had bestowed great pains and labor, that there was but little evidence remaining of benefit having resulted to the individuals and families in whom they were most interested; but the reason of that complaint was, I think, to be found in the fact, that many of those to whom he referred had become connected with dissenting congregations instead of with his own. It has often been my privilege, whilst attending the annual tea-meetings held in support of the schools to which I have alluded, to listen to the lively recitals and heart-stirring appeals of a dear old man—Robert Clark—who had been one of the first scholars in the Cheddar school. He had there received some of his earliest religious impressions; but having subsequently been led to dissent from the Established Church, he was one of the first to join what has now become a large congregation of Baptists. Although possessed of but few of the advantages of human learning, he may be said to have borne, throughout a lengthened life, an effectual testimony to the love of Christ his Saviour.

Those who have read Hannah More's life will hardly fail to remember a striking letter from Martha More to her sister, in which she describes

the funeral of their old Cheddar teacher, "Mrs. Baber." One cannot help wishing, when one reads of the difficulty which Patty More had on that occasion to restrain herself from speaking to the assembled multitude, that she had belonged to a religious body whose views and practices would have allowed of her exercising freely the spiritual gifts with which she had been entrusted. She mentions in that letter to her sister the names of some of the bearers who manifested deep emotion as they lowered the coffin into the grave. I had once an opportunity of conversing with one of these men—Robert Reeves—and of hearing him speak of his love for the memory of the old schoolmistress. But what struck me most in his remarks, was the description he gave of the change which had taken place in his feelings towards her. He said he well remembered the day when she first came to Cheddar, and that he thought as he saw her walking through the village, that he should have liked to join others in stoning her out of the place, because she looked so different to all the other people there. (It is probable that the old fashioned Methodist bonnet which this good woman wore, had to do with the repugnance which her appearance excited. It appears from Martha More's journal, that stones were really thrown at her on her first going to Cheddar.)

Although I am sufficiently acquainted with the other villages to which the labors in question were extended, to be able to speak of the general advance in Christian civilization which has been observable in them since the commencement of those labors, my knowledge of them is of a more restricted character. I must, however, refer to the case of the old schoolmaster of the Shipham School, Paul Stowell, to whose accounts of the improvement which had taken place in that once heathenish village I have often listened. Of Martha More in particular he had a most loving remembrance. He used to say, that "when the gentlefolks came to visit the school, it was Miss Hannah they wanted to see; but Miss Patty did the teaching." Very striking was the account which he gave of the benefit he had himself derived from teaching in the school. He had belonged to that class of teachers to whom Martha More so often refers as being themselves very deficient in the knowledge of the truth. He used to describe himself as having taught to others that with which he had himself at the time no saving acquaintance. But the Bible was the ordinary reading book in the school, and by constantly hearing it read he had acquired a great familiarity with its contents. And when in after life he was made a living partaker of the grace of the Gospel, the knowledge which he had thus acquired became to him a treasure of great value. His last illness was very protracted, and as his weakness prevented his reading much, it was then that his stores of

Scripture knowledge were most largely drawn upon. Sometimes, he used to say, a single verse of Scripture served him as food for meditation for days and nights together.

It was perhaps permitted to Hannah and Martha More, to see more of the fruit of their instructions than commonly falls to the lot of Christian teachers. But there were many instances like that of Paul Stowell, in which the seed which they were instrumental in sowing sprang up and bare fruit after they had been called away from their field of labor.

WILLIAM TANNER.

Bristol, Ninth month 3d, 1859.

[From the London Friend.]

CONFUCIUS.

Confucius, the celebrated Chinese philosopher, was born in the kingdom of Lou, five hundred and fifty-one years before the Christian era. When a child, he had a grave and serious deportment, which gained him respect, and plainly foretold what he would one day be. But he was most distinguished by his unexampled and exalted piety. He honored his relations; he endeavored in all things to imitate his grandfather, who was then alive in China, and a very pious man: and it was observable, that he never eat any thing, but he prostrated himself upon the ground, and offered it first to the Supreme Lord of heaven. One day, while he was a child, he heard his grandfather fetch a deep sigh; and going up to him, with much reverence, "May I presume," said he, "without losing the respect I owe you, to inquire into the occasion of your grief? Perhaps you fear that your posterity will degenerate from your virtue, and dishonor you by their vices." "What put this thought into your head," said the old man to him; "and where have you learned to speak after this manner?" "From yourself," replied Confucius: "I attend diligently to you every time you speak; and I have often heard you say, that a son, who does not by his virtue support the glory of his ancestors, does not deserve to bear their name."

At twenty-three years of age, when he had gained a considerable knowledge of antiquity, and acquainted himself with the laws and customs of the country, he projected a scheme for a general reformation of manners. Wisely persuaded that the people could not be happy, so long as avarice, ambition, voluptuousness, and false policy reigned amongst them, he thought it incumbent upon him to recommend a severe morality; and, accordingly, he began to enforce temperance, justice, and other virtues; to inspire a contempt of riches, parade, and splendor; and to excite such an elevation of mind as would render men incapable of dissimulation, and insincerity. In short, he used all the means he could think of to redeem his countrymen from a life of pleasure to a life of reason. He was every

where known, and as universally beloved: his extensive learning and great wisdom soon made him known; his integrity and the splendor of his virtues made him beloved. Kings were governed by his counsels, and the people revered him as a saint. The good effects of his example and admonitions were, however, but temporary. He lived in times when rebellion, wars, and tumults raged throughout the empire. Men had little leisure, and less inclination, to listen to his philosophy; for, as we have observed, they were ambitious, avaricious, and voluptuous. Hence he often met with ill treatment and reproachful language, and it is said that conspiracies were formed against his life: to which may be added, that his neglect of his own pecuniary interests had reduced him to extreme poverty. Some philosophers among his contemporaries were so affected with the sad state of things, that they retired into the mountains and deserts, thinking that happiness could no where be found, but in seclusion from society. They, in vain endeavored to persuade Confucius to follow their example. "I am a man," said he, "and cannot separate myself from the society of men, and consort with beasts. Bad as the times are, I shall do all I can to recall men to virtue; for in virtue are all things. If mankind would but embrace it, and submit themselves to its discipline and laws, they would not want me, or any body else, to instruct them. It is the duty of a teacher first to perfect himself, and then to perfect others. Human nature came to us from Heaven, pure and without defect; but in process of time, ignorance, the passions, and evil examples, corrupted it. Reformation consists in restoring it to its primitive beauty: to be perfect we must ascend to the point from which we have fallen. Let us obey Heaven. Let our reason, and not our senses, be the rule of our conduct: for reason will teach us to think wisely, to speak prudently, and to behave ourselves worthily upon all occasions."

Confucius did not cease to travel about, and do all the good in his power. He gained many disciples, who became strongly attached both to his person and his doctrine. These he sent into different parts of the empire to promote reformation of manners amongst the people. All his instructions were enforced by his own example. He was remarkable for his gravity and sobriety, his rigorous abstinence, his contempt of riches, and what are commonly called the goods of this life; for his continual attention and watchfulness over his actions; and above all, for his unaffected modesty and humility. He is said to have lived three years in retirement; and to have spent the latter part of his life in sorrow. A few days before his last illness, he told his disciples, with tears in his eyes, that he was overcome with grief at the sight of the disorders which prevailed in the empire: "The mountain," said he, "is fallen, the high machine is demolished, and the

sages are all fled." His meaning was that the edifice of perfection, which he had endeavored to raise, was entirely overthrown. He began to languish from that time; and a few days before his death expressed himself thus: "The kings reject my maxims; and since I am no longer useful on the earth, I ought not to regret leaving it." After these words, he fell into a lethargy; and at the end of seven days expired in the arms of his disciples, in the seventy-third year of his age. Upon the first hearing of his death, the prince who then reigned in the kingdom of Lou could not refrain from tears; "God is not satisfied with me," cried he, "since he has taken away Confucius."

Wise and good men are indeed precious gifts, with which heaven blesses the earth; and their worth is seldom justly appreciated till after their decease. Confucius was lamented by the whole empire. He was honored as a saint; and so high a veneration was entertained for his memory, that it will scarcely ever be effaced in those parts of the world.—*Religious Tracts.*

FRIENDS' INTELLIGENCER.

PHILADELPHIA, ELEVENTH MONTH 26, 1859.

OUR TESTIMONIES.—The events which have transpired within the past few weeks in the State of Virginia, have agitated our country from one end to the other, and doubtless the subjects of war and slavery have been introduced into households where they are seldom freely discussed. At such times as the present it is well for us all to think seriously respecting our testimonies upon both of these subjects, and to make individual inquiry as to whether our lives and conversation are in accordance with the high professions we are making. Whilst we condemn the resort to violent measures in the sad occurrences at Harper's Ferry, it requires great care that we so express our opinions as to give no countenance whatever to the enslaving of our fellow-men. As many of our members may not be perfectly familiar with the language of our discipline, we give some extracts from the respective chapters on Negroes or Slaves and War.

"It appears to have been the concern of this Meeting, revived from time to time with increasing weight, to testify their entire disunity with the practice of enslaving mankind, (and particularly to guard all in membership with us against being concerned in the purchase of slaves from the coasts of Africa), yet as we have with sorrow to observe, that in some parts of our country this shameful practice is still continued and connived at, we think it proper to revive the advices here-

tofore issued, and again exhort our members to be no way accessory to this enormous national evil, but to discourage it by all the justifiable means in their power; it being obvious, that wherever it prevails it tends to corrupt the morals of the people, so as not only to render them obnoxious to the displeasure of the Almighty, but deaf to his warnings, and insensible and regardless of his impending judgments."

"Friends are exhorted faithfully to adhere to our ancient testimony against wars and fightings, and in no way to unite with any in warlike measures, either offensive or defensive; that by the inoffensiveness of our conduct, we may convincingly demonstrate ourselves to be real subjects of the Messiah's peaceful reign, and be instrumental in the promotion thereof, towards its desired completion, when, according to ancient prophecy, "the earth shall be full of the knowledge of the Lord, as the waters cover the sea;" and its inhabitants "shall learn war no more."

This meeting fervently recommends to the deep attention of all our members, that they may be religiously guarded against approving or showing the least connivance at war, either by attending at or viewing of military operations; or in anywise encouraging the unstable deceitful spirit of party, by joining with political devices or associations, however speciously disguised under the ensnaring subtleties commonly attendant thereon: but that they sincerely labor to experience a settlement on the alone sure foundation of pure unchangeable Truth; whereby through the prevalence of unfeigned Christian love and good will to men, we may convincingly demonstrate that the kingdom we seek is not of this world. A kingdom and government whose subjects are free indeed! redeemed from those captivating lusts from whence come wars and fightings."

DIED, At her late residence in Westchester county, N. Y., on the 25th of 10th mo., 1859., PHEBE CARPENTER, in the 74th year of her age, the widow of our much esteemed friend, Jacob Carpenter. They were Elders of Purchase Monthly Meeting for many years.

Their loss is deeply felt, and by their exemplary walk gave evidence that their day's work was done in the day time.

—, On the morning of the 18th inst., EMMA C. MILLER, daughter of Anna R. and Daniel L. Miller, Jr., in the 12th year of her age.

—, On the morning of the 20th inst., MIRA, wife of SAMUEL TOWNSEND.

A USEFUL HINT.

In a late number of the *Eclectic Medical Journal* the editor remarks that young babies often cry from thirst. Their natural supply is intended as food not as drink, and makes them thirsty without really quenching the thirst as a cool liquid would. They cry, he thinks, for cold

water. Many a mother is anxious to know what ails the little sufferer that it should cry so loudly, and imagining it to be suffering from pain, administers some unnecessary opiate, or pain-killer, when all the child needs is a few teaspoonsful of good, pure, sparkling cold water. As the experiment is a very simple and easy one, let all mothers try it first, before having recourse to medicine. In warm weather, particularly, children may be suffering from thirst instead of pain, and a small quantity of cold water may give them immediate relief.—*B. Journal.*

“CANST THOU SEND LIGHTNINGS?”

Though vast the realm over which man holds control, there are moments when he feels oppressively his own nothingness. Whether he sleep or wake, regard with attention or indifference, the earth arouses from her wintry torpor, and arrays herself in beautiful garments. He has no power to cause one leaf to unfold, one petal to expand, one blade of grass to pierce the dusky mould; but ere summer comes, the leaves hang thick upon the trees, the flowers deck garden, field and wood, and everywhere the earth is green with abundant herbage. The wild bird of the forest learns not its song from him, and the breezes that come, he knows not whence, and go, he knows not where, are inexplicable mysteries.

And as time bears onward the golden summer hours, and with them the freshness and beauty that had made the world so fair, and the leaves drop upon the faded sod, and the blossoms lose their colors and fragrance, what can man do to retain the passing glory, and bid decay pause in her desolating career?

And when from over the sea the fierce storm breaks upon the defenceless shore, and rocks man's humble habitations, and bends the ancient trees like slender reeds, what can he do but listen, and tremble and wonder? Or, if in a stout bark he rides the tempest-tossed wave, how feeble, even with his brave heart and cool reason, are all his efforts for mastery over the seething flood! He may outride the danger, he may, in an hour sleep below the whelming waters. A will mightier than his is moving over the face of the great deep.

How terrible, how sudden, how strong, are the movements of the lightning, that passes from one cloud to another in the mystic roll of the thunder, or glances to earth, bearing destruction in its path. It rends the oak of a century; it tears rocks from their mountain beds, and hurls them fathoms down to dark abysses; it seizes the masts of brave ships, and wrenches them from their strong hold; it destroys the habitations of men in an instant, and it takes their breath and leaves them clay; and all these without human interference, and even in defiance of the subtlest human skill.

Canst thou send the lightning? While gazing on the threatening cloud whose bosom is rent by the electric fire, the soul feels that a mightier than itself holds the directing and controlling power. Upward the heavy mass moves until the whole sky is veiled from our sight, and no human arm can stay the unfolding of that dread curtain; and when the lightning leaps across the dark expanse with blinding brilliancy, and scatters here and there its resistless bolts, and the rolling of the thunder bids the firm earth tremble, then is felt, with convincing power, that God is in the storm, and that man is powerless before His stupendous machinery.

But a few weeks since, and the setting sun left behind a cloudless firmament, from which the great multitude of stars shone out with unwonted brilliancy; gradually, the north became luminous with its mystic fires, and the east and the west gathered to themselves of the great glory, and from the horizon to the zenith, undulations of light in broad waves, or golden pillars sharply defined, or delicate streamers like the folds of a gossamer curtain, made the heavens almost too wondrously beautiful.

No sound borne through the silent night accompanied this magnificent display of the Creator's skill, and man could only fold his hands in reverence, in wonder and adoration. What were all the mimic exhibitions of human ingenuity to this wondrous walking forth of the light out of the frozen regions of the North?

Such thoughts as these, while they inculcate due humility, really ennoble and enlarge the human mind, leading it from low and degrading pursuits, from narrow and unworthy thoughts, into contemplations that have their end in Omniscience. If the undevout astronomer be mad, surely he is not less so who can go out into Nature's broad domains, and use his sense aright, without feeling all within moved to worship. The ear is regaled with an infinity of sweet sounds, the eye feasts on ever-changing beauty, and the fragrance of the garden, so spiritual in its unseen presence, seems earth's fitting incense to its beneficent Author.

O, go not forth with cold heart and unobservant eye, into the domain prepared with so much skill and care for man's enjoyment! Bear in your silent thoughts the memory of Him who gave the blade of grass its transient life, and notes the rolling of the farthest star. He has cared for you with a love immeasurable as His own eternity; and what deeper sin is there than ingratitude to Him?

We can send no lightnings on their path, nor stay the passage of stormy seas, nor hush the winds in their wild revelry; but we can lay upon God's altar, with pure hands, the oblation of loving, faithful, obedient hearts.—*New England Farmer.*

THE LATE ROBERT STEPHENSON.

The death of Robert Stephenson, of which the last accounts from England apprize us, has left a void in the ranks of mechanical inventors and chiefs of mechanical industry, which will not easily be filled. Mr. Stephenson has left monuments of his genius and skill in many parts of the world,—in Belgium, in Egypt, and in Canada, as well as in England, his native country, which is justly proud of his world-wide reputation. He held the foremost place amongst the engineers of the world; was thoroughly educated in the school of practical as well as theoretical science; was of slow and sound judgment, and yet bold in his undertakings; and his professional career has been distinguished by extraordinary success.

Mr Stephenson was the son of the celebrated George Stephenson, the inventor of the railway locomotive system, and was carefully educated by his father for the station he has so honorably and usefully filled. The history and professional success of father and son are indeed identical; for the son was old enough to aid the father materially in the great achievement of his life. The father was born in a small colliery village, near Newcastle, where he was early employed as assistant fireman to his father, at a shilling a day. At the age of fifteen he was promoted to be fireman on his own account at twelve shillings a week. It is said that the first Saturday of his full wages, he marched out of the fireman's office, exhibiting his twelve shillings, and adding, "I am now a made man for life." His opportunities for watching the working of the engine inspired him with a devoted admiration of the machine, and he employed his leisure hours assiduously in studying its construction till he became master of its various parts. At the age of eighteen he could neither read nor write. His passion for engines, however, and the desire to learn what books might teach him about them, determined him to learn to read. By the expenditure of fourpence a week at an evening school, for a year or two, he acquired as much reading, writing, and arithmetic, as served his immediate purpose.

This little stock of learning was increased by practice, and as fast as opportunity would permit. Having qualified himself for the place of "brakeman," he was employed in that capacity in a colliery till 1812, when he was thirty-one years of age, never receiving wages higher than about a pound a week. He increased his earnings, however, by mending shoes for his fellow-workmen, and by cleaning clocks. In 1802 these earnings enabled him to marry a farm-servant, the soling of whose shoes was the greatest ecstasy of his life. His only son, Robert, was born in 1803, and within two or three years the mother died. His chief care now was to train up his son to be a good engineer. His mechani-

cal genius had now developed itself, so that he found employment in repairing engines, and his earnings in this line, added to those of clock-doctoring and the like, enabled him to send Robert, at the age of eleven, to a good academy.

The year 1812 was an epoch in George Stephenson's life. He was then appointed engineer of the colliery at Killingsworth, at a salary of one hundred pounds a year. While thus employed, he solved the problem of railway locomotion, and acquired that experience which, in the railway department, made him the first engineer of the age. On Saturday afternoons his son Robert went to Killingsworth, carrying with him scientific books from the library to which his father had subscribed. Father and son were joint learners from these books; and a general scientific culture was the result of the studies, carried on for a series of years. Mr. Stephenson had watched with great interest sundry experiments and failures to construct locomotive engines, and was desirous, if he could obtain the means, of making an attempt himself. Lord Ravensworth having afforded him the means, he with the aid of the colliery blacksmith, constructed an engine, which he called "Blutcher," which in 1814 was tried, and ascended a gradient of 1 in 450, drawing after it thirty tons, at the rate of four miles an hour.

Although this was the most successful engine that had been constructed, it had defects, which Mr. Stephenson carefully noted. In 1815 he built another, which he called the "Puffing Billy," which is regarded as containing the germ of all that has since been effected. Mr. Stephenson now turned his attention to what he discovered to be necessary, namely, the improvement of railways, so as to fit them for the use of locomotives. In 1816 he took out a patent embodying his improvements both in engines and railways, including the form of the rails, modes of junction, &c. In 1819 he superintended the construction of a new coal railway from the Hetton coal mines to the banks of the Wear; and in 1822 five of his locomotives were running upon it, dragging sixty-four tons each, at four miles an hour. Mr. Stephenson was now convinced that he had solved the problem, and that the steam locomotive was destined to supersede every other tractive power, and to come into universal use. He was assisted at this time by his son Robert, especially in the elaborate calculations which were necessary for his purposes. Indeed through life he was accustomed to refer to his son for any subtle theoretical elucidation that he might want, as well as for literary help on important occasions, when he had to put his views on paper. The Stockton and Darlington railway was projected in 1823, a special clause in the charter empowering the company to use locomotives. Mr. George Stephenson was appointed engineer. Robert, who had recently returned

from the University of Edinburgh, remained for some time with his father; but in 1824 went to South America, as an engineer, and did not return till 1827. During his absence the Stockton and Darlington line was constructed. It was opened on the 27th of September, 1825, and on that day the first railway passenger train in the world was driven by Mr. George Stephenson.

Mr. Stephenson now set up a locomotive manufactory at Newcastle. He was appointed, however, soon afterwards, to be principal engineer of the Liverpool and Manchester railway, at a salary of £1,000 a year. But he had to fight with that company before he could convince them that locomotives would pay better than horses or fixed engines. The controversy was going on when Mr. Robert Stephenson returned from South America. Many eminent engineers had reported unfavorably of the locomotive system, and the son's pen had to be called into requisition to defend the father's ideas. At length the directors offered a prize of £500 for the best locomotive engine which would fulfil certain conditions, which were that it should consume its own smoke, should draw three times its own weight at the rate of ten miles an hour, should be supported on springs, not exceed six tons weight, and should not cost more than £550. The trial was fixed for the 6th of October, 1829, and on that day the great match took place. Out of four engines entered for the prize, two were withdrawn as not fulfilling the conditions, a third broke down on trial, and Mr. Stephenson's "Rocket," which stood every test, was left to carry off the prize. The maximum velocity which it attained was twenty-nine miles an hour.

Mr. George Stephenson was forty-eight years of age when he accomplished this feat. He lived to the age of 67, dying in 1848. He lived to see the development of the railway system throughout the world, and, in conjunction with his son, laid down most of the important lines in England.

Mr. Robert Stephenson, with an education which gave him superior advantages, seems to have inherited the best practical traits of his father's character. He had attained the highest eminence in his profession before his father's death, and had indeed accomplished the great feat of his life. The Tubular Bridge over the Menai Straits was the *chef d'œuvre* of his genius and skill. This bridge, as is known, is on the Chester and Holyhead Railway, in England, across that great tidal chasm which separates Carnarvon from the island of Anglesey. It was there required by the interests of commerce that the structures should be a hundred feet above high water mark, and the Straits, it is said, rise and fall 20 to 25 feet with each successive tide. Mr. Stephenson at first conceived the idea of effecting the object by means of a

magnificent bridge of two cast iron arches, each of which, springing fifty feet above the water, was to be 450 feet span and 100 feet high, to be supported by a centre pier. This plan was rejected, however, by the Admiralty, because the stipulated height of 100 feet would only be attained under the crown of the arch, instead of extending across the whole of the water-course. Mr. Stephenson was therefore put to his trumps to devise a bridge which throughout the whole of its length should be of the specified height. And he succeeded, the result being the present magnificent structure. This wonderful invention, as our readers are aware, has been adopted as the general model of the Grand Trunk Railway bridge at Montreal, which was also devised by Mr. Stephenson, and has been constructed under his directions, and which will be the greater and grander work of the two.

The invention consists of two straight tubes—one for up and one for down trains—composed of wrought iron boiler plates, firmly rivetted together. In order to turn aside the force of the wind, the tubes are made oval, or elliptical. The extremities rest on stout abutments of masonry, and the intermediate portions repose on three massive and lofty towers, one at high water mark on each side of the Straits, and the other, no less than 210 feet high, is erected in the middle of the stream, upon a rock fortunately there, protruding above the surface at low tide, but covered with ten feet of water, or more at high tide. The length of the tubes is 1,492 feet. This is about a quarter of a mile. The bridge at Montreal is about two miles.

Previous to the construction of the Menai Straits, or Britannia Bridge, as it is called, a series of searching experiments were made, to ascertain the precise shape and thickness of the immense wrought iron aerial galleries that were to be thrown across the Straits, as also the exact amount of weight they would practically bear. This investigation developed many interesting and important and some wholly unexpected results. It confirmed Mr. Stephenson's theory, and led to the confident adoption of his plan, pretty much in detail. He determined that the size and adjustment of the iron to be used should be such as to enable the unsupported portion of the tube to bear up no less than 4000 tons over its whole surface, or 2000 tons in the centre. As the maximum weight of a loaded train of 460 feet—the greatest distance between the towers of the bridge—was found to be 460 tons over the whole surface, or 230 at the centre, this of course is nine times greater than the amount of strength which was actually required.

The manner of constructing this famous bridge and of raising the immense iron tubes to their places, was scarcely less ingenious and skilful than the invention itself. The whole length of the twin tubes is, as we have stated, 1492 feet;

each tube, in the construction, was divided into four parts—those from the embankments to the highwater towers at each side being 274 feet; and those from these towers to that in the middle of the stream being 472 feet. The shorter parts were permanently constructed on scaffoldings in the positions in which they were to remain. The longer parts, those overhanging the Straits, were constructed at highwater mark on the shore, on wooden platforms, about 400 feet from the towers on which they were eventually placed. When finished they were floated to the bases of these towers and deposited on abutments in the masonry purposely made to receive them; and finally they were raised and deposited in their exalted stations, by the power of hydraulic presses of great size and force.

Mr. Stephenson visited this country in 1853, having been deputed by capitalists in England to go to Montreal for the purpose of ascertaining the feasibility of constructing a bridge, for the use of the Grand Trunk Railway, over the St. Lawrence. His skill as a practical engineer, and above all, his successful experience in the construction of the Menai Bridge, had determined these capitalists to rely upon Mr. Stephenson's judgment in the matter. Men of less boldness, and of less knowledge undoubtedly, had regarded the idea of such a bridge as chimerical, if not impossible, on account of the dangers to which it would be exposed from the ice, and the necessity of elevating it so as to present no obstruction to the navigation of the river.

Mr. Stephenson met this emergency with his accustomed courage and scientific skilfulness. It happened to us to be present when he announced to the citizens of Montreal, in general terms, the result of his investigations and calculations. He expressed a very decided opinion that the bridge was a practicable idea, and that no circumstances whatever connected with the ice could occur to endanger or injure the structure. His calculations had satisfied him that no pressure of ice that could by any possibility come against the piers, would be sufficient to displace them. There were facts, he remarked, connected with the breaking up of the ice, which were capable of mathematical demonstration; and the actual pressure of the shore was also capable of being estimated accurately and certainly. If the ice were piled thirty or forty feet high, as it is said to be sometimes, it could be easily withstood. A bridge could be constructed to resist the pressure of ice piled even twice that height. The weight of any conceivable pressure, and the strength necessary to sustain it, could be ascertained with as much certainty as any problem in Euclid. As to another objection against the bridge, that it would heap up the water, Mr. Stephenson considered that likewise as wholly groundless. The proposed bridge, he said, would occupy about 8 per cent. of the channel of

the river. The speed of the current, estimated at three miles an hour, would therefore be increased 8 per cent. by taking 8 per cent. from the channel. The question was, what height of water would create this additional 8 per cent. of speed. It would require about $3\frac{1}{2}$ inches, and that was the utmost that could possibly take place. The time is at hand for testing Mr. Stephenson's confident views in regard to the Victoria Bridge. That stupendous work is nearly completed. It will not only be a splendid monument of his genius, but will constitute one of the scientific wonders of the world.—*Boston Courier.*

FRESH AIR.

Give your children plenty of fresh air. Let them snuff it until it sends the rosy current of life dancing joyfully to their temples. Air is so cheap and so good, and so necessary withal, that every child should have free access to it. Horace Mann beautifully says: "To put children on a short allowance of fresh air, is as foolish as it would have been for Noah, during the deluge, to have put his family on a short allowance of water. Since God has poured out an atmosphere of fifty miles deep, it is enough to make a miser weep to see our children stunted in breath.—*B. Journal.*

LADY FRANKLIN.

The following graceful tribute to Lady Franklin is from the pen of ELIZABETH H. WHITTIER, sister of the Quaker Poet of Amesbury.

Fold thy hands, thy work is over,
Cool thy watching eyes with tears,
Let thy poor heart, overwearied,
Rest alike from hopes and fears.

Hopes that saw, with sleepless vision,
One sad picture fading slow;
Fears, that followed, vague and nameless,
Lifting back the veils of snow.

For thy brave one, for thy lost one,
Truest heart of woman, weep;
Owning still the love that granted
Unto thy beloved sleep.

Not for him that hour of terror,
When the long ice-battle o'er—
In the sunless day his comrades
Deathward trod the Polar shore.

Spared the cruel cold and famine,
Spared the fainting heart's despair—
What but that could mercy grant him?
What but that has been thy prayer?

Dear to thee that last memorial,
From the cairn beside the sea;
Evermore the month of roses
Shall be sacred time to thee!

Sad it is the mournful yew-tree
O'er his slumbers may not wave;
Sad it is the English daisy
May not blossom on his grave.

But his tomb shall storm and winter
 Shape and fashion year by year—
 Pile his mighty mausoleum
 Block on block, and tier on tier.

Guardian of its gleaming portal
 Shall his stainless honor be,
 While thy love, a sweet immortal,
 Hovers o'er the Winter sea!

TO A CITY PIGEON.

Stoop to my window, thou beautiful dove!
 Thy daily visits have touch'd my love;
 I watch thy coming, and list the note
 That stirs so low in thy mellow throat,
 And my joy is high,
 To catch the glance of thy gentle eye.

Why dost thou sit on the heated eaves,
 And forsake the wood with its freshen'd leaves?
 Why dost thou haunt the sultry street,
 When the paths of the forest are cool and sweet?
 How canst thou bear
 This noise of people—this sultry air?

Thou alone, of the feathered race,
 Dost look unscared on the human face;
 Thou alone, with a wing to flee,
 Dost love with man in his haunts to be;
 And the "gentle dove"
 Has become a name for trust and love.

A holy gift is thine, sweet bird!
 Thou 'rt named with childhood's earliest word!
 Thou 'rt link'd with all that is fresh and wild
 In the prison'd thoughts of the city child;
 And thy glossy wings
 Are its brightest image of moving things.

It is no light chance. Thou art set apart
 Wisely by Him who has tamed thy heart,
 To stir the love for the bright and fair,
 That else were seal'd in this crowded air;
 I sometimes dream
 Angelic rays from thy pinions stream.

Come then, ever, when daylight leaves
 The page I read, to my humble eaves,
 And wash thy breast in the hollow spout,
 And murmur thy low, sweet music out!
 I hear and see
 Lessons of heaven, sweet bird, in thee!

N. P. WILLIS.

History of the Life and Labors of Sir Charles Bell—[*Histoire, etc.*] By Amédée Pichot, D. M. (Paris, Lévy).

To an English reader such a volume affords little opportunity for extract. Here the whole career of the man is clear before us all. We see him in the old-fashioned, godly, Scottish home, in which he was born in 1774, with his humble and unselfish father, the Episcopalian minister, who was not richer than the Man of Ross, and who nevertheless educated several sons for liberal professions, of whom Charles was the most able and remains the most famous. Equally well are we acquainted with the successful course of the latter at the University, and his struggles among his ungenerous fellow-countrymen, his

comparative want of success in which drove him to London, where he again struggled long, but with ultimate and abiding triumph. With talent, originality, and perseverance like his he could not be forever kept in the background; and as with these he gradually made way, the inert, the dull, and the dunces in his profession, grew annoyed or alarmed. He had colleagues, however, who were too noble to be jealous; nevertheless, as he climbed higher and higher, till his elevation rendered him a remarkable object in the eyes of all men, there were some of his own vocation too ready to sneer at "the confounded Scotchman who, just like so many of his countrymen, sir, will push older men from their seats."

Again, who has forgotten the sensation caused by his discoveries connected with the nervous organization of man? More than Harvey effected by his discovery of the circulation of the blood was accomplished by Charles Bell, when he proved the truth of his nervous system. Harvey was the first to understand and demonstrate what had been previously suspected and indicated; but Charles Bell was the first who thought of, and the first who proved the absurdity of the system of the older anatomists, who held that the nervous substance was everywhere identical, and who attributed to all the nerves, without distinction, an equal share in the double function of motion and sensibility. Charles Bell long doubted that nature caused to emanate from the same organ two functions so distinct, and which exist independently of each other. Relying on the consistency of nature, he studied the nerves of the spine,—lived among them, so to speak, and he discovered that they were provided with two different roots, and composed of two networks, distinct the one from the other. By isolating one of these from the anterior root to the point of union, and irritating the root itself, he beheld a convulsive contraction of the muscle; by irritating the posterior root of this nerve in the animal which was the honored but rather unlucky subject of the experiment, the useful victim was made to emit a cry of pain. Bell at once saw that he had before him the nerves of motion and those of sensibility. Nor was this all or near all. By beholding and by comprehending thus much, he had founded a new system, but he proceeded greatly beyond this. By further study and repeated experiments, he made his culminating discovery, and won his great and imperishable renown. In the spinal conduit he came upon a third division of nerves in connection with other nerves which, for the most part, extend themselves to the muscles serving for the mechanism of respiration. He thereby arrived at the conclusion that this function was not altogether destined for the vivification of the blood in the lungs, but that the functions in question afforded us also the power of communi-

cating with our equals, of uttering the thoughts of our heart and soul, and that, in short, the nerves which regulate respiration are also the nerves of expression; and that in this way is organized what is popularly understood by the word "emotion" of any sort.

In recapitulating the great discovery, in order to keep in mind details which may have slipped from the memory of many persons who may also be glad to recover them without trouble, we purposely avoid technical terms, and we shall, doubtless, have been easily understood. There may be, nevertheless, a few readers disposed to ask,—"What of all this? Why should such a matter make a man famous?" They may fairly ask such questions. Charles Bell himself was heartily laughed at, at first, by foremost men in the ranks of medical science, for his suggesting that there were respiratory muscles in the face, and that these had any thing to do with expression.

The sum of the great discovery, then, is this: Bell found that the nerves of motion and sensibility were common to all beings capable of sensation and movement—to all animals, in short; but that the third or superadded division of nerves exists only where the organization exacts more elevated functions. He alone had discovered the method by which the brain communicates its will or impressions, to the body, and the manner by which the body makes its pains or pleasures sensible to the brain. His treatise must be read thoroughly to understand this, but such is a summary of the system; and when Abernethy had studied the latter, and acknowledged its undeniable truth, he generously exclaimed, that all other medical men had been blockheads for not having thought of this grand and simple truth before.

We will not pursue the theme further. The life of Bell is worthy of the study of every man who has to fight his battle or has withdrawn from the field of life. What an indication of the hero there is in the fact, that while this man's heart began to beat with pitying emotions at the beginning of a cruel operation, he could so make compassion subservient to duty, as to pass whole days and nights on the plain of Waterloo or in the Flemish hospitals, performing the most terrible operations on thousands of sufferers, among whom none, whatever his uniform, was looked upon as a foe! His heart would shake if his eye rested for a moment on a single man about to come under operation; but he turned his eyes to the great mass of agonized beings before him, and steadied both heart and hand by recollections of his duty,—and what uses humanity might derive from his study of the wounds he was seeking to assuage. What a recognition, too, of his great merits was that exclamation of the French Professor Roux, into whose lecture-rooms Bell once entered, for the purpose of listening to that

eminent man imparting instruction to his pupils! On recognizing Bell, the Parisian sage ceased to speak, closed his book, and turning to the students (as he pointed to the illustrious stranger) exclaimed, "Enough, gentlemen, enough for this day,—you have the honor of seeing Charles Bell!"

DESULPHURIZING MINERAL COAL—AN IMPORTANT DISCOVERY.—We see by the Pittsburg papers, that experiments have been made in that city, at some of the iron establishments, in desulphurizing mineral coal, by the use of steam, an entirely new process, and one described as more effective and economical than the process of coking. If it is all that is described, this is a very important discovery for our furnaces, foundries, blacksmiths, copper and tin smiths, and in fact all trades which work in metals. According to the statements made, coal can be desulphurized in about six hours, and in doing so it loses much less weight than in coking. It gives four times more heat than coke, leaves no cinders, and is much better suited to smelting ores, yielding a full complement of iron, entirely free from all foreign matter, rendering the metal softer and tougher than iron made by any other process. The cost of applying the process is said to be very trifling, and the smelting can be done in any style of furnace now in use. In blacksmiths' forges it will make hard or brittle iron soft, malleable and tough. In copper and tinsmithing, it will hold the sodder to the irons better, and give more heat than any other coal. It is also much cheaper than charcoal. Gen. J. K. Morehead, of the Novelty Works, at Pittsburg, speaking of experiments made in his shop, bears the following testimony to the value of the process:

NOVELTY WORKS, PITTSBURG, Nov. 8, 1858.

MR. JESSE BURROUGHS:—Dear Sir—I was much pleased with the experiment you made in our shop. The coal used by you was so impregnated with sulphur that our blacksmith could do nothing with it; and after putting it through your process, he not only used the same coal, but could weld and make links of the worst kind of Maryland short iron. If this testimony will be of any use to you, it is freely given.

Yours, &c.,

J. K. MOREHEAD.

Mr. Wm. Matthews, of this city, is engaged in the enterprise of introducing this new process to the public, and is now endeavoring to bring it to the attention of those engaged in the manufacture and use of iron. Those who are in the business will understand the importance of this discovery, and can satisfy themselves, by experiment, of its value. This subject is also well worthy the attention of our numerous railroad companies.—*P. Ledger.*

FARMERS' HIGH SCHOOL.

This institution, the object of which is to afford a system of instruction as extensive and thorough as that of the usual course of the best colleges, and to embrace, to the fullest extent, those departments of all sciences which have a practical or theoretical bearing upon agriculture, has just issued a catalogue of the officers and students for the present year, by which it appears that the number of the latter is 119. To be admitted, students must be sixteen years old, and possess a knowledge of reading, writing, geography, arithmetic and English grammar. Satisfactory evidence must be furnished of good moral character. The students are required to perform three hour's work each day, and more if desired. It is required that the sum of \$100 be paid previous to entrance, which, with the work performed, will cover all expenses, except for light and text books. The college is located in one of the most beautiful valleys of the State, between the mountain ridges east of the Alleghanies. It is accessible to visitors and students by the Pennsylvania Railroad to Lewistown, and thence by stages. The College yearly session commences on the 16th of February, and closes on the 12th of December. The Farm embraces four hundred acres of land of good quality. As yet the college building is not finished. It is stated that nothing has been done to it since February last. At that time the basement story of the whole building, and one entire wing and curtain were up. The entire building is two hundred and thirty-four feet in front, embracing a central part and two wings, all facing in the same line. The parts of the building completed give sixty-four dormitories, two lecture rooms, six private dwellings, library, reading room and business office. The managers urge upon the citizens the necessity of an early completion of the buildings, so that the experiment, so well commenced, may be fully tested.—*Philadelphia Ledger.*

ITEMS OF NEWS.

EUROPE.—The steamship Canada brings the intelligence that the English and French Governments are completely agreed on the basis for the European Congress which is to be held in Brussels. All that remained to be settled was the official ratification of the agreement by the British Government.

A vague report prevails that Gen. Garibaldi, at an interview with the king of Sardinia, had declared that Italy had been betrayed, and that he would head a revolution to protect her liberties. The king protested against such a proceeding.

Charles Sumner, United States Senator from Massachusetts, is among the passengers in the Canada.

The French Government proposes to establish a direct steam communication between France, India, and China. The French trade is said to be valued at from four to five million pounds sterling per annum, and is now carried on almost exclusively through the means of English steamboats. The Government proposes to act as a banking house, with a view of faci-

tating commercial relations with those countries where it is alleged English houses now reign supreme. The French Government have appointed a committee to inquire into the scheme.

EXTRACT OF A LETTER FROM THE WASHINGTON CORRESPONDENT OF THE UNITED STATES GAZETTE.—The Indian bureau will recommend to the consideration of Congress a new plan for the more effective civilization of those tribes which are at all disposed to peace and a settled mode of life. It proposes, in a measure, to do away with the tribal system of treatment, and to substitute for it an individual method. For example, where the land is now cultivated by a tribe, and the maintenance provided in the aggregate, it is designed to distribute the reservation among the individual members of the tribes, rendering each man a proprietor in himself, and making the support of his family depend upon his and their labor. By this means it is hoped to encourage industry, to incite emulation, and to subdue and attract the Indian into the habits of civilized life. Some of them have voluntarily introduced this question, after a form, and the example is working beneficially. Such an experiment is worthy of the age, and associated as it necessarily must be with other Christianizing benefits, may yet exert a benign influence upon a people whose whole history is full of touching interest, and whose destiny is now foreshadowed with sad associations. The fact is not generally known, that the Indians who roam over the wilds from the Missouri to the Pacific, like Arabs of the desert, are perceptibly diminishing in numbers and force, according to all the accounts of observing officers, who have been exiled on the frontier posts.

AFRICA.—There is news from Dr. Livingstone, the African explorer. Letters have been received from him dated at Sette, on the river Zambesi, in Second month last. It was the worst period of the year, and fever was very fatal on the coast, but the members of the expedition had but slight attacks. The result of experience seems to be that the condition of safety is to get away from the coast. Dr. Livingstone had conducted the steamer 1700 miles, and proved not only the navigability of the Lower Zambesi in the dry season, but that the Shire is a splendid river for a steamer, upward of 100 miles from its confluence. The last trip prior to the above mentioned date was up the Shire. Near the confluence there is a mountain over 4000 feet high, with considerable cultivation on the top, and a climate fitting it admirably for a sanatorium. Orange and lemon trees were found growing wild upon it, and there are fine springs and hot water baths. The valley of the Shire is 20 or 30 miles broad, and wonderfully fertile. The people seem never to have been visited by Europeans before, and were very suspicious of manstealing. The explorers landed frequently and took great pains to allay these unfounded fears, and to explain their real intentions. They bought provisions and cotton yarn of the natives.

EARTHQUAKE.—By the New Granada, at New York, from Callao, which port she left on the 16th, there is highly important news from Peru and Chili. The British ship Minnehaha, from Caldera, had arrived at Callao, bringing intelligence of a terrible earthquake at Copiapo, by which more than one half of the town was destroyed, and causing a great loss of life. The shock was sensibly felt at Caldera. The captain of the Minnehaha reports the water as having receded some twenty-three feet in the harbor, and says that his ship swayed to and fro, as if in a heavy sea. The Caldera and Copiapo railroad has suffered, it is said, considerable damage, in consequence of which no trains could pass over the road when the Minnehaha sailed. The Chilian minister to Peru was murdered on the night of the 15th ult. at Chorilias. This makes two

foreign ministers who have been assassinated in Peru within the last eighteen months.

SAW DUST.—Saw dust is now turned to good account and commands a fair price as manure. One hundred barrels were shipped for Nova Scotia week before last, which were purchased for about forty cents per barrel. They are also in large demand for the object of extracting the alkali contained in them to manufacture into pearl ashes.

THE CAPE COD TELEGRAPH.—Samuel C. Bishop, of New York, has just completed an important link in our Cape Cod telegraphic facilities, by laying a very substantial submarine telegraph cable of his own manufacture from Edgartown to Nantucket, a distance of eight or ten miles. This new line will supply a want which has been much felt by the people of Nantucket and the Vineyard, and offers important accommodations to the shipping and insurance interests of the whole country.

COAL IN THE TERRITORIES.—Last June a party was sent out by the Land Office to run a base line between Kansas and Nebraska, and a geologist also accompanied them. At the base of the Rocky Mountains they have discovered stratas of coal from four to seven feet thick, specimens of which were received at the office yesterday. They enclose, also pieces of the gold bearing scoria mixed, to some extent, with quartz. The discovery of this coal sets at rest the inquiry as to where fuel for the railroad purposes in those territories is to be obtained.—*Washington Constitution 18th.*

THE GALE ON THE ENGLISH COAST.—A return at Lloyd's, made to the 29th ult., gives the following result of casualties to life and shipping, by the great gale on the English coast:—Vessels totally wrecked, 96; vessels stranded and other casualties, 530—total, 626. Probable loss of life, including the Royal Charter 600. Numerous losses are reported on the Welch coast.

STATE NORMAL SCHOOL.—The formal opening of the State Normal School at Millersville, Lancaster county, will take place on 1st and 2d of next month. In accordance with the requirements of the act of the Legislature, creating normal school districts, the Governor, in conjunction with the State Superintendent of Common Schools, has appointed a committee to visit the school on that occasion, to make the necessary examination and report the result, when the institution will be formally opened as a State school.

PHOTOGRAPHY IN NATURAL COLORS.—From statements which have lately been published abroad, it appears that the problem of taking sun pictures in natural colors has at length been solved. M. Becquerel, an eminent French chemist, has invented a process by which all the colors appear in all their beauty, and the green and yellow tints, which previously were obtained with difficulty, are now bright and clearly defined.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market is dull, but there is no disposition on the part of holders to submit to lower prices. There is little or no shipping demand and sales are confined to the wants of the home trade at \$5 25 a 5 50 per bbl. for superfine; extra family at \$6a 25, and fancy lots from \$6 50 to 6 75. Rye Flour and Corn Meal are quiet at \$4 25 for the former and 3 87½ for the latter.

GRAIN.—The market is poorly supplied with Wheat, and sales of 600 bushels good and prime red at \$1 27 a 1 30 per bushel, and small lots of White at 1 39 a 1 40. Rye commands 91a92c for Penna., 86 a 87 cents for Southern. Corn—Sales of 1200 a 1500 bushels

old yellow at 90 afloat, and new yellow at 68 a 75c., the former rate for damp. Oats are rather dull. Delaware sold at 41 a 41½ cts., and 44c. per bushel; for Pennsylvania.

CLOVERSEED is not so much inquired for. Sales at \$5 a 5 25 per 64 pounds. Timothy is worth \$2 50, and Flaxseed \$1 55 per bushel.

HEAVY BLEACHED SHIRTINGS made from AMERICAN COTTON, warranted in all respects the product of *Free Labor*. For sale by

ELI DILLIN,
No. 1218 Green st., opposite Ridge Avenue.
11 mo. 26, 1859.

WANTED—A situation as teacher, by Mary Emma Satterthwaite. Address
10 mo. 29—4 t. Denton, Caroline co., Md.

TWO YOUNG WOMEN, members of the Society of Friends, are desirous of situations as teachers in families where they would make themselves otherwise useful, or would engage as assistant teachers in established schools. Apply at the office of the *Intelligencer*.
10th mo. 29—2m.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The Winter Session of this institution will commence on the 14th of 11th mo. next, and continue twenty weeks.

Terms \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address

HENRY W. RIDGWAY,
Crosswicks P. O., Burlington Co., N. J.
9th mo. 24—3 m.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

GEO. A. NEWBOLD,
Purcellville, Loudon Co., Va.
8th mo. 6, 1859.—6m.

BUCKS COUNTY MALE AND FEMALE ACADEMY.—Boarders taken by the year at reduced rates. Autumn Quarter of 12 weeks, commences on the 8th of 8th mo. Winter Term of 18 weeks, on the 7th of 11th mo. Charges for board and English branches, Autumn Quarter, \$36. Winter Term, \$66. 75 cents deducted per week, for such as are absent from sixth day to second day, without washing. Bills payable, one-half in advance, and no deduction for lost time, less than a week at one time. Day scholars, English branches, from 50 cents to 70 cents per week.

Extra charges for each twelve weeks. Latin, Greek, French, Pencilling, and Pells work, each \$2.00; Water Colors, Monochromatic, Colored Crayons, Oriental, and Grecian Painting, each \$2.50; reading, Books only, furnished free of charge. Other books furnished if desired, and charged for, according to the care taken of them. SAMUEL BATCHELDER, A. M.

Attleboro', Bucks Co., 5th mo., 28, 1859. 6m.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, TWELFTH MONTH 3, 1859.

No. 38.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

A CHAPTER FROM JANNEY'S HISTORY OF FRIENDS.

(Continued from page 579.)

William Crouch was born the 5th of the Second month, 1628, at Penton, near Andover, in Hampshire. His father was a substantial yeoman of good repute, and his mother a religious woman. In 1646 he came to London, and bound himself as an apprentice in Cornhill, near which place he continued to reside after he attained to manhood.

In his account of his early life he writes, "God was pleased in His abundant grace and favor to place His witness near, even in my heart and conscience, so that when I was a child I was preserved from many evils incident to youth, and an awe continued with me as I grew up; and God did often visit me in mercy, and preserved and delivered me from many great temptations and evils; for which my soul gives thanks and praise to his excellent name, in the continued remembrance thereof." . . . "In the year 1656, I came to be in some measure convinced of the everlasting truth of God, revealed and made known to a despised people called Quakers; my mother and sisters having been before convinced in Gloucestershire, near to Bristol. For by a good hand of Providence I was brought to some meetings of the said people in London: concerning whom I had heard various reports, but when I heard for myself the testimony of truth declared, it was to my outward ear as 'a very lovely song.' (Ezek. xxxiii. 32.) But I felt not the power working in my heart until it pleased the Almighty to touch it therewith; who did hereby open my heart and set my sins in order before me. Then, oh then! I saw my woful state and condition, although I was in a profes-

sion and form of religion; and that salvation is only in and through Christ Jesus, the gift of God and light of the world, given of the Father for a Saviour unto the ends of the earth. Now I found him a God nigh at hand, a discoverer of the thoughts and intents of the heart, a judge standing at the door, a reprovcr in secret, before whom I was made to bow and bend. He in mercy showed me my state and condition, and through the manifestation of His light and truth in my heart and conscience, showed unto me the way to escape the many snares and temptations wherein I had been overtaken and captivated. Now did sin appear exceeding sinful, and the fire of God's jealousy was kindled in my soul, in the sense and feeling of which I travailed day and night, for months and years, and sometimes in the bitterness of my soul cried out, Hath God forsaken me? Is there no pardon or mercy for me? Hath God forgotten to be gracious? Hath His anger shut up His tender mercies?"

In the depth of distress he cried to the Lord and found deliverance; then under a lively sense of divine favor he was led to exclaim, "Righteous art Thou, O God! and thy judgments are true; search me thoroughly; try my heart, and if iniquity be found therein, let the fire of thy jealousy burn up, and consume everything that is contrary to thy holy will; let not thine eye pity nor thy hand spare, but in and through Christ Jesus, the only Mediator and Saviour, give me favor with thee, and life eternal, whatever it cost."

"I found," he says, "a necessity to continue my travel and get forward, for I saw that a distance is set between seed-time and harvest. The considerate husbandman doth not expect to reap so soon as the seed is sown, but he waits the appointed seasons, through many storms and tempests, until the blade appears, and 'then the ear, and after that the full corn in the ear,' according to the will of God. Even so the seed of the kingdom is sown in the good ground,—the honest and good heart,—which having heard the word keeps it, and bringeth forth fruit with patience. He that believeth shall not make haste."

As there were inwardly fiery trials, so the Lord permitted outward exercises to attend; such as imprisonments for not swearing, scoffs and revilings of men, loss of goods by distresses, for a good conscience towards God, for not paying to the hireling priesthood, and for meeting with

the people of God to worship Him." . . . "Through all the Lord supported me and bore up my head so that the storms and tempestuous floods of persecution prevailed not over me. God gave me power, strength and courage, to undergo with joy and gladness whatever He was pleased to permit and suffer to come upon me."

William Crouch is mentioned by one who knew him well, as a remarkable example of Christian meekness and fidelity. He did not rest in the beginnings of regeneration, where too many content themselves; but, through the assistance of the Holy Spirit, pressed forward and labored for a thorough sanctification of heart.

"Such was the heavenly frame of his mind, such the spiritual travail of his soul. He had a state of perfection in his view, and believing it attainable by the grace of God, he desisted not from the pursuit, till through the same grace, we hope, he was made a partaker of it.

"He was a humble, self-denying man, and owned no state above a watchful one; nor did he assume to himself the attainment spoken of, but continued in faith, humility, watchfulness and prayer, looking unto Jesus, that he who had begun the good work in him would confirm it unto the end; relying always upon the grace of God, and not upon any duties or performances of his own." . . . "Now as doing righteousness or doing good, according to the apostle, is a certain proof of being born of God, so is it vain for any man to conceit he is so born, in whom the fruits of righteousness are not. But where we see those fruits apparent, there we have good grounds to infer the person is born of God."

Gilbert Latey was born in the county of Cornwall, in the year 1626. In youth he was bound apprentice to a tailor, and served out his time, notwithstanding he had a very wicked and severe master.

In the year 1648, he came to the city of London, where he prospered in his business; "being employed and respected by persons of the first rank and quality in the kingdom." He was at that time exemplary in life and conversation, and earnestly engaged in seeking for religious knowledge. He followed those who were esteemed the most zealous among the clergy, often hearing four sermons a day, and being frequently engaged in private prayer. But he did not find that peace of mind and assurance of divine favor for which his soul was thirsting. In the year 1654, he was informed that some men from the north of England were to have a meeting at the house of Sarah Matthews, a widow who lived in Whitecross street; and repairing thither, he heard the gospel preached by Edward Burroughs so effectually, that he was convinced of the doctrines declared. Being directed to "the light of Christ in himself," and not consulting with flesh and blood, he gave up to the leadings of the Holy Spirit, resolving, with the Lord's assistance,

to take up his cross and despise the shame, accounting all things but as dross that he might win Christ.

It was not long before he found a great trial awaited him in the prosecution of his business; for, being engaged in making apparel for persons of rank and fashion, whose garments were usually adorned with lace and ribbons; he felt a conscientious scruple against administering to their sumptuous habits. He would neither make such garments himself, nor allow his journeymen to make them; which deprived him of his most profitable business, and led some of his neighbors to question his sanity.

Although he suffered a temporary loss, he was in the end amply compensated; being not only prosperous in his outward affairs, but abundantly blessed with the more enduring riches of Christ's kingdom.

He received a precious gift in the gospel ministry, and was eminently serviceable as a solicitor for the release of his imprisoned brethren and sisters, as will more fully appear in the course of this history.

One of the earliest sufferers among the Friends in London was Ann Downer, already mentioned as a minister of the gospel. She, for some expressions against the preacher who officiated at a house of worship in Stepney, was, in the year 1655, committed to the house of correction, and because she refused to work, was beaten with a rope's end. She was then a maiden about thirty years of age, and afterwards became the wife of George Whitehead. She was a woman of excellent endowments, very serviceable in religious society, a mother in the church—well qualified to exhort others, and exemplary in her Christian care over persons in sickness and poverty.

In the same year, George Baily, for speaking in a parish house of worship after the priest had ended his sermon and prayer, was sent to Newgate prison, where he lay three weeks till the sessions, when no accuser appearing against him, the court seemed willing to discharge him; but demanded an acknowledgment of his offence. He answered, that "he could not do so without hypocrisy, because his conscience did not accuse him of any offence." This innocent boldness they called obstinacy; and required sureties for his good behaviour, which he, not being willing to give, was sent to Bridewell, where he remained above ten weeks.

About the same time, and for the same cause, Ruth Hill, William Markfield, and William Robinson, were sent to the house of correction.

Francis Howgill, feeling a sympathy with Friends who were persecuted and imprisoned in several places, waited on Oliver Cromwell, and interceded with him to put a stop to it. There is no evidence that his object was attained, but his visit had a salutary effect upon some of the Protector's family, among whom Theophilus

Green was so much affected with his discourse, that he subsequently joined himself in membership with Friends.

EXTRACT OF PAUL'S SPEECH TO THE BISHOP OF CRETE.

BY HUGH TURFORD.

Paul, an apostle of Jesus Christ, writing to Titus, the first Bishop of Crete, had this saying:—"The grace of God that bringeth salvation hath appeared unto all men; teaching us that denying ungodliness and worldly lust, we should live soberly, righteously, and godly in this present world."

From which weighty sayings, the following questions arise:

First. What is the grace of God?

Answer. The grace of God that bringeth salvation is no less than a divine inspiration,—the gift of God to the sons and daughters of men,—an adversary to the devil, a destroyer of sin, and the only saviour of mankind therefrom.

The gift of grace under the gospel administration, is the fulfilling of the covenant which God, by the mouth of His prophet Jeremiah, promised to make with the house of Jacob; which was that he would write His law in their hearts, and put His spirit in their inward parts; that His people might have a rule of righteousness within themselves to guide their steps by.

As the princes of the earth rule and govern their people by an outward law, so the Lord resolved to rule and govern His people by an inward law. They should have no need to turn over the leaves of a book, as the children of Abraham under the first covenant had, to know how they should walk in right paths; but they should know by looking into their own hearts what was right and what was wrong,—what they might do and what they should leave undone; what was just and what was unjust; what was pleasing to God and what was not. For this law is a light that enlightens men's souls, as the sun in the firmament enlightens our houses, showing what is clean and what is unclean; what may remain and what is to be swept out.

For as God made man in the beginning humble, lowly, meek, merciful, pure, peaceable, just and faithful; so He would have all men to be. But forasmuch as nothing less than the good Spirit of God in the inward parts of man can bring us into such a state, God hath given to every man a measure thereof, to enlighten their understandings and to guide them in the path of life and salvation: and this measure being the free gift of God, is by the apostle in the text (and in many other places of Scripture) called grace.

Second question. Where doth the grace of God that bringeth salvation appear?

Answer. The great God, in His infinite wisdom and everlasting love, hath placed His royal seed and plant of renown in the hearts of the

sons and daughters of men; for that is the term used for the soul. There, the grace of God that bringeth salvation may be found: from thence (until it comes to be veiled by the clouds of iniquity) it shows itself a witness against all unrighteousness and ungodliness.

As every evil motion and temptation that leads to sin appears within; so the grace of God that is given to men to save from sin, appears also within.

There is not a man born into the world, if he has lived to commit sin, but hath felt and known in himself rebukes for sin; and these rebukes are the appearances of grace, and are called in Scripture, light, or the true light, because it manifests every work of darkness; and it shows us both when and wherein we have done amiss, and this it hath been and done in all ages.

God hath not in any age left Himself without a witness in the hearts of men, to declare His righteousness, truth and faithfulness. But there is as much difference between the appearance of grace, and the power of grace to salvation,—the light of righteousness, and that fulness which enables us to lead a life of righteousness,—as there is between a seed that is sown, and the herb or tree when it is come to full growth. But the one leads to the other: and it is he that attains to the fulness of grace that comes to lead a sober, righteous, godly life in this present world.

It was said of Jesus, the second Adam, that he "was full of grace;" and we may believe it from the fruits he brought forth in his life. He was humble, lowly, meek, patient, peaceable, just and faithful; he resisted the devil in all his temptations; he led a blameless life,—fulfilled all righteousness, and in the whole course of his life retained what the first Adam lost by transgression, namely, the image of God: and whosoever grows in grace until he attains to the stature of Christ so as to be filled therewith, may be called as Job was, "a perfect man."

As the appearances of grace are inward, so are its discoveries, revelations and teachings. Whosoever applies to man for a right knowledge of the things of God, goes to a wrong school; because, as Paul truly said, "that which may be known of God is manifest within."

The proud, the covetous, the envious, and other ungodly persons, may for a time have the appearance of grace,—they may also have the rebukes for sin; but if by such rebukes they do not learn righteousness, they grow not in grace, neither doth grace grow in them. All such hide their talent, and in time (for want of improvement,) come to have it quite taken from them; and thus being left graceless, they lead a wicked and ungodly life in the present world.

Third question. If the grace of God appears unto all, and if there is a sufficiency therein to make men godly, how comes it to pass that there are so many ungodly?

Answer. As the grace of God that bringeth salvation appears unto all men,—so motions of sin that lead to destruction arise in all men, and commonly make an early appearance. All men have evil motions and temptations in themselves, before they are sensible of any rebukes in themselves for sin, and our selfish reasonings make forbidden things appear to be desirable, and the world and its vanities to appear pleasant. As our will and affections come to be taken therewith, and we make the world our delight, and so pursue after it,—we depart from God. And though grace may often appear in us—though the good Spirit of God may long strive with us—though we may have in ourselves many checks and rebukes, by which we are made sensible that our ways and our doings displease God,—yet we persevere therein; and through a continued perseverance, sin grows stronger and comes to have the dominion over us; one ungodly person also acts as a bait to allure and catch another: and these are the causes why there are so many ungodly livers in the world.

The further any man goes from God and godliness, the less desire he hath to return; and the more we take delight in the vanities of the world, the less felicity we behold in the things of God. As men pursue this downward course, they at length become quite graceless; and many such graceless ones would be more apparent, were not wickedness somewhat limited by outward laws. Should these become, as Israel once was, without a king, or outward restraint,—or as the inhabitants of Laish, who had no magistrates in the land to put them to shame for anything,—though they might bear the Christian name, they would manifest the devil's nature by working all manner of wickedness.

It therefore highly concerns all who have the appearance of grace, to learn righteousness by its teachings, so that it may grow in them and become their only guide; for nothing but grace, and obedience thereunto unto righteousness, make any to differ from the worst of men in vile actions. As all righteousness proceeds from a fulness of grace, so the abounding of wickedness is by a departure from grace, and not being willing it should rule over and in us.

Fourth question. What manner of salvation doth the grace of God bring?

Answer. As the appearances of grace are in rebuke for sin, so the salvation that grace brings is a saving from sin.

If grace teaches men to live soberly, righteously, and godly in this present world, grace saves such men from sin in this present world.

Nothing defaces the image of God in man but sin; nor can anything recover that image again but our being saved from sin.

The mortification of sin brings men back, as it were, to their beginning: for the more humble, lowly, meek and merciful any man becomes, the

more he resembles his Maker. The more patient, peaceable, just, upright and faithful any man is, the more conformable he is to the life and nature of Christ.

Paul told the Ephesians that they were saved by grace. And what were they saved from, but from the power of sin? And where was this grace, but in their own hearts? Before they came (through turning from their iniquities) to have grace ruling in their hearts, they walked as many do now, according to the course of this world; not denying, but fulfilling the desires of their fleshly minds. And all such are now, as they then were, without Christ, without light, without life, and without the sense of feeling or anything in them that was of God; being aliens from the government of the Divine Spirit in their inward parts, and strangers from the promised covenant; not knowing or not observing the Divine law in their hearts to guide their steps by. But when they came to be quickened by Christ, and to be led by his Good Spirit, they were saved from sin,—they came to have new natures, and so to be new creatures. Then they were no longer strangers to the law of Christ's government in themselves, but became subjects to righteousness, citizens with saints, and of God's family.

To this blessed state we might all come, did we but embrace the gift of God for our salvation, and give ourselves up to be taught and guided thereby; and this would be our greatest wisdom; since nothing else can subdue and save from sin, as well as enable us to "live soberly, righteously and godly in this present world."

Saving from sin on this side the grave, may, to such as are strangers to God's salvation, seem an incredible thing. But were they as well acquainted with the power of grace as too many are with the strength of sin, they would say, Christ's yoke is easy.

Hath it not been the saying of many ungodly men, that they would amend their lives if they had but the power?

Where any heart, through a perseverance in sin, comes to be filled with unrighteousness, sin hath such power over the faculties of the soul, that such think they cannot resist evil motions and temptations; and so yield thereunto and suffer themselves to be led thereby, though they know it is to evil practices.

Now if sin hath such dominion over ungodly men, why may not grace have as much or more dominion over godly men? Surely Joseph had such power in his soul, when he said, "How can I do this evil and sin against God!"

Grace being a divine inspiration, influences the hearts of all good men; and the heart being thus endued, governs every member of the body, holding them all in subjection as with bit and bridle.

The ear of a gracious man is shut from heark-

ening to falsehoods and evil reports; his eye is withholden from gazing upon vanity and forbidden things; his tongue is not suffered to curse, swear, lie, or be employed in slanders and evil communications; his hand is kept from taking of bribes to prevent justice, and from taking by fraud or violence what is not his own; his feet are retained from going with the drunkard to excess, or with a lewd woman to the chamber of wantonness, or with rude persons to rioting, revelling, and every other evil thing.

It is by this dominion that grace comes to have over us, that the Lord saves his people from their sins; and as we live in subjection to the power of Divine grace, we are servants to another Prince, and sin has lost its dominion over us. This is God's salvation, and by this we come to live soberly, righteously and godly in this present world.

Fifth question. Whom did the apostle mean when he said "teaching us?" Was it the world in general, or only some particulars?

Answer. Christ was given as a light to the Gentiles; to which, as they became obedient, he was also their leader out of all ungodliness, and then they came to live under the government of the Eternal Spirit manifested in their own hearts. It is such as these only that the Lord owns as His people, and none but such can in truth call Him Lord.

Grace appears unto all men; every one that is born into the world hath a light in his soul that shows him the motions of sin, and rebukes him when and as often as he yields thereunto.

All righteousness is learned out of the book of the law written in our hearts; but that law being the law of the Spirit of Life, we must be quickened by Christ, and have the spirit of life before we can learn from that law.

Our ancestors made it their concern to teach youth good manners: as temperance, moderation, chastity, civil behaviour; to be dutiful to parents,—to show respect to their elders,—to be circumspect in their communication,—swift to hear, slow to speak,—to answer with meekness and gravity,—to be true to their trust,—faithful to their promises,—just in their dealings, keeping to their word in all things, so that their word might be taken in all cases without doubt or scruple;—and every one to know their proper place and abide therein.

Now as we turn from ungodliness to sobriety, we bring forth all these fruits in our lives; for grace teacheth all this and much more. But since we find so few thus qualified, we must conclude, that though grace appears unto all, all are not obedient thereunto.

(To be continued.)

Early piety presents a heart to God much unsoiled by the world; and like the morning fire it burns clear, being free from ashes.

ON WANDERING THOUGHTS AND DEJECTION.

1. Two things trouble you; one is, how you may avoid wandering thoughts; the other, how you may be sustained against dejection. As to the former, you will never cure them by set reflections; you must not expect to do the work of grace by the resources and activity of nature. Be simply content to yield your will to God without reservation; and whenever any state of suffering is brought before you, accept it as his will, in an absolute abandonment to his guidance.

Do not go out in search of these crucifixions, but when God permits them to reach you without your having sought them, they need never pass without your deriving profit from them.

Receive everything that God presents to your mind, notwithstanding the shrinking of nature, as a trial by which He would exercise and strengthen your faith. Never trouble yourself to inquire whether you will have strength to endure what is presented, if it should actually come upon you, for the moment of trial will have its appointed and sufficient grace; that of the present moment is to behold the afflictions presented tranquilly, and to feel willing to receive them whenever it should be the will of God to bestow them.

Go on cheerfully and confidently in this trust. If this state of the will should not change in consequence of a voluntary attachment to something out of the will of God, it will continue forever.

Your imagination will doubtless wander to a thousand matters of vanity; it will be subject to more or less agitation, according to your situation and the character of the objects presented to its regard. But what matter? The imagination, as St. Theresa declares, is the fool of the household; it is constantly busy in making some bustle or other, to distract the mind which cannot avoid beholding the images which it exhibits. The attention is inevitable, and is a true distraction, but, so long as it is involuntary, it does not separate us from God; nothing can do that but some distraction of the will.

You will never have wandering thoughts if you never will to have them, and may then say with truth that you have prayed without ceasing. Whenever you perceive that you have involuntarily strayed away, return without effort, and you will tranquilly find God again without any disturbance of soul. As long as you are aware of it, it is not wandering of the heart; when it is made manifest, look to God at once with fidelity, and you will find that this simple faithfulness to Him will be the occasion of blessing you with his more constant and more familiar indwelling.

A frequent and easy recollection is one of the fruits of this faithful readiness to leave all wanderings as soon as they are perceived; but it must not be supposed that it can be accomplish-

by our own labors. Such efforts would produce trouble, scrupulosity, and restlessness in all those matters in which you have most occasion to be free. You will be constantly dreading lest you should lose the presence of God, and continually endeavoring to recover it; you will surround yourself with the creations of your own imagination, and thus, the presence of God, which ought, by its sweetness and illumination, to assist us in everything which comes before us in his providence, will have the effect of keeping us always in a tumult, and render us incapable of performing the exterior duties of our condition.

Be never troubled, then, at the loss of the sensible presence of God; but, above all, beware of seeking to retain Him by a multitude of argumentative and reflective acts. Be satisfied during the day, and while about the details of your daily duties, with a general and interior view of God, so that if asked, at any moment, whither your heart is tending, you may answer with truth that it is toward God, though the attention of your mind may then be engrossed by something else. Be not troubled by the wanderings of your imagination which you cannot restrain; how often do we wander through the fear of wandering and the regret that we have done so! What would you say of a traveller who, instead of constantly advancing in his journey, should employ his time in anticipating the falls which he might suffer, or in weeping over the place where one had happened? On! on! you would say to him, on! without looking behind or stopping. We must proceed, as the Apostle bids us, that we may abound more and more. (1 *Thess.* iv. 1.) The abundance of the love of God will be of more service in correcting us than all our restlessness and selfish reflections.

This rule is simple enough; but nature, accustomed to the intricacies of reasoning and reflection, considers it as altogether too simple. We want to help ourselves, and to communicate more impulse to our progress; but it is the very excellency of the precept that it confines us to a state of naked faith, sustained by God alone in our absolute abandonment to Him, and leads us to the death of self by stifling all remains of it whatever. In this way we shall not be led to increase the external devotional practices of such as are exceedingly occupied, or are feeble in body, but shall be contented with turning them all into simple love; thus, we shall only act as constrained by love, and shall never be overburdened, for we shall only do what we love to do.

2. Dejection often arises from the fact that, in seeking God, we have not so found Him as to content us. The desire to *find* Him, is not the desire to *possess* Him: it is simply a selfish anxiety to be assured, for our own consolation, that we do possess Him. Poor Nature, depressed and discouraged, is impatient of the restraints of naked faith, where every support is withdrawn; it is grieved to be travelling, as it were, in the air,

where it cannot behold its own progress towards perfection. Its pride is irritated by the views of its defects, and this sentiment is mistaken for humility. It longs, from self-love to behold itself perfect; it is vexed that it is not so already; it is impatient, haughty, and out of temper with itself and every body else. Sad state! As though the work of God could be accomplished by our ill-humor! As though the peace of God could be attained by means of such interior restlessness!

Martha, Martha! why art thou troubled and anxious about many things? One thing is needful, to love Him and to sit attentively at his feet!

When we are truly abandoned to God, all things are accomplished without the performance of useless labor; we suffer ourselves to be guided in perfect trust; for the future, we will whatever God wills, and shut our eyes to everything else; for the present, we give ourselves up to the fulfilment of his designs.

Sufficient for every day is the good and the evil thereof. This daily doing of the will of God is the coming of his kingdom within us, and at the same time our daily bread. We should be faithless indeed, and guilty of heathen distrust, did we desire to penetrate the future, which God had hidden from us; leave it to Him: let Him make it short or long, bitter or sweet; let Him do with it even as it shall please Himself.

The most perfect preparation for this future, whatever it may be, is to die to every will of our own, and yield ourselves wholly up to his; we shall in this frame of mind be ready to receive all the grace suitable to whatever state it shall be the will of God to develop in and around us.

3. When we are thus prepared for every event, we begin to feel the Rock under our feet at the very bottom of the abyss; we are as quiet respecting the past as the future. We are ready to suppose every imaginable evil of ourselves, but we throw ourselves blindly into the arms of God, forgetting and losing everything else. This forgetfulness of self is the most perfect repentance, for conversion is nothing more than the renouncement of self and acceptance of God; it is the sacrifice of self-love; it would be a thousand times more agreeable to accuse and condemn ourselves, to torment body and mind, rather than to forget.

Such an abandonment is an annihilation of self-love, in which it no longer finds any nourishment. Then the heart begins to expand; we begin to feel lighter for having thrown off the burden of self, which we formerly carried; we are astounded to behold the simplicity and straightness of the way. We thought there was need of strife and constant exertion, but we now perceive that there is little to do; that it is sufficient to look to God with confidence, without reasoning either upon the past or the future, regarding Him as a loving Father, who leads us every moment by the hand. If some distraction

or other should hide Him for a moment, without stopping to look at it, we simply turn again to Him from whom we had departed. If we commit faults, we repent with a repentance wholly of love, and, returning to God, he makes us feel whatever we ought. Sin seems hideous, but we love the humiliation of which it is the cause, and for which God permitted it.

As the reflections of our pride upon our defects are bitter, disheartening and vexatious, so the return of the soul towards God is recollected, peaceful and sustained by confidence. You will find by experience how much more your progress will be aided by this simple, peaceful turning to God, than by all your chagrin and spite at the faults that exist in you. Only be faithful in turning quietly towards God alone, the moment you perceive what you have done; do not stop to argue with yourself; you can gain nothing from that quarter; when you accuse yourself of your misery, I see but you and yourself in consultation; poor wisdom that will issue from where God is not!

Whose hand is it that must pluck you out of the mire? Your own? Alas! you are buried deeper than thought, and cannot help yourself; and more, this very slough is nothing but self; the whole of your trouble consists in the inability to leave yourself, and do you expect to increase your chances by dwelling constantly upon your defects, and feeding your sensitiveness by a view of your folly? You will in this way only increase your difficulties, while the gentlest look towards God would calm your heart. It is his presence that causes us to go forth from self, and when He has accomplished that, we are in peace. But how are we to go forth? Simply by turning gently towards God, and gradually forming the habit of so doing, by a faithful persistence in it, whenever we perceive that we have wandered from Him.

As to that natural dejection which arises from a melancholic temperament, it belongs purely to the body, and is the province of the physician. It is true that it is constantly recurring, but let it not be voluntary, and, whenever God permits it, let it be borne in peace, as we receive from his hands a fever or any other bodily ailment.

The question is not, what is the state of our feelings, but what is the condition of our will. Let us will to have whatever we have, and not to have whatever we have not. We would not even be delivered from our sufferings, for it is God's place to apportion to us our crosses and our joys. In the midst of affliction we rejoice, as did the Apostle; but it is not joy of the feelings, but of the will. The wicked are wretched in the midst of their pleasures, because they are never content with their state; they are always desiring to remove some thorn, or to add some flower to their present condition. The faithful soul, on the other hand, has a will which is perfectly

free; it accepts, without questioning, whatever bitter blessings God develops, wills them, loves them, and embraces them; it would not be freed from them, if it could be accomplished by a simple wish; for such a wish would be an act originating in self, and contrary to its abandonment to Providence, and it is desirous that this abandonment should be absolutely perfect.

If there be anything capable of setting a soul in a large place, it is this absolute abandonment to God. It diffuses in the soul a peace which flows as a river, and a righteousness which is as the waves of the sea. (*Isaiah* xlviii. 18.) If there be anything that can render the soul calm, dissipate its scruples and dispel its fears, sweeten its sufferings by the anointing of love, impart strength to it in all its actions, and spread abroad the joy of the Holy Spirit in its countenance and words, it is this simple, free, and child-like repose in the arms of God.—*Fenelon*.

LOVING-KINDNESS.

This, says Webster, is a scriptural word. It is to us one of the best if not the very best words in the English language. There may be kindness without much love, but loving-kindness implies a tender regard; a kindness which is moved and influenced by love, heart-felt and sincere. The Christian journeys onward in his pilgrimage to the "better country," singing as he goes, of God's "loving-kindness;" dwelling on this theme on his dying couch, and looking forward and rejoicing to the bright day when he shall mingle with the spirits of just men made perfect, and pour forth the song of redeeming love with ecstasie heart.

HABITS OF A MAN OF BUSINESS.

A sacred regard to the principles of justice forms the basis of every transaction, and regulates the conduct of the upright man of business. He is strict in keeping his engagements; does nothing carelessly or in a hurry; employs nobody to do what he can do himself; keeps everything in its proper place; leaves nothing undone which ought to be done, and which circumstances permit him to do; keeps his designs and business from the view of others; is prompt and decisive with his customer, and does not overtrade for his capital; prefers short credits to long ones, and cash to credit transactions, at all times when they can be advantageously made, either in buying or selling, and small profits with little risk, to the chance of better gains with more hazard. He is clear and explicit in all his bargains; leaves nothing to the memory which can, and ought to be, committed to writing; keeps copies of all important letters which he sends away, and has every letter and invoice belonging to his business titled, classed and put away. He never suffers his desk to be confused by

many papers lying upon it; is always at the head of his business, well knowing, if he leaves it, it will leave him; holds it as a maxim that he whose credit is suspected is not safe to be trusted, and is constantly examining his book, and sees through all his affairs as far as care and attention enable him; balances regularly at stated times, and then makes out and transmits all his account current to his customers and constituents, both at home and abroad; avoids as much as possible, all sorts of accommodations in money matters and law suits where there is the least hazard; is economical in his expenditures, always living within his income; keeps a memorandum book, with his pencil in his pocket, in which he writes every little particular relative to appointments, addresses and petty cash matters; is cautious how he becomes security for any person, and is generous when urged by motives of humanity.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, TWELFTH MONTH 3, 1859.

PLEA FOR THE CHILDREN.—To every age and generation are attached peculiarities, which, though seldom approved, are almost universally followed at the time, and as generally denounced and ridiculed when succeeded by others which perhaps are no less inconsistent.

Among the fashions of the present day, none appear more foolish and unnatural than the custom of dressing little children. At an age when it is especially important that by moderate and daily exercise their limbs and muscles may become active and strong, they are dressed in a style which almost forbids healthy bodily development; and for gymnastic or other exercise promoting vigorous circulation, especial garments must be provided. Unless, from the influence and example of their older and sometimes injudicious friends, children seldom attach importance to dress; and when their fresh young spirits go out naturally and joyously to worthy objects, and there is such a world of beauty and knowledge to be unfolded to their minds, it is unwise, to say the least of it, not to direct them to more elevating pursuits.

The two chief objects in dress, utility and comfort, seem nearly ignored; and with the excuse of making them hardy, children are too frequently subjected to the variations of a changing climate, with portions of the person so insufficiently clad that it is a problem if their

constitutions can bear the test of such repeated exposures. After a chilling bath in cold water, their little figures are encircled in a frame-work which prevents the abundant skirts from affording an adequate protection; their feet are slightly clad in thin slippers, and thinner hose, between which, and the receding pants is often an unhealthy and unsightly disunion; while the arms and shoulders are uncovered, leaving the extremities, which are farthest from the seat of life and consequently need greater assistance in keeping up a healthy action, almost entirely unprotected. Who can doubt that any adult, daily subjected to such exposures, would not pay the penalty of imprudence in neuralgia, rheumatism and the other attendants upon a violation of the laws of health, and can we wonder that under the present system, so many children suffer from colds, croup and other ailments.

Another evil greatly to be deplored, is the early initiation of children into large and expensive parties, by which a taste is often formed for improper amusements, and a necessity for varied excitement, which, added to the concomitant late hours, must have an enervating effect both on the body and the mind.

Then again, the amount of time and labor bestowed on the making of children's garments, and the increasing expensiveness of their apparel, in some instances the cost of one outfit equalling that expended in the yearly wardrobe of a person practising wholesome economy, thus introducing the little creatures into luxury and extravagance, and habits which engender pride, and will most probably lead to sorrow and embarrassment.

While these evils are more particularly to be encountered in a city life, few, even in country places, are not harassed with difficulties in raising their children, which would very much diminish, were they willing to be and to appear in the simplicity. Are there not mothers, even in our Society, who sometimes shrink from taking their little flock to meeting, because they do not make an appearance similar to others of their acquaintance?

It requires considerable moral courage to act independently in such cases, but if parents who feel that they are following fashions sanctioned by custom, against their better judgment, would resolve to be governed as far as circumstances will permit,

by their individual convictions of propriety, what a salutary influence they might exert on the community around them. Children are simple in their tastes and pleasures, and the more inexpensive their enjoyments the less likely are they to weary of them. A gentle and controlling spirit may give almost any direction to their pursuits and inclinations, and, at least, during the earlier stages of life, a mother may keep them from these dangerous temptations.

TO CORRESPONDENTS.—We always regret not to insert in our paper an article furnished for publication, but the Friend who sent us the London Epistle, issued in 1823, will remember we have recently published several of a similar import.

MARRIED, On Fifth-day, the 17th ult., at the residence of the bride's parents, with the approbation of Makefield Monthly Meeting, MARK PALMER RICH, of Middletown, to HARRIET JONES, daughter of Amos Jones, of Upper Makefield, Bucks county, Pa.

—, According to the order of the Society of Friends, on Fourth-day, the 26th of 10th month, RICHARD P. HALLOWELL to ANNA C. DAVIS, daughter of Edward M. and Maria M. Davis.

—, According to the order of the Society of Friends, at Quakertown, Hunterdon county, N. J., on Fourth-day, the 26th of 10th month, THOMAS W. DELL, of Philadelphia, to JEANNETTE H., daughter of Lindley M. and Rachel H. Vail.

DIED, On First-day morning, the 13th of 11th mo., 1859, at the house of her son-in-law, Thomas Nixon, Washington Township, Washington County, Indiana, PRISCILLA CADWALADER, (formerly Priscilla Hunt,) aged seventy-three years.

In the death of this much beloved Friend and minister, the Society of Friends, particularly Blue River Monthly Meeting, has lost a valued member. She was endowed with talents, and highly gifted as a Gospel Minister, in which capacity she had travelled much, not to promulgate any sectarian views, but to preach the glad tidings of the Gospel of Jesus Christ, and to turn the people from the "power of Satan unto God." Her desire was, that all should seek and know the Lord for themselves, and not put their trust in the preacher, but in Him who will assuredly teach his people Himself, as man never taught. Many times she has been heard to say, "why is it so that we poor weak instruments are called to go and proclaim to the children of men the goodness, the wisdom, and the grace of the Most High God, when his grace hath appeared unto all men, for all the world of mankind to profit by. It is in the heart of man, that the 'Lord God of Israel' speaks to his people. Then why will they continue to follow the 'Lo here is Christ, or the Lo he is there.' That power can only be known by retiring inward, to the place where true prayer is wont to be made, and there wait in the stillness of all flesh, for the manifestations of Truth, which will enlighten each and every one who seeks the Lord with full purpose of heart, for He hath promised that 'they who seek me shall find me.'" She would often add,

"this is all I have to depend on, and this is all I have to invite others to, for it is only the spirit of Jesus Christ that can satisfy the desires of the spirit of man."

She attended Blue River Quarterly Meeting held at Honey Creek, in Vigo County, the latter part of the 8th month, (120 miles), left home again on the 21st of the 9th month for Richmond, to attend Indiana Yearly Meeting (a distance of 140 miles,) but was too unwell to attend all its sittings. She was present at the last meeting on Fifth-day, however, and her gospel service was satisfactory to many friends. She started the afternoon of that day for home, where she arrived on First-day afternoon, having stood the journey well for one of her age. This was the last time she was able to get out. Her close was,

Calm as a summer's setting sun,
And bright as is his parting ray
Her prospect of a future day.

Indiana, 11th mo., 1859,

B.

DIED, on the 21st of 1st month, 1859, in Saratoga, N. Y., THOMAS SHEPHERD, aged 82 years, 7 months and 21 days.

To commemorate the praiseworthy example of those who have passed from works to rewards, is a practice that long since obtained, and may be profitably continued as a means of encouragement to survivors "to go and do likewise," in other words, inducing a desire to emulate their virtues.

Our beloved friend, the subject of this brief memoir, was born in New Bedford, Massachusetts, and was the eldest of a family of several children. At the age of sixteen, he, with his parents, David and Sarah Shepherd, moved and settled in Saratoga, which was then comparatively a new country, where he remained until the close of his days.

Early in life he united in marriage with Mary Wright, who proved a worthy, kind and sympathizing companion, a union that was broken by death several years previous to his removal. As a husband and father he was kind and affectionate, and by his agreeable, social, yet unassuming manner, he gained, not only the respect and good-will of his neighbors, but of a large circle of acquaintance. It may be truthfully said, that in his dealings among men he was strictly upright, always acting in accordance with the profession he was making.

For more than sixty years he was a member and diligent attender of Saratoga Meeting, filling the important station of an Elder for forty years or more of the time, to the entire satisfaction of his friends, possessing as he did qualifications that fitted him for that capacity. In all the relations of life he was exemplary, filling up his sphere of usefulness with circumspect devotion.

His last illness, which lasted several weeks, was attended with great bodily suffering, with little intermission, which he bore with Christian resignation, often remarking "that he had but little longer to suffer, and hoped that his patience might endure to the end." A short time previous to his departure, he said to those around him, "No tongue can tell my sufferings." Soon after he quietly passed away.

In view of the upright and exemplary life of the departed, we doubt not the language of the apostle as being applicable, "Blessed are the dead that die in the Lord, henceforth; yea, saith the Spirit, that they may rest from their labors, and their works do follow them."

—, On the 9th of 11th mo., 1859, SUSAN TAYLOR, wife of Thomas R. Taylor, a member of Spruce Street Monthly Meeting.

—, Near Medford, on the 23d day of the 12th mo.,

1858, of typhoid fever, ALBERT H., son of Daniel and Sarah Ann Bates, members of Medford Monthly Meeting New Jersey, aged 10 years, 10 months and 22 days.

DIED, On 11th mo. 19th, 1859, at his residence, near Dublin, Indiana, MATTHEW SYMONS, in the 62d year of his age, a member of Milford Monthly and Bethel Preparative Meeting of Friends.

—, At Mercer, Mercer County, Pennsylvania, on the 9th instant, MARY P., wife of William F. Clark, and daughter of the late Joseph and Ann Pryor, of this city.

A life of practical usefulness in her neighborhood verified the truth of a testimony given forth during the funeral obsequies,—“*Of her character I need not say much; it is recorded in the hearts of the community.*”

—, On the 7th of 11th month, at the residence of her son, John Chadwick, Rensselaerville, Albany co., N. Y., MARTHA CHADWICK, in the 87th year of her age.

The deceased, through a long life, was a bright example of all the virtues that adorn her sex: a faithful and affectionate wife, a tender and loving mother, kind and gentle in her manner towards all, rendering her universally beloved. She was diligent in the attendance of meetings, even to the day preceding her death. She quietly passed away without sickness or pain.

—, On the 21st of 10th month, in the 73d year of his age, DR. DANIEL JANNEY, of Loudon co. Va.

During more than a year he was affected with an extremely painful disease, which he bore with Christian patience, and was favored at the close with serenity and peace.

—, On the 29th of 10th month, at his residence in West Davenport, Delaware co., N. Y., SOLOMON FERRO, aged 70 years. He loved religious meetings, and was a diligent attendant of them, herein setting a good example to survivors.

The Annual Meeting of the “Association of Friends for the Relief of the Suffering Poor,” will be held on Seventh day, (this evening,) the 3d inst, at 7½ o'clock, over Parrish's Drug Store, S. W. corner of Eighth and Arch streets, where all Friends are invited to attend.

For Friends' Intelligencer.

OUR QUARTERLY MEETINGS.

These meetings, which constitute in our religious and social order a striking feature, it seems to us, might often afford an interesting article for the Intelligencer; forming, as they do, so many centres of attraction, as well as radiation of good, within the compass of our Yearly Meeting.

The early fathers and mothers of our religious family were remarkable for their unselfishness; their religion was an every day religion, their worship an unceasing evidence of a firm dependence upon an all-protecting Power that had, as they were obedient to it, called them from mere worldly enjoyments to take part in high spiritual endeavors to improve and christianize the race. This every-day religion brought them often together, and they had frequently to verify the idea that the countenances of each other tended to inspire and urge them on to the fulfilment of

the great duties which devolved upon them. This desire frequently to meet together, led no doubt to the organized plan of meetings for special purposes connected with the high interests of the church, independent of the peculiar spiritual advantages which might arise from their thus coming together. Hence, Quarterly Meetings were established, adapted for certain districts of country, and generally of easy access, where the aggregated mind of that district might have an opportunity to develop itself in matters appertaining to right discipline, as well as to feel with, and for each other in their highest spiritual aims; affording also an opportunity for minds exercised in the ministry to spread truth fully before all, for encouragement and edification. It was at these meetings that the social feelings of friends were also largely increased, friendships were established or renewed, and the still and thoughtful spirit often found an opportunity to unbend in cheerful converse, thus imparting a halo over their religious and family meetings which brightened and sweetened their intercourse, and made them a cheerful loving brotherhood. That this beautiful idea may continue to be carried out among us, should be the aim of every Friend. We would therefore encourage all to their attendance and support of these meetings. In accordance with the original intention, the young should be called in for their aid, as it is to them we must look when many who are now laboring in their several vocations in the church, shall be called to their rest.

Our late Quarterly Meeting of Philadelphia was well attended, and afforded cause for encouragement, the labors of Friends in the meeting for worship giving evidence of a lively care for the spread of truth in its simplicity, calling to the original ground of an inward teaching. In the Meeting for Discipline views were presented which went to strengthen the idea of the rightfulness and beauty of our mode of public worship, and the importance of the maintenance of that unity by which we are known as brethren in Christ. The committee appointed at the last Quarter to confer with Radnor and Exeter Monthly Meetings, in relation to the holding of meetings for Divine worship on certain afternoons of First-days within their several districts, reported that those Meetings had agreed to the proposal; Friends of Radnor agreeing to appoint meetings on the third First day afternoon of every month, commencing the third First-day afternoon in the Third month next, at Haverford; in the Fourth month at Merion; in the Fifth month at Radnor; in the 6th month at the Valley, concluding at Schuylkill in the Seventh month, and so continue alternately. Exeter proposes to hold an afternoon meeting at Reading, on the first First-day in the Twelfth month next, and continue every three months at the same place; Third, Sixth, Ninth and Twelfth months.

It is desirable that Friends in the several neighborhoods where these meetings are held will feel that a labor of love devolves upon them in their attendance. Their countenance and interest will inspirit others, and we may hope that this effort may have a useful and encouraging effect.

For the Young.

SIMPLE PLEASURES.

The civilising, softening influence of art is acknowledged by all who have studied their fellow-man's moral and mental development, and the accumulation of objects of interest and beauty in a house tend to knit more closely the bonds of family affection, and change the four walls from a cold dwelling-place into a sacred and holy home. All the feelings which spring up in every true man's or woman's breast at the utterance of that word *home*, are feelings of association, and not of mere locality, and hence wherever we go, and at every stage of our lives, if the associations are pleasant ones, we look back with glowing emotion on the home of our childhood, and to the one we have ourselves created. Dryden beautifully says :—

"Home is the sacred refuge of our life."

And it should be our endeavor to decorate this place, of all others, with lovely objects, and nature's beauties or simple works of art. There are many that cannot afford to buy these decorations, who still have all the desire to possess them and the taste to appreciate; therefore, we will tell our readers how some very beautiful and interesting objects of art and nature may be made at little or no expense.

Green is a color that is ever suggestive of pleasure, and it is stimulating to the eye, and Nature's own tints may be obtained at any season of the year, combined with graceful vegetable forms, by either of the following ways :—Take a carrot, and having cut off the green, cut about the thickness of a cent off the top, let this float on a saucer of water in a warm room, and it will quickly begin to sprout, presenting an object of beauty not excelled by any artist, because it is the work of the law established by the Grand Artificer of the universe. Another beautiful decoration may be made from a pine cone. One should be procured that is dried and opened, and the different circles should have grass seed or mustard and cress sprinkled in them, and then placed in a wine-glass of water; in a few days the warmth and moisture will give the burr or cone life, and the circles will close upon the seed, which, in its turn, shortly germinates, and sprouting out all over the burr, makes a harmonious contrast of color between the lively green and ombre brown that has a truly pleasing and novel effect, actually refreshing all who look upon it. The growing acorn is a very pretty and inter-

esting object to study, and an ornament that teaches while it gives delight. It is thus prepared: Cut a circular piece of card to fit the top of a hyacinth-glass, so as to rest upon the ledge and exclude the air. Pierce a hole through the centre of the card, and pass through it a strong thread, having a small piece of wood tied to one end, which resting transversely on the card, prevents its being drawn through. To the other end of the thread attach an acorn; and having half filled the glass with water, suspend the acorn a short distance from the surface. The glass must be kept in a warm room: and in a few days the vapor from the water will hang from the acorn in a large drop. Shortly afterwards the acorn will burst, the root will protrude, and thrust itself into the water, and in a few days more the stem will shoot out at the other end, and, rising upwards, will press against the card, in which an orifice must be made to allow it to pass through. From this stem small leaves will soon be observed to sprout, and in a few weeks there will be a handsome, though dwarf, oak plant.

The forms of crystals are very educative, in an artistic sense, their cold and distinct outlines cultivating an acquaintance with geometric forms, and they are capable of combinations that produce a broad and rugged effect. Alum is a good substance to crystallise. A piece of wire may be taken and bent to form any object that fancy may dictate, and then placed in a hot saturated solution of alum, which as it cools will deposit crystals upon the wire, thus producing a crystal ornament of great beauty. These crystals are translucent, but may be colored to suit the fancy by the addition of coloring matter tumeric making them yellow; litmus red; logwood purple; and common writing ink black. A piece of coke may be made to assume the appearance of a new mineral by placing it in an alum solution, as the crystals will avoid the smooth portions, and deposit themselves only on the rough and broken parts. Sulphate of copper or blue vitriol may be substituted for alum, but this is a positive blue, and the color cannot be changed.

We think we have for the present given a sufficient number of hints how each home may be made cheaply into a place of ornament as well as necessity, and these little things scattered about the rooms of a house decorate and soften the asperities of papered walls and rigid furniture, adding a look of comfort and a feeling of repose that is the very concentration of true home life. As a people we neglect *taste* in the surroundings of our lives, which should be cultivated; and such little things as we have been describing are important aids, and help the man, the woman and the child to better appreciate the truth of that line of Keates'—

"A thing of beauty is a joy forever."

[Sci. Amer.]

HYMN OF TRUST.

O Love Divine, that stooped to share
 Our sharpest pang, our bitterest year,
 On Thee we cast each earthborn care,
 We smile at pain while Thou art near!

Though long the weary way we tread,
 And sorrows crown each lingering year,
 No path we shun, no darkness dread,
 Our hearts still whispering, Thou art near!

When drooping pleasure turns to grief,
 And trembling faith is changed to fear,
 The murmuring wind, the quivering leaf,
 Shall softly tell us, Thou art near!

On Thee we fling our burdening woe,
 O Love divine, forever dear,
 Content to suffer, while we know,
 Living and dying, Thou art near!

O. W. HOLMES.

JOY FILLS THE GOLDEN CUP.

Look up, my weary soul,
 A brighter day for thee is drawing nigh;
 For morning beams are flashing in the sky—
 Look up with faith, my soul!

Not always night shall keep
 Its heavy shadows round thine onward path;
 For morning comes, though long, to him who hath
 A soul that will not sleep.

Let me not slumber here!
 There is a toil which calls the valiant heart
 Forth to the strife in which the victor's part
 Is fraught with many a tear.

Not always doubt shall fill
 The earnest toiler with its spectral train,
 For, through the twilight, hope shall come again,
 And nerve his freedom will.

Look up with sterner gaze!
 The teacher tells me, from the depths within,
 That trial is the soul's true discipline,
 Invoking louder praise.

In all life's lessons learn
 That true men through their trials persevere,
 Winter but comes, with all its storms severe,
 To hasten spring's return.

Joy fills the golden cup!
 'Tis thine once more to quaff the nectar sweet,
 And new-born songs in grateful strains repeat—
 Look up, my soul! look up!

INFORMATION has reached us from India of a tree abundant in the forests of the Madras Presidency, which yields a milky juice similar in property to gutta-percha. The tree, which grows from eighty to a hundred feet high, is known as the Pauchontee: the juice becomes brittle when dry; but dissolved in turpentine or naphtha, it forms an insulating paste, which, under our new Indian regime, may become a source of profit. At present, these trees are cut down by thousands every year in clearing the ground for coffee-plantations. The same forests contain many oil-producing plants, which, as botanists show, would well repay cultivation.—*Chambers's Journal*.

AMERICANS IN PEKIN.

A correspondent of the *Journal of Commerce*, furnishes that paper with a graphic account of the reception of the United States minister at Pekin. We have selected some extracts from it which we think will interest our readers.

PEKIN, CHINA, Wednesday, Aug. 10, 1859.

My last communication left us at a government house, a sort of caravanserai, as I was told, for travellers and pilgrims, quite neat, though not large in size, or commanding in appearance, and the more agreeable from its being set back some distance from the road, and having a spacious court in front, all carpeted in living green. It is about two miles outside of the walls, which as yet had not risen before our eyes, so thick were the trees and groves between them and us on this great plain, extending from the gulf to the city, which nowhere has either elevation or depression. Here those dismounted who had been favored with horses, and others crawled out of their dens who had been caged in them; and all, having rested one hour and taken a cup of tea, which is uniformly offered instead of wine and other liquors, returned to their carriages, forgetting aches and bruises in the thought of the shortness of the distance which remained, and the wonders which were so soon to startle our vision. Onward we moved, every one solemn, silent, his heart beating quicker, till at last it fairly throbbed with the big emotion, when, there! there! rose the walls, and there the immense bastion towered over the gate, armed with tier above tier of cannon, and we had fairly reached Pekin!

Long before reaching the walls, however, we were surrounded by crowds whom no man could number. They did not come there; they seemed to have grown there; they did not move, they only stood—acres and acres, and field after field of human flesh and bones compacted into one solid body, out of which grew innumerable heads, arms, and shoulders. It added to the impressiveness of the scene, that not one wore a hat or cap; not one covered his back or shoulders with shirt or coat; not one wore a vest to protect his bosom. A single article constituted the whole of their dress and wardrobe—a piece of blue cotton made into an Oriental petticoat, and tied about the loins and reaching below the knee. All that met the eye, therefore, was naked flesh, glistening with the sweat which oiled it as the sun shot down his burning rays; while those thousands and thousands of piercing, prying, steady eyes, and up-turned faces, all without a smile, and solemn in their wonder, indicated that all was not a mass of flesh there; mind was there; humanity was there; our brothers were there—almost the population of a common city was seen outside of the walls; nor could any estimate of the number

f the population within amaze and stagger me, when I saw what there was around one gate in the suburb only, without. Not one shout was raised; not one voice was heard; not one foot or hand was moved. The last European Embassy was that of Lord Amherst in 1816—forty-three years ago, more than the period of a generation—and most of the living population of Peking had never seen a white man. We passed under two imposing portals, something like triumphal archways, about half a mile from the city, which, however, with the walls, the gates, the bastions, the towers, and other objects of interest within and without the city, must be the subject of another letter.

Passing through the Russian wall by the "Eastern Gate," Chaou-yeng-men, we entered the Tartar division of the city, and, moving along a street, compared with which Pennsylvania Avenue in Washington is a narrow lane, when we had gone a mile and a half, we turned at right angles to the right, when, proceeding a quarter or half a mile further, we reached the quarters which the Government had assigned for our residence. A wall runs along in front, excluding all sight of the houses from the street; or they were a *cluster* instead of one, and were owned and occupied a few years since by the Prime Minister, who lost them by confiscation or the crime of not defeating the rebels. Upon our reaching the house two principal officials were found awaiting our arrival, who were directed to make provision for our wants, and attend to our wishes, and who, upon retiring, left behind some inferior officers, who were permanently present. Dinner was served about sunset, in Chinese style of dishes and cookery; but after this, provisions were sent in of fine quality, and great variety and abundance, which were cooked in American style by the cooks we brought with us.

Mr. Ward did not send a communication to Kweiliang, the Prime Minister, on the day of his arrival, since this would not have been in accordance with Chinese etiquette; but the next day, Thursday, the 28th, he addressed to him a letter, or rather to the two Imperial Commissioners, Hwashana being the other, informing them of his arrival in Peking, and his desire to pay his respects to them at such time and place as they might designate.

Mr. Ward met the Commissioners at the place and time appointed, going on horseback with his three officers. After the usual civilities upon such occasions, Mr. Ward introduced the object of his mission, the exchange of the ratifications of the late treaty, and the delivery of the President's letter to the Emperor. But the Commissioners would discuss nothing but the proposed audience with the Emperor, which Mr. Ward did not request, aware of the embarrassments and even serious difficulties which the subject

might create, even by the discussion, and the utter impossibility of his submitting to the humiliations which an audience invariably requires. On the other hand, the Commissioners were solicitous that Mr. Ward should request an audience, which, as the third Commissioner told Mr. Williams, the Emperor himself was desirous of conferring, having evidently been favorably impressed by what he had learned of America and Americans, and wishing to see the first representative of that nation and that continent who had ever appeared in his capital. The Emperor, whose name is Hien-fung, is a young man, being only 29 years old, and in addition to naturally good powers of mind, devotes himself, as one of the ministers stated, earnestly to business every day, early and late, with them. Whatever exaggeration there may possibly be in this, enough remains to indicate even inquisitiveness of mind, and the dawning of new ideas, which, joined to the ardent temperament of a young man, may have prompted the expressed desire to see Mr. Ward. The Commissioners urged Mr. Ward to comply with the old and established usages upon presentation to the Emperor, insisting that as he had come to the capital, he must conform to the "rites," as they called them, or customs of the empire. The rite called the Ko-tow is performed whenever the highest native dignitaries approach the Emperor, and was performed by the Dutch and Portuguese ministers in repeated instances, and as the Chinese affirm, and circumstances lead every one to believe, by Lord Macartney, the English Ambassador in 1793. The late treaty with England provides that in future no English Ambassador to the Court of Peking shall be required to render any homage to the Emperor of China, beyond what he would be required to render to his own Sovereign. Unhappily, the late occurrence at the mouth of the Pei-ho have rendered that treaty a nullity, and its advantages could not be claimed under "the most favored nation" clause. What the ceremony called the Ko-tow is, and how degrading in the eyes of Western nations, will be best understood by a relation of the experience of the Russian Embassy in 1720.

Count Ismailof had been sent by Peter the Great with an imposing retinue to negotiate a treaty which should adjust all difficulties which had occurred in the frontiers of the two empires, and prevent their occurrence in future. Admitted to the city under the most imposing forms, three Commissioners were appointed, just as was the case now upon the entrance of the Minister from the United States, to conduct the negotiations, and now, as then, officers of the highest dignity and power. Count Ismailof informed the Imperial Commissioners that he had brought an autograph letter from the Czar to the Emperor, just as Mr. Ward had brought one from the President of the United States, which he was

required to present with his own hand. Beside this, the Czar had also sent a present to the Emperor, which he was required to deliver. While these preliminaries were under discussion in the Imperial Hall, dinner was sent in by the Emperor himself; before partaking of which, the Russian Ambassador was required to perform the Ko-tow before the table itself, as the representative of his Majesty, who had furnished from his own table the dinner which was laid upon it. This the Count peremptorily refused, when the matter was at length compromised by the consent of the Count to render a common act of obeisance before it. Then came a long struggle between the Emperor, the Commissioners, and the Count; the Count insisting on delivering the Czar's letter to the Emperor with his own hand into the hands of the Emperor, and still persisting with inflexible obstinacy in his determination not to perform the Ko-tow, maintaining that as his master was the equal of the Emperor, it was degrading to the Czar for his ambassador and representative to submit to such a ceremony. So anxious was the Emperor to secure the homage, that with his own hand he wrote letters to Count Ismailof urging his rendering it, though, to save his dignity, he required his Commissioners to send them as their own. Still the Count refused, and matters were assuming a threatening aspect, when the Emperor sent Mandarins directly from himself to the Count, who said that the Emperor considered the family of the Czar as his own, and his honor as his own, and that if he should ever send an ambassador to the Court of the Czar, he should be required to stand uncovered in the presence of the Czar, though this is considered most disgraceful to the Chinese, among whom condemned criminals are required to expose their heads bare; at the same time the chief Mandarin uncovered his head, taking off his cap and standing bare-headed before the Count, the representative of the Czar. This was decisive; the Count could not refuse to meet the Emperor upon equal terms, and at once promised to perform his part, and enact the Ko-tow, and place the letter upon a table, instead of into the hands of the Emperor, according to the "Chinese rites," a Mandarin then taking it from the table and presenting it to the Emperor.

The day appointed for the audience arrived. The Count and suite waited here at the vestibule of the Hall of Audience, where at length the Emperor entered, followed by his principal officers, and mounted a magnificent throne, ascending by steps on the left, as being the side of honor, while others ascended on the right. Three officers were seated on the right on cushions, while at a greater distance were officers standing. At the foot of the throne, on the floor of the Great Hall, sat upon cushions, in different rows, the first Mandarins, the lords of the imperial family, and many Mandarins of inferior rank.

Before the throne, at the entrance of the Hall, stood a table prepared with sweet meats for the use of the Emperor, while in the open vestibule, a few steps lower than the Great Hall, another table was set, beyond which Count Ismailof was standing, according to Court usage. The Count should have placed the Czar's letter upon this table; but the Emperor ordered it to be brought into the Audience Hall, and at the same time the Count advanced also, which was thought a great honor to him. The Count at once entered the Hall, immediately prostrating himself before the table, holding up the Czar's letter in both hands. The Emperor, who had showed the Count so much honor thus far, now determined to mortify him by making him remain some time in this disagreeable and offensive posture. The proud Russian became indignant, showed it by motions of his lips, and by turning his face aside, which, under the circumstances, could not be but highly offensive to the Emperor, as well as daring on the part of the Count. Upon this, the Emperor requested the Count to rise, and take the letter and bring it to himself. This the Count did, kneeling down at the Emperor's feet, who received it with his own hands, and thus gave the Count another mark of his regard.

After the presentation of the letter, the Count, attended by the master of ceremonies, returned to his former place in the vestibule, from which he soon removed to the centre of the hall, opposite to the throne on which the Emperor was seated, and back of which were his principal attendants and soldiers. When all were marshaled, at a signal given by the master of ceremonies, all fell upon their knees, and after the lapse of a few minutes, beat their heads three times upon the ground. After this, they rose to their feet, and then again fell upon their knees, and thrice knocked their heads upon the ground as before, when they rose again, and then repeated the kneeling and head-knocking the third time, thus kneeling three times, and knocking their heads nine times. The Count, having suffered no essential injury in his cranium, was then conducted to the Emperor, who graciously inquired what request he had to make. Such is the ceremony of the Ko-tow—literally head-knocking—which is still practised by all the Mandarins when they appear in the presence of the Emperor, and which is demanded of all foreign ambassadors, and was demanded of Mr. Ward.

(To be continued.)

COST OF WHEAT.

We have the following from George Pettye. He says: "I saw a statement in your paper that not one farmer in ten knew the cost of grain per bushel, therefore could not tell how much they must sell for in order to make a living profit. I will give you what it costs me to raise wheat;

and I think all may figure on the same rule, if they do a day's work in a day. It will vary, of course, in proportion to the bushels grown per acre.

In order to come to a plain plan, we must include as much ground in our estimates as can be cut in one day with a reaper, say—

Fifteen acres, valued at \$25 $\frac{1}{2}$ acre ; interest		
10 $\frac{1}{2}$ cent		\$37 50
Ploughing, \$1 $\frac{1}{2}$ acre		15 00
Seed, 1 $\frac{1}{2}$ bushels $\frac{1}{2}$ acre at \$1 $\frac{1}{2}$ bushel		22 50
Sowing one day		1 00
Harvesting, three days		5 00
Reaping at 75c $\frac{1}{2}$ acre		11 25
Seven hands to bind and shock at \$1 75 $\frac{1}{2}$ day,		
board included		12 25
Stacking		4 00
Threshing at 10c $\frac{1}{2}$ bushel—15 bushels per		
acre		22 50
Cleaning and drawing to market		9 00
		\$140 00

Here we have a fraction over 62c. per bushel. These figures cover board, wear, and interest on tools. I consider the straw worth as much to feed as would pay to draw the manure back on the land to keep it in good heart. This is the most paying part, if well attended to. Now, farmers, you must be your own judges as to how much over 62c. per bushel you must sell wheat, in order to pay debts. It will depend upon the size of the debt, and how much per cent. you are paying on it. As I am asked the question almost daily, 'Would you sell your wheat at present prices?' I will give my opinion. I have made up my mind there is not more than two-thirds as much wheat as was thought there would be. Every man hereabouts is disappointed, and we have letters from different points to the same effect. When our grain buyers recover from the bite they got before harvest, and find out how light the crop is, grain will bring a better price. It will not pay us to sell at 50c. per bushel. Better keep it two years and get \$1 than grow two crops at 50c. Those that can hold on until it pays cost and profit should do so. Wheat is of good quality and worth holding. If growing wheat does not pay, sow less; grow pigs and corn; seed down, or grow flax for the seed."—*Prairie Farmer*.

LABELS FOR TREES.

Take of verdigris and sal ammoniac each two drachms; lampblack one drachm; water four ounces. Mix well in a mortar adding the water gradually. Keep in a glass vial securely stopped. Write with the ink in a quill pen upon clean, bright zinc plates of any desired form. When dry, it may be exposed to the weather or buried in the ground for years without obliterating the writing. Shake the ink well before using. Another writer says, Write with a common lead pencil upon zinc, and it will remain indelible.

ITEMS OF NEWS.

SHIPWRECK.—We have intelligence from Sackville N. B. that the iron steamer Indian, from Liverpool, struck a sunken ledge near Maria Joseph, on 21st ult. She had 38 passengers a crew of 100 men, 800 tons of cargo and some specie, half an hour after striking she parted amidships. Twenty-seven persons have perished by this calamity, none of whose bodies have been recovered. None of the cabin passengers perished. The weather was hazy, and the Indian going at the rate of eight knots an hour when she struck on the ledge, which was so violent that she tore off her bottom and filled almost immediately. The captain, it appears, was deceived in the sounding, and supposed he was off Cape Sable.

Many of the passengers who were saved were robbed of all their baggage by the people on the shore, and left utterly destitute.

THE EASTERN MARKET, Corner of 5th and Merchant St. was formally opened on the 26th ult. A great crowd of purchasers were in attendance. The butchers and dealers appeared satisfied with their prices, and customers with their purchases. The sheds on Market street are completely dismantled. Their demolition is looked for before the end of the week.

SINGULAR INSTANCE OF LONGEVITY.—Among the passengers of the ship Tonawanda, which arrived at this port on the 26th ult. from Liverpool, was Anna McKenna, a native of Ireland, aged 99 years, with good teeth, sight, and hearing. The old lady was accompanied by her youngest son, aged 66 years. The parent and child are in excellent health.

EMIGRATION.—The government of Peru has entered into a contract with Dr. Edward Cullen for the introduction of twenty-five thousand Irish emigrants. The principal stipulations are that the emigrants shall renounce allegiance to their government, and must become Peruvian citizens. The government of Peru has to pay their sea passage, and every colonist is to have about nine English acres of land.

THE PROGRESS OF THE TELEGRAPH.—California papers announce that in 3d mo. next San Francisco will be within ten days' telegraphic communication with the Atlantic States. This will take place by the simultaneous completion at that time of the telegraphic lines between St. Louis and Forth Smith, on the Atlantic side, and San Francisco and Los Angeles on the Pacific side, thus cutting off three and a half days on each side, and with the mail facilities, reducing the time of communication between the Atlantic and Pacific cities to about ten days. It will not be long, therefore, before the telegraphic wires will close the intervening gap, and make the communication between the East and West instantaneous.

A REMARKABLE FACT.—Professor Mitchell, in his lectures on astronomy, related a very remarkable fact. He said that he had not long since met, in the city of St. Louis, a man of great scientific attainments, who for forty years had been engaged in Egypt in decyphering the hieroglyphics of the ancients. This gentleman had stated to him that he had lately unravelled the inscriptions upon the coffin of a mummy, now in the London Museum, and that by the aid of previous observations, he had discovered the key to all the astronomical knowledge of the Egyptians. The zodiac, with the exact positions of the planets, was delineated on the coffin, and the date to which they pointed was the autumnal equinox in the year 1722, before Christ, or nearly thirty-six hundred years ago. Professor Mitchell employed his assistants to ascertain the exact position of the heavenly bodies belonging to our solar system on the equinox of that year, (1722 B. C.), and sent him a correct diagram of them, without having

communicated his object in doing so. In compliance with this the calculations were made, and to his astonishment, on comparing the result with the statements of his scientific friend already referred to, it was found that, on the 7th of October, 1722, B. C., the moon and planets had occupied the exact position in the heavens marked upon the coffin in the London Museum.—*Public Ledger.*

THE ERUPTION OF VESUVIUS.—Vesuvius is still in a state of eruption, the lava having now reached a point three miles from the crater. The present mouth was opened eighteen months ago, by a violent earthquake, the cinders from which were carried as far as Constantinople—another proof of the great eastern current. The lava now issues from the base of the cone, passes down the valley below Piano delle Ginestre, and falls into the great ravine known as the Sasse-Grande, 250 feet deep by 1,000 feet broad, which is now completely filled. Below this it cuts across the carriage road in three places, destroys about twenty houses and some olive groves and vineyards, and is now near the Cemetery of Portice, whose inhabitants are full of apprehension. It is estimated that 28,000,000 cubic yards of lava have issued from the crater during this eruption. The temperature of the lava is 2,000 degrees Fahrenheit. The guides have provided themselves with molds in which they cast medallion heads of the King and Queen of Naples, Louis Napoleon, Queen Victoria, Victor Emanuel, and Czar Alexander.

AFRICA.—Dr. Livingstone finds himself unable to prosecute his African explorations without a more powerful steamer than the fragile one hitherto employed on the Zambesi, and has appealed to friends in England for assistance.

SLAVERY.—Late dates from the coast of Africa state that the American ship Memphis, with seven hundred slaves, had escaped all the cruisers and put to sea. Twenty-six vessels were expected on the coast for cargoes of slaves for the United States.

ARTESIAN WELLS.—The Artesian Well, at Columbus, Ohio, has reached a depth of over two thousand feet, with a prospect of again striking a sandstone stratum.

This well is now the deepest in the United States, and, with one exception, the deepest in the world. The following are the depths of the four principal holes in the ground:

Well at Columbus, O.,	2,328 feet.
Well at Louisville, Ky.,	2,096 feet.
Well at St. Louis, Mo.,	2,199 feet.
Well at Luxumberg, Germany,	2,336 feet.

An enormous iceberg was recently seen by Capt. Kirby, of the ship Uncowah off Cape Horn. The ice-field and bergs were estimated to be from eight to ten miles long, and very high—a solid mass of ice against which the sea broke as upon the ironbound shores of a continent. At four miles distance the water about the ship was agitated with eddies and ripples caused by the opposing presence of so large a body to the usual ocean currents. The sides along which the ship passed appeared to be precipitous up for more than a hundred feet from the water, when they broke up towards the peaks in the interior of the island, and down the steppes, the spyglass showed the existence of great gullies and water-courses. When the sun shone full upon the island it reflected the light with great brilliancy.—*The Press.*

Hong Hong letters of the 28th of 9th month say that the ratification of the American treaty had produced no change in Commercial matters, and, according to one authority, it would not go into operation until matters are settled with England and France. The Chinese forts at the mouth of the Peiho had been

strengthened, and the general bearing of the Chinese led to the belief that they contemplate resistance.

CHINA.—An official census has been taken twice in China during the present century. The last was taken in 1852, and gives the number of inhabitants at over five hundred and sixty millions, being an increase since 1812 of more than one hundred and seventy six millions, six hundred thousand in 40 years.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The only sales for shipment are 600 bbls. Pa. extra at \$5 62½ a 5 75 per bbl. Sales for home consumption at 5 25 a 5 37½ for common and select brands; 5 50 a 5 75 for extras; 5 87½ a 6 25 for extra family, and 6 25 a 6 50 for fancy. Rye Flour is worth 4 25. Corn Meal is quiet. We quote Pennsylvania at 3 75 a 3 87½ per barrel.

GRAIN.—Holders of Wheat have put up their prices to \$1 35 per bushel for prime red; 500 bushels sold at 1 38. Rye continues to sell at 93 cts. for Pa., and 90 cts. for Southern. There is a fair demand for Corn; sales of 1400 bus. of yellow at 92 cts. afloat and in store, and 3 a 4000 bus. prime dry new at 75 cts. and damp at 65 a 70 cts. Oats—Sales of 3000 bus. prime Delaware at 42 cts., and 800 bus. Pa. at 44 cts per bushel.

There is a fair amount of Cloverseed offering, most of it of inferior quality. Sales of 200 bus. good and prime at \$5 12½ a 5 25 per 64 lbs., and 450 bus. common at \$5 a 5 06½. 700 bus. Timothy sold to go out of the market at \$2 50 per bushel. Flaxseed is worth \$1 55 per bushel.

No. 324 South Fifth Street,

PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

EXTRACT FROM THE LIFE OF JOHN RICHARDSON.

Now the time came on for my leaving all my near and dear friends in these parts, and I embarked for the islands the 6th of the Ninth month, 1702, with my companion James Bates, on board of a sloop, Samuel Salter, master, for Barbadoes; and we put into Bermudas in our way. Soon after we landed, being on the 21st of the same month, we were sent for by Governor Bennett to come before him, and being near his door, a man came and clapped me on the shoulder, as we were walking on our way, and said roughly to us, You must go before the governor, and seemed to hasten us. I replied meekly, I am willing to go as fast as I can, but I have been very sea sick, and can go but weakly. The man fell from his roughness, bid us take time, and carried himself very civilly, and put us by a man who was keeping sentry at the governor's door with his musket on his arm. When we were come into a large room the man left us, and we waited a while. I began to reason in myself, What if the governor should be a rigid man, and severe to us, and either confine or punish us? But I said in my heart, Lord, thou that knowest all things, knowest that I have not only offered up my liberty, but life also, for thy name and Gospel's sake; and immediately all fear and reasonings about human power were taken away from me.

Being unwell, and weary with walking from the ship, I sat down to rest myself unbidden, when there came a friendly well-carriaged young woman, who I supposed to be a servant, and spoke kindly to us. I desired her to do as much for us as to give us something to drink, for we were very thirsty, and had been much out of health, and were not well recovered since we came from the

sea, having had rough weather. She brought us wine and water, and taking most of a glass of water, and a very little wine poured into it, I drank and was very well refreshed. By this time the governor called us into an upper room, and as I came near to the top of the stairs, going but faintly, for reasons before given, the governor put forth his hand and reached to take hold of mine, and like a tender father drew me up, and led me along towards a great window, and stood and looked on me and said, he believed he knew what I was, and my business too. I replied it might be so, and asked if he was the governor of that place: he said he was, and bowed his head. I then spoke to him in the love of God and said, Thy countenance bespeaks moderation, and the apostle said, "Let your moderation appear to all men, for the Lord is at hand:" and it was with me to say to him, The Lord of heaven and earth bless thee and all thine. He bade us sit down, and gave us each a glass of wine, and inquired from whence we came. I told him my home was in Old England, but it was long since I was there; my companion's was in Virginia. He wanting to know the affairs in Europe, I told him there was a merchant belonging to the same ship that we did, was lately come from Europe, and I thought was a man of parts and memory, and well versed in the affairs of those parts of the world, and when we came into this place he was with us. The governor sent for him, and when he came, he answered his expectation in resolving all or most of his questions, for the knowledge of the news appeared to me to be the young man's talent. Having dismissed him, he said he must now have some discourse with us; then rose up all the great men who were with the governor, to make way that I might come near him. I said if it was the governor's mind I had rather sit where I was, for I sat in the air, and that suited well with my present weakness. So he bade them all sit down, and they did so.

Now, said he, I want to know the reasons why you, as a people, do not assist the king and country with men and arms, for their and your own defence and safety, against all that may attempt your hurt. I replied, the most convincing reasons I have to offer to the governor are, we have neither precept nor example from Christ, or his apostles, to use the sword to hurt one another with. No, said he, what then means that saying of our Saviour, when he bade him that

had no sword, sell his cloak or coat and buy one? I replied, one of his disciples answered and said, Lord, here are two; Christ said, It is enough. Now how two swords can be enough to answer for a general precept, I leave the governor and all these men to judge. So after a little pause he said, In case you were assaulted by robbers that would break your house, and take what they could get from you, or upon the highway, and would take your purse or horse, what would you do in that case? I replied, I could not directly answer what I should do in such a case, because through the Lord's mercy I was never yet so assaulted; but it appears most likely, that I should endeavor to keep my house from being broken up, and yet withal be tender of men's lives; and as to the other assault, inasmuch as it is well known I do not provide any outward weapon for my defence, neither sword, pistol, nor any such like weapon; therefore I must rely upon the Lord for protection and help, who is able to rescue me out of the hands of all such ungodly men: or if he does not, I must endeavor to bear what the Lord suffers such to do to me. The governor said, You say well: for inasmuch as you have not provided any things for your defence, you have nothing to fly to but the Lord; you say very well; and said, he hoped what he had offered had not given any offence. I replied, it was so far from that, we were glad he was so free with us; yet if he pleased to dismiss us, we should be willing to be going, for night came on. He said, there were some of our friends would be glad to see us. I replied, I understood there were some on the island that did own us, but how much they were of us I could not tell, for I had not seen any of them. He asked, whether we had a mind to go by water or by land, for he had a boat, and a couple of hands should carry us where we would; or if we had a desire to ride, he had two horses, we might take them and keep them as long as we staid upon the island. I endeavored to persuade him to let us go without troubling himself any further, for I was sensible of his good will and love to us, and having his countenance, was more than we expected, and as much as we desired. He still urging to know after what manner we would choose to go, I told him, I was very sensible of his generosity to us who were strangers, and if he would be easy and let us pass, we had wherewithal to defray our necessary charges, either by water or land, as would answer best with our conveniency. He pressed upon us to accept of his offer, for he said he did not do it in compliment to us. Seeing no way but to accept of his generous offer, I said riding at present would be much more acceptable to me, considering how I had been lately fatigued at sea, of which I was not yet well. He immediately gave orders for the horses to be brought to the door, which being done, and we having notice thereof, I rose up and made an

offer to go, and the governor likewise rose up and came and took me by the hand, and we went down into the great room where we first entered in the Lord's dread and holy fear. I had resigned my life and all to the Lord who gave it, and my life at that time, as at many others, was not dear to me for Christ's sake; and being thus resigned, I felt the love of God, and a measure of that life was manifest, in which I had dominion over men, bonds, and over death, and the powers of darkness; blessed be the Lord for ever.

Coming to take horse, I looked out at the door, and saw two horses. The one next the door, which I supposed I was to ride on, had a saddle set about with three rows of shining silver lace, I thought about two inches broad on each; the governor holding me by the hand, and looking in my face, said, I am apt to think you are not used to ride upon such a saddle as this. I told him, if he could let me have one more like myself, plain, without much trouble, I should like it better, but if not, I could ride on it, I thought, without much straitness, in case of necessity. He answered, he could not, for horses and saddles were scarce on that island; one was that which he rode on, and the other was for his man; but he said he would tell me how to prevent all this. If, said he, you get over the inlet of water though he questioned it, because the wind blew very strong in the mouth or inlet of the river, and should come to Richard Stafford's an old judge of life and death, we might ask there for the cover of his saddle, which ties on with little straps at each corner and hides all this, and then it will be like yourself. But if the ferryman says he cannot carry the horses over, what man soever you meet, white or black, if capable, tell him he must bring me my horses, he dares do no other but bring them; and be sure you take no further thought for them: and if we met with any thing that troubled us, let him know and he would help it, if it lay in his power. So with his blessing on us, we took leave of him, and came to the water-side, but could not get the horses over, therefore we sent them back again, and intended to stay at the ferryhouse all night; but the boat was about going over as we alighted; and notice being got to the judge, that there were two strangers on the other side of the water, he sent a boat and a couple of men for us, who said we must go, for the judge said he could not sleep until we came. So we went, after asking if they at the ferry-house had been at any cost or trouble on our account in providing supper, for as yet we had not eaten anything since we landed; the people said no, they had not done any thing which we should pay for. It grew dark and very stormy, and the sea broke over the boat, so that some of us were forced to hold our coat laps one to touch another on the weather-side, to keep out the breakers, that they might not fill the boat.

We came safe over to the judge's house, and no sooner got into the passage but his friendly wife met us, and asked us if we were the strangers her husband had sent for? I said, we are strangers. She bid us follow her to the judge, and we did so. When we came to him he rose up, and took the candle in his hand and said, Are you the strangers I sent for? I said, who thou mayest expect I know not, but we are strangers. When he had looked well in my face, he sat down the candle, and said, What a mercy is this, that the Lord should send men from I know not where; in his love to visit me! and took me in his arms and kissed me; and I said to him, The Lord of heaven and earth bless thee; and we shed many tears and wept together.

As I entered the house, I felt the love of God, and his glory, I thought, shone in and filled every room as I passed through them, and I said, peace be to this place, and I felt it was so. He inquired of our travels, and from whence we came, of which we gave him a brief account; he also asked, if I knew any thing of the family of Staffords, at Lahorn, near Haverford-west, in South Wales. I told him all I knew about them, both of the dead and of the living; with which he was much pleased, and said he had not heard of them for many years, and that family were his near kindred.

I found his usual bed time drew near, and I made an offer to go away lest I should incommode him, yet he appeared unwilling to part with us; but considering his own ailments, and our early rising in the morning, he at length consented. Before we parted, his wife asked leave of him to go with us on the morrow to the meeting, to which he readily assented, if he was not worse of his distemper, and then ordered how we should ride, and which negro should go, not only to help his wife but us also, and take our horses when there was occasion, and do any thing he could for us; and indeed so he did, and appeared to me to run on foot without much trouble, being a lively young man.

I omitted before, that the judge asked if we had seen the governor, and if he was kind to us. I told him he was very friendly to us, and said if we met with any trouble that he could help us in, only let him know and he would right us. The judge said it was very well, and he was glad of it. I perceived the judge was rather a moderator of the governor, he being an ancient wise man, and had lived long as a judge upon the island, and understood, it is likely, more fully the state of things here than the governor, he being but a young man, although he appeared to be a wise man, and, as William Penn said, came of an ancient and honorable family in England which he knew very well, whose name was Bennett. Afterwards I told William Penn how it had fared with us on that island; and especially the kindness of the two chief men in power there,

and William Penn wept; and said, he had not heard any account of this nature, that he had been so much affected with, as he remembered; these many years.

We left the judge until the morning, and got some refreshment it being late; and I had been faint for several hours for want of eating; but the Lord's heavenly power bore me up over all, so that at times I felt no want of any thing. Oh! renowned over all be the name of the mighty God, now and for ever. We went to bed, and when morning came, I and my companion were stirring early, having eight miles to the meeting, and it being in the latter end of the Ninth month, we were willing to be in time that we might give some notice to the people. I was waking in our lodging room early, and the judge's wife came to the door and asked if she might speak with us; I said she might: then she came in and said she had a message from her husband to us. I queried what it was; she said he desired we would come and pray for him before we went away. I desired she would favor us so much as to lay before her husband something which I had to say, and she promised she would; Well then, tell the judge, that if he will suffer us to come into his room, and sit down and wait upon the Lord, as our manner is in such a case as this, if it please the Lord to move us by his Holy Spirit to pray, we may; but if not, let not the judge take it amiss, for we are willing to be at the Lord's disposing in all things. She went, and I believe, as she said, laid the matter before him, as I had delivered it to her; for she was a woman of a good understanding, and came back again to us in a very little time. I asked what the judge said; she replied, he said, let the men take their own way, and whether they pray for me or not, I believe they are men of God. So after some little respite, being brought to the judge's bed-side, we sat down and waited upon the Lord, who was pleased in his love, and by his mighty power to break in upon us, and also opened my mouth in his gift of grace and of supplication, in which gift ardent and fervent cries went up to the Lord of heaven and earth, that he would send health and salvation to the judge, and also to all his family, and to all people far and near, that all every where might repent, and come to the knowledge of the Truth and be saved. The judge wept aloud, and a mighty visitation it was to his family, and especially to himself and his tender wife. We left the judge in a fine frame of spirit, and no doubt near the kingdom, having his blessing and earnest request, that when we could reach his house we would not fail to come to it, for we were very welcome; and I found and felt it so, and it was mostly our lodgings. His wife and foot page went with us to all the meetings, except one, while we were on the island, which was about two weeks, in which time we had many good opportunities among a

soberly behaved people, amongst whom we met with no opposition, but had large quiet meetings.

When we were clear, as we thought, of the island, we went to take our solid leave of the governor, acknowledging his civility and generosity to us. I told him and the judge, that they would not want their reward for what they had done to us, and if such who should take their lives as in their hand, and come in the love of God to visit those remote parts of the world, which we durst not have undertaken if we had not believed it required of us by the Almighty, and our peace concerned in it, as also the glory of God, and the good of the children of men; these are the motives to those our great undertakings, or words to that purpose. So we parted in much love, with these great men, especially the judge, with tears on his face, as also his tender and friendly wife, who had been very serviceable to us in ordering meetings, and making way for us. There was none like her in all the island, that we met with, being given up to that service, for encouraging Truth and Friends in what she was capable of.

Being invited to a Friend's house to dine one day, when we were sat down at the table, the woman of the house desired that one of us would say grace; from which I took occasion to show her and several more in the company, who appeared not much more grown in the Truth than she, that since we had been a people, we had both believed, and accordingly practised, that true prayer was not performed without the help of the Holy Spirit of God, and no man could pray aright and acceptably without it; nor was it in man's power to have it when he pleased. Therefore it is man's place to wait upon the Lord for the pouring forth of this gifts upon him, and also to know whether it be required of him to pray so as to be heard by man, or only to pray secretly, so as to be heard of God, as did Hannah, and as many more have done; which, as they do aright, no doubt, but as Christ said to his disciples, their Father will hear them in secret, and reward them openly; or to this affect; with which they all appeared satisfied.

We then went on board our vessel, and set sail with a fair wind for Barbadoes; but soon after we got out to the mouth of that inlet where we arrived first, the wind came full against us, and we put in there again; and the master, although not called one of us, said, in a friendly manner, What is the matter now? This is because of you, Mr. Richardson, as he was pleased to call me; although I often showed my dislike to it, you have something to do yet upon the island. I said I know not of any thing; but he seemed positive, and said, if the wind came fair at midnight he would call, if I was willing, if not, he would stay as long as I pleased. I said I knew not of any thing to hinder, but he

might call as soon the wind came fair. So we parted, only telling him we intended to go for the judge's house. It was late in the evening when we got there, and the judge was gone to bed; but his wife was up, who lifted up her hands with more than ordinary surprise, and much joy, and said was always glad to see me, but never more than now: I said why so? She then began to tell, that since I went away, there had been a man with the judge, who had incensed him against me all that he could, and said he knew me in England, and that I was broken, and came into these parts to preach for a living. I asked what her husband said to all that? She said his answer to the man was, that he believed I was no such person, but an honest man; yet the accuser seemed very positive. I said it would be well if this man could be brought with me to the judge's face, that he might be convinced, not only of the man's ignorance of us a people, but of me in particular, and his envy against me be made known. I opened to her the nature of such journeys and services, how we proceeded, and how the meetings were constituted in which we did so proceed, and from whence we had certificates, viz: from Monthly and Quarterly Meetings, or meetings of ministers to which we belonged, and from Friends in the several provinces and islands where we travelled, if we desired them, many of which I could show the judge, if time would admit. She said, lest we should be called away in haste, she craved to see some of those certificates. I showed her them, beginning at the first, wherein Friends of Kelk, now Bridlington, Monthly Meeting in Yorkshire, to Friends in America, declared not only their full unity with my present journey, but also with my service for the Truth, and conversation in the same, where I had lived and travelled; and that I had settled my outward affairs to Friends' satisfaction, under many hands variously written.

When this great and wise woman saw this, she said it was enough: but I showed her other certificates from divers places, wherein Friends had signified sufficiently their unity and satisfaction with me. I likewise informed her, that in case any man, not approved by us as a minister, attempted to impose his preaching upon any who were strangers to him, such as knew him took care to acquaint the churches therewith, if his intentions could be known, that no impostor might do any hurt. All which she admired, and said she had never heard so much before, neither did she think there had been such excellent order amongst any people.

Having thus acquainted her with our order and discipline, and afterwards informed her of the cause of our unexpected return, I renewed my proposal of having my accuser before the judge. She told me she had good place with her husband, and would endeavor to obtain it; and accordingly, after talking with him, she let

me know, that the judge expressed his readiness to do me any service which lay in his power, and was of opinion my accuser durst not face either him or me in that affair. If the wind continued against us, he would try to find him out, and bring him, which might be of service; but if the wind favored, she thought I might be easy to go; as indeed I was, and the more so, considering that our captain, Salter, who lived near the judge on the same island, had showed a great deal of patience and good disposition to us, for about two weeks, yet would gladly be gone. About midnight we were called to go on board the ship, for the wind was fair, if we were ready. I replied, we come quickly: and so we did, and took leave of all we saw of the family, and remembered our dear love, with grateful acknowledgments, to the judge, for all his civility and kindnesses to us, with reasons why we could not see him, for he had been afflicted some time with the gout, and was now fallen into some rest, and we going away very early, were not at our own disposal.

I admired the Lord's good providence in all this, and there was something from the same watchful Providence, to order that to be put into my certificate which did so fully remove the slur this enemy would have fastened upon me, *i. e.* That I had broken in England, and could not pay my debts, and therefore had come into these remote parts of the world, where I was unknown, to preach for a livelihood. But it fully appeared, that I was known, and well beloved too, and had effects to discharge any just demand upon me, blessed be the worthy name of the Lord now and for ever.

As the shadow of the sun is largest when his beams are lowest, so we are always least when we make ourselves the greatest.

EXTRACT OF PAUL'S SPEECH TO THE BISHOP OF CRETE.

BY HUGH TURFORD.

(Continued from page 597.)

Sixth question. We must confess that we have known inward rebukes for sin; we have been checked, reprov'd and convicted in ourselves after we have done amiss; but we have not found anything in and of ourselves, when strong motions and temptations have arisen in our minds, to restrain us as with bit and bridle from doing amiss; and to deny ungodliness and worldly lusts in our own strength seems too hard for any mortal, especially when sin hath got the dominion over us: what can we do in such a case?

Answer. If man in his own strength could deliver his soul from under the power of sin,—return unto God, and lead a sober, righteous and godly life in this present world,—there would be no need of a Redeemer,—no occasion for a Sa-

viour,—no use of a quickening spirit to give life to our souls,—no necessity of God's writing His law in our hearts for a rule to guide our steps by,—no want of a light in our souls to show us the motions of sin. But man can no more deliver his soul from the power of sin, without the Lord's help, than Israel when in Egypt could go free from the servitude of Pharaoh without His help;—therefore grace appears unto all men for their aid.

And though the first appearance of grace may seem but small aid to set our souls free from the servitude of sin, and to conduct us in the way of life and salvation, till we come to the end of our race, so to live under Christ's government,—yet it is not smaller than Israel's aid was to bring them from under the servitude of Pharaoh, and conduct them to the promised land. For this purpose there were but two aged men, the younger of them being about eighty years old, having no weapon but a rod in one of their hands; and yet by this small means, God being with them, there were brought from under the power and servitude of Pharaoh, six hundred thousand men, besides women and children. And grace being a Divine inspiration, is aid enough to bring six hundred thousand millions from under the servitude and power of sin, if men would but confide therein, and give themselves up to be guided by it.

Inward rebukes, if attended to, beget a fear in men, as the shaking of the rod doth in children; and as "the fear of the Lord is the beginning of wisdom," so is it the beginning of a reformation of our lives.

If I am checked in myself for making a lie, and have regard to that which checked me, I shall be afraid of telling another. If I feel in myself rebukes for not keeping my promise, or for doing anything amiss, and have regard to such rebukes, I shall be afraid to do the like again, lest the next rebukes should be sharper. As this holy fear abides in us, we learn to deny ungodliness; and in denying ungodliness, we learn righteousness. But such as find in themselves rebukes for sin, and have no regard thereto, are like unto children that carry horn books at their sides, but learn nothing therein,—they are not scholars in the school of grace.

We read that "the reproofs of instruction are the way of life;" and there are many good men who can acknowledge that they had never come to a life of righteousness, had they not the reproofs of instruction in their own hearts; by attending to which they came to deny and turn from unrighteousness. For where rebukes for sin are received in love, the Lord doth not leave such souls, but follows them therewith, and enables them to forsake sin and subdue evil motions. The more we walk in the light of the Lord, the more we shall receive power from Him to overcome all sin.

But if one rebuke will not make us willing to part with a beloved sin, we shall have another; yea, trouble and terror. Paul knew terror before he found peace with God and peace in his own conscience; he was acquainted with judgment before he came to obtain victory. Nothing has power to break the bonds of captivity to sin, and to set us free from the law of sin and death, but the law of the Spirit of life in our own hearts.

The body of sin is not subdued as soon as we begin to turn from unrighteousness;—but when we come into the life of righteousness, we have grace in our hearts, and sin cannot stand before us.

And even if violent motions to sin should arise, we may stand still in the power of grace, and the Lord will fight for us. Thus, as our hearts become possessed of Divine grace, if the enemy should come in as a flood, the Spirit of the Lord being in us as our saviour from sin, will lift up a standard against him.

The Lord's controversy is not, as some vainly imagine, against the sinner, but against the sin. His appearances are all in love, in order to save the sinner; and his rebukes and judgments are to weaken the strength of sin. When man is once freed from sin, he is as willing to live a righteous life, as any ungodly man can be to lead a wicked life; and far more joy he hath, though the world cannot see it.

Seventh question. What may truly and properly be called a sober, righteous, godly life?

Answer. A sober life may in some measure be acquainted with; but a righteous, godly life is rarely considered.

Devotion, which is thought by many to consist in hearing sermons, reading good books, performing family duties, &c., hath for many ages been accounted godliness, and those who practice such things have been thought righteous men. And these things are not to be discommended, when they are done in sincerity; but they are not the true characteristics of righteousness and godliness.

These things were found among the Scribes and Pharisees; yet Jesus told his disciples, that except their righteousness exceeded the righteousness of the Scribes and Pharisees, they could in no wise enter the kingdom of God.

Many in the present day who are called Christians, will one day in seven be exercised in something that is called godliness, although they have not learned to deny ungodliness. But such as have not learned to deny ungodliness, are far from such a righteous, godly life, as the grace of God teaches all its followers to live in this world.

One way to know what is righteous and godly, is to consider what is unrighteous and ungodly; for the one is as opposite to the other as light is to darkness. Drunkenness, whoredom, theft, envy, hatred, bloodshed, swearing, cursing, lying, ex-

tortion, fraud, double-dealing, tale-bearing and whispering, which is the seed of strife; all these things are unrighteous; and pride above many evils is most ungodly.

These are not fruits proceeding from the good Spirit of God, but from the flesh or the evil spirit of this world; they are not the issues of life, but streams that flow from a corrupt source. These ungodly things come not from the teachings of Divine grace in the heart, but from the evil motions that arise in the mind. These render men sinners before the Lord; and as long as men live in the practice of any of them, they will not be accounted righteous in His sight. Those that have brought forth fruits of this kind, have, in all ages of the world, been testified against as unrighteous and ungodly livers. These are called infirmities, that millions of money have been given to pretended physicians to cure; but behold spiritual health hath not been by them restored. These are weeds that thousands have been hired to pluck up; but they have never made clean gardens, and never will by all the art they have; for Christ is the physician of souls, and none can take away the sins of the world but Christ alone.

Whosoever thinks to attain to a righteous, godly life, in any other way than by the teachings of Divine grace in his own heart, deceiveth his own soul. Men may lop or hinder the growth of many branches of iniquity that appear outwardly; but they cannot take away the root cause, which is within: and until the cause is removed, there can be no thorough cure.

As grace hath a spring, so iniquity hath a root; and the axe that smites at this root is in Christ's hands. What is the axe that is laid at the root of the corrupt trees, but the law of the Spirit of Life,—the law of righteousness manifested in our inward parts? This wrought a perfect cure in Paul; this made him a free man, a good man, a preacher. And that which cured Paul, and set him free from the power of sin, hath a sufficiency in it to set all men free from sin.

"Walk in the Spirit," said Paul, "and ye shall not fulfil the lusts of the flesh." That is the only remedy,—that is the soul-healing salve. And what is this walking in the Spirit but following the leadings of Divine grace in our own hearts. For grace, as it comes to have the rule over us, brings down all exalted thoughts,—abases pride,—shuts out covetousness,—gives no place unto wrath,—reduces us to, and preserves us in a cool, quiet frame of spirit; in which calm state we can bear and suffer. Grace will not allow us to do any unjust thing, nor to speak an ill word; much less to be drunk, steal, or any other abominable vice; for it is the promised "Spirit of Truth" that leads into all truth, and out of all error; and so brings salvation indeed.

No man can lead a righteous life until a right

spirit comes to have the whole possession of his heart; because from the good treasures of the heart proceeds all good living. A right spirit being in us, and this being a Divine guide, brings us to be heavenly-minded. And the righteousness that proceeds from a right spirit in our own hearts, is the righteousness of Christ; and not our own righteousness.

As murder, adultery, theft, and all other gross evils, proceed out of the heart while the evil spirit of this world has possession thereof; so good-will to all men, and all other virtues proceed out of the heart when the good Spirit of God comes to make its abode therein. But this abiding is not known till, by denying ungodliness and worldly lusts, the spirit of this world is denied, and the heart cleansed; then, and not till then, can we come to know "the Lord our righteousness."

He that is reduced to a qualification to feel good-will to all men, is of all men most godly: for as God in His unlimited love to mankind, "causeth His sun to shine on the evil and on the good, and His rain to descend on the just and on the unjust,"—so he that hath good will to all, will not wrong any, nor oppress any; neither will he show violence to any, nor speak evil of any; but will be ready to serve all men in love and faithfulness. This is the true character of a sober, righteous, godly man. Such are converted indeed, and are entered into that kingdom which consists in righteousness, peace and joy in the Holy Spirit.

As this reformation is effected wholly and alone by the grace of God, let me say with the prophet, "Ho every one that thirsteth, come ye to the waters and drink." Every one that hath a desire in his soul after righteousness, turn unto the grace of God in your own hearts. The water to which the prophet invited all thirsty souls, is no other than that which Christ giveth; and whosoever drinketh thereof thirsteth no more, but hath (as many can bear witness) a well in himself, not only issuing but flowing up to eternal life.

The grace of God is a free gift without money and without price. Nothing is required on man's part but to hearken thereunto, and take council therefrom. "Hear," said the prophet, "and your souls shall live."

Adam, by hearkening to evil motions, died unto righteousness, and so do all ungodly men; but he that hearkens to the voice of Divine grace, lives unto righteousness; and from the flowings of that spring which he hath in himself, he leads a sober, righteous, and godly life in this present world.

Hearing and reading, at the best, tend only to instruct us in what we ought to do, but godliness is doing what grace teaches; and all such doings are right and good.

(To be continued.)

THE SONG IN THE NIGHT.

Last spring, a mocking bird built her nest in a rose-tree, just below my window, and every night about twelve o'clock, sent forth the sweetest strains of music. Often have I lain wakeful upon my bed, or stood by the open window, with the soft moonlight falling around, and listened to the bird's clear notes. I know not how much influence was from the stillness of midnight and the solemn awe that steals over the soul at that impressive hour, but it seemed to me my ear had never heard so sweet a song as that of the mocking-bird.

There came a night, when "the clouds poured out water: the skies sent out a sound:—the voice of his thunder was in the heaven: the lightnings lightened the world," and I did not expect my bird's song,—when suddenly and sweetly it rose amid the storm! It cheered my heart and touched my very soul. The rain fell in torrents; loud thunder succeeded the vivid flashes; and the mighty wind blew,—but the bird ceased not her song, and as its silvery notes arose, I could but deem it a pleasant offering of praise and thanksgiving to God; a token of perfect trust in Him who over-rules.

Let the song in the night and the storm bring a lesson of submission, of trust and thankfulness to tried and tempted souls. Ye, who are tossed and not comforted, whose earthly lights are all gone out, and over whose head the tempest beats wildly, turn with heart and voice to God; forget not that He rules the storm and sends it for purposes you may not know, you could not understand now, but "ye shall know hereafter." The plumage of the little bird was wet and dripping with the rain and her nest-home was rudely shaken by the wind, but the tribute of song she still gave to God. So let it be with your afflicted souls. You praise the Lord when all is calm and pleasant, praise Him no less when the darkness thickens around you and the storm disturbs your peaceful home. The voice of His children is ever pleasant to the Father's ear; the song of the righteous is at all times His delight, but that song is especially sweet to Him, which arises when all seems adverse below and the storm of affliction rages.

David, the shepherd king of Israel, was a man of sorrow while he was also the recipient of peculiar blessings. Life was not all a calm to him; he bowed his head to many a severe tempest, and thick darkness often settled on his soul;—more than once his language is,—“my sore ran in the night, and ceased not: my soul refused to be comforted.” And in his great grief he says:—“O! that I had wings like a dove! for then would I fly away and be at rest; I would hasten my escape from the windy storm and tempest.” But David did not despair; he was mindful of God and His goodness;—“I call to remembrance *my song in the night,*” and in the

sweet trusting spirit of a child he adds: "Thy way is in the sea, and Thy path in the great waters, and Thy footsteps are not known." "My heart is fixed, O God, my heart is fixed: I will sing and give praise." Then, "praise ye the Lord," whether the sunlight of prosperity is smiling upon you or the storm of adversity is beating around you; "sing unto the Lord a new song," and let David's words be yours: I will sing unto the Lord as long as I live; I will sing praise to my God while I have my being."

Christian Observer.

THE BIRD IN THE STORM.

The rain was falling, the winds were calling,
The clouds swept over the sky,
When 'mid the alarm of darkness and storm
A shower of song swept by—
Says the little wee bird: 'Tis I!

' Ah! is it not dreary, and are you not weary,
Poor little wee bird? ' I said,
' How lonely and queer you must feel out here,
Just under the tempest dread—
Ah! birdie, you 'll soon be dead!'

' While the storm is ringing, is my time for singing,
Says the little wee bird to me;
' Though the clouds be dim, yet I warble my hymn;
And I die not, though cold it be;
For my name it is Hope,' says she.

So the song it is gushing, and seems as if hushing
The atmosphere tempest-stirred;
Softly and clear it falls on the ear,
Through clouds and through darkness heard—
The song of the sweet wee bird!

FRIENDS' INTELLIGENCER.

PHILADELPHIA, TWELFTH MONTH 10, 1859.

"A daily Scriptural Watchword and Gospel Promise."

This is the title of a neat little volume, which is now in press, and will soon be issued, compiled by J. Johnson. It embraces about 200 pages, and contains in addition to the "Watchword and Promise," a selection of several poetic effusions. It will no doubt furnish a suitable and acceptable offering for the New Year.

The book will be for sale by the Publishers, Hayes & Zell, No. 439 Market st., Philada.

A little work entitled "*Honey Blossoms for little Bees*" has been sent us with a request that it might be noticed, in order to give it publicity. It is neatly gotten up, and from a hasty perusal we should judge its moral and spirit to be unexceptionable as a book for children. The book is published by M. W. Dodd, No. 506 Broadway, New York, and it may be procured of H. H.

Henderson & Co., Booksellers and Publishers,
No. 528 Arch St., Philadelphia.

MARRIED, Near Camden, Jay county, Indiana, on the 3d of Eleventh month, by approbation of White Water Monthly Meeting of Friends, CALEB K. FARRINGTON, of Warren county, Iowa, to ELIZABETH JONES, of Jay county, Indiana.

DIED, At his residence near Flushing, on the 26th inst., WILLIAM L. TITUS, in the 65th year of his age.

So sudden has been the transition from an earthly to a Heavenly home of this our beloved friend, that we feel called upon to give a brief notice of his decease. He attended meeting on First-day, as usual, and the following evening after reading, as was his custom, he was about retiring for the night, when he was stricken with paralysis, and sank back in his chair entirely speechless,—although it was thought he could recognize his wife, yet mortal ear heard not again the sound of his voice, and almost before we were aware of his apparent danger, he gradually sank into the cold embrace of death—but if the countenance is an index of the mind, his gave evidence that *all was peace within.*

We can testify to his worth in all the relations of life—both as a man and a christian.

In a neighborhood of Friends, sadly thinned of latter years, his demise cannot but be felt with sorrow by the community at large, but the conviction is sealed upon our minds that, although suddenly called from a sphere of active service—he has been gathered as a shock of corn "fully ripe" to the fold of eternal rest.

He filled the station of Overseer in the Meeting, being one of its most useful and exemplary members.

Remarkably affectionate in his disposition, aided by genuine politeness of character, he had endeared himself to a large circle in a quiet, unobtrusive way.

The following Third-day morning his remains were taken to the meeting house, where a large concourse had assembled to witness the last solemn act of committing the "*frail tabernacle*" to its final resting place.

A solemn and impressive testimony was held forth in the belief that although the messenger of death came, as it were, in the twinkling of an eye, yet it was felt that his work had been done in the daytime, and for him was now prepared a mansion eternal in the Heavens that fadeth not away. E.

—, On the morning of the 24th inst., at his residence in Moorestown, N. J., ASA ROBERTS, a worthy member of Chester Monthly Meeting, in the 65th year of his age.

This beloved Friend endured the sufferings of a short but severe illness with Christian patience and resignation, evincing by his serene countenance and tender affection, a preparation for his change. He passed away like one falling into a sweet sleep, and no doubt, entered into a state of unchanging felicity. He was buried on the 26th inst., from Friends' meeting house. A very large concourse of people assembled to pay the last tribute of respect to a dear friend and relative.

A Stated Meeting of the Committee of Management of the Library Association of Friends of Philadelphia will be held in the Library Room, on Fourth-day evening next, the 14th inst., at half past 7 o'clock.

12th mo. 10th, 1859. JACOB M. ELLIS, Clerk.

Remember the power of indirect influence—that which distills from a life, not from a sudden effort. The former never fail; the latter often.

SELECTIONS FROM THE LIFE AND EXPERIENCE
OF THOMAS BULMAN.

Thomas Bulman was the son of a yeoman in Cumberland. This class of persons is still numerous in that county; many of them are to be found cultivating their own little estates, and living in much simplicity and comfort, especially if walking in the fear of God. Thomas Bulman himself was also a man of this class; but though thus circumstanced, he had not the advantage of a school education. By attention to the teaching of divine grace, he became learned in the school of Christ; and by his own personal diligence he overcame, in some measure, the defects of his education, and acquired the art of writing, so as to be able to note down his religious exercises, and to communicate them by letter. He seems to have thought of leaving upon record a more regular account of the dealings of the Most High with him than is to be found among his papers; but an attempt is here made, in conformity with the object which he had in view, to supply what is wanting, by extracts from a diary which he kept for some time, and from his correspondence.

Thomas Bulman's own record is as follows: "It hath, for some time past, impressed my mind, to leave upon record some of the dealings of God, with me; and perhaps when I am no more in mutability, some poor Zionward traveller may find a little comfort in reading them.

I was born of honest parents, at Irthington, in the county of Cumberland, on the 14th of 4th month, 1747, and was brought up in all the performances of that way of worship called the Church of England, till I attained the age of 29 years. During that time I often felt the good Spirit of the Lord striving with me, and at times so powerfully, that I could have wished I had been as the beasts that perish without accountability; but I was sensible there was an immortal part in me that must exist for ever: and alas! I was unfit to meet a holy God.

Before I could be prevailed upon to take up the cross, and to become a scorn and derision to my former companions in mirth and idleness, how often did I rebel against the Pure Witness for God in my mind! I remember one evening, being loath to be called religious, I gave way to my associates, and went with them into such riotous and vile wickedness, that after I lay down to sleep, I felt as it were the very flames of hell flash within my guilty breast. This time of judgment I trust I shall not soon forget. I was not, however, forsaken, but was mercifully enabled to feel again and again the strivings of that good Spirit, till at last a willingness was wrought in me to take up the cross, and to despise the shame. Once more being thrown amongst my former companions, and seeing in them the same disposition to vanity and idleness, I felt that this was not the way to work out the

soul's salvation; so I withdrew and took a solitary walk in the fields; and I think I shall never forget the evening of that day, when the rain sweetly dropped upon the tender grass, to the refreshing of it; but not sweeter was it to the grass, than was the refreshing dew of heaven to my soul. Then did my soul taste of the heavenly manna; then did I make a covenant with my God, that I would no more bring the vain things of this fading world into the balance with the heavenly blessings which I had that night experienced.

I now forsook all my former connections, and joined in fellowship with the people called Methodists. Whilst with them, I felt at times, many divine consolations to my soul; and yet I saw a more pure and holy worship, and also a further cross to be taken up, before I should find enduring peace."

Whilst Thomas Bulman was in religious profession with the Methodists, he adopted the practice of noting down the daily breathings of his soul. In these there is evinced much of a true hunger and thirst after righteousness. The following extracts from the diary prove that he was no stranger to that warfare in which "the flesh lusteth against the Spirit, and the Spirit against the flesh;" they show also that the longing of his soul was, that he might be enabled to walk in the Spirit, and that the Lord condescended to answer his fervent prayers.

19th. Thanks be to thee, O my God, for preserving me day by day, granting me thy blessing, and continuing to preserve me when almost overcome with temporal matter. Why should I complain when thou art all-sufficient, and willing to help in every needful time?

Jan. 23d, 1776. Merciful art thou, O God, to such an unworthy creature as I am; thou dost still visit me with thy loving tenderness, and preservest me through many dangers. O that I could love all mankind as myself; that I could show pity and kindness to all, even to enemies, as thou hast had pity on me, and hast loved me while an enemy to thee.

28th. Thanks be unto thee, O my God, for turning my face Zionward, and for giving me a desire to seek thee, and to glorify thy name; but oh, I am far short of that holiness which thou requirest, and of that purity which is without spot or wrinkle, or any such thing. May thy love purify my body and soul.

Feb. 7th. O God, how sweet is the least glimpse of thy pure love, to a seeking, burdened soul! It is like the drops of rain to the thirsty ground. May I not only truly seek thee, but earnestly contend for that true faith, once delivered to the saints.

8th. O for the peace of God that passeth all understanding, and that is able to keep my heart and mind stayed upon him at all times, and in all places, and under every exercise that may be-

fall me. In prosperity may I not be lifted up, nor in adversity be cast down; and still whatever befalls me in this life, may I give unto God thanksgiving and praise, and still earnestly crave that he may cast out of my heart every thing that is contrary to his holy will.

11th. I must still entreat thee to carry on thy work in my soul, O God. Let not the world get any place in my heart, to cause thee to withdraw thyself from me, and to leave me comfortless. O grant that the light of thy countenance may shine upon my soul, and destroy all the works of the wicked one.

March 18th. Glory be unto thee, my God, for giving me peace in some measure this day; but O never let me fall into a false peace, or be at peace with my soul's enemies; but do thou enable me to trample them under my feet, till they are all destroyed.

29th. Oh that I could use this world in its proper place, and let it have no share in my heart, nor ever let my affections rest upon it, but still fly to thee, the fountain of all happiness, for my guard and safety.

30th. From what spirit came this exercise, but from thy Holy Spirit; why should I reason upon it, and not rather diligently watch over my words, thoughts and actions, daily and hourly, that I may be enabled to glorify the Giver of every good and perfect gift.

18th May. In all the circumstances of life, and in every part of my duty, may I still keep my eye fixed upon thee, O God! and give to this world my hands, but to thee my heart.

20th. How often have I cried, O Lord, when will it be, when will the happy hour come, when I shall have found my all in thee? Now I experience this in a small degree; but when shall I be satisfied with thy love? When shall I come before thy face and see thee as I am seen, and know thee as I am known.

28th June. Last night, Lord, thou didst keep me in a measure of peace. To-day the sense of thy love is not lost, but a little sullied by worldly cares. O that I may be more and more delivered from the love of this world, and bear the cross patiently; for this is thy will concerning me!

29th. Glory to the Lord! his goodness hath been multiplied unto me. Not unto me, but unto him, be all the praise.

30th. Going to the market in a composed mind, enjoyed my golden moments. O for more deadness to this world, that I may bear its temptations and its frowns with patience!

1st July. This day, kept in a measure of peace, but not filled with the love of my God as yesterday. O thou who hast quickened and raised me again to a measure of my former experience! thou knowest that love to thee is the brightest of all the train of virtues, and quickens all the rest. How swiftly it makes my feet to

run in the way of thy commandments; and how heavily do I go when deprived of thy love!

4th. When thou hast withdrawn a little from me, thou fairest of ten thousands, and to me altogether lovely, and hast left me to mourn thy absence, O preserve me from making unto myself any idols, and enable me patiently to wait for thy return!

5th. Draw me, O Lord, with the cords of thy love: then will I run after thee. What enemy can prevail against me when thou dost uphold me; or what evil, when thou art present? Be pleased to cleanse me from all sin.

7th. Sweet is thy love, O thou Most High! O that it may be more and more shed abroad in my heart, until it hath purified me from all sin, that I may glorify thee according to thy own good pleasure.

9th. Idols, idols, idols! O thou God of purity! how long will it be ere I give up my whole body, soul and spirit unto thee! O that I were so truly wise as to give up all for thee. Every idol fails in time of need, and leads into captivity again; but thou, Lord, endurest for ever!

11th. Stir me up, O Lord, to wrestle for thy blessing—to an earnest hunger and thirst after purity of heart—freedom from all sin; that I may glorify thee with a pure love; without any mixture of self, any sin, or any root of bitterness. Why should I go lamenting all my days?

17th. If I trust in my own strength in the least, how soon do I suffer loss! When in company, I have need to be continually on my guard, and to set myself like a flint against the smiles of the world. O Lord give me more and more deadness to this world, till there be nothing left in me to savour its smiles, or be cast down with its frowns.

21st. I will through thy assistance, love thee, although thou smitest me: O that I could be more and more thankful for crosses—that I could praise thee in every circumstance of life—that I could retain thy love in adversity and in prosperity, and neither be lifted up nor cast down: but thou knowest my failings.

23d. How long will it be ere all my complainings end? Shall I still cry, my leanness, my barrenness! when will all my dross be spent, and when shall I become fully dedicated unto thee, and enabled to praise thy name?

25th. O that I could return thee the thousandth part of that praise which is due unto thee for all thy goodness! Oh what need have I of thy assistance daily, hourly, every moment! Give me grace still to press forward to that holiness, without which I shall never see thy face to my comfort.

29th. Preserve me, O Lord, through all the various trials which thou mayst permit or apportion me. Thou canst, through thy grace, make me pure, so that my ways may please thee. Increase my desires still to press on through this

scene of conflict, so that I may not fall a prey to the enemy of my soul.

(To be continued.)

THE ADVANTAGES OF POVERTY.

Of course by this we do not mean penury and absolute want are beneficial, but that to be so far relatively poor as to feel that one's circumstances do not come up to one's wants and expectations and desires, while it has its obvious disadvantages, is also highly useful and advantageous to most men in several respects. As to *happiness*, for instance. Take two young men of equal health and education, one notoriously rich and the other not worth a cent, and the poor man will, in more than half the number of instances, be the most cheerful and happy man of the two. He will have fewer indulgences and excesses to react upon his system, fewer sources of anxiety and dread, fewer unemployed hours to let the mind turn in broodingly upon itself. He is compelled to be at work regularly, lives carefully, sleeps soundly, and is happy. There is many a young man who begins life cheerful and happy, but who increases regularly in riches and in size, in the comforts of home and the luxuries and refinements of an advancing position, and yet, as he does this, will confess that he is not so happy now, rolling in wealth, as twenty years ago when worth nothing but a clear head, a brisk pair of hands, and the conviction that the world was before him.

As to the prospect even of becoming wealthy, the poor man at starting is, on the whole, we believe, better off than the young man who receives an inheritance to begin with. Facts show this. True, money grows and paves the way finely to success. "The gift of the wise man maketh room for him." But the ways of getting rid of money also grow, and much faster in every young man who has more money in his purse than he knows what to do with. We have known young men not spending more than two hundred dollars a year, yet moving always in the best society, and we have known young men to get through nearer twenty thousand without being really respectable or half so happy. Habits of frugality, forethought and patient calculation as to where the means were to come from for anything wanted, are the necessary foundations of enduring wealth. Without these, no matter how rich a man may be to-day, either he or his children will get through it all in a very short time. So far from a capital to begin with being necessary to operate upon, the want of capital often teaches the poor man superior financial wisdom and economy.

As to fame, few rich men, at the beginning of life, ever win it in any pursuit that requires labor or peril. It is the children tugging at the lawyer's gown that makes him an eloquent pleader at the bar. In fact, strong necessities and press-

ing wants do more to elicit genius and develop greatness than can well be described. A man rolling in wealth and luxury has too many enticements to ease to climb the rugged path of lofty achievement. As to care there is no comparison. The poor man has nothing to lose, while the rich live in perpetual dread. The abundance of the rich will not suffer them to sleep. They are not so sure that their friends are true and disinterested. It has often been said that prosperity makes friends and adversity tries them. But the real fact is exactly the other way. It is adversity that makes *real* friends and prosperity that tries them.

And now, as to the next generation. Are the children of wealthy or of poor parents (those parents being of equal intelligence and character) most likely to prosper? The strongest, healthiest, finest men, grow up from boys who *have* to do all they can for a living. It is possible, no doubt, for the children of the wealthy to be thus brought up. Yet not one child in a hundred is; most of them are pampered and puny, without the same bodily vigor, and, therefore, without the same mental strength and fortitude which those of a more hardy training exhibit. The habit of self-reliance is the foundation of all independence of character, and this is closely connected with every virtue. Yet none are so self-reliant as the poor.

So far, then, the chief advantage of wealth is the means it affords of superior mental cultivation, superior books and *apparatus* of learning of all kinds. This is the chief advantage of it. Where wealth is only regarded as *capital*, the principal of which is only to make the possessor more wise and powerful for good—there it is a blessing and one of the greatest of blessings. But directly any man *feels* wealthy—that is, that he has more money than he knows how and needs to use, as capital for higher good and more extended usefulness—then his money becomes an injury to him and not a blessing. Many, with a little assistance, surmount the evils of poverty in obtaining an education, and everything else—few that of too much wealth. In one State at least, even a University education is without charge. Many work their way through, and those who do, almost always make the best scholars. Indeed, some of those now among the highest literary men in the land, have worked their way through college from the carpenter's bench or by personal labors. Facts like these should remove the discontent of those whose lives are spent in visions of what they *would* accomplish had they only the pecuniary advantages of others around them.—*Ledger*.

A religious or holy life has a voice; it speaks when the tongue is silent; and is either a strong attraction, or perpetual reproof to those around us.

For Friends' Intelligencer.

Review of the weather, &c. for ELEVENTH month.

	1858.	1859.
Rain during some portions of the 24 hours,	6 days	4 days.
Rain all or nearly all day,	4 "	1 "
Snow,	4 "	0 "
Cloudy without storms,	10 "	8 "
Ordinarily clear,	6 "	17 "
	30	30

TEMPERATURES, RAIN, DEATHS, &c.

Mean temperature of the month at Penna. Hospital,	42 deg.	47 50 deg.
Highest do. during month do.	65 "	67 "
Lowest do. do do do.	25 "	28 "
RAIN during the month,	5.61 in.	3.82 in.
DEATHS, during month, count- ing four current weeks for each year,	624	664
DEATHS (omitted in last month's review) in New York for the three months ending Tenth month 31,		6606
Do. in Philadelphia during the same period,		2272
The average of the mean tempera- tures of this month for the past 70 years is	43 deg.	
Highest do. during that entire period, 1849,	50.50 "	
Lowest do. do. do. 1793, 1827, 1842,	38 "	

FALL TEMPERATURES.

Mean temperature of the three fall months of 1858,	55.93 deg.
Mean temperature of the three fall months of 1859,	55.47 "
Average of fall temperature for past seventy years,	54.43 "
Highest fall do. during that period, 1850	58.16 "
Lowest do. do. do. 1827	49.33 "

It will be seen by the above that the temperature of the month under review exceeds that of last year five and a half degrees; the average for the past seventy years four and a half degrees, and is only three degrees lower than the highest on record during that entire period.

It may also be observed that the fall temperatures of the present year, of last year, and for the past seventy years, vary but little from each other.

The entire month, with the exception of a very few days, might have been called an "*Indian Summer*," so remarkably pleasant was the weather—and the writer thinks there can be no mistake as to *when* this fickle and uncertain season made its appearance the *present year*, notwithstanding the difference of opinion so generally existing as to whether its *proper time* is in the *Tenth* or *Eleventh* month.

Philadelphia, Twelfth mo., 1859.

NATURAL CURIOSITIES FROM AFRICA.

An intrepid hunter of this city, Mr. Paul du Chaillu, has recently returned from Africa, where he has been hunting all sorts of monsters for four years back. He brought with him the skins

of his victims. among which, the first that have been seen in this country, are several splendid specimens of that newly-discovered race of Troglodytes known as Gorillas. These creature are exaggerated monkeys, and combine the cunning and nimbleness of the Siniian tribe with the muscular power of at least three prize-fighters. One of Dr. Chaillu's full sized males would probably whip Sayers, Heenan, and Morrissey all together. The larger specimens are about 5 feet 5 inches high, and 25 inches around the chest, with a neck like a bull's, and arms as thick as a man's thighs. They eat fruit, but are furnished with very long and sharp mandibles, like a squirrel's or woodchuck's, and probably could tear flesh as easily as a tiger. The general appearance of the Gorilla is that of a libellous caricature on mankind, and some skeletons of the species, exhibited in the same collection, would be easily mistaken, on casual inspection, for the framework of deformed human beings.

LOSS AND GAIN.

Thou hast done well to kneel and say:
Since He who gave can take away
And bid me suffer—I obey.

And also well to tell thy heart
That good lies in the bitterest part,
And thou wilt profit by her smart.

But bitter hours come to all;
When even truths like these will pall,
Sick hearts for humbler comfort call.

Then I would have thee strive to see
That good and evil come to thee
As one of a great family.

And as material life is planned,
That even the loneliest one must stand,
Dependent on his brother's hand;

So links more subtle and more fine
Bind every other soul to thine,
In one great brotherhood divine.

Nor with thy share of work be vext;
Though incomplete, and even perplex,
It fits exactly to the next.

What seems so dark to thy dim sight
May be a shadow, seen aright,
Making some brightness doubly bright.

The flash that struck thy tree—no more
To shelter thee—lets Heaven's blue floor
Shine where it never shone before.

Thy life, that has been dropped aside
Into Time's stream, may stir the tide
In rippled circles spreading wide.

The cry wrung from thy spirit's pain
May echo on some far-off plain,
And guide a wanderer home again.

Fail—yet rejoice. Because no less
The failure that makes thy distress
May teach another full success.

It may be that in some great need
Thy life's poor fragments are decreed
To help build up a lofty deed.

Thy heart might throb in vast content,
Thus knowing that it was but meant
As chord in one great instrument;

That even the discord in thy soul
May make completer music roll
From out the great harmonious whole.

It may be, that when all is light,
Deep set within that deep delight
Will be to know *why* all was right;

To hear life's perfect music rise,
And, while it floods the happy skies,
Thy feeble voice to recognize.

Then strive more gladly to fulfil
Thy little part. This darkness still
Is light to every loving will.

And trust—as if already plain
How just thy share of loss and pain
Is for another fuller gain.

I dare not limit time nor place
Touched by thy life; nor dare I trace
Its far vibrations into space.

ONE only knows. Yet if the fret
Of thy weak heart, in weak regret,
Needs a more tender comfort yet,

Then thou may'st take thy loneliest fears,
The bitterest drops of all thy tears,
The dreariest hours of all thy years,

And, through thy anguish there outspread,
May ask that God's great love would shed
Blessing on one beloved head.

And thus thy soul shall learn to draw
Sweetness from out that loving law
That sees no failure and no flaw,

Where all is good. And life is good,
Were the one lesson understood
Of its most sacred brotherhood.

—*English Woman's Journal*. ADELAIDE A. PROCTOR.

AMERICANS IN PEKIN.

(Continued from page 606.)

It will not surprise our countrymen, that our Minister refused peremptorily and persistently from the beginning, to perform a ceremony so degrading to himself and to them. He expressed the determination in the most respectful terms, not reproaching the Chinese for their Court customs, or rites, as they call them, but lamenting there was such a difference between American ideas and rites that compliance was impossible, since it would offend his Government and his country, and disgrace him in the estimation of both. He would be most happy to render to the Emperor all the marks of high respect which he would to the President of the United States, but no more. Though the discussion was a good deal animated, no bad feeling was exhibited, and the debate closed by appointing the 2d day of August to return the visit of Mr. Ward, when they would resume the consideration of the subject. They sat down to a magnificent dinner,

prepared with all the gastronomic science and art which the Soyers at work in the Imperial kitchen could command. I have not space to name the various dishes—birds' nests, sharks' fins, heifers' teats, watermelon seeds, &c., the whole amounting to no less than 30 courses, and including dishes, apart from those not agreeable to American taste and fancy, which the gentlemen upon their return declared were hardly equalled by anything within their experience or knowledge. The gentlemen of the suite, who have resided for many years in China, said they had never known anything equal in sumptuousness, delicacy and richness, and even one of the Commissioners, when the dinner was complimented, said nothing better could be got up for the Emperor himself. Though only the three Chinese Commissioners and Mr. Ward, his Secretary, and two interpreters, were present and sat down to it, the supply was enough for at least a hundred, and the expense was estimated at \$1,500.

Thursday, Aug. 2, the three Commissioners returned Mr. Ward's call, attended by a great retinue of Mandarins of different grades, who had a long conference with him in the Reception Hall, where the only subject discussed was his performance of the Ko-tow, against which he was as persistent as before.

The same night he received a letter from the Commissioners, stating that as he had then been for many days in the capital, and after repeated interviews had obstinately adhered to his decision in regard to the ceremonies, or Ko-tow, no audience could be had with the Emperor; and they were at a loss to know, therefore, for what reason he had come to the Capital. Mr. Ward replied that he had come there to exchange the ratifications of the treaty, and present the President's letter to the Emperor; but as the forms of the Court rendered it impossible to do this in person to the Emperor, he proposed to deliver the letter to the Prime Minister, and that he was ready to exchange the ratifications any day which might be designated previous to 11th. On the 6th, the Commissioners replied that as Mr. Ward declined an audience with the Emperor, both according to the old "rites" and the lowered terms, they should refuse receiving the President's letter, and the exchanging of the ratifications in Peking, referring the place to be eventually designated to the Emperor. On the 8th, the Deputy Commissioner called again to say that if Mr. Ward would write a letter, stating that if he should fail to treat the Emperor with all the respect and honor he would show the President, the President would be offended by his conduct, the Emperor would order his seal to be affixed to the treaty, which had not yet been done, it seemed. Mr. Ward replied that he had no objection to this, and wrote accordingly. The deputy then said, if Mr. Ward would request the appointment of an officer to receive

the President's letter, one would be designated, and if, moreover, he would express the wish to have the ratifications exchanged at some place in the north of China, it would be granted. He declined doing either, as both points were matters belonging to the pleasure and decision of the Emperor. On the 9th a more conciliatory letter was received from the Commissioners, appointing the 10th for the reception of the President's letter, and the Buddhist monastery as the place, where the first interview was held and the town of Pei-tang where we commenced our journey, as the place for the exchange of the ratifications.

On the 10th Mr. Ward, with his Secretary and interpreters, proceeded to the temple, where again he met the three Commissioners, and delivered the President's letter in the following Oriental style: All the party stood, no business or discussion being allowed till this august ceremony was performed. First Mr. Ward's Secretary took the letter and handed it to him, who raised it above his eyes, signifying that he was inferior to the President; and then passing it over the *left* shoulder, in sign of honor, according to Chinese ideas, handed it to Kweiliang, the Prime Minister, who in turn raised it above *his* eyes, and passed it over *his* left shoulder, handing it to a high Mandarin, who placed it reverently with both his hands upon the table in the centre of the room, around which a guard was at once placed to protect and honor it. Such are Chinese customs and rites. Thus, everything being satisfactorily concluded, and perfect good feeling preserved, the Commissioners and Mr. Ward, with his party sat down with a better relish to the rich tables, spread as at the first visit; when, returning to their quarters by the middle of the afternoon, all preparations were made for our departure to-morrow morning.

It was said by some of the Chinese officials that the Emperor was intent on giving Mr. Ward an audience, and anxious to see him, and would in some way have managed to gratify his wishes, but for the persistent opposition of princes of the royal family. His own mind is evidently more enlightened and liberalized than those of most of the nobility, though the two Commissioners, and especially the Prime Minister Kweiliang, exhibited talent worthy of the respect of even European statesmen. Mr. Ward compared Kweiliang to Gen. Cass, and Hwashana to the late Secretary Clayton.

In the morning we leave this grand capital of three millions of population, as the Chinese officials assure us, which has had such a historic renown, and whose future is so uncertain, in whose center a handful of your unarmed neighbors found themselves, as if by magic power, and where they spent a fortnight in a sort of dreamy, unknowing, doubting, wondering existence, but full of gratification and never to be forgotten—

a privilege for which many would give a fortune, but which cost us nothing but the wear and tear of flesh, and the aches and torture of bone and sinew. What I saw in it, and learned about it, I must defer to another opportunity. A little incident occurred while we were in the capital, whose interest it is impossible for you to appreciate. We left Shanghae June 16th, when our American dates were down to April 11th. Not one word since had been heard from the United States; not one word from Europe, though the papers received from England at Shanghae, just as we left, had intimations of a possible outbreak between France and Austria. In this state of utter ignorance we remained to August 10th, the day before our departure from Peking, when the Russian Minister kindly sent Mr. Ward some twenty numbers of the *London Times*, which he had received overland, via St. Petersburg and the Amoor, coming down to May 20th, and announcing the startling events in Europe. Thus here, in Peking, we read American items, and first learned the happy result of the Paraguay expedition.

When we reach Pei-tang, on our return journey, where the ratifications are to be exchanged, I will give you the finale of the first American mission to Peking.

THE RETURN JOURNEY—THE CEREMONY OF EXCHANGING THE RATIFICATIONS—CHINESE IMPRESSION OF AMERICA AND AMERICANS.

Tuesday, Aug. 16th, 1859.

Leaving Peking as proposed on the morning of Thursday, the 11th, we reached Tung-Chow the first day without much of the suffering endured when we went up, as most of our party were furnished with horses. Three days' tracking, with the aid of the current, brought us through the immense forests of vegetation on the banks of the Pei-ho, and the innumerable towns and villages on each bank, to Pei-tang, where we arrived Sunday afternoon, near evening, and spending the night there in our junks, we left early on Monday morning, and resuming our carriages, reached this place about noon to-day.

On reaching this town, everything was found in readiness for putting the last hand to the treaty. Mr. Ward and his suite were conducted at once to the yamun, or Official Hall, a very respectable structure, and tastefully fitted up for the occasion. A regiment of cavalry lined the street on which the yamun is situated, and soldiers and officers were drawn up at the gate, and lined each side of the passage from the street gate to the yamun, situated some twenty rods back. Some were armed with short swords, others with rusty matchlocks, and others still with bows and arrows! I counted seven arrows in one quiver. The gates and interior of the yamun, were ornamented with strips of red cloth, and also with perpendicular strips of red paper, covered with gilt Chinese

characters, all containing sentiments of respect and good wishes. Three tables were also arranged, one at each end, and one at the centre of the back side of the yamun, all loaded with the choicest delicacies of the Chinese culinary art. Another table was set in front, on which the ratifications, were laid, and around which Mr. Ward and the Chinese officials were standing. Wang-fun, Governor-General of the Province of Chili, was deputed by the Imperial Commissioners to act in their place, an officer who after the Prime Minister has no other before him in the Empire. His residence is Tien-tsin, 70 miles above this town, at this junction of the Pei-ho and the Great Canal, whence he was ordered to hasten down to meet Mr. Ward and exchange the ratifications. Wun-hiuh Treasurer of the province, was also in attendance with a large number of officials, who had travelled quite a distance, some 50 or 100 miles, to do honor to the occasion. The ratifications were laid upon the table, the treaty having the Emperor's seal attached to it, for he never signs his name, and the American President's name fully and boldly written. The business was soon dispatched, and in a most agreeable manner and spirit, all parties standing when Mr. Ward expressed the hope to the Governor General that the treaty would be the bond of lasting peace and friendship between the two nations; to which the Governor replied, with great earnestness, and apparent social tone, that the observance of the conditions by both parties would be much better for this end. Both he and the Treasurer showed decided ability and humane feeling.

Thus beautifully and successfully terminated the first American mission to Peking. There were several grounds for serious apprehension, that the ratification would be defeated, as, 1st, the attack of the French and English upon the forts on the Peiho, which naturally created new suspicions and antipathies on the part of Chinese against all foreign nations. 2d. The course Mr. Ward and Commodore Tatnall thought themselves justified in taking while lying in the Peiho during the battle, all which was well known to the Chinese officials, as one of the Commissioners stated, but which under the known circumstances, they fully ignored. 3d. The persistent refusal of Mr. Ward to perform the Ko-tow, though so much desired both by the Emperor and his Ministers. And, 4th. The bold assertion, and constantly repeated, of the English prisoner, that two hundred Americans had been landed from the Powhatan and actually engaged with the French and English in the attack upon the forts. With such obstacles lying in his way, it is highly to the honor of Mr. Ward that, by his courage, urbanity, and discretion, he brought everything to a successful issue, and left behind him, as I doubt not, impressions most favorable to American character and American interests.

DANGER OF STRAINING THE EYES IN TWILIGHT.

In the London and Edinburgh Philosophical Magazine for May is an account of sudden loss of the power of distinguishing colors, produced by over-taxing the eyes. A sea captain, who was in the habit, when time hung heavy on his hands, of occupying it by working at embroidery, was one afternoon engaged upon a red flower, and being anxious to finish it, prolonged his labor until twilight came on, and he found it difficult to select the suitable colors. To obtain more light, he went into the companion way, and there continued his work. While thus taxing his eyes, his power of distinguishing the colors suddenly vanished. He went upon deck, hoping that an increase of light would restore his vision. From that time to the present, more than ten years, he has remained color blind. Mr. White Cooper, who brought this case to notice, says that, after the great exhibition of 1851, several instances came under his notice in which the sensibility of the retina was temporarily blunted by the excitement to which it was exposed in that brilliant scene.

The path of virtue is the path of peace, in that only we can travel with safety, or rationally hope to enjoy permanent pleasures.

The greatest wisdom of speech is to know when, and what, and where to speak, the time, matter and manner; the next to it is silence.

ITEMS OF NEWS.

WASHINGTON IRVING died, at his residence in Tarrytown, not many miles from New York, on 28th ult. He wanted only a few months of the advanced age of seventy-seven, having been born in New York, on the 3d of 4 mo. 1783.

CONTENTS OF THE DEAD-LETTER OFFICE.—*The Washington Constitution* advertises the catalogue of letters which have accumulated in the dead-letter office since 1848. The department has used every effort to restore them to their proper owners, and, being unable to deliver them, they are now to be sold for the postage, the proceeds, if any, after paying charges, to be deposited in the United States Treasury, subject to order should the proper owners hereafter be found.

The catalogue embraces coats, hats, socks, drawers, gloves, scarfs, suspenders, patent inhaling tube, gold pens, pencils, and all kinds of small jewelry imaginable, undersleeves, fans, handkerchiefs, box of dissecting instruments, pocket Bibles, children's dresses, lace collars, books, buttons, cloth, purses, slippers, chemises, bed-quilts, boots, shirts, gaffs for game fowls, cornfield hoe, black silk basque, hoods, shawls, gaiters, cigar-case, snuff box, spectacles, false teeth, night caps, brogans, aprons, pantalettes, ear-trumpet, shoulder-braces, silk flag, razors, one hundred catechisms, watch crystals, nipple-glasses, demi-veils, edging, and a thousand other things too numerous to mention. No pawnbroker's shop ever excelled in variety the collection of the Dead-Letter Office.

LAND SLIDE.—An extraordinary land slip, or subsidence as it is called, occurred at St. Hilaire, Canada, on Monday, the 14th inst. It commenced about nine o'clock in the evening, accompanied by a sound like thunder, and lasted about half an hour. A correspondent of the Montreal Gazette, who visited the spot, says that about fifty acres of land sank down to the depth of 30 feet.

ICE NAVIGATION TO BE OPENED ON THE UPPER MISSISSIPPI.—Arrangements have been made at Prairie du Chien, to launch the ice boat on the first closing of the river. No doubts are entertained by the proprietor of the success of the enterprise. The boat is to make semi-weekly trips to St. Paul. "The engine is of sufficient force to draw sixteen loaded cars. Grain dealers are stationed at all important points up the river, and will have a hundred thousand bushels of wheat ready for shipment on the first arrival of the boat."

VICTORIA BRIDGE.—This gigantic undertaking and wonder of the New World is at length a fixed fact. The first locomotive with cars attached crossed this majestic structure to-day from shore to shore, conveying about fifty persons the most of the party preceded by the train to Quebec, and the balance returned again to the Montreal side of the river, well pleased with the success of the undertaking, as also the honor of being the first conveyed across it.

A few solid facts may not now be uninteresting. The length proper of the bridge is about two miles, and consists of two abutments, each 250 feet long, and 24 piers 90 feet in length and 16 broad, reduced to 33 feet at the top, and shape of a wedge at the upper end (to divide the ice in Winter), and built of solid blocks of limestone, which, together, makes 3,060,000 feet of solid masonry; then resting upon this foundation are 24 iron tubes, each 242 feet span, and the center one 330 feet, under which steamers will pass on their trips down the St. Lawrence; the tubes are 60 feet above the Summer water level; entire length of tube 6,600 feet; each of the 24 weighs 322 tons, and the center one, being double, weighs 840 tons. Total weight of iron work, 8,000 tons. The size of tube is 22 feet high by 16 broad. The greatest expansion and contraction of each tube caused by the variation in the temperature from 40 below zero to 125 above, does not exceed 3½ inches, which space is left between, each one being placed upon rollers so that the affect of this variation is not at all dangerous or sudden. The only wood used in that whole structure is the string-pieces that the rails are laid upon, and a narrow side walk that is now being laid at the side of one of the rails for the employees to pass with more ease and rapidity upon. The cross pieces are made of ¼ inch iron laid 7 feet apart. The cost of the entire work will be about \$6,500,000.

The bridge will be regularly opened for traffic on and after Monday, Dec. 19, when the Grand Trunk Rail. way of Canada will be one of the largest continuous lines in the world, being over one thousand miles long—now in running order. It is indeed a fine road, and when in connection with this work, may well be considered one of the first public works of the day; and when we consider that the bridge has added nearly \$7,000 per mile to the cost of the same, it is a bold one.

STAMPS.—The London journals report that the annual demand for penny postage stamps in Great Britain is little short of 506,000,000.

AFRICANS ON A FAIR GROUND.—Two genuine Africans were exhibited at the Columbia (S. C.) fair grounds on Saturday last. The South Carolinian, in noticing the fact, condemns it, and loudly disapproves

of this "open demonstration of a violation of the laws." The journal adds: "We cannot doubt that the framers of our federal constitution intended the federal Congress to have full control of the trade, and that the southern States expected it would be prohibited."

John Brown was executed at Charlestown, Va., on the 2d inst. His body was restored to his friends, who passed through this city with it on the following day.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—There is very little demand for Flour either for export or home consumption, but holders manifest no disposition to accept lower quotations. The sales are confined to 400 bbls. good superfine on private terms; 100 bbls. scraped at \$5; and in small lots for home consumption at 5 37½ up to 5 87½ for common and extra brands; \$6 a 650 for extra family, and 6 62½ up to 7 for fancy brands. No change in Rye Flour or Corn Meal. We quote the former at \$4 37½ and the latter at 3 75 per barrel.

GRAIN.—The demand for Wheat is limited and prices are hardly maintained. Sales of 2000 bus. good and prime Pennsylvania and Southern red at 130 a 132c. White 140 a 145c. 500 bushels Pennsylvania Rye brought 93c. Corn is in fair request—sales of 2000 bushels yellow at 73 a 75c. for damp, and 78 a 80c for dry. Old yellow is worth 92 a 93c. Southern Oats are worth 42 cts. and Penn'a. 44 cents per bushel.

CLOVERSEED is less active, but there is less coming forward and prices remain without change. Small sales of fair and prime at \$5 a 5 25 per 64 lbs.

HEAVY BLEACHED SHIRTINGS made from **AMERICAN COTTON**, warranted in all respects the product of *Free Labor*. For sale by

ELI DILLIN,

No. 1218 Green st., opposite Ridge Avenue.

11 mo. 26, 1859.

TWO YOUNG WOMEN, members of the Society of Friends, are desirous of situations as teachers in families where they would make themselves otherwise useful, or would engage as assistant teachers in established schools. Apply at the office of the Intelligencer. 10th mo. 29—2m.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The Winter Session of this institution will commence on the 14th of 11th mo. next, and continue twenty weeks.

Terms \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address

HENRY W. RIDGWAY,

Crosswicks P. O., Burlington Co., N. J.

9th mo. 24—3 m.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

GEO. A. NEWBOLD,
Purcellville, Loudon Co., Va.

8th mo. 6, 1859.—6m.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, TWELFTH MONTH 17, 1859.

No. 40.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,

PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

FROM THE JOURNAL OF JOB SCOTT.

Under the exercises, conflicts, and deep inward trials, which I had to experience through this year, it has gradually, from time to time, been opened and sealed on my mind, that a great part of the Scriptures, which many generally understand to speak only of outward things, is either only a metaphorical or allegorical relation and description of things inward, expressed by outward images or representations, or that the real outward acts and occurrences may be understood, by the truly enlightened mind, to convey much inward and spiritual instruction. God's design is to confound the wisdom of the wise, and bring to naught the understanding of the prudent. He has hid, and will hide, divine things from the wise and prudent, and reveal them unto babes.

The natural man not only *does not*, but *cannot* know them, because they are only "spiritually discerned." To this purpose Christ spake in parables, that such as had an eye inward to the divine light, which alone gives the true spiritual discerning, might understand, receive, and know the mysteries of his kingdom, while all the wise and learned could but guess, mistake, stumble, and be confounded. So when the disciples asked him why he spake in parables, he informed them it was because it was given to them to know these things, but to others it was not given. It was not given to them to the exclusion of others in the same state of inward seeking, docility, and child-like simplicity.

God's design was then, and ever will be, to hide these things from all such as are striving to know them by their own mere natural powers. They may, and do, study the Scriptures, and reason very copiously upon them, and think they clearly comprehend their meaning; and yet re-

main in total darkness, as to the spiritual import, meaning, and mystery of many passages which they are strongly persuaded they understand rightly.

Before this wisdom and creaturely comprehension the stumbling-block is, by God's determination and counsel, *laid*; on purpose laid, that man ever may stumble and fall, and be snared and taken, so long as he goes this way to work to understand divine things: not that God determines any certain number of persons shall so stumble, and be snared, &c. but all universally on this ground, and in this wisdom; for through all ages it is true, "if any man thinketh that he knoweth any thing, he knoweth nothing yet as he ought to know." Even Paul declares, "I know nothing by myself."

While Paul thought he knew something divine by or of himself, his reasoning rose against the Messiah, and with all his might he fought against the only true way of salvation. So, in degree, it will be with all; if they think they know, even *any thing* divine of themselves, or by the exercise of their own creaturely faculties, they have never yet learned any thing as they ought: for as soon as they *know any thing* as they *ought*, they see and know that they knew nothing by or of themselves; but are altogether beholden to a spiritual discerning from the divine light shining in their hearts, to give them this knowledge. Hence, says the apostle, "God, who commanded the light to shine out of darkness, hath shined (take notice where this shining is) *in our hearts*, to give the light of the knowledge of the glory of God in the face of Jesus Christ."

Here, first, it is *God that hath shined*; secondly, it is "*in our hearts*;" thirdly, it is to *give us* what we had not before, and could not have without this insinuing, that is, *the light of the knowledge of his own glory*; fourthly, it is "*in the face of Jesus Christ*." It is only in *his face*, his inward appearance, whereby he causeth his *face to shine upon us, in order that we may be saved*, that we can ever see "the light of the knowledge of the glory of God;" according to the true saying, "In his light shall we see light." His light shining "in our hearts," is the only possible medium wherein and whereby we can ever see God, or clearly discern his glory: for it is an eternal truth, "whatsoever doth make manifest is light." Natural light manifests natura

things, and spiritual and divine light, spiritual and divine things. As water rises but to the height of the fountain head; and as effects cannot exceed their causes; so nothing short of divine light, a real, substantial ray from God himself, an emanation of his own holy light, life, and substance, can ever fully manifest him to the mind of man.

The outward sun can only be seen through the medium of its own light. Nothing lower or less can ever manifest or reveal it. A thousand other lights may be lighted up, or schemes contrived to exhibit or reveal its glory; but it is impossible they should ever do it. The sun is essential light in itself. Other lights may show many other objects; but any less lights will be swallowed up, or outshone by the rays of the sun, and cannot manifest the sun. Any greater or brighter light, if such could be in natural things, instead of revealing or showing us the sun, would but outshine, and so obscure it; as we see the sun itself outshines, obscures, or hides wholly from our view, the stars that glow, and in brightness shine by night, when the sunbeams are withdrawn from our eyes, and let the lesser lights appear. So God can never be seen, but in his own divine light. He ever is light, and dwells always in the light, and "in him is no darkness at all." What then can ever manifest or reveal him, but his own light, by which he shineth in our hearts, to give us to know him, and behold his glory.

Those that are bound for heaven, must be willing to swim against the stream; and must not do as *most* do, but as the *best* do.

EXTRACT OF PAUL'S SPEECH TO THE BISHOP OF CRETE.

BY HUGH TURFORD.

(Continued from page 615.)

Eighth question. Were not the Scriptures written for our learning? and are they not a sufficient rule of righteousness?

Answer. The Scriptures are called a rule, but who can walk thereby, unless he be inspired with the good Spirit of God?

The Israelites had only ten commands written on tables of stone; but they had many other statutes and judgments proceeding from a righteous Judge, written in their books, and not only read but expounded unto them every Sabbath day, in order that they might walk in righteous paths. But though they had the words of God in their books, many of them had not the fear of God in their hearts. They thought they had a great zeal for an outward worship and form of devotion; yet they were ungodly in life and conversation.

And what shall I say of us who are called Christians? We have the words of God and

the words of Christ, the words of the prophets and the words of the apostles, in our books,—we have many precepts of righteousness;—but do we guide our steps thereby? or can we, without the aid of divine grace?

The Christian's rule of righteousness is Christ's direction. Let all who say the Scriptures are their rule, examine their abilities to walk by their rule. Are they lights to the world? Do their good works glorify God? or do their lives shame the Christian profession? Are we so far from committing adultery that we have not so much as a lustful thought? Are we so far guided by the truth, that every word that proceeds out of our mouth by way of promise is sure and steadfast? Can we refrain from smiting when we are smitten? Can we give our cloak to him that sues us at the law, and wrongfully takes away our coat? Can we love our enemies? Can we bless them that curse us? Can we do good to them that hate us? Can we pray for them that spitefully use us? Can we depend on God's providence, without taking care what we shall eat or what we shall drink? Can we do unto all men in all things whatsoever we would that they should do unto us?

This is Christ's yoke; can we bow our hearts and minds thereunto? This is Christ's burden, can we bear it? He said his yoke was easy and his burden light; but if these things are too hard and too heavy a burden to us, it is because we have not his grace or his spirit; we have a Christian name, but are not in the Christian nature and spirit; we have a rule, but have not power to walk by our rule; and then what good does our rule do us?

If ever we think to walk by Scripture rules,—if ever we intend to keep our Lord's commands,—and if we would lead a righteous, godly life in this present world, we must turn in to the grace of God in our own hearts; for that gives us power to keep to our rule.

It was for want of grace, that the Israelites did not keep the commands of Moses; and it is for want of grace, that Christians do not keep Christ's commands. He lays no other burden on us than what he bore himself. The fulness of grace that dwelt in him made all these things easy to him; and as we grow in grace till we become filled therewith, they will be easy unto us also. Grace mortifies sin, and when sin is mortified, nothing is easier than to lead a righteous life.

Objection. But some may say, our dependence for life and salvation is not on works of righteousness, but on faith. We believe, and therefore hope to be saved.

Answer. I know that is the dependence of many, and we all think we have faith; but is it a faith that purifies the heart, and makes our bodies fit temples for the Holy Spirit?

Paul put the Corinthians on an examination

of themselves,—on a trial and proof of their faith; and it would not be amiss if all who count themselves believers did prove themselves by the same touchstone. “Know ye not” said Paul, “that Christ is in you except ye be reprobates.”

Was Christ in the Corinthians? And is he not in all men that turn from ungodliness, and come to have their hearts purified?

How can we know the only true God, if we do not behold his presence? How can we know our Saviour, if he be not in us, to save us from our spiritual enemies? And this is life eternal, not only to hear of a God and a Saviour, but to know him,—to feel the power of God,—and to be witnesses of Christ's salvation. These are believers, and true believers; for their eyes have seen what they believe.

True faith and works of righteousness go together. He that hath the one hath the other; and divine grace is the spring from which both proceed. But the ungodly, the graceless, and the reprobate have neither.

Ninth question. If inward and spiritual grace be sufficient to teach us our duty towards God and man, and to establish us in righteousness,—wherefore was there an outward ministry? and to what end were apostles, prophets, evangelists, pastors and teachers given to the church?

Answer. Paul, as he told king Agrippa, was made a minister and a witness. He was a witness of the powerful operation of grace in his own soul, and so could tell others what it would do for them.

In a state of degeneracy, all men are strangers to grace; they know not the Lord. The work of the ministry is to open the understandings of all such, and to turn them to this heavenly teacher; since nothing else can enable us to lead a sober, righteous, godly life in this present world. And as some were to plant, so others were to water, that no young plants might wither before they come to be rooted and grounded in the truth.

In the primitive times we find some declined from what they had attained to; because they kept not with their true guide, and with and for such, Paul had to travail in birth again. As plants are not grounded as soon as they are planted, so men are not established in righteousness as soon as they are turned from unrighteousness. Hence, such as were strong were to watch over the weak, and lend them a helping hand in their travels, until they all came in the unity of the Spirit to be perfect men; and then there was no more need of man's help. We all become perfect men when a right spirit comes to have the whole government in us.

But who are fit to plant and to water? Surely no ungodly man, for such have not the spirit of Christ; such know not the way of God's salvation themselves, and so cannot direct others thereto, nor lend them a hand therein. But

such only are qualified to minister to others, as are what Paul after his conversion was, not only a minister but a witness of what he testified,—even such as have known the way of God's salvation themselves, and are come through the teachings of grace in themselves, to that strength and perfection, as to deny all ungodliness and worldly lusts, and to live soberly, righteously, and godly in this present world.

A good example, which like the small taper gives light to read by, is preferable to the blazing meteor, which raises astonishment, but soon leaves us in darkness.

SELECTIONS FROM THE LIFE AND EXPERIENCE OF THOMAS BULMAN.

(Continued from page 619.)

The diary at this point is discontinued; but occasional memorandums prove that the work of grace was still going forward. One of these memorandums is as follows:—

It is lovely and reviving to exhort the disobedient to leave off that course of life which is so contrary to the Lord's will; oh that I could do it with that humility, tenderness and holy boldness, which would prevent the cause from suffering by me. Perfect the work in me, O my God! that my example may reprove, as well as my words.

Under the date 1777 are the following remarks:—“When in profession with those called Methodists, very many were the blessed visitations of God to my soul; still it was revealed to me that there was a more spiritual and divine worship to be known, but that for that I must wait the Lord's time.

Travelling on in his fear, and pressing after a more spiritual worship and greater purity of soul, I attended a meeting at the burial of a Friend, where I met with the Beloved of my soul, greatly to my comfort, insomuch that at my return home I was made, like the eunuch formerly, to go on my way rejoicing. So I kept frequenting Friends' Meetings, till it appeared right to request my admittance into membership with them.”

Thomas Bulman's faith had now become strong in the promise of the Most High to his church, “All thy children shall be taught of the Lord;” and in that of Christ, that the Spirit of Truth should guide his disciples into all truth. By attention to the convictions and openings of this Spirit, he had been awakened to a sense of the sinfulness of sin and to his need of a Saviour, had been given to feel the mercy of God in his dear Son to repenting sinners, and had been led onward in the way of holiness; and in the further manifestations of the Spirit he was now given to perceive the contrariety of the ministry of the Episcopal Church, in its appointment, monopoly, authority, exercise and support, to the example

of the primitive church, and the principles and precepts of Christ and his apostles; and he felt it laid upon him of the Lord to refuse an active compliance with the unrighteous laws of the land enjoining the payment of tithes for the support of this ministry. On this subject he writes:—

21st of 7th mo. 1777. This was a day of great exercise of mind with me on account of tithes. I may just unbosom myself, and note down a few particulars to help me in time to come, that I may return praise to my Heavenly Father for his preserving hand and fatherly care over me. I could not pay tithes to support a ministry which I believed was not according to Scripture. My father and brother were very zealous for "The Church," as they called it, and would not by any means forbear rendering to the priest what they estimated his dues. This made my burden the heavier, as I had no horse of my own, but was obliged to borrow from them to lead home my crop. My father desired me to go to tell the priest to come and take the tithe hay; this I refused to do, and told him plainly I could neither do so, nor send any other person on that errand; so he went himself: and when about to lead the hay from the field, my brother would load the carts himself, to prevent my taking that set out for the tithe, away with the rest; and he said the man and I should take the other into the house. This being the case, I thought I might have been excused from farther trouble. Oh this flesh, how unwilling to suffer! But this would not do; my burden still remained, and my life was bitter. I knew that in the place where I lived, there were none who refused to pay tithes for conscience' sake but myself, but I felt constrained to be faithful to the testimony given me to bear; and I durst not omit using the utmost of my endeavors to be faithful to my duty. I was encouraged by the fatherly instructions of my friend, Thomas Blair, of Solport, to keep to the inward light and power of the Spirit which was able to carry me through exercises which nothing else could do. Thus encouraged, I gathered strength, and firmly resolved not to charge my conscience with any fear of man. I told my brother my trouble, and desired he would bring away that left for tithe with the rest, for I could not wrong my conscience by leaving it. My brother, however, entirely refused, saying, I should not load it; neither would he suffer any one to load it on his horse, and he used some arguments trying to prove the lawfulness of the priest having the tithes. Finding I could not prevail without violence, I came away, and found myself clear and my mind at peace. My Heavenly Father, I believe, accepted the will for the deed.

O the goodness of God! who can fully set it forth? Who can worthily magnify his holy name? Marvellous are his condescensions to such a poor unworthy creature as I am. See

how he gathers his lambs in his arms! Who ever trusted in him and was deceived? Now I am on the banks of deliverance, will I sing to my Well-beloved a song. He hath brought me out of the mire and clay, and set my feet upon a rock; he hath ordered and established my goings; he hath put a new song in my mouth, even of praise and thanksgiving; he hath given me the oil of joy for mourning, and the garment of praise for the spirit of heaviness; but I am not able to impress these feelings on the minds of my friends according to the flesh, and they cannot share with me in my joy.

The brother mentioned in the preceding memorandum afterwards became much enlightened on the subject of tithes, and though he did not become a Friend, he rejoiced in seeing his brother bear a faithful testimony against tithes.

When Thomas Bulman believed the time had come at which he ought to request admittance into membership with Friends, he addressed the following letter to Carlisle Monthly Meeting:

Irthington, 18th of 8th mo. 1777.

Many have been the impressions of my mind to request my admittance into membership with Friends, but now it appears with solemn weight. As Paul said the love of God constrained him to preach, so has it constrained me to request this. I trust that in degree, the same love has enabled me to take up the cross, not only outwardly, but likewise in renouncing my own will, which is contrary to the will of God, and to let his will be my law. Glory be to his name, which is as ointment poured forth; it is of his abundant loving kindness, and of his free mercy, that he hath visited my soul with the dayspring from on high; not for any works which I have done. So, if I may, I desire to be one with you, as I hope some of you are one with Christ, or at least right dear in his sight. I have renounced all fellowship with others, and am clearly convinced this is the most spiritual and divine way of worship. Blessed be God! since I first gave up to request this, oh, the sweet enjoyments I have had under his wing! I have at seasons been under the shadow of his wing with great delight, and his fruit was sweet to my taste. Glory and honor be to his name! for he is giving me victory over my besetting sins, and will, I trust, lead me on from one degree of grace to another, till he hath perfected in me that which is lacking. He is giving me to see I have no continuing city here, but that I must seek one to come, eternal in the heavens, whose builder and maker is God. The Scriptures which were to me as a sealed book, are now, in measure, opened unto me, and I see many of the promises belong even unto me. That principle or Spirit, which first condemned me for sin, has now turned to be my comforter. Oh, how many refreshing times and seasons have I enjoyed under this holy and divine guide! Dear Friends! it is to you that I direct this, who re-

joy to see Zion prosper, and Jerusalem a praise, and who sigh and mourn because of the iniquities of the land. If, unworthy as I am, I may be in union and communion with you, and rejoice with those that rejoice, and weep with those that weep, and so fulfil the law of love, well; but if not, then may I be permitted to enjoy with free liberty, which I now do, as it were to eat of the crumbs that fall from the children's table. Now, dear friends! let the secret breathing of every sincere heart be unto the Lord for me, viz. for my preservation; that when I have put my hand to the plough, I may not look back and incur the displeasure of God, and he pronounce me unfit for the kingdom of heaven. Time and paper would fail me to declare all the dealings of God with my soul, but by these few broken hints, you may see what is the desire of the unworthy writer.

THOMAS BULMAN.

(To be continued.)

A minute of Women Friends, at a Yearly Meeting, held at Burlington, for Pennsylvania and the Jerseys, the 23d of the 7th month, 1740.

This meeting tenderly recommends to the Quarterly Meetings the reading of the former advice of this Meeting, for the 21st of 7th month, 1726, against Pride and all sorts of superfluity, and particularly against Hoop Petticoats—

And that all Friends avoid the unnecessary use of Fans in Meeting, but if any are obliged to use them that they be plain, and that no Friend use the indecent custom of Taking Snuff in Meetings.

We also earnestly desire that all Friends in their several meetings be zealously concerned to encourage ye good works of visiting families, keeping near to truth in themselves, which brings into and preserves in True Unity and Gospel Fellowship.

Signed on behalf and by order of said Meeting by
GRACE LLOYD.

A VOICE FROM THE HOP GROUNDS.

RESPECTED FRIENDS,—There may be many who are of opinion, that the vast area of acres in the south-eastern districts of England, devoted to the growth of hops, might be turned to a better purpose. It is not this question I am about to enter upon. Putting the morality of the matter aside, there are perhaps some of your readers who are unacquainted with the production of the article, or, at all events, would feel surprise at the extraordinary abundance and beautiful appearance of the crop now in the course of picking. Whether the subject may be one of sufficient interest for your subscribers generally, I am unable to say.

Those who have been accustomed to districts

where tall chimneys are abundant, and where clouds of black smoke darken the air, would be struck with the contrast, on beholding masses of pure white vapor rolling over our verdant valleys and orchards, during four or five weeks at this particular season, occasioned by the brimstone fires necessary to prepare for the market an article which this year will produce nearly, or quite the sum of £300,000 for the revenue.

To begin, however, at the beginning: when the hops are approaching to ripeness, the grower circulates information among what are termed his "home pickers, poor persons resident near the spot, that on such a day the work will commence; but as it is impossible a sufficient number of this class can be found, means are taken to diffuse such announcement on a more general scale. Aid is solicited on all hands; wagons drawn by teams of horses are despatched to various parts of the country, where the population may be dense and labor not so abundant. Very few refuse to lend a hand; the work is so simple that a child of seven years of age and the man of seventy can equally engage in it. Character is never inquired into; a glut of labor suddenly arises, and a proportionate mass of human machinery is put on to meet it; the "ticket of leave" man and the man of scrupulous honesty stand side by side—the very scum of the alleys of London and the scholars of the humble village school meet upon the same ground.

With those who come from a distance the expense of lodging is, of course, an object; and they consequently postpone their arrival to the latest possible period. This compels them, in many instances, to travel on the first day of the week; and special trains, or trains lengthened in consequence, are appointed to convey them. It is a singular sight to witness vast numbers of the poor creatures wending their weary way through the streets—the stronger members of the family bearing upon their backs all the household goods actually indispensable on such a pilgrimage; huge bundles of bedding, cradles, kettles, and every article possessing the charm of easy portability. Chairs and tables, of course, are supplied by mother earth.

The fact of both parents seeking labor on the same ground necessitates the removal of the youngest child. They have not the means of leaving it at home. All flit, from the infant of a span long to the grandsire who has seen seven years of Sabbath-days. Any observant person, in watching the various groups, as they sit in circles in the inn-yards (for landlords are not ambitious of such customers) eating their humble fare, may often detect the head of a child protruding, in a most unexpected manner, from some high roll of bed-furniture.

These remarks apply more particularly, however, to the Irish, who flock into the hop-gar-

dens by thousands. For weeks previous to the picking, a stream of them is seen, footsore but still cheerful, as though toil and privation were moulded into their very natures. On the route, in many instances, they will not hesitate to enter a shop or private house, if the door be open, and, in a rich brogue, inquire, "Can we boil the kettle here, masthur?"

In repeated instances, those who grow hops extensively see the same faces in their grounds many years consecutively. This fact will prove that the Irish who resort here are those who reside for the remaining portion of the year in London and its environs.

The fares by railways are reduced to meet the influx and circumstances of the class to which I refer; but it is astonishing how soon the vast crowds which the train discharges disappear. Their destinations are almost as various as the colors of their garments; the latter having been described by a witty writer as a "parcel of holes sewn together."

The office of station-master at the railway terminus is far from a sinecure at such seasons. I saw, last year, an Irishwoman attempt to climb into a third-class carriage without a ticket. Her arms were seized in a most determined manner by her companions inside, and her legs were held equally firm by the station-master of the platform.

Throughout most of the towns in Kent notices are placed in the windows where poor persons reside, and who, from some circumstance or another, are prevented going into the hop-grounds, to the effect that "Children are taken care of during the hopping!" This arrangement enables many a mother to close her house entirely during the hours of labor.

The plant, during the whole of the present summer, has received scarcely a single check. The continued drought has suited the hop admirably, and the most experienced planter admits that of the "thousand evils to which hops are heir" he has known nothing. They have enjoyed a singular immunity from flea, fly, fireblast, blight, red mould, lice, dauphin, with a long *et cetera*.

I was conducted to-day, by the superintendent of a hop-ground about two miles distant from this town, into a portion of the plantation, where, although I have seen fine hops in preceding years, I was surprised at the excessive exuberance of the crop. The upper half of many of the poles were quite bare, as the weight of the luxuriant mass had caused it to sink nearly to the ground; while in other instances, where the poles upheld them, they could be compared to nothing but huge "billows" of hops, a sea of which extended as far as the eye could reach. The size of the hops in the garden to which I allude was that of a medium fir-cone. The pliant arms of the plant had grasped the tops of the neighbor-

ing poles on each hand, forming perfect alcoves beneath a complete labyrinth of vegetation; so much so that it was necessary to cut through the superincumbent weight before the pole could be pulled out of the ground.

The question will very naturally arise in the mind of the reader, how such a concourse of individuals can possibly find shelter, incapable, as they are, of obtaining lodging in the house of decent people. The attention of the traveller, while passing along through the lanes in the vicinity of the hop grounds, will be arrested by a long, low building, composed in many instances of mud-walls and a straw roof, innocent alike of either window or chimney. It has of course, a door; but when that is closed, not a ray of light can honestly enter. If a gleam or two does penetrate, it must steal through some cranny not sufficiently large to admit anything else.

These buildings are known as "hoppers' houses;" and, as they are not often inhabited until an hour when

"Tired nature's sweet restorer"
is courted by all, and evacuated with the first beams of the morning, windows are a superfluity. Culinary operations being carried on out of doors, places a chimney in an equally unimportant point of view.

A melancholy instance of the evil consequences attendant on living in such a crowded and unwholesome atmosphere occurred close to this town in the autumn of 1849. Cholera was at that time paying its periodical visit, and, unfortunately, that year in particular the tide of Irish pickers rose to what might be termed "flood." One fell sick, to be succeeded rapidly by a second; and a panic soon spread throughout the class in question. Tales got about that they were being poisoned by their rival pickers, the English (a great feeling of jealousy at all times prevails). The messenger on the pale horse, however, still scattered his arrows among the terrified strangers, and the hand of violence began to show itself in the street of the quiet village. Windows were broken, and threatening language was heard at every corner. The magistrates met, the tumultuous portion of the community were reasoned with; but the phantom their own imaginations had conjured up was not to be so soon laid. The police, as well as a small body of the military, were sent for from a neighboring town, when it occurred to some person in authority to forward a message to London. In the course of a short period an individual arrived, at the motion of whose hand the evil spirit collapsed. Knees were bent at the sound of a few words from the lips of a priest, which operated like oil upon a troubled sea. No fewer than forty-three, however, fell victims to the destroyer; and a humble wooden cross in the neighboring churchyard, bearing a simple inscription, marks the spot where they lie.

On drawing near to that portion of the plantation whereon picking is proceeding, a stranger would be at a loss to imagine where so confused a sound of human voices could possibly proceed from. The poles being lofty, and laden heavily, no sign of human life is visible. It is like approaching a fair; for probably, on turning the next corner, a mingled crowd bursts upon the view. Labor and laughter seem to go hand-in-hand; and the loud voice of the superintendent mingles with the feeble wailing of some embryo picker as it lies extended in its cradle. A great source of annoyance, almost necessitating the use of a veil, is experienced by visitors on traversing the hop-grounds. This arises from vast numbers of small winged insects, who, finding their strong-holds suddenly assailed by the sinewy arms of the pole-puller, sally forth in myriads, beating in one's face like a storm of sleet, and, entering the eyes, cause much discomfort.

The air all around is impregnated with a most delicious aroma, wafted from the whirling crows upon the oast-houses, wherein the hops are in course of drying.

We must now, gentle reader, stand with our back close to the hedge in this narrow lane, while a waggon, creaking under the weight of a hundred "pokes," slowly passes by. A "poke" is a bag containing ten bushels; thus 1000 bushels are on their way to the oast.

In the garden of which I write, 1700 pickers find active employment, and 11,000 bushels are gathered daily. After perambulating many acres, my companion ejaculated—

"We can describe it in four words, Sir, this year—'We are all hops!'"

The "bine," as it is called, is severed at about twelve inches from the root; the heavy pole is then raised from the earth, and is placed longitudinally over a "bin," composed of coarse kind of sacking; active fingers are now at work on both sides of the "bin," and for every eight, nine, or ten bushels picked, they receive a shilling. The price of course varies with the character of the hops; if very fine, the grower will stipulate for ten bushels; but this "tally," as it is termed, is very much complained of, and the average is eight most years. A quick picker will earn 2s. 6d. a day; if a woman can take, which is often done, three or four children with her, the combined earnings amount to something considerable. Voluntary assistance is often forthcoming; for when the weather is fine, the work is really so attractive that visitors will often spend an hour or two at the bin, imbibing the fine aroma of the hop, and carrying out benevolent motives at the same time.

Idleness is a sin very seldom to be met with in the hop plantations—the faster the work goes on, the greater the remuneration. A woman will snatch her infant from a wide-spread shawl on which it has been seated, and while engaged in

supplying it with its natural support, continue busy with one hand in the equally important duty of providing her own.

Persons worse for liquor are, as soon as possible, removed from the grounds, but these fluids are much in request. I saw one poor man go through a variety of manœuvres with both hands, in an attempt to raise to his lips an iron boiler.

It is calculated that in many instances the produce this season will average twenty hundred-weight to the acre; the duty is 18s. 8d. per hundred, with five per cent. recently added. The principal grower in this district is a gentleman from Manchester. He will send 3000 pockets into the market; the weight will be about 200 tons, and the duty consequently near upon £4000. This must be paid whether he sells the article or stores it.

Passing into the stowage or oast-house, the extreme brilliancy of the furnace fires, composed of sulphur and coke, attract attention; and on ascending to the kilns, which dry 11,000 bushels in twenty-four hours, the visitor is soon powdered over with a fine aromatic yellow dust. The hops are spread upon the kilns to the depth of about six inches; sulphureous vapors float here and there over the extended surface like an "*ignis fatuus*;" but the overpowering fragrance of the hop rules paramount.

The packing-room is next shown, and may be briefly explained. Circular holes are seen in the floor of about two feet diameter; in each hole a strong bag or pocket is suspended, and on looking into it, the head of a man is seen bobbing up and down perpetually. His duty is to keep dancing or treading the hops, while a boy stationed on the floor supplies more as they are required. By degrees, as the pocket becomes full, the figure of the man is developed, and, to judge by his appearance, one would suppose him to be laboring under jaundice of the most distressing kind, and which disorder appears to have seized upon his scanty attire as well; the skin becomes so stained with the hop, and the clothes so saturated with perspiration, they absorb the golden dust to such an extent as to convey the impression alluded to. The most unpleasant consequence arising from treading the hops, is their sticky or adhesive character. Not only do they impart a yellow color to the skin, but upon touching it, it has the feel of varnish freshly laid on. While the treading is going on, women are busily engaged in stitching with a greater regard to strength than neatness, the necessary number of pockets. Every pocket is stamped with the name of the grower, the year, and a distinguishing mark that it passed under the notice of the officers of excise.

As the three or four last days of the picking draw nigh, the hilarity of the laborers is manifested on the high grounds by a display of every article in any way approaching to a flag or stream-

er. Long poles are selected, to which are affixed shawls, handkerchiefs, ribbons of all colors, and a perfect saturnalia is enjoyed by the motley company assembled; the men employed in pulling the poles catch the infection, and waving them high in the air, then swaying them to and fro, present almost the appearance of an agitated sea.

Fourteen thousand acres of land in the county of Kent, formerly cultivated as hop gardens, are now appropriated to other produce. By such diminished acreage, it would seem that the pursuit is not a profitable one; but it is more to be accounted for by many of the small planters having abandoned the growth, from the circumstance of the duty pressing heavily upon them, when unable to get a remunerating price for the article. The introduction of pale ale, and the enormous exports of it to India, it is supposed, will keep up the demand for fine hops, and the production of such is now a scientific attainment.

Hop growing has been at all times acknowledged to be a precarious calling. The fluctuations of the market, even when the crop and season are favorable, renders them unsafe to hold. Instances are on record in which a grower, whose capital in poles alone has been £20,000, has actually been summoned for his poor rates.—*British Friend.*

FRIENDS' INTELLIGENCER.

PHILADELPHIA, TWELFTH MONTH 17, 1859.

By a communication received from a friend, in Reading, and also one from a member of the committee, we learn, that on First-day afternoon, 4th inst., a meeting for worship was held at Reading, under the care of a committee appointed by Philadelphia Quarterly Meeting, which is to be continued four times a year, on the first First-day in the 3d, 6th, 9th and 12th months, at 3 o'clock in the afternoon. Seven of the committee were present, and although the weather was very inclement, the attendance was quite encouraging. Several interesting and touching testimonies were given both in the morning and afternoon meetings, which were listened to with much attention. The views and principles of Friends were presented, and their adaptedness to render man holier, and therefore happier, and we cannot doubt that some of the thoughts uttered will fall as good seed on a prepared soil, growing and producing a harvest in due season.

The social intercourse with some of the Friends of Reading, and their families, formed an inter-

esting feature of this visit. The younger, as well as the elder, seemed to feel that a gain from such intercourse might be realized, encouraging and sustaining each other in our endeavors to maintain the character of a loving brotherhood, desirous of promoting each other's welfare in every relation of life.

There has been a small meeting of Friends at Reading for more than a hundred years; a few years since it appeared to be going down, but by the perseverance of a few Friends it was continued, and is now apparently in an awakening condition. In the public mind there is an anxiety to know what our principles are, as is shown by the large gatherings at that place on occasions of the visits of Friends in the ministry, and we trust that the meeting now established will afford enquiring minds an opportunity of learning more of our religious principles, and be instrumental in causing this branch of our Society to flourish. The meeting house is an ancient structure, small, and built of logs, and though no doubt adapted to the early settlers of the country, is in many respects unfitted for the present purpose.

The interest manifested, as well as the growth of Reading, which now numbers upwards of 20,000 inhabitants, demands a larger and more comfortable house to which Friends need not hesitate to invite their neighbors when a larger meeting than usual is expected.

As Friends of Reading are few in number we hope an interest will be manifested throughout our Quarterly Meeting, to aid them in the erection of a new building, when they are prepared to make the effort.

DIED, Within the limits of Pilesgrove Monthly Meeting, on the 22d of the 11th month, SALLIE, wife of Joseph A. Robins, and daughter of John and Abigail Ogden, in her 24th year.

This dear young woman so early taken from our midst was of a thoughtful turn, and for a time, (after being attacked with a cold which terminated in consumption,) she appeared depressed, and expressed a fear she was not prepared to die. But this feeling was not permitted to continue long; she sought and found her Saviour, who whispered peace to her troubled soul.

To a relative who visited her, she remarked, "I had not expected to have continued so long, but I still linger patiently waiting; willing to go when the summons comes." That some time before, she had seen what appeared a bright light, and a voice saying, "Put thy trust in Me and I will care for thee;" this, she said, "I have been enabled to do, since which time I have seemed to have nothing to do but to wait."

She was remarkably cheerful throughout the latter

part of her illness, and passed gently away, while her purified spirit has, we believe, entered into one of those mansions prepared for the righteous.

[From the Chester County Times.]

THE SENECA CHIEFS—A BILL OF MORTALITY.

To the Editor of the Chester County Times.

Believing that it would be very satisfactory to many of the Society of Friends (as well as others) particularly those who were cotemporaries during the great struggle between the strong and the weak, viz: The Ogden Land Company, and the Seneca Nation of Indians, residing in the State of New York, to be made acquainted with the fate of most of the Chiefs who were engaged in that momentous effort, which caused so much anxiety and expense, and so many heart-rending scenes, I know of no medium by which those interested can be made acquainted with the following cases of mortality since the year 1838, but through a public Journal. They will discover that death has claimed for its victims many for whom they toiled and wept during that onslaught upon the moral, political and civil rights of that greatly wronged and injured people.

Out of 92 Chiefs who were concerned in that long to be remembered conflict, 61 have gone to their spirit home, no longer to be annoyed by land speculators, or an ungrateful government. The following are their names with the places at which they died:

1838—Reuben Pierce, Cattaraugus; George White, Buffalo.

1839—Capt. Snow, Cattaraugus; Wm. Cass, Buffalo; Big Kettle, Buffalo; Isaac Davis, Cattaraugus.

1840—Adam Doxtater, Cattaraugus; Black Chief, Tonawanda; Jas. Robinson, Alleghany; Capt. Pollard, Buffalo; John Snow, Buffalo.

1841—Blue Eyes, Cattaraugus; John Pierce, Alleghany; Walter Thompson, Cattaraugus; Mark Charles, Buffalo; John Dennis, Cattaraugus; Moses Pierce, Alleghany.

1842—Tunis Halftown, Alleghany.

1843—Oliver Silverheels, Cattaraugus.

1845—Johnny John, Cattaraugus; John Pierce, Alleghany.

1846—Capt. Strong, Alleghany; Little Johnson, West; Thomson S. Harris, West; Jas. Shongo, Alleghany.

1847—Wm. Jones, Cattaraugus; Jas. Stevenson, Cattaraugus; George Bennett, Cattaraugus; Jim Jonas, Cattaraugus.

1848—John Gordon, Alleghany; Tall Peter, Tonawanda; Tommy Jimmy, Cattaraugus; Long John, Alleghany.

1850—John Bark, Cattaraugus.

1852—Blue sky, Tonawanda; John Luke, Tonawanda; Robert Watt, Alleghany.

1853—Jacob Blacksnake, Alleghany; Geo. Silverheels, Cattaraugus.

1854—John Sky, Tonawanda, David Snow,

Alleghany; *John Bigfire, Tonawanda; Geo. Kill Buck, Alleghany.

1855—Taffany, Tonawanda; Black Smith, Tonawanda Henry Two Guns, Cattaraugus.

1856—John Tall Chief, Cattaraugus; Joe Himlock, Cattaraugus; Jimmy Johnson, Tonawanda; Jas. Washington, Tonawanda.

1857—Lewis Halftown, Cattaraugus; John Seneca, Cattaraugus.

1858—Young Chief, Cattaraugus.

1859—Saml. Gordon, Cattaraugus; George Fox, Cattaraugus; Sky Pierce, Alleghany; John Green Blanket, Cattaraugus.

Time not known—Gov. Black Snake, Alleghany.

The above is derived from an authentic source. G. M. COOPER.

10th Mo., 1859.

P. S.—Seneca White, who has been a highly respected Chief, is still living, and the oldest survivor, being over 83 years; he retains his health and works on his farm.

THE EFFECTS OF SMOKING.

The remarkable research made by M. Bouisson upon the danger of smoking has attracted the notice of the Academie, and has been rewarded with high praise. The horrors hitherto unknown, or unacknowledged, with which smokers are threatened, nay more, convicted, by M. Bouisson, are sufficient upon bare anticipation to ruin the revenue and the pipe-makers also. Cancer in the mouth, M. Bouisson declares to have grown so frequent from the use of tobacco that it now forms one of the most dreaded diseases in the hospitals, and at Montpelier, where M. Bouisson resides, the operation of its extraction forms the principal practice of the surgeons there. In a short period of time, from 1845 to 1859, M. Bouisson himself performed sixty-eight operations for cancer in the lips at the Hospital Saint Eloi. The writers on cancer previous to our day mention the rare occurrence of the disease in the lips, and it has therefore become evident that it must have increased of late years in proportion with the smoking of tobacco. M. Bouisson proves this fact by the relative increase in the French duties on tobacco, which in 1812, brought an annual amount of twenty-five millions, and now give a revenue of one hundred and thirty millions; almost that attained by the duties on wines and spirits, and far beyond that rendered by those on sugar. M. Bouisson remarks, justly or not, that "this figure, extravagant as it may appear, fades into insignificance before that attained by the British tax, which,

*This Chief jumped out of the third story window at a Hotel in Batavia whilst attending Court in a suit, Tonawandas against Joseph Fellows Agent of Ogden Land Co. He was in a somnambulant state when the accident occurred.

according to Dr. Seymour, amount to a fabulous sum, in a country where boys smoke from five o'clock in the afternoon till three o'clock in the morning, and where children of ten years old are known to consume as many as forty cigars in a day!"

The use of tobacco rarely, however, produces lip cancer in youth. Almost all Bouisson's patients had passed the age of forty. In individuals of the humbler classes who smoke short pipes and tobacco of inferior quality, the disease is more frequent than with the rich, who smoke cigars or long pipes. It becomes evident, therefore, that it is owing more to the constant application of heat to the lips than to the inhaling of the nicotine, that the disease is generated. With the Orientals, who are careful to maintain the coolness of the mouthpiece by the transmission of the smoke through perfumed water, the disease is known. M. Bouisson, whose earnestness in the cause does him the utmost credit, advises a general crusade to be preached by the doctors of every country against the immoderate use of tobacco, as being the only means of exterminating the habit; because, although the most powerful sovereigns have been powerless to prevent it—although Sultan Amurath threatened in vain to cut off the noses of those who smoked, and Peter the Great vowed direst vengeance against all smokers, and even the thunders of the Vatican have been hurled against them in vain, there is one thing which mankind holds in more horror than a noseless face, or even an excommunicated soul—and that is an untimely death. Let young men be once impressed with this truth, and the "Art of Smoking," which one of our best authors has lately extolled as the finest of all the fine arts, will soon be set aside and forgotten.—*London paper.*

Dyers and chemists will be glad to hear of new substances which they may turn to profit. Dr. Hofmann has communicated a paper to the Royal Society, describing products which he obtains from the berry of the mountain-ash; one, to which he gives the name of sorbic acid, and its compounds. Further experiments in Paris confirm the efficacy of keussou as a remedy against tape-worm. Professor Nickles has been at work upon the privet, *Ligustrum vulgare*, known as an oleaceous plant, bearing blackberries, which in Belgium and Germany are called ink-berries. These he finds to contain glucose, raisin-sugar, and a waxy substance of a beautiful crimson color, to which he gives the name of *liguline*. This makes good dye in different shades of crimson and purple, and is available as a test for water. In a tumbler of pure distilled water, a drop of solution of liguline colors the whole a bright crimson; but if the water contains, as many drinking-waters do, carbonate of lime, then the color changes to blue. The test may be ap-

plied as well with liguline paper as with the solution, and paper thus prepared will doubtless come into use, and prove of service to the traveller and scientific explorer. Liguline, moreover, promises to be useful to the optician, as the solution when viewed in glass tubes presents singular optical effects.—*Chambers's Journal.*

Thirtieth Annual Report of the Female Association of Philadelphia, for the relief of the sick and infirm poor with clothing.

In presenting the Annual Report of this Association, it may be well to refer briefly to its plan of operation.

For several years after its commencement, the clothing distributed was made by the members of the Society, at its stated Monthly meetings. So great, however, was the demand of the poor for employment, and so desirable is it to encourage in them a feeling of independence and self-reliance, that it was thought best to enlarge the annual subscriptions of the members, and by this, and other means, raise a fund to employ those that are able to work in making garments which are afterwards distributed among the sick and infirm.

Every succeeding winter has proved the advantage of this mode of operation, and the Association has only to regret that its resources are so limited.

While it gratefully acknowledges many generous contributions, it would urge upon its friends the necessity of continued and increased interest in its behalf.

During the past winter, the receipts of the Society amounted to \$640 00; \$396 62 of this sum were expended in the purchase of goods, and \$241 78 were paid for sewing; 129 ½ garments were distributed, 1241 of these were made by the poor who were employed by the Association. The following donations of goods were received, viz: 20 blankets, 75½ yds. muslin, 43½ yds. gingham, 46 yds. canton flannel, 20 yds. calico, 108 lbs. soap, 25 lbs. candles, 250 bread tickets, and a lot of trimmings.

Hannah Miller, President, 315 N. Eleventh St. Elizabeth Jenkins, Treasurer, 937 Franklin St. Helen G. Longstreth, Secretary, 23 S. Sixteenth St.

To either of whom donations may be sent.

Philadelphia, 3d mo. 5th, 1859.

It has been remarked that the advance of engineering manufactures is shown by the construction of the tools and appliances which they call us into; and we may form some notion of the huge masses of metal henceforth to be operated on in the red-hot state, by the fact, that a steam-hammer weighing seven tons, with a fall of six feet, has recently been made at Morison's Works, Newcastle-on-Tyne. The blow from a

mass of solid steel of more than fifteen thousand pounds' weight, will be tremendous. We hear of a machine that will clean twelve knives at once, and keep the edge in good condition: and of "the renewable stocking," which is to save wives and daughters the trouble of darning. According to the inventor, stockings are so cheap, that it does not pay to darn them, and he therefore manufactures toe and heel pieces, which are to be sewn in when required, and thus make the stocking as good as new.—*Chambers's Journal*.

HYGIENIC HINTS.

Hall's Journal of Health says that a person born scrofulous or becoming so after birth, need not remain so to any specially hurtful extent. If "white swellings" or "runnings" do not relieve the system of ill-humors, the disease may be worked out of the system by a change in the habits of life—such a change as involves large out-door activities for the greater part of every day. The same thing may be accomplished, to a great extent, in-doors, as where a sedentary life is followed, by spending a large portion of each day in active employment on foot. More decided results will follow if the aid is given, meanwhile, of judicious personal habits, as scrupulous cleanliness of body and clothing, of regular, full, and sufficient sleep; of plain, simple and nutritious food, eaten at regular intervals of five or six hours, and nothing between, with that daily regularity which is essential to health under all circumstances. A scrofulous person should eat fresh meats largely, and bread, fruits and berries of every description, using vegetables sparingly. In short, whatever promotes high bodily-health promotes the eradication of scrofulous taint. In regard to internal remedies, one of three things is the uniform result. First, the medicine gradually loses its power; second, the system is benefited only while it is taken; or, third, the remedy gradually poisons the system, or impairs the tone of the stomach, and hastens a fatal result. No medicine ever eradicated scrofula, or kept it under any longer than while it was taken under certain conditions; a scrofulous person has a greater chance of long life than one who is entirely free from it, because, being conscious of a slenderness of constitution, greater care is taken to avoid causes of sickness.

The tendency of India rubber shoes is to make the feet cold, thus endangering the health; hence they are useful only in walking when the ground is muddy or sloshy with melting snow. In these cases they are invaluable. When rubbers are on the feet, persons should keep moving and remove them on entering the house. If the rubbers have been on the feet several hours, both shoes and stockings are necessarily damp by the condensation and confinement of the perspiration;

therefore all should be removed and the naked foot held to the fire till warm and dry in every part. The same rule holds good in relation to leather boots and shoes made water proof. For common purposes leather boots and shoes are the best, if kept well blacked, with several renewals of dry socks during the day if the feet perspire profusely.

If a man begins to cough, as the result of a common cold, it is the result of nature herself attempting a cure, and she will effect it in her own time, and more effectually than any man can do, if she is only let alone, and her instincts cherished. What are those instincts? She abhors food and craves warmth. Hence, the moment a man is satisfied that he has taken a cold, let him do three things; 1st, eat not an atom; 2d, go to bed and cover up in a warm room; 3d, drink as much cold water as he wants, or as much hot herb tea as he can, and in three cases out of four he will be almost entirely well within thirty-six hours. If he does nothing for his cold for forty eight hours after the cough commences, there is nothing that he can swallow that will, by any possibility, do him good, for the cold, with such a start, will run its course of about a fortnight, in spite of all that can be done, and medicine will only hinder a cure. "Feed a cold and starve a fever," is a mischievous fallacy. A cold always brings a fever; the cold never begins to get well till the fever begins to subside; and every mouthful that is swallowed feeds the fever.

THE LATE BARON DE GOLDSMIDT, OF LONDON.

HIS CHARITABLE BEQUESTS BY WILL.

It may not, perhaps, be generally known that this distinguished London merchant, who in early life was a member of the London Stock Exchange, and within the last six years one of the contractors for the Turkish loan, has left the following munificent legacies, and, although of the Jewish persuasion, it will be seen that his liberality was not confined to any sect or religion:

To the widows of decayed members of the London Stock Exchange, to be distributed by the chairman for the time being of that establishment, at his discretion, either in purchasing their annuities in the English funds or in such manner as he may think fit, £20,000, or \$100,000.

To the decayed members of the London Stock Exchange, whose ages exceed 60 years, £20,000, or \$100,000.

To the poor Quakers in England, Ireland, Scotland and Wales, to be distributed by the approval of the monthly meeting of the Quakers' meeting in Bishopgate street, London, £5,000, or \$25,000.

To the sons of poor Quakers, to apprentice them to various trades with consent of the monthly meeting, &c., £5,000, or \$25,000.

To the poor of all denominations in Brighton, in Sussex, England, (where Baron Goldsmidt had a large house property, the sum of £10,000, or \$50,000.

To be distributed annually to the poor of Brighton, in coals, blankets, tea and sugar, and in money, 5s or 1½ dollar, he has left the sum of £20,000, to be invested in Turkish bonds, and the interest only to be applied annually to the above purpose, or \$100,000.

To the London Smithfield Cattle Show, annually, to improve the breed of South Down sheep; the amount to be invested in the name of the Trustees for the time being, and the dividend paid to them of £12,000, or \$60,000

To the porters and policemen on the London and Brighton Railway, to purchase for each porter six pounds of roast beef and a plum pudding on every New Year's Day, the interest annually of £20,000, to be distributed at the discretion of the Chairman and Deputy Chairman of the said railway, or \$100,000.

To Peter Thompson, hairdresser, Brighton, Sussex, England, who had cut his hair for forty-years, £500, or \$2,500.

To each of his clerks, six in number, who have been in his employ fifteen years, if living with him when he dies, £3,000, or \$90,000.

To the omnibus coachman and conductors between Paddington, Regent's Park and the Bank of England, via the New Road, to be distributed by their friend, Sir Peter Laurie, late Lord Mayor of London, each one guinea—£210 or \$1,050.

To the fourteen keepers at the Zoological Gardens, Regent's Park, London, each £5—£70, \$350.

To the poor of Belgravia, to be distributed by his liberal friend, the Marquis of Westminster, £1,500 or \$7,500.

To the committee of the London Reform Club for the time being, to engage competent lecturers on political economy, the interest of £10,000 annually, \$50,000.

To the Liberal Association of the City of London, by his friend the Marquis of Westminster, £20,000 or \$100,000.

For the promotion of social science, by his friend Lord Brougham, the interest of £20,000, to be expended every year, \$100,000.

To the Society of Foreigners of all Denominations in distress in London, by the Chairman for the time being, the interest on £10,000 annually, \$50,000.

The foregoing are exclusive of legacies to an immense amount to Jewish charities, and all free of legacy duty. The Baron Goldsmidt's property exceeds five millions sterling, or twenty-five millions of dollars.

When the winds of applause blow fresh and strong, then steer with a steady hand.

For Friends' Intelligencer.

THE MONARCH.

Why does the flush of beauty fade,
Almost beyond belief?

Why do we see in every glade,
The death of flower and leaf?

And why doth pride and power pale,
In every clime and land?

And why the strength of manhood fail,
Before an unseen hand?

Before its all resistless power
Whole nations pass away;
Are fading as the fragile flower
That blooms but for a day.

While wealth and station cannot steal
Away its fell decree;

Alike the great and poor must feel,
They are mortality.

That they must meet the sickle keen,
And share the common lot,
That knows no difference between
The palace and the cot.

Which scans the ages' rapid flight,
That bow before its power,
While as they pass before its sight
Are as a passing hour.

They pass away—and household bands
In quick succession fall;
But it remains o'er many lands,
The Conqueror of all.

W. W. H.

THE COMPASS FLOWER.

BY PARK BENJAMIN.

Behold the Compass Flower! a little flower
Which starts up in the prairies, like a thought
Of beauty in some wasted bosom wrought,
And cheers the traveller in his dreariest hour—

For it directs him on his devious way,
Even as the needle doth the sailor, tost
On landless billows, desolate and lost,
Without a star to lend its guiding ray.

Pointing due North, its leaves and petals show
Where lie the undiscovered realms, and where
The icebergs lift their pinnacles in air
From deep foundations of eternal snow.

Pointing to where the Arctic circle keeps
Its awful secrets locked in pierceless gloom,
And Franklin, the explorer, in his tomb
Of frost, unchangeable, for ever sleeps.

Pointing to that last, utmost verge, around
The pole, whereon the solid planet turns,
And, all undimmed, the Boreal splendor burns
Out of the darkness of that vast profound.

Thou extreme North! what is the force that draws
Toward thee alike the needle and *this* flower,
What is that wierd, inexplicable power—
Of such mute marvel what the wondrous cause?

Thus, as the traveller his path pursues
Lonely across the Texan wilderness,
Such musings may his idle mind possess
While the small Compass Flower he gladly views.

Brightening the desert, as the swinging light,
Set here and there upon a wave-borne buoy,

Inspires the coastwise pilot's heart with joy,
When he surveys it through the murky night.

How small a thing, and yet how great a deed!
Like many a blessing which our God bestows,
From the sweet scent and glory of the rose
To the strange virtue in a homely weed.

BRITISH GUIANA.

HER LUXURIANT VEGETATION—THE VICTORIA REGIA—REMARKABLE NUT—VEGETATION WONDERS.

British Guiana, lying within the tropics where a constant summer prevails, contains a vigorous and luxuriant vegetation. The grandeur of nature's gigantic efforts, displayed there in the vast size, varied forms, and extraordinary rapidity of growth of the vegetable kingdom, strike the stranger accustomed only to the less luxuriant aspects of colder climates, with astonishment and delight.

The peculiar and distinguishable feature of the coast of Guiana is a fringe or belt of mangrove and courida trees, immediately behind which comes the cultivated strip of land. The intervening space, back to the base of the mountain ridges, is covered with well watered savannahs of great extent, and dense forests. In these primitive scenes, gigantic trees raise their lofty crowns to a height unknown in our northern latitudes. Clusters of palm trees, of all the vegetable forms the most grand and beautiful, rise majestically above the surrounding vegetation, waving pinion-like leaves in the soft breezes. Nature, as if not satisfied with the soil allotted to her, decorates with vegetable parasites the trunks and limbs of trees, the stones and rocks. These parasites, interlacing the branches and trunks of the forest trees, are called *Lianes*, or "bush ropes," which, in many cases, after surmounting the highest limbs, descend to the ground and take root again.

The forests of Guiana are capable of affording supplies of timber unsurpassed in quality and durability for building purposes or in beauty for household furniture or fancy work. Birds of brightest plumage; insects and reptiles, in inexhaustible variety, people the otherwise silent solitudes of these vast domains. It is literally a vegetable realm; even the surface of the water is covered with a carpet of plants, interspersed by magnificent flowers.

The splendid *Victoria Regia*, the most beautiful specimens of the flora found in the western hemisphere, grows in great profusion upon the surface of the lakes and rivers. The following graphic description of this flower is from the work entitled "Brazil and the Brazilians:"—

Of all the nymphacea the largest, the richest, and the most beautiful, is the marvellous plant which has been dedicated to the Queen of England and which bears the name of "*Victoria Regia*." It inhabits the tranquil waters of the shallow lakes formed by the widening of rivers.

Its leaves measure from fifteen to eighteen feet in circumference; their upper part is of a dark, glossy green: the under portion is of a crimson red, furnished with large salient veins, which are cellular and full of air, and have the stem covered with elastic prickles. They are thus described:—

The flowers lift themselves about six inches above the water, and when full blown have a circumference of from three to four feet. The petals unfold toward evening; their color, at first of the purest white, passes, in 24 hours, through successive hues from a tender rose to a bright red. During the first day of their bloom they exhale a delightful fragrance, and at the end of the third day the flower fades away and replunges beneath the water there to ripen its seeds.

Naturalists and travellers become enthusiastic in their admiration when they behold this plant for the first time. It was discovered by Sir Robert H. Schomburgh, on the first day of January, 1837, in the river Berbice, British Guiana. He named it in honor of Queen Victoria.

The cultivated regions of British Guiana—the towns, plantations and settlements—are all within fifty miles of the sea coast. Beyond that is a dense and almost impenetrable forest, abounding in inexhaustible treasures of rare and valuable woods. This region is seldom visited by travellers, or even by the inhabitants of that country, save for the purpose of obtaining the rich woods for exportation.

Excursions into the interior are made with open boats upon the rivers. There are no roads nor foot-paths by land. On these inland voyages the native Indians are employed to propel the boats, and when on shore to clear away with their cutlasses the underwood, vines, &c., which render the forests impassable. On such occasions it is customary for the party to go on shore early in the afternoon, and seek a suitable place to encamp for the night, where they may suspend their hammocks between two trees, and build fires to prevent the unhealthy effects of the decaying vegetable matter, and as a necessary prevention against the attacks of tigers and other wild beasts.

Among the innumerable variety of trees, fruits and nuts which abound in this productive region, there is one, the seed of a tree, a nut, which is more remarkable and curious than all others. It is called the snake nut. While the voyageurs are selecting a place for their night encampment, should they chance to discover any of these snake nuts upon the ground, they quickly abandon the site, return to their boats, and proceed to select another place. The natives regard the presence of this nut as a warning that its locality is inhabited by venomous snakes, the bite of which is certain and almost instantaneous death. It is said that such a snake is found in the vicinity of the tree bearing this nut. The co-existence of the

nut and the snake is a subject which we shall leave for the imagination of others, as we have not been able to glean any facts which explain why they are thus made companions.

This remarkable nut slightly resembles a bitter walnut in external appearance, yet it often attains the size of an English walnut. It grows with a smooth husk, covering a thin stone or shell. When dried, the outside of the shell is of a dark brown color, while the inside is whitish, and has a beautiful, pearly-like surface. The kernel, or embryo of the nut, grows in the form of a snake, as it lies coiled upon the ground. One end is large, resembling the head of a snake, and from this it gradually tapers in coils to the other extremity. Its entire length, if uncoiled, would be from six to eight inches, according to the size of the nut. When green, or fresh from the tree, the kernel may be thus uncoiled, and suspended in a bottle of spirits, in which condition it appears like a miniature snake.

While the nut is fresh the kernel is white and fills the shells, but when it has been kept for a long time the kernel becomes shrunken, hard and of a dark woody appearance, resembling a dried snake. On first opening the shell, the serpentine form of the embryo may be distinctly observed, although it is entirely covered by a thin, brownish skin, which may be easily removed, when the perfect form of the snake appears, with coils distinctly more separated than in the real snake. In the embryo of a fresh nut, the coils are filled with a woolly or downy substance. This hardens in drying, yet is easily removed. When vegetating, its root germ springs from the small end of the kernel. The appearance of the interior of the kernel, under a microscope, is very much like that of a piece of coarse grained maple sugar.

While Sir Robert H. Schomburg was in British Guiana, he discovered this nut in Demarara, and gave it the name it now bears, *ophiocaryon paradoxum*, or paradoxical snake nut. The snake nut tree, which produces this singular seed, is said to belong to the soap nut family. Specimens of this remarkable vegetable production were sent to the exhibition at the Crystal Palace in 1851, also to the exhibition at Dublin.

A few of these nuts have been brought to New York by Mr. Bernhard Reis, who was a resident of Demarara for twenty years, and for several years the Venezuelan Consul for British Guiana. He travelled much in the interior of that country, and to him are we indebted for the possession of a specimen of this wonderful nut, and for many of these facts pertaining to it.

The snake nut is truly among the most remarkable and seemingly paradoxical productions of the vegetable kingdom. Why the kernel of a nut growing on a certain kind of tree should invariably assume the form of a snake in a coiled position, is one of the mysteries of nature which she does not

reveal to casual observers. After extensive yet fruitless researches in the most complete works published on natural history and botany for some account of this curious and mysterious nut, we have come to the conclusion that it belongs to that neglected class whose history has never been recorded.—*Evening Journal*.

[From the Tiffin (Ohio) Tribune.]

AN INDIAN CAPTIVE RECLAIMED AFTER THIRTY-FIVE YEARS' ABSENCE—INCIDENTS OF HIS LIFE.

The following narrative of the return and recognition of Matthew Brayton, the long lost son of Elijah Brayton, of this county, who was stolen by the Indians thirty-four years ago, will be read with interest. It was kindly furnished by Mr. J. W. Chamberlin, of Cary, and can be relied upon as true:

On the 20th of September, 1825, two children of Elijah Brayton, then residing near Springfield, in this county, were sent out after the cows. After going a short distance from home, the younger one, Matthew, a lad between seven and eight years of age, became fatigued and started for a neighboring house, close by, while the other continued the search for the cows. Since that time nothing has been heard of the child, until lately. The country was thoroughly searched by all the whites and friendly Indians that resided near this settlement, and continued several weeks, but without effect. At the time he was lost there were two scars on his person, one on his head, caused by a boil, and one on the big toe of his right foot, caused by a cut with an axe.

During the latter part of last August it was ascertained, through the medium of the papers, that a returned Indian captive was at Cleveland, searching for his relatives. Search was made for this person, but he was not found until Tuesday evening, November 15th, when he was discovered at a farmer's house, near Sugar Grove, Warren county, Pa., by William Brayton, who started with him immediately for Adrian, where he arrived Thursday noon.

The news flew like wildfire through the neighborhood, and the people have been visiting him constantly since his arrival, questioning and cross questioning him until he is almost exhausted. The scars, corresponding to those on Matthew Brayton when lost, were found on his person. He is a man about five feet seven and a quarter inches in height, and of light complexion. He has some tattoo marks on his chest, also some scars on his right leg, caused by wounds received in an Indian battle some three years ago. The Indians, in performing the necessary surgical operation, strapped him to a log, and sewed up the wound, (some eight inches in length,) with a buckskin thong, making but three stitches.

The scars made by the needle and thong are nearly as large as that made by the cut of the tomahawk. He has with him his Indian dog, called Nemi, and a large pipe made of flint, which weighs nine ounces. He says it took him one moon to drill the hole through his pipe, which he did with a piece of steel, some bear's oil and water. He was stolen by the Pottawatomie and Canada Indians, and was shifted from one of these tribes to the other, until he was sold by them to the Pawpaw Indians, who gave five and a half gallons of whiskey for him, and they sold him to the Winnebagoes for seven and a half gallons. They were living at Michigan at that time. The Chippewas bought him of the Winnebagoes, and kept him two months and a half, and then sold him to the Sioux for eleven gallons of the "fire water." This he does not recollect himself, but it was told him by the various tribes, as he traced himself back to Ohio.

He remembers back to the time when he was owned by the Sioux, which he says was twenty-six years ago. To use his language, "I was then a head shorter than I am now." He was purchased from the Sioux twenty-five years ago last April, at Cedar Rapids, Iowa, by the Snakes and Copperheads, with whom he has resided ever since. He lived in Iowa two years, then moved to Minnesota, where he staid six months; thence to California, where he resided five and a half years; thence to Oregon, where they staid two years; thence to the Russian Possessions, where he has resided ever since, except when travelling to and from their trading points. He lived near Behring's Straits, two hundred miles northwest of "Big Esquimaux" village, 60 degrees north latitude. He has crossed the Straits several times in the winter season on the ice. He was crossing once, a few winters ago, on the back of a large elk, going at a pretty sharp pace, when the elk stepped into an air hole throwing him over his head into the water. At the time this took place the lamented Dr. Kane, with his expedition, was in that section. After getting out of the water he met one of his crew, a man by the name of Thomas Hickey. Since his return to the States, on his arrival at Cleveland, when he got off the train, he saw Hickey, who recognized him instantly, calling him by his Indian name.

He was in St. Paul when it only contained seven houses. About eight years ago his tribe, being nearly famished by hunger, went to Hudson Bay in search of provisions, where he first learned that he was a pale face. The whites being unable to purchase him (the Indians refusing to part with him) threatened to take him by force, but the great disparity of their numbers prevented them from putting their threat in force. They would not visit any white settlement for three years after that, for fear he would leave them or be taken away by the whites. They

then visited Lord Selkirk's settlement on Red River, where they got into a skirmish with the whites. The whites told him there, also, that he was a white man. He had been at St. Paul seven or eight times on trading expeditions; also at Lord Selkirk's settlement, Hudson's Bay, and St. Anthony's Falls. The whites repeatedly told his tribe that if they did not let him go to the States to search for his relations, they would take him from them by force. He left his residence September, 1858; left St. Paul on the 16th of April, 1859, in company with his Indian brother, (chief elect last Fall,) six Indians, three ponies and five dogs. They came with him to Chicago, where he was taken sick and placed in the hospital for treatment and kept there till he recovered. His Indian friends there left him and returned to their tribe. He went from there to Detroit, Michigan; thence to Ohio; thence to Northern Pennsylvania, where he was found by William Brayton. He was then on his way to some Indians in New York. He can speak five different Indian languages, viz: Snake, Copperhead, Crow, Utah and Flathead. He also speaks the English language very fluently and correctly, which, he says, came to him almost intuitively on meeting with the whites. The tribe with which he lived had a compass and watch, enclosed in one copper case, which they used in travelling. They purchased it of the Russians, for one hundred dollars.

He says the Snakes, Copperheads, Crows, Utahs and Flatheads, together, number 100,500 souls—men, women and children included.

He married the daughter of the Grand Chief, seven years ago. He has two children, son and daughter. His daughter's name is Tefrona, [Tame Deer,] and is five years old. His son's name is Tulloosa, two years old last June. His own name is Owahowah Kishmewah. When he arrived at Chicago he was dressed in Indian costume, daubed and painted, his hair hanging down to his knees. While in the hospital, they cut off his hair and scrubbed him with sand, soap and water, until all vestige of the paint was removed. He ate meat raw, but will not eat food containing salt.—*Ledger*.

ITEMS OF NEWS.

TELEGRAPHIC EXPEDITION TO THE NORTHERN REGIONS.—The barque Wyman, which sailed from Boston, in 8th month, having on board a surveying party to make surveys and soundings for a submarine telegraph line from the coast of Labrador to Greenland, Iceland and the Faroe Islands to Scotland, arrived at Glasgow on the 14th ult.

THE OVERLAND TELEGRAPH.—The telegraph line now being projected to the southwest towards Fort Smith, in Arkansas, and ultimately to make connection with the line being built eastwardly from California, is finished to Warsaw, in Missouri. It will be completed in about a week to within eighteen miles of Springfield, when the work on it will probably be suspended for the winter.

THE TOTAL ECLIPSE OF THE SUN.—The total eclipse of the 18th of 7th month next will be a very important one to the scientific world. The director of the Dorpat Observatory was the first to remark that at the moment of obscuration four of the principal planets—Venus, Mercury, Jupiter and Saturn—will appear in the vicinity of the eclipsed sun as a kind of rhomboidal figure; a phenomena of such extraordinary rarity that many centuries will elapse before its repetition. Darkness will commence and terminate on the land, the localities being California and shores of the Red Sea. Between these extreme points the eclipse will be visible in N. America, from whence the moon's shadow will pass across the Atlantic, and traverse Spain; total darkness including the following important towns in that country: Ovide, St. Vincent, Santander, Bilbao, Vittoria, Bruges, Pampeluna, Saragossa and Valencia. The line of totality will then cross the Mediterranean and enter Africa, passing across Algiers, Bezan, Tozer, Sockna, Sebba, Goddona and Mourzuk. Thus, although this remarkable eclipse will not be total in any part of the United Kingdom, it will be so in a large portion of Spain and accessible portions of Africa.—*North American.*

POISON IN PLANTS.—Dr. Edmund Davy, Professor of Agriculture and Agricultural Chemistry in the Royal Dublin Society, has made some startling statements, conveying the result of his experiments as to the presence of arsenic in crops. He states positively that arsenic as it exists in the different artificial manures (such as superphosphate) will be taken up by plants growing where those manures had been applied. He found this to be the case with cabbages; and turnips taken from the fields in which superphosphate had been used gave the most unmistakable evidence of having been arseniated. The facts thus collected appear to Dr. Davy to have some important bearings, for "though the quantity of arsenic which occurs in such manures is not large when compared with their other constituents, and the proportion of that substance which is thus added to the soil must be still small, still plants may, during their growth, as in the case of the alkaline and earthy salts, take up a considerable quantity of this substance, though its proportion in the soil may be but very small. Further, as arsenic is well known to be an accumulating poison, by the continued use of vegetables, containing even a minute proportion of arsenic, that substance may collect in the system till its amount may exercise an injurious effect on the health of man and animals."

DESTITUTION OF THE JEWS AT GIBRALTER.—The *Jewish Messenger* publishes letters from Gibraltar, revealing a state of terrible destitution and suffering among the Jews in that part of the world, resulting from the war between Spain and Morocco. The *Chronicle* says:

"Placed as they are between the attacking Spaniards, the defending Moors, with the savage Kabyle ready to pillage and plunder them, need we wonder that hundreds of Jewish families have fled from Tangiers, regardless of their destitution, heedless where they shall find a shelter for their weary heads, a home for their houseless wives and starving children? Twenty-seven hundred of these care-worn beings have arrived at Gibraltar.

HAYTI.—*La Republique* of 11th month 10th, declares that the present Republican Government is the best that has ever existed in Hayti, and enumerates among the good works it has already achieved, the creation of a good police, the re-organization of the tribunals and their freedom from corruption, and the extension of commerce.

In England lately a coal-digger at Hettonle-Hole;

an earnest student of astronomy, and greatly in want of a good telescope, made a direct application to the Queen for an instrument. His hopes were not disappointed, and after the lapse of a short time a very beautifully finished brass instrument was received by the petitioner.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market is still dull, but prices are well maintained. There is a light export demand at 5 25, with small sales of extra family at \$6 50, and in small lots for home consumption at 5 37 a 5 44 per barrel for superfine; \$5 62 a 5 87½ for extras. Fancy lots range from \$6 50 to 7. Rye Flour is firm at \$4 37½, and Penna. Corn Meal at \$3 75 per barrel.

GRAIN.—The offerings of Wheat continue light, but the demand is quite active; sales of 2000 bus. prime Delaware and Penna. red at 132c; white at 137 a 143c. Rye is in demand, at 93 cents, Corn is in fair demand, and 8000 bushels new yellow sold at 77 a 80c., afloat and in store, and some damp at 73 a 75c. Oats are steady; 2300 bushels Delaware sold at 42 a 43c.

CLOVERSEED is in fair demand at \$5 a 5 25 per 64 lbs.; 5 50 for a choice lot, and 4 75 for lots from wagons. Timothy sells in a small way at \$2 50, and Flaxseed at 1 56 per bushel.

A YOUNG WOMAN having had some experience in teaching, and possessing a certificate of qualification, is desirous of a situation in a family school. Address C. CLEMENT, 12 mo. 17,—3t. Paulstoro, N. J.

"SCRIPTURAL WATCHWORD"—a little book for daily reading, just issued and for sale by the publishers, Hays & Zell, 439 Market st., Philadelphia. Retail price 31 cents; per dozen \$3.36 cents. Single copies sent by mail, prepaid, for 37 cents. 12 mo. 17.

HEAVY BLEACHED SHIRTINGS made from AMERICAN COTTON, warranted in all respects the product of *Free Labor*. For sale by

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, TWELFTH MONTH 24, 1859.

No. 41.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,

No. 324 South Fifth Street,

PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

LETTER FROM JOSEPH RICKMAN TO ANN GILBERT.

Ann Gilbert, to whom the following letter was addressed, resided at the time of its date in England. She was under religious exercise of mind, and had requested the writer's sentiments on the subject of music, painting and poetry.

7th month, 1795.

My dear young Friend,—There is an originality inscribed on all the works of the great I Am, that claims all our attention, and reverent regard; but we are too apt to overlook it, prescribe likenesses to one another, and expect to receive them.

This is one mischief of what is called "polished life." Nevertheless, thou hast some little reason to believe I am not an advocate for rusticity, nor an enemy to just regulations of civility, within the limits of the pure truth; but these do not extend to a fastidious delicacy, which is easily offended, and is scarcely tenable, compatible with the varieties of probationary life, without being offended or disgusted. Mayst thou be preserved from extremes on every hand; but do not be uneasy,—say rather, do not be too anxiously solicitous; uneasy thou wilt be, about violations of exact propriety. A wise parent, when the child is in no danger of breaking bones, may permit it, at just walking alone, to get now and then a fall, to induce a habit of greater care and watchfulness, in situations where a fall would be seriously hurtful. But *ever settle it in thy mind*, my dear young friend, in thy very outset in the divine life, nor suffer the enemy of thy soul's happiness, the forger of lies, ever to prevail with an insinuation contrary thereto, that "He with whom we have to do,"

as the sacred Scriptures with comprehensive simplicity, express it, is a Father,—a tender parent! It will settle many reluctancies to returning, when thou mayest have wandered a little or much. He is ever ready,—more ready than the tenderest of parents,—than even a maternal tenderness,—to receive the returning mind! Let the divine, all-solacing idea expand, and it will be a volume to thee. Wouldst thou grieve a tender parent,—a mother, for instance, perhaps more nearly affecting,—wouldst thou grieve her, because persuaded she would forgive thee? Would that persuasion induce a wilful violation of her commands and desires? But, if so far lost to proper consideration for a moment, as even wilfully to violate, would a mother refuse to relent, when addressed with the tenderness of filial penitence? It is spoken of, indeed, in holy writ, as a possible case, though altogether so unlikely, as to occasion this mode of inquiry. Can a mother forget her children—the child at her breast—that she would not have compassion for her own son? Yes! even such a strange case may possibly be; but, saith the Lord, "I will never forget—never forsake," &c. And He who prescribed "receiving a returning, repenting brother, not unto seven times only, but seventy times seven," he will much more abound in mercy and condescending regard. Let no distance, therefore, after any offence whatever,—great or small,—keep thee from returning humbly to thy heavenly Father immediately—and, "my life for thine," if lawful to use such strong language, thou wilt find the good effects thereof, and no presumption.

Love softens the heart—and excites he uniform spring of obedience, that no legal conviction can produce; and here thou wilt have to tell unto others, from thy own happy experience, that "God is good"—that his name and his nature is "love"—that "he so loved the world that he gave his son"—the manifested Deity—"not to condemn, but to save the world"—that "whosoever believeth on Him should not perish, but have everlasting life." And who is this glorious Him? "Who is this King of glory?" Why, every thing that is truly amiable and excellent in nature and in grace, in the moral and natural world, is a portion of Him; and the more extensively we see his glory tending to final consummation in the "land that is very far off," the more need we shall rightly value and

prize the beauties that are near at hand, and obviously from him. As thou hast intimated in thy inquiry, from which, as is very apt to be the case with me, my mind has been drawn into a very unexpected and unsought for line of communication; but I hope not wholly unadapted. Speaking of the staining of the beauty of this world, thou must understand of its corrupt mixtures; among which, however offensive this remark to some minds, who would be thought liberated in the pure truth, we must reckon many things deemed *refined*, and classed among the polite arts and sciences.

There undoubtedly is, for instance, a refinement, comparatively, in the pleasures and sciences, of music, painting and poetry; yet how apt are they to be corrupt, either in their degree or application—therefore, how necessary they should be stained, and how certainly they will be, as to their captivating effect, to an extreme, by minds that have felt and tasted “the power of an endless life.” Superior glory lessens, or stains inferior glory; or, as it were, absorbs it. I am no enemy to the useful, and, within certain limits, the pleasing application of the second and third branches, (which last I have often cultivated with satisfaction, on moral and religious subjects); and with regard to the first,—it is not my business either rudely or determinately to censure others:—for myself, having an opportunity in the early part of my life of being much conversant therewith, had I been easy,—I can only say, that in religious, or professedly religious exercises, it appeared to have a more amusing, softening, enervating effect on my system, than to be solidly edifying. But, mindful of the originality in every one’s make, or constitutions, if I may so speak, I will not dare pronounce for another. With regard to that science merely as an entertainment, I observed it to have equally, if not more enervating, dissipating effects; and besides that, as time is precious, and much to be acquired in a small space, there were other entertainments for a young mind, far more interesting than mere sound; and real entertainments too, in which the useful is blended; such as informing the mind by history, &c., so there seemed to me no room, nor any properly cogent inducement for the prosecution of that science. I had opportunities of observing some who excelled in it, sadly ignorant of the true harmony,—the harmony of the mind,—and very uninformed.

Now, if my dear young friend has really more time than she knows what to do with, (a predicament I am much a stranger to,) and can employ it to no more improving and profiable purposes, blending the *utile* and *dulce*,—even let her sing, dance and be merry. “Rejoice, O young woman, in thy youth, &c.” but remember, Solomon adds: and it is a solemn remembrance, if thou recollectest,—calling for se-

dateness, not gloominess. But, O dear Ann! to be serious, thou knowest, and will doubtless more know, that life has its arduous exercises, calling for our being deeply prepared to meet, and to be cautious of its offered amusements and evanescent beauties of man’s creating and inventing, additionally to the genuine and natural ones; as a much admired writer says on another occasion, “God made the country, man the town,” so we may speak on this; there are numerous additions, amusements, &c., of man’s making, that we had more need by example and precept to seek to contract than to expand. Yet enough will be left after a great deal of contracting, to recreate and unbend, which may be requisite for some constitutions, and for some who are much bent, if I may so speak. But, as a memorable character once said, “Those are apt to talk most about its being requisite to unbend, who never were bent.” For my part, I am rather an advocate than otherwise for amusements; but I approve of the union of improvement and entertainment at the same time. There are numerous less exceptionable than some the polite would advocate the cause of; yet I would not be illiberal; what is poison to one, may not be so to another. If a parent had a wild, dissipated, rough, unfeeling son; he might be allowed to be pleased by having his violence restrained a little, by some domestic amusement, and the evil spirit cast out, or soothed into quietude by some potent harp, like David’s, (if he has left such an one below.) But were the same parent a truly wise and judicious one, possessed of a daughter already meekened and harmonized by the sweetness of truth, and a well improved educational care, I do not conceive he would discover that wisdom, or a deep knowledge of human nature, in wishing that daughter to be much conversant with the fascinating charms of music. But though I think thus from my own observation and experience of the powers of music, (God made the voice,—man, the complicated, enervating additions,) I am not to judge for another; sufficient, if I am made sensible, and preserved attentive thereto—that such and such things are most suitable for my line; and this is all I wish to inculcate on the minds of the youth,—a deep attention to the proper use of each, according to that voice, which, if obeyed, produces peace. Thou knowest not what Divine providence may allot for thee in a future day; perhaps such a place as the arts of music will have no proportion of consistency with; yet thou wilt, I hope, ever be preserved from judging others, and only simply say, so and so things appear and feel to me. This is a mode of speaking and a line of communication most easy to my mind, in addressing the variety of characters I am obliged to meet with. The rude insinuation I have heard, that some people are in such and such a contracted

line, from want of taste, is not applicable to all who decline some generally received embellishments; it is from the deep sense of necessity for their minds to abide under the operation of the cross of Christ, and to keep a tight rein on their natural taste, lest it exceeds the bounds of propriety and moderation in degree or application. But I perceive a larger field of communication to thy susceptible mind than the present time will allow of my entering far into. Dwell deep,—be humble, watchful, docile,—and the Lord will bless thee, perhaps make thee in thy day a more desirable character than that which too many of the syren songsters of our day are imitating among the daughters of men. Farewell for the present.

Thy sincere and very affectionate friend,
JOSEPH RICKMAN.

Integrity is a great and commendable virtue. A man of integrity is a true man, a bold man, and a steady man; he is to be trusted and relied upon. No bribes can corrupt him, no fear daunt him; his word is slow in coming, but sure. He shines brightest in the fire, and his friend hears most of him when he most needs him.

SELECTIONS FROM THE LIFE AND EXPERIENCE
OF THOMAS BULMAN.

(Continued from page 619.)

The monthly meeting complied with Thomas Bulman's request, and in reference to his union with Friends he writes,—

“O how shall I express the many visitations of God to my soul! for though I was far from meeting, and had the cross to take in leaving all my near relations, as well as communion with the members of what is called the Church of England and with the Methodists, in order to join myself with this despised people, yet I am satisfied in having done so, believing them to be highly favored. May I adore the Lord's holy name whilst in this world!

My residence being about six miles from meeting, the distance at times felt rather trying to me, and I thought of disposing of my small property, and removing more amongst Friends, and nearer the meeting; but still feeling for the divine hand which had hitherto led me safely along through many trials and difficulties, it clearly opened in my mind that I should remain where I was, to bear a testimony to God's holy name amongst a crooked and perverse generation; unto this I freely gave up; and oh the sweet incomes of divine love vouchsafed to my soul! May the Lord ever keep me in holy obedience to that pure witness in my heart, the Spirit of the living God, the all-sufficient guide through this transitory world. By giving up to this requiring, it never more felt as a difficulty for me to get to meeting; but many times was sweet and

pleasant; blessed be the Lord's holy name, for all his favors, which are more in number than the hairs of my head.”

So far from complaining in after-life of any difficulty in getting to meeting, Thomas Bulman pleasantly replied to a Friend who was sympathizing with him on this subject, “Oh I have whiles three good meetings in a day, viz. in going, when there, and on returning home;” and he remarked, that he thought some of those who lived near the meeting-house were often so engaged with worldly matters till the time for meeting, that they could scarcely get there in due time; and when there, it was hard for them to have their minds rightly directed; and if they sometimes felt a little good, the impression was in danger of being soon lost, as immediately after leaving meeting they were again engaged in the things of the world.

As Thomas Bulman grew in grace he felt with increasing weight the responsibilities of religious fellowship; and as a good steward of the manifold grace of God, he sought, under the constrainings of the love of Christ, to strengthen the weak, and encourage the honest-hearted, as well as to warn the unruly. His services as a father in the church were acceptable to the flock over which the Holy Ghost had made him an overseer, and they recognized his gift by appointing him to the office of Elder.

The following are extracts from some of his pastoral letters.

Dear Friend,

I have been concerned about thy not attending our week-day meetings, and the concern has been so long with me, reviving in my mind again and again, that at length my heart was melted into tenderness for thee. I once thought that thou mightest, as a father, have administered advice to me, poor unworthy mortal. But oh, dear brother, consider the cause of this neglect; plead not thy situation in life as an excuse; it seems far beyond mine in opening a way to attend at these opportunities. Let me tell thee in the feeling of divine love, that I would not part with my share of heavenly blessings, which I receive in these meetings, for all that thou dost possess in this world. O, I say again, consider from whence this neglect arises. Hast thou fallen into a state of indolence and ease? Remember that woe is pronounced against those that are at ease in Zion. Arise and shake thyself from every thing that would hinder thee from taking up the cross and daily following Christ. Art thou ashamed to assemble with a few despised ones? Remember the Lord, whom we profess to serve, can bless, or can blast our endeavors, notwithstanding all our unnecessary care and fretting. Oh my dear friend! let these few hints have place in thy breast, till the Seed of the Kingdom leavens every thing that is of a contrary na-

ture to the pure simplicity of the Truth; and then thou wilt find a concern to attend with thy brethren, and bear thy part in the holy warfare. Then thou wilt feel an earnest desire to become a father in Israel, a pillar in the church, a good example to thy children, a light in the world, a city set on a hill, which cannot be hid. Oh friend, I have nothing in view but love to thy soul in thus addressing thee, being led thereto in obedience to the divine Power which called me from darkness to his marvellous light: and the honor of the cause of Truth is more to me than my necessary food. Therefore submit when thou art warned, lest when thou wouldst, thou shouldst find it more difficult than in this precious season, when our meetings are so divinely favored with heavenly blessings. Why shouldst thou stand at a distance and shut thyself out, whilst we feed on a feast of fat things, on the wine on the lees, well refined, and refresh our spirits at the never failing streams of the Living Fountain? I say arise and come away, all things are now ready; come to the marriage.

THOMAS BULMAN.

In the year 1779, when about 32 years of age, Thomas Bulman believed it best for him to look towards a settlement in life by marriage. And on this important subject many were the prayers of his spirit for right direction, which there is reason to believe he did not seek in vain. By keeping his eye single unto the Lord, he had faith to believe that a suitable help-mate would be provided for him, and that the Lord would bring his desire to pass in his own way and time; and this was remarkably the case. When his choice was made, and his affections centered on her who became his wife, it was his earnest desire that she also might clearly see that the matter was of the Lord, and that his will might be done in them and by them. The following extract from one of his earliest letters to his friend shows the simplicity and integrity of his mind.

"My dear, I am not inviting thee to worldly honor, riches or pleasure, or to vain glory; for these things have not the savour of life in them; but it is to dwell in a lonely cottage, to be a pattern of humility, of lowliness and meekness, such as becomes women professing godliness, that thou mayst become a standard bearer in righteousness."

About this time, he wrote a letter to his former fellow-professors, the Methodists, explanatory of his reasons for withdrawing from their society. It appeared they had expressed some dissatisfaction that he had not mentioned to them his reasons previously. In this letter he reminds them, "that he was born a member of the so called Church of England, and was according to its rites baptised, and brought up in its way of worship," he then says, "But I found nothing among them to comfort or satisfy my immortal

soul. At times, however, the good Spirit of God was secretly striving with me, and condemning me for my wicked course of life, when I could have wished to have been like the beasts that perish; for unto them after death there is no judgment. But I found there was in me an immortal part that could never die; and yet alas! in that condition I was unfit to meet a pure and holy God. Then your example made me think there was something in your society to heal a sin-sick soul; so I took up the cross and joined with you; and at seasons I found the Lord to bless my soul, and comfort me in my heavenward progress, preparing me for a more spiritual worship. For in my nearest access to the throne of grace, I was made sensible there was yet a greater cross for me to take up before I could find true and lasting peace." He then relates how he was led to unite with Friends: "That a servant of the Lord, a Friend, had to tell me he believed I could become one with them, which I then thought little of; but a while after, attending a Friends' meeting on the occasion of a funeral, I felt such love amongst them, and such peace on my return home, that I was made to go on my way rejoicing. And having tasted of such divine love, I was sensible this was the worship well pleasing in the Lord's sight, and that which my soul needed, and I now enjoy true peace. So I could not think of turning my back on such spiritual and divine worship. The savour of the precious ointment was so largely poured forth on my soul, that the cross, which before appeared as a mountain, was laid low, the crooked paths were made straight, the rough places smooth, and the world's frowns as so many blessings to drive me to my Father's house. In the strength of my Father's love I am what I am. Dear friends, I have nothing but love to you all, and wish that you may so far know an overcoming of your spiritual enemies, that you may have to rejoice in the God of your salvation. And in your nearest approaches to the throne of grace, if it be but a sigh or a groan that arises in your hearts for me, breathe it out for my preservation in the Truth.

My love to you all as if named. Seek after and hold fast that which can alone preserve you blameless in the sight of God."

Soon after writing this letter, Thomas Bulman thought it right to call upon some of his former friends, to inform them why he could not accept the invitation which they sometimes sent him, to meet with them when they had the company of any of their most admired preachers. Much conversation seems to have ensued under a feeling of Christian love towards each other. In the course of it, he said, "I have now got a more pure and a more noble testimony to bear;" doubtless meaning to the spirituality of the Gospel, "and I must not violate this noble testimony." He commended them to that measure of grace which was revealed in their hearts; and

both the visitor and visited seem to have been melted into tenderness for each other. On taking leave, the master of the house said in much love, "O Thomas, I never felt the like of this, I think we can never part." A sincere friendship continued to exist between Thomas Bulman and this individual to the close of life. The name of this worthy and venerable man was Robert Bowman; he died at Irthington on the 13th of Sixth month, 1823, at the remarkable age of one hundred and eighteen years.

(To be continued.)

Love silence, even in the mind. True silence is the rest of the mind, and is to the spirit what sleep is to the body, nourishment and refreshment. It is a great virtue; it covers folly, keeps secrets, avoids disputes and prevents sin.

For Friend's Intelligencer.

MORNING REFLECTIONS.

Happening to rise this morning while the stars were still visible, I was struck upon opening the window shutter with the uncommonly beautiful appearance of the eastern sky. As the grey of dawn disappeared, I observed just above the horizon clouds like belts, which presently became a bright purple, then the tints gradually overspread the higher clouds until, like a panorama, the eastern sky kept changing with purple and red, and the most beautiful blue, like a morning in summer, until the golden clouds rolled together in splendor, covering the east, the west, the south and the north, with the clear light of day. These days are so full of events, that many minds are impressed with deep reflections. I could not help thinking while I was gazing at this change from night to day, of the departure of *one* who has lately left the scenes of earth for those, I doubt not, where there is no more night.

It is not my intention to describe *that man* who, while he has written the history of the noble, and true, and dauntless spirit, who seemed to see this land long before his frail ship, with its doubting crew, actually neared its shores, and ended his labors in describing *him* whose name he bore. Washington Irving had a heart, that wasted none of its energies in religious or political excitements, and while his life evinced genial kindness without partiality, he did not fear to satirize the high professors as too often "reading lessons of humility out of gilt edged prayer books, or humbling themselves upon velvet cushions." He drew touching but faithful delineations of truth and virtue—depicted them in simple robes—and so varied were these scenes from the grand drama of life, none can doubt his heart-felt interest in its moral or social welfare.

B.

For Friends' Intelligencer.

ANCIENT EGYPT AND THE TRANSLATORS OF EGYPTIAN HISTORY.

In a recent number of "Friends' Intelligencer" we noticed an article taken from "The Public Ledger," which set forth that Professor Mitchell, in his fine astronomical lectures, in Philadelphia, had alluded to a remarkable translation, which had been made of the inscriptions upon the coffin of an Egyptian mummy, by a gentleman of St. Louis, whose name was not given. Supposing that those who are not familiar with the subject may feel an interest in further information respecting this devotee to Egyptian researches, with some account of his labors, we refer them to an article published among the transactions of the Academy of Sciences in St. Louis. We do so with the greater readiness, because, having formed his acquaintance, we are much impressed, apart from his scientific and literary attainments, with his integrity and worth as a man.

The article referred to has the following title: "An Astronomical Inscription, concerning the year 1722, B. C., explained by G. Seyffrath, Professor in the Concordia College, St. Louis." Professor Seyffrath is a native of Germany, and is possessed of numerous titles, conferred upon him by the Universities of Europe, where, we are assured, he is justly considered the most learned translator of Egyptian writings in the world.

His life was spent, until his arrival a few years since in the United States, in the acquisition of knowledge, in decyphering the hieroglyphics on the monuments, and in translating the writings on the papyrus scrolls of Egypt.

From the character of the calculations derived from these sources, they promise to put an end to the discussions respecting the correctness of portions of the Sacred Scriptures, which, since the commencement of the present century, have agitated the minds of speculative readers.

The results of his inquiries have appeared in his books, issued at different periods, from 1832 to 1857, which may all be seen at the Astor Library, New York. They comprise about forty volumes, the greater portion written in Latin, the rest in German, with the exception of the article we have spoken of above, and a larger work, (also written since he became a resident of this country,) published in New York, by Henry Ludwig. Both these are written in English. The last named work contains "A Summary of Recent Discoveries in Biblical Chronology, Universal History, and Egyptian Archeology." We refer the reader to four of the chapters, which we will name.

Chapter X. is devoted to the Inscriptions on the Ceiling of the little Temple of Dendara, which was sawed out of the roof of the temple, with great labor, by one of the savans attached

to Bonaparte's expedition, and transported to Paris in 1799. This wonderful relic of other ages was received there with enthusiasm by all classes, and the most profound scholars of that day lent their energies to giving a correct translation of the inscriptions carved thereon. After a long and patient investigation, they declared that the hieroglyphics on this ceiling set forth that the temple of Dendara had been built seventeen thousand years before Christ. This decision was believed by the French philosophers, and others of that class, who united in representing that the Mosaic account of the Creation and of the Deluge was a "Myth." This was held in favor until 1833, when Professor Seyffarth, having discovered the Key to the Astronomical Calculations of the Ancient Egyptians, visited Paris. He made a study of this remarkable ceiling, and gave a translation diametrically opposite to those who had gone over the ground before him, and pronounced the carved representation of the Heavens, with the signs of the zodiac and other figures thereon contained, to be nothing more than "the planetary configuration of the birth of Nero, the Roman Emperor, which took place the 11th of February, of the 37th year after Christ." Half of the name of Nero is visible on the ceiling, and his name may yet be seen engraved on the parts of the temple which are still standing, where it was originally constructed at Dendara.

According to the writers of Roman History, the Emperor Nero had constructed and restored many temples in Egypt.

The XX. chapter produces "Astronomical Facts, in confirmation of the Chronology of the Old Testament."

The XXI. chapter "corrects the Grecian and Roman History by Astronomical Observations," whilst

The XXII. chapter "Re-establishes by Mathematical Facts the History of the New Testament."

Our space does not suffice to say more concerning the contents of this volume, which is filled with matter of importance to all who feel an interest in the records of ancient time. The learned author is a man of uncommonly retiring and unobtrusive habits, who, after his own labors were accomplished in its preparation, has taken no pains to recommend the work to the attention of the public; but those who have read it carefully, and particularly those readers who are intimately acquainted with Prof. Seyffarth, do not hesitate to believe that the extraordinary Mathematical and Astronomical Calculations published in this book, would all bear a test of similar character to that to which Prof. Mitchell submitted the translation of the Inscription of the Egyptian Coffin, in the British Museum, and with a similar result.

T.

12th mo. 16, 1859.

The following remarkable circumstance is related on the testimony of a minister in the Society of Friends, residing in Cornwall:

A person of respectability and good standing in society, residing in the town of Plymouth, England, was awakened out of sleep one night under strong emotions of mind by a voice sounding in his ear, as he thought, and calling him to "*Arise and go to Launceston*"—Launceston is an ancient town in Cornwall, about twenty-two miles from Plymouth, having an antiquated castle, in which George Fox was some months a prisoner in the year 1656.

Having no acquaintance in the place, nor any known business that would take him there, he treated the occurrence as the effect of a dream, and again composed himself to sleep. In a very short time he was awakened under stronger feelings by a similar command, which he still treated with neglect, though more reluctantly than before; and after falling asleep, was a third time aroused under sensations which admitted of no further postponement. He therefore arose and mentioned the singular occurrence to his wife, who endeavored to discourage him from attempting so long a journey at such an hour of the night, and especially as he had no apparent object in going. But his uneasiness was so great that he was not to be turned aside from his purpose, and saddling his riding horse, he set out. After proceeding some miles in the chilly darkness, groping his way as best he could, his resolution began to waver, and he reasoned with himself on the folly of his undertaking. "Surely," said he, "I am going on a fool's errand. I am an entire stranger in Launceston; I have no business there, nor any one on whom I can call." Under the influence of these cogitations he turned his horse towards home and thought of returning, but had retraced only a few steps when his mind became exceedingly distressed, and the words seemed to sound in his ear, with commanding authority, "Go to Launceston—go to Launceston." Yielding to this renewed requisition he resumed his journey, and reached an inn in the town soon after breakfast time.

While eating his breakfast, he inquired of the waiter what objects of interest there were in the place. "O," said the waiter, "not many—there is the old castle—people sometimes go to look at that. But now everybody is going to the Court of Assizes which is sitting here. The bell is ringing now, and the court assembling." After finishing his meal, he inclined to go to the court house, and found they were trying a man for his life on a charge of burglary. Two witnesses deposed positively that they saw the prisoner in the house at the time of the robbery, and the evidence being conclusive, the judge asked him if he had any defence to make. The poor man was evidently much distressed, and firmly but

earnestly asserted his innocence—declared that he was in Plymouth at the time specified by the witnesses against him, and that there was a gentleman in that town who could prove it, if he were here. The judge told him he had heard the evidence against him—that it was full and positive, and that the court could not receive his assertion in the face of such testimony. That if there was any one in Plymouth who could prove him to have been there at the time specified, he ought to have procured his attendance on the trial. The prisoner said he was poor—had been shut up in jail, and had neither the means nor the opportunity to obtain the attendance of witnesses. That he was an innocent man—that it was hard to die for a crime which he had not committed, and that he had no refuge but to trust in that Being who knew his innocence. His bearing and manner of speaking made an impression on the audience, and attracted more than ordinary attention. The judge said he pitied him, but if he had no testimony to adduce, he must instruct the jury to find a verdict of guilty. The poor man again asserted his innocence—spoke of the gentleman in Plymouth who could exculpate him, and closed by again committing his cause into the Divine hand. The judge made some further remarks about the person of Plymouth, and the desirableness of having him produced, when as the prisoner glanced his anxious eye around the crowd of gazing spectators, he suddenly descried the face of the Plymouth gentleman; and calling to the judge, said, “My lord, there he is now.” The court requested the prisoner to point him out; the traveller appearing to have no idea that he was the individual alluded to. On facing the bench, he was desired to look on the prisoner at the bar and say whether he knew him. “No, my lord,” answered the man, “I never saw him before.” This seemed discouraging; but leave being given to the prisoner to ask him some questions, the following interrogatories and replies, in substance, ensued:

Prisoner. Do you not remember a person calling at your office on the day specified and asking you to give him employment?

Ans. I do not remember such a circumstance.

Prisoner. Do you not recollect his telling you that he had a large family, and was destitute, and in great distress?

Ans. No; I have no such recollection.

Prisoner. Do you not remember that you gave him some encouragement to hope you might soon be able to employ him, and gave him permission to call on you again?

Ans. I do not.

Prisoner. Do you not remember expressing sympathy for his distressed situation, and a desire to help him, and that you might not overlook his case, making a memorandum of his

name, and the date, &c., on a note-book with a red morocco cover?

Ans. I cannot recall any such circumstance.

The prisoner seemed distressed at the want of recollection in the witness, and ceased to question him. After a few moments' silence, the witness remarked, “But I believe I have my note-book in my pocket, and will refer to it, and see if there is any such entry.” On this, he drew from his pocket the little book with the red morocco cover, and turning over the leaves, suddenly paused, and looking towards the bench with a countenance expressive of strong emotion, said, “Why, here it is—the name, the date and all about it. It had all entirely passed from my memory.” The excitement throughout the court-room had been increasing in intensity during the questioning, and now seemed at its height. The judge examined the memorandum book, and by comparing the date with the time at which it was proved that the burglary had been committed, it was obvious the prisoner could not have been there, and consequently could not have been the robber. The judge was so fully satisfied of his innocence that he directed the jury to find a verdict of acquittal, and thus the life of an innocent man was spared to his needy family.

Looking out of his window one summer evening, Luther saw, on a tree at hand, a little bird making his brief and easy dispositions for a night's rest. “Look,” said he, “how that little fellow preaches faith to us all. He takes hold of his twig, tucks his head under his wing and goes to sleep, *leaving God to think for him!*”

FINDING FAULT WITH YOUR CHILDREN.

It is at times necessary to censure and punish. But very much more may be done by encouraging children when they do well. Be, therefore, more careful to express your approbation of good conduct than your disapprobation of bad. Nothing, can more discourage a child than a spirit of incessant fault-finding on the part of its parent. And hardly any thing can exert a more injurious influence upon the disposition, both of the parent and child. There are two great motives influencing human actions—hope and fear. Both of these are at times necessary. But who would not prefer to have her child influenced to good conduct by a desire of pleasing, rather than by the fear of offending. If a mother never expresses her gratification when her children do well, and is always censuring them when she sees any thing amiss, they are discouraged and unhappy. They feel that it is useless to try to please. Their dispositions become hardened and soured by this ceaseless fretting; and at last, finding that whether they do well or ill, they are equally found fault with, they relinquish all

efforts to please, and become heedless of reproaches.

But let a mother approve of her child's conduct whenever she can. Let her show that his good behaviour makes her sincerely happy. Let her reward him for his efforts to please, by smiles and affection. In this way she will cherish in her child's heart some of the noblest and most desirable feelings of our nature. She will cultivate in him an amiable disposition and a cheerful spirit. Your child has been throughout the day very pleasant and obedient. Just before putting him to sleep for the night, you take his hand and say, "My son, you have been very good, to-day. It makes me very happy to see you so kind and obedient."

FRIENDS' INTELLIGENCER.

PHILADELPHIA, TWELFTH MONTH 24, 1859

We have forborne an extended notice of the sad occurrences which have taken place at Harper's Ferry, because we were aware they were almost universally known to our readers, and because we believed that during the progress of the trial of John Brown, and its attending circumstances, the wisest course was to be still.

The events of the past few weeks should cause every thoughtful mind to look at the subject of slavery, as it now exists in the United States. In some sections of the Southern States, so rapid has been the increase of slaves, that they largely outnumber the white population, and those who have had opportunities of observation assert that they are also increasing in intelligence. The ruling classes, accustomed as they are to depend upon the labor of others, are rapidly losing that energy and independence of character which are necessary to success in life.

Surrounded by an oppressed and servile population who are smarting under a sense of their degradation, the oppressor is harassed by fears and perplexed by the difficulties of his position. Habits and associations are thus formed which often unfit an entire community for the enjoyment of rational freedom, and in time degrade them to the condition of the class whom they hold in bondage. Such is the effect of slavery upon a community subjected to its influence, and it is no marvel that those who have been educated to believe that carnal weapons may be awfully used in the redress of grievances, should seek this unrighteous remedy for the evil; nor

is it matter of surprise that some of the servile class, who have been raised by circumstances or force of character in the scale of intelligence, should have attempted by the same unjustifiable means to secure the freedom of themselves and brethren. Facts like those which have occurred in our history, and may occur again, point with unerring significance to the great truth that no country can long flourish in an open violation of the laws of justice and right, without suffering the penalty. It is earnestly to be desired that the occurrences which have been adverted to will awaken our government, and our brethren of the South, to the danger which always threatens such a state of society, and to the adoption of means which will prepare the way for universal emancipation. Nor should we of the North refuse to share in the general burthen caused by this state of things, remembering that our forefathers fastened this festering sore upon the body politic, which is destroying the peace and prosperity of the whole country.

We should never forget that there are many of our southern brethren and sisters who sympathize with the feelings of those in the free states who are laboring in this cause, and we should be willing, if needful, to make heavy sacrifices to bring about the great day of emancipation. Especially should we avoid the use of harsh and irritating language, which is calculated to excite the angry passions but does not convince the judgment.

Without attempting to arrogate any thing to our own Society, we think it may be claimed for our predecessors in religious profession that they were actuated by a high sense of duty, and governed by that wisdom which is from above, in their efforts for emancipation among themselves. From that day to this, the Society have, upon suitable occasions, borne testimony against this great national sin, and have at times entered their protest to the general government of our country, and their appeal in behalf of the down-trodden and oppressed descendants of Africa.

We earnestly desire they may continue to maintain this testimony against slavery, and seek to know when they may availingly approach the powers of government to stop its encroachments.

The outbreak at Harper's Ferry, the execution of the conspirators, and the political aspect which the question has assumed, all call upon us, as

members of the Society of Friends, to be watchful, lest we be leavened into a spirit and action contrary to our professed principles.

We cannot expect to reform others either by denouncing, or ridiculing them, and it will be found that persuasion is always more available than force in the correction of an evil. Principle and a wise policy must ever go hand in hand, and it is far better to promote a good cause by love, faith and charity, than to hold up to reproach and ridicule those who still adhere to the prejudices of a false education. We must be large and catholic in our sympathies, use the arguments of justice and truth, and be willing to allow time for them to make a proper impression, ever bearing in mind that we too are guilty concerning our brother in this thing. A reference to our own experience will convince us that we are but slowly emerging from the darkness, and that the truth opens upon our vision only as we are humble and obedient to the light. We are among those who desire that the light with which we have been enlightened upon this subject may not be put under a bushel, that we may be willing to labor and to wait for the Divine blessing, remembering that our success will depend upon the spirit and manner in which we perform it.

A copy of the extracts of Indiana Yearly Meeting has been sent us for publication; but as we gave a short account of that Yearly Meeting, as well as those of New York and Genessee, it seems not necessary to publish them at this late day.

DIED.—On the 17th of 10th month last, at Yonge Street, Canada West, ANNA wife of Seth Armitage, nearly 63 years of age. She was an Elder of Yonge Street Monthly Meeting, much beloved by her relatives and friends generally.

THOUGHTS ON LABOR.*

BY T. PARKER.

“God has given each man a back to be clothed, a mouth to be filled, and a pair of hands to work with.” And since wherever a mouth and a back are created, a pair of hands also is provided, the inference is unavoidable, that the hands are to be used to supply the needs of the mouth and the back. Now as there is one mouth to each pair of hands, and each mouth must be filled, it follows quite naturally, that if a single pair of hands refuses to do its work, then the mouth goes hun-

gry, or which is worse, the work is done by other hands. In the one case, the supply failing, an inconvenience is suffered, and the man dies; in the other he eats and wears the earnest of another man's work, and so a wrong is inflicted. The law of nature is this, “If a man will not work neither shall he eat.” Still further, God has so beautifully woven together the web of life, with its warp of Fate, and its woof of Freewill, that in addition to the result of a man's duty, when faithfully done, there is a satisfaction and recompense in the very discharge thereof. In a rational state of things, Duty and Delight travel the same road, sometimes hand in hand. Labor has an agreeable end, in the result we gain; but the means also are agreeable, for there are pleasures in the work itself. These unexpected compensations, the gratuities and stray gifts of Heaven, are scattered abundantly in life. Thus the kindness of our friends, the love of our children is of itself worth a thousand times all the pains we take on their account. Labor, in like manner, has a reflective action, and gives the working man a blessing over and above the natural result which he looked for. The duty of labor is written on a man's body; in the stout muscle of the arm and the delicate machinery of the hand. That it is congenial to our nature appears from the alacrity with which children apply themselves to it, and find pleasure in the work itself, without regard to its use. The young duck does not more naturally betake itself to the water, than the boy to the work which goes on around him. There is some work, which even the village sluggard and the city fop love to do, and that only can they do well. These two latter facts show that labor, in some degree, is no less a pleasure than a duty, and prove, that man is not by nature a lazy animal who is forced by hunger to dig and spin.

Yet there are some who count labor a curse and a punishment. They regard the necessity of work as the greatest evil brought on us by the “Fall;” as a curse that will cling to our last sand. Many submit to this yoke, and toil, and save, in hope to leave their posterity out of the reach of this primitive curse!

Others, still more foolish, regard it as a disgrace. Young men,—the children of honest parents, who, living by their manly and toil-hardened hands, bear up the burthen of the world on their shoulders, and eat with thankful hearts their daily bread, won in the sweat of their face,—are ashamed of their fathers' occupation, and forsaking the plough, the chisel, or the forge, seek a livelihood in what is sometimes named a more respectable and genteel vocation; that is, in a calling which demands less of the hands than their fathers' hardy craft, and quite often less of the head likewise; for that imbecility, which drives men to those callings has its seat mostly in a higher region than the hands.

* From the Dial for 4th mo., 1841.

Affianced damsels beg their lovers to discover (or invent) some ancestor in buckram who did not work. The Sophomore in a small college is ashamed of his father who wears a blue frock, and his dusty brother who toils with the saw and the axe. These men, after they have wiped off the dirt and the soot of their early life, sometimes become arrant coxcombs, and standing like the heads of Hermes without hands, having only a mouth, make faces at such as continue to serve the state by plain handiwork. Some one relates an anecdote, which illustrates quite plainly this foolish desire of young men to live without work. It happened in one of our large towns, that a Shopkeeper and a Blacksmith, both living in the same street, advertised for an apprentice on the same day. In a given time fifty beardless youngsters applied to the Haberdasher, and not one to the Smith. But that story has a terrible moral, namely, that forty-and-nine out of the fifty were disappointed at the outset.

It were to be wished that this notion of labor being disgraceful was confined to vain young men, and giddy maidens of idle habits and weak heads, for then it would be looked upon as one of the diseases of early life, which we know must come, and rejoice when our young friends have happily passed through it, knowing it is one of "the ills that flesh is heir to," but is not very grievous, and comes but once in the lifetime. This aversion to labor, this notion that it is a curse and a disgrace, this selfish desire to escape from the general and natural lot of man, is the sacramental sin of "the better class" in our great cities. The children of the poor pray to be rid of work; and what son of a rich man learns a trade or tills the soil with his own hands? Many men look on the ability to be idle as the most desirable and honorable ability. They glory in being the Mouth that consumes, not the Hand that works. Yet one would suppose a man of useless hands and idle head, in the midst of God's world, where each thing works for all; in the midst of the toil and sweat of the human race, must needs make an apology for his sloth, and would ask pardon for violating the common law, and withdrawing his neck from the general yoke of humanity. Still more does he need an apology, if he is active only in getting into his hands the result of others' work. But it is not so. The man who is rich enough to be idle, values himself on his leisure; and what is worse, others value him for it. Active men must make a shamefaced excuse for being busy, and working men for their toil, as if business and toil were not the Duty of all and the support of the world. In certain countries men are divided horizontally into two classes, the men who WORK and the men who RULE, and the latter despise the employment of the former as mean and degrading. It is the slave's duty to plough, said a Heathen poet, and a freeman's business to en-

joy at leisure the fruit of that ploughing. This same foolish notion finds favor with many here. It is a remnant of those barbarous times, when all labor was performed by serfs and bondsmen, and exemption from toil was the exclusive sign of the freeborn. But this notion, that labor is disgraceful, conflicts as sharply with our political institutions, as it does with common sense, and the law God has writ on man. An old author, centuries before Christ, was so far enlightened on this point, as to see the true dignity of manual work, and to say, "God is well pleased with honest works; he suffers the laboring man, who ploughs the earth by night and day, to call his life most noble. If he is good and true, he offers continual sacrifice to God, and is not so lustrous in his dress, as in his heart."

Manual labor is a blessing and a dignity. But to state the case on its least favorable issue, admit it were both a disgrace and a curse, would a true man desire to escape it for himself, and leave the curse to fall on other men? Certainly not. The generous soldier fronts death, and charges in the cannon's mouth; it is the coward who lingers behind. If labor were hateful, as the proud would have us believe, then they who bear its burthens, and feed and clothe the human race, and fetch and carry for them, should be honored as those have always been, who defend society in war. If it be glorious, as the world fancies, to repel a human foe, how much more is he to be honored who stands up when Want comes upon us, like an armed man, and puts him to rout? One would fancy the world was mad, when it bowed in reverence to those who by superior cunning possessed themselves of the earnings of others, while it made wide the mouths and drew out the tongue at such as do the world's work. "Without these," said an ancient, "cannot a city be inhabited, but they shall not be sought for in public council, nor sit high in the congregation;" and those few men and women who are misnamed the World, in their wisdom have confirmed the saying. Thus they honor those who sit in idleness and ease; they extol such as defend a State with arms, or those who collect in their hands the result of Asiatic or American industry, but pass by with contempt the men who rear corn and cattle, and weave and spin, and fish and build for the whole human race. Yet if the state of labor were so hard and disgraceful as some fancy, the sluggard in fine raiment and that trim figure—which, like the lilies in the Scripture, neither toils nor spins, and is yet clothed in more glory than Solomon—would both bow down before Colliers and Farmers, and bless them as the benefactors of the race. Christianity has gone still farther, and makes a man's greatness consist in the amount of service he renders to the world. Certainly he is the most honorable who by his head or his hand does the greatest and best work for his race.

The noblest soul the world ever saw appeared not in the ranks of the indolent, but "took on him the form of a servant," and when he washed his disciples' feet, meant something not very generally understood perhaps in the nineteenth century.

Now manual labor, though an unavoidable duty, though designed as a blessing, and naturally both a pleasure and a dignity, is often abused, till, by its terrible excess, it becomes really a punishment and a curse. It is only a proper amount of work that is a blessing. Too much of it wears out the body before its time; cripples the mind, debases the soul, blunts the senses, and chills the affections. It makes a man a spinning jenny, and a ploughing machine, and not "a being of a large discourse, that looks before and after." He ceases to be a man, and becomes a thing.

In a rational and natural state of society,—that is, one in which every man went forward towards the true end he was designed to reach; towards perfection in the use of all his senses; towards perfection in wisdom, virtue, affection, and religion,—labor would never interfere with the culture of what was best in each man. His daily business would be a school to aid in developing the whole man, body and soul, because he would then do what nature fitted him to do. Then his business would be really his calling. The diversity of gifts is quite equal to the diversity of work to be done. There is some one thing which each man can do with pleasure, and better than any other man, because he was born to do it. Then all men would labor, each at his proper vocation, and an excellent farmer would not be spoiled to make a poor lawyer, a blundering physician, or a preacher, who puts the world asleep. Then a small body of men would not be pampered in indolence, to grow up into gouty worthlessness, and die of inertia; nor would the large part of men be worn down as now by excessive toil before half their life is spent. They would not be so severely tasked as to have no time to read, think, and converse. When he walked abroad, the laboring man would not be forced to catch mere transient glimpses of the flowers by the way side, or the stars over his head, as the dogs, it is said, drink the waters of the Nile, running while they drink, afraid the crocodiles should seize them if they stop. When he looked from his window at the landscape, Distress need not stare at him from every bush. He would then have leisure to cultivate his mind and heart no less than to do the world's work.

(To be continued.)

No man can tell whether he is rich or poor, by turning to his ledger. It is the heart that makes a man rich. He is rich or poor according to what he *is*, not according to what he *has*.

THE SCHUYLKILL RIVER.

The people of Philadelphia have been excited of late, touching the condition of the Schuylkill river as the fountain from which a large population must look for its supply of wholesome water. Certain appearances in the river indicated to common eyes, as in the case of our own Croton, that the water had become foul, and it was presumed that this foulness was the effect of an excessive growth of some injurious plant. It was known that the river water at and above Reading was unfit to drink, and that no fish could live in it, all kinds except eels having long since disappeared. But it was also known that great revolutions had taken place among the finny inhabitants even as low down as Fairmount. These changes were as harmless, however, as they were curious, and were owing to the damming of the river at that point, to furnish power to force the water up into the basin. The building of the dam was followed by the appearance of several kinds of fish which had not previously been known in the river, and which took up their quarters in the slack-water above that work, where they have continued to increase and multiply. Other kinds as mysteriously evacuated the same locality, while the delicate white catfish, peculiar to the Schuylkill, and famous, with its collateral coffee, as the staple luxury of tavern and picnic along the shores of the river for a hundred years, has almost wholly disappeared.

The discussion growing out of the alleged impurity of the Schuylkill water has developed facts far more striking than any which the condition of the Thames or Croton has elicited. It has laid bare the chemistry of a vast river, showing how beautifully Nature carries on even her most colossal operations for the benefit of man. The great mountain feeders of the river flow into it ninety-four miles above Philadelphia, and within that ninety-four miles the river falls more than six hundred feet. Instead of the sluggish current of the Thames, it may be called a mountain torrent, subject to impetuous freshets which carry havoc along its banks. Why such a stream, so thoroughly purified from its very sources by these freshets at various times in the year, should be fatal to the fish in its upper waters, has been a puzzle to many. But the fact is so, nevertheless. Formerly they were alive with trout, but they, with all other kinds, down as low as Reading, have disappeared. The cause is simple and obvious—the coal mines have done it. A hundred and thirteen collieries are now in operation on the head-waters of the river, forty-seven of which are worked above the water-level, and sixty-six below it. From the slopes and shafts of these collieries, steam engines are pumping out, day and night, great volumes of water charged with sulphuric acid, and emptying it in the river. The shales and slates of the coal seams contain large amounts of sulphuret of iron,

which is constantly oxydating, and generating sulphuric acid, by which the water is extensively impregnated.

In some cases this water is so highly charged with acid that the iron of the gangway railroads is consumed in a few months, requiring new rails. Breakers, screens, tools, and all iron things with which the acid water comes in contact, are speedily eaten up. The engines which raise it from the bowels of the earth are supplied with water brought at great expense from a distance, as the mine water would destroy their boilers. Its ravages on machinery of all kinds occasion a heavy annual expenditure in mines worked below the water level. The stream thus poured into the Schuylkill impregnates the river for thirty miles below the mines. Freshets may suddenly change the body of water in the river, but they no sooner pass away than a new impregnation commences; and as the stream is here ordinarily small, it soon becomes general. All the tributaries of the river are thus acidulated, and from them, as well as from the river down to Reading, the fish have long since disappeared. At that city there were certain indications some weeks ago similar to those which recently alarmed us for the Croton. The water became of a greenish blue, and was covered with an unsightly scum. But, while scarcely fit to use at Reading, it was entirely pure at Philadelphia, as below the former city the great tributaries enter the river, purifying all below them.

Above Reading the river enters the great limestone formation which has given to Berks and the adjacent counties their high agricultural position. It here receives the waters of Maiden Creek, which flows over a limestone bottom, and immediately the river water changes its appearance. The two streams, before they unite, are clear and transparent, but they no sooner mingle their waters than chemistry displays its wonders on the grandest scale. Maiden Creek, impure by being overcharged with lime, combines with the river, equally overcharged with sulphuric acid. These several impurities, having a strong chemical affinity, enter into combination, and render the whole stream perfectly pure, but destroying its transparency and giving it a milky or clouded appearance. The lime which is held in solution by the creek water unites with the acid which impregnates the river, and gypsum is the result, first rendering the water a bluish white, and then purifying it before it reaches Reading, by precipitating the gypsum to the bottom. It is probable that no natural laboratory of similar magnitude is to be found in any other part of the world. It is a beautiful example of the power of an ever-acting agency to make an entire river a blessing to the human species. With no acid from the coal mines to neutralize the lime, the populous city of Reading would be without a pure soft water for domestic purposes.

Her factories, her furnaces, her engines, would otherwise have no means of safely using steam, except by costly Artesian wells. So the Schuylkill, without its limestone tributaries to neutralize the acid from the coal mines, would be unable to furnish pure water to the city of Philadelphia, or to feed the boilers of the twelve hundred steam engines which have made her so great a manufacturing centre. Considering that the Schuylkill is a mountain stream, with a precipitous channel, often completely purified by heavy freshets, and that its chemical condition is absolutely perfect, it is difficult to understand how our neighbors of Philadelphia can be alarmed for the purity of their water. On that score nature has done everything for them but to raise it to their lips; and having made it pure to their hands, it will be their fault alone if it does not continue so.—*N. Y. Tribune.*

TRUST IN PROVIDENCE.

On a bridge I was standing one morning,
And watching the current pass by,
When suddenly into the water
There fell an unfortunate fly.

The fishes that swam to the surface,
Were looking for something to eat,
And I thought that the hapless young insect
Would surely afford them a treat.

"Poor thing!" I exclaimed with compassion,
"Thy trials and dangers abound,
For if thou escap'st being eaten,
Thou canst not escape being drown'd."

No sooner the sentence was spoken,
Than, lo! like an angel of love,
I saw, to the waters beneath me,
A leaflet descend from above.

It glided serene on the streamlet,
'Twas an ark to the poor little fly;
Which, soon to the land re-ascending,
Spread its wings in the breezes to dry.

Oh! sweet was the truth that was whisper'd,
That mortals should *never* despair;
For He who takes care of an insect,
Much more for his *children* will care.

And though to our short-sighted vision,
No way of escape may appear;
Let us *trust*; for when least we expect it,
The help of "*our Father*" is near.

RETIREMENT.

Deep solitude I sought. There was a dell
Where woven shades shut out the eye of day,
While, towering near, the rugged tree-tops made
Dark back-ground 'gainst the sky. Thither I went.
And bade my spirit drink that lovely draught
For which it long had languish'd 'mid the strife
And fever of the world. I thought to be
There without witness. But the little flowers
Looked up upon me,—the fresh wild rose smiled,
And the young pendant vine-flower kiss'd my cheek.
And there were voices too. The garrulous brook,
Untiring, to the patient pebbles told
Its history;—up came the singing breeze,

And the broad leaves of the cool poplar spake
 Responsive, every one. E'en busy life
 Woke in that dell. The tireless spider threw
 From spray to spray her silver-tissued snare.
 The wary ant, whose curving pincers pierced
 The treasured grain, toiled toward her citadel.
 To the sweet hive went forth the loaded bee,
 And from the wind-rocked nest, the mother-bird
 Sang to her nestlings.

Yet I strangely thought
 To be alone, and silent in thy realm,
 Spirit of life and love! It might not be!
 There is no solitude in thy domains,
 Save what man makes, when, in his selfish breast,
 He locks his joys, and bars out others' grief.
 Thou hast not left thyself to Nature's round
 Without a witness. Trees, and flowers, and streams,
 Are social and benevolent; and he
 Who oft communeth in their language pure,
 Roaming among them at the cool of day,
 Shall find, like him who Eden's garden dressed,
 His Maker there, to teach his listening heart.

THE PRAIRIES OF THE WEST.

We all write and speak of the prairies of the West, but no man can have an idea of them, until he has seen them in all their variety in Illinois. The real prairie is at some seasons of the year an unbroken sea of green, and this great landscape grows majestic from its vast extent. Far as the eye can reach in every direction, boundless as the view at sea when the billows are hushed, not a tree or dwelling in sight, these prairies stretch away in their grandeur; and when the change comes, when a group of trees is seen, or a solitary dwelling fills the void, the effect is in no sense weakened. To us it was the most wondrous prospect upon which we had ever gazed, and as we glided on for hours with this unchanged and magnificent view before us, we wondered that the fashionable tide of travel did not set in this direction. As we passed along near one of the towns, we saw a large picnic party emerging from the open prairie with immense bouquets of prairie flowers, which bloom in great variety and beauty of this season. We saw no rose, but almost every variety of small flowers seen at the East may be found here in a profusion which is wonderful.

The formation of these prairies is accounted for on various hypotheses; but the most natural and probable is the idea that they resulted from the deposits of water by which the land was ages ago covered. The clay and gravel which lie beneath have no peculiar qualities; but they are covered by a loam from twelve to thirty-six inches in depth, which is of inexhaustible fertility. It has been produced by the constant springing up and rotting down of prairie grass, which has been going on for ages. One of the most noble characteristics of the prairies is their destitution of vegetation, except in the multitude of rank grasses and flowers to which we have referred; but this is caused by the continual fires which sweep over the plains. Every fall these vast prairies

are burned over, and when this is prevented by the settlement of the country, forests will spring up in great rapidity. There are at present no indications that the soil can be worn out. It requires no manure, and will yield its crops so readily that the farming population pay too little attention to its proper cultivation. All over Illinois there are gross complaints of the careless manner in which agricultural operations are carried on; and so far as our observations extended the charge was substantiated. There are no barns anywhere, and the grain lies scattered about with unparalleled waste.—*Cor. Newark Mercury.*

TEACHING THE EYE.

The great majority of mankind do not and cannot see one fraction of what they might see. "None are so blind as those that will not see," is as true of physical as moral vision. By neglect and carelessness we have made ourselves unable to discern hundreds of things which are before us to be seen. A powerful modern writer has summed this up in one pregnant sentence: "The eye sees what it brings the power to see." How true is this! The sailor on the look out can see a ship where the landsman sees nothing; the Esquimaux can distinguish a white fox amidst the white snow; the American backwoodsman will fire a rifle ball so as to strike a nut out of the mouth of a squirrel without hurting it; the Red Indian boys hold their hands up as marks to each other, certain that the unerring arrow will be shot between the spread-out fingers; the astronomer can see a star in the sky, when to others the blue expanse is unbroken; the shepherd can distinguish the face of every sheep in his flock; the mosaic worker can detect distinctions of color where others see none; and multitudes of additional examples might be given of what education does for the eye.

THE HUMAN HAND.

Cassell's Natural History has the following interesting paragraph upon the human hand, showing how true it is that we are "fearfully and wonderfully made."

Issuing from the wrist is that wonderful organ, the human hand. "In a French book, intended," says Sir Charles Bell, "to teach young people philosophy, the pupil asks why the fingers are not of equal length. The master makes the scholar grasp a ball of ivory, to show him that the points of the fingers are then equal!" It would have been better had he closed the fingers upon the palm, and then have asked whether or not they corresponded. This difference in the length of the fingers serves a thousand purposes, as in holding a rod, a switch, a sword, a hammer, a pen, a pencil, or engraving tool, in all which, a secure hold and freedom of motion are admira-

bly combined. On the length, strength, and perfectly free movements of the thumb, depends, moreover, the power of the human hand. To the thumb, indeed, has been given a special name ("*pollex*," from a Latin verb meaning to be able, strong, mighty,) because of its strength—a strength that is necessary to the power of the hand, being equal to that of all the fingers. Without the fleshy ball of the thumb, the power of the fingers would be of no avail, and accordingly the large ball formed by the muscles of the thumb is the special work of the human hand, and particularly that of a clever workman. The loss of the thumb almost amounts to the loss of the hand.

Conscripts, unwilling to serve in the army of France, have been known to disable themselves effectually by cutting off the thumb of the right hand. The loss of both thumbs would reduce a man to a miserable dependence. Nor should we overlook another peculiarity. Were the tips of the fingers and thumb bony instead of being covered with flesh, many things we readily do would be absolutely impossible. We now can take up what is small, soft and round, as a millet-seed, or even a particle of human hair. So exquisitely prehensile are the human fingers. The nails are often of special service—perhaps always in works of art which require nicety of execution. Their substance is just what is needed; they are easily kept at the precise length which answers every purpose; had they been placed on the tips of the fingers, there would have been a loss of power, but their position ensures their highest efficiency. An interchange of power for velocity which takes place in the arm, adapts the hands and fingers to a thousand arts, requiring quick or lively motions. In setting up the type of this page, there have been movements on the part of the compositor of surprising rapidity to an ordinary observer; these are among many instances of the advantage gained by this sacrifice of force for velocity of movement.

UNHEALTHY POSITIONS OF THE BODY.

Those persons engaged in occupations requiring the hands alone to move, while the lower limbs remain motionless, should bear in mind that without constantly raising the frame to an erect position, and giving a slight exercise to all parts of the body, such a practice will tend to destroy their health. They should, moreover, sit in as erect a position as possible. With seamstresses there is always more or less stooping of the head and shoulders, tending to retard circulation, respiration, and digestion, and produce curvature of the spine. The head should be thrown back, to give the lungs full play. The frequent long-drawn breath of the seamstress evinces the cramping and confinement of the lungs. Health cannot be expected without free

respiration. The life-giving element is in the atmosphere, and without it in proportionate abundance must disease intervene. Strength and robustness must come from exercise. Confined attitudes are in violation of correct theories of healthy physical development and the instincts of nature. Those accustomed to sit writing for hours, day after day, can form some idea of the toilsome and ill-paid labor of the poor seamstress.—*Scientific American*.

THE AFRICAN SLAVE TRADE.

Though the slave trade continues to be prosecuted to a vast extent, and with circumstances of inhumanity no less infamous and appalling than in former years, yet the enlightened world will be gratified to learn of the efforts now being put forth in this country for its more effectual suppression, and the success which has already attended these endeavors.

The brig S. T. Hooper, was seized at New York lately, charged with having shipped a cargo of Africans, and landed them on the south side of Cuba. The U. S. steamer Mohawk arrived at Key West recently, with the brig Cygnet, found a few miles from Sagua la Grande. She was deserted, having evidently landed her slaves but a few hours before. The barque Emily was a few days since brought into New York, on suspicion of being a slaver. The U. S. ship Portsmouth captured her off a noted slave-shipping point on the coast of Africa.

Two slavers have been taken into and condemned at St. Helena, one of which is reported as the Samuel H. Townsend, of New Orleans, and had a full slave cargo and over 200 doubloons. The Laura reached Port Royal in care of a prize crew, on suspicion of being a slaver. Other instances might be named to show the activity of our own and the British African block-ading fleets.

The American African squadron consists as follows:

Vessels.	Officers and men.	Tons.	Guns
Steam frigate San Jacinto,	430	1446	13
Steam gunboat Mohican,	200	994	6
Steamer Mystic,	100	300	6
Steamer Sumpter,	100	405	6
Sailing corvette Constellation,	300	1452	22
Sailing corvette Portsmouth,	300	1022	22
	1430	5619	75

The Mohican has not yet started for her destination. All the others are on duty. The Marion and Vincennes are not named above, as they are ordered home. These vessels draw less water than those heretofore employed in this service, and being mostly propelled by steam, they possess a decided advantage. The depot of the squadron has been removed from Porto Praya to Loando, which is in the neighborhood of the principal slave marts. Great Britain is

represented in the same quarter by eighteen vessels, mostly small steamers, having one thousand eight hundred men, and an aggregate of one hundred guns. Nor is this all. An efficient fleet has been stationed on our own extensive line of sea board to suppress the traffic. This consists of the steamers Crusader, Mohawk, Wyandotte, and Fulton. The British generally keep six or seven ships cruising on the coast of Cuba, to look out for suspicious craft.

The African slave trade always has been, is now, and must ever be maintained by kidnapping, rapine, and endless, desolating, tribal, international wars. Who can estimate the cruelties involved in these, and those borne by the captives while on their journey to the slave mart, during their confinement in the barracoons, and on the voyage across the Atlantic? In this connection we cannot forbear quoting briefly from a very able article against the re-opening of the slave trade, from the pen of John Leighton Wilson, D. D., for upwards of twenty years a missionary to western Africa, and published in the October number of the Southern Presbyterian Review, and which seems to have been received with great favor wherever it has reached:

"After a most careful examination of this whole subject, extending our inquiries over a period of more than a hundred years, and carefully weighing the statements of more than fifty different authors, we have come to the deliberate conclusion that, in the seizure of slaves, in the march to the sea coast, during their detention there, and on the middle passage, the destruction of life must be more than one hundred and fifty per cent. upon those safely landed in America—so that to get one hundred slaves for practical purposes, at least one hundred and fifty lives must be sacrificed! Let us dwell upon this startling fact. In order to procure 100,000 laborers for the cotton and sugar fields of the South, we must go into the business with the full understanding that it cannot be done except by sacrificing the lives of at least 150,000 immortal beings, to say nothing of the wide spread desolation which it must occasion in other respects in Africa."

Speaking of this trade, one of our ablest statesmen forcibly remarked, on a recent occasion:

"I can conceive of nothing in the dark record of man's enormities, from the death of Abel down to this hour, so horrible as that of stealing people from their own home, and making them and their posterity slaves forever."—*North American*.

FLORAL INDICATIONS OF WEATHER CHANGES.

There are a great many plants that give indications of coming storms, or changes in the atmosphere. Several very common flowers close at night and open again in the morning. Dickens' says:

"The scarlet pimpernel (*Anagallis arvensis*), shepherd's barometer or poor man's weather-glass, is the best floral barometer; because, not only does the flower never open on a rainy day, but long before the shower is coming is conscious of its approach, and closes up its petals. This peculiarity was noticed by Derham in his 'Physico Theology;' by Lord Bacon, who calls it vinco-pipe, and by Leyden. Not only does the pimpernel shut up its blossoms during rainy and cloudy weather, but it is one of the best of clock flowers, opening its petals in our latitude at about ten minutes past seven in the morning, and closing them a few minutes after two in the afternoon. Dr. Seeman, the naturalist of Kellet's Arctic expedition, mentions the regular closing of the flowers during the long day of an Arctic Summer. 'Although,' he says, 'the sun never sets while it lasts, the plants make no mistake about the time, when, if it be not night, it ought to be; but regularly as the evening hours approach, and when a midnight sun is several degrees above the horizon, they droop their leaves and sleep, even as they do at sunset in more favored climes.'"

ITEMS OF NEWS.

FREEDOM OF SPEECH.—The right to Freedom of Speech was vindicated in this city on the 15th inst. An effort was made to prevent George W. Curtis from delivering a lecture on slavery. A great crowd gathered in front of National Hall with the design to do some mischief, but the excellent arrangements of the Mayor and Chief of Police defeated the plan.

THERE is to be another expedition for the purpose of pursuing the explorations of Dr. Kane, which will probably start from Boston in the Spring, and be under the command of Dr. Hayes, the Surgeon of the Kane Expedition. The amount required is about \$30,000, and liberal subscriptions have already been made. Many of the scientific societies have already enlisted in the enterprise, and have appointed Committees to promote it.—*N. Y. Tribune*.

EUROPE.—The steamship America brings the intelligence that the European press are chiefly engaged in discussing the approaching congress of the great Powers, which it is rumored will meet on the 5th ultimo. The London Times strongly urges the claims of Lord Palmerston to represent England to the congress.

COOK, Coppie, Green and Copeland were executed at Charleston, Virginia, on the 16th inst.

MORE AFRICANS COMING.—The Sea Coast (Miss) Democrat of the 7th inst., under the head of "Good News," has the following:

"We learn from good authority that a cargo of African slaves is expected in ship island Harbor the latter part of the present month. They will, if they arrive safe, be landed without any attempt at secrecy, the consignees trusting to the sentiment predominant in Mississippi, as to the necessity of increasing the number of laborers, a triumphant acquittal in the event of a government prosecution."

RAFTS ON DELAWARE.—About 100 rafts came down the Delaware this fall. Among the number was a mammoth raft shipped by Thomas Barnes 195 feet long, 63 feet wide, and drawing 3½ feet water. The

raft was manned by eight men, and was composed of the following timber: 3000 railroad ties 6000 hoop poles, 35,000 feet of joist, 108,000 feet wharf timber, 2500 feet tie timber, 10 ship knees. This is the largest raft, and drawing more water than ever before came down the Delaware.

Charles Summer has been chosen a foreign associate member of the French Society of Political Economy at Paris. He is the first American on whom this honor has been conferred.

The freight trains are now crossing the Victoria Bridge, and the passenger trains will soon commence running over.

A bill is pending in the Kentucky Legislature to compel free colored persons to leave the State, or be sold.

A TOUCHING SCENE.—The misshapen form of a little newsboy, afflicted with spinal curvature, is unfamiliar to few persons whose business leads them in the vicinity of the Exchange. The name of this little fellow was John Ellard. He died on the 15th inst., of consumption, at the Newsboys' Lodging House, No. 273 south Third street, above Spruce. The little cripple breathed his last in the arms of the superintendent, surrounded by every comfort that love and compassion could bestow. Few persons in the hurry skurry of business life, perhaps, have ever thought, as they passed the misshapen form of the child, that by his toil he supported a mother; that he possessed a nature alike noble, docile and loving, and that he carried in him the seeds of a wasting disease, by which his days were numbered. "Diddley Dumps" was the soubriquet conferred upon him by his comrades, and by this name alone he was called by his friends and customers. Some four months ago he took what among newsboys is considered a lofty flight. He relinquished his business of newsboy and became a newsman. By this we mean that he gave up his pursuit of crying his merchandise in the streets, and opened a stand at Sixth and Chestnut streets. Here he did a thriving business. The jealousies subsisting among other newsboys were not entertained for him, and in a little time Diddley found his savings increased to the sum of about a hundred dollars. Death, however, had sealed the child for a better world, and some time since he gave up his stand and committed himself to the care of the Superintendent of the Newsboy's Lodging House.

We regret to add, in this connection, that the society which benevolently founded this institution is not sustained by the public as it should be, and that, unless the beneficence, as well as the benevolence, of the public is aroused, such unfortunates as the subject of this paragraph will be homeless indeed.—*North American*.

LIBERATED SLAVES.—Thirteen negroes passed through Pittsburg recently en route from Petersburg, Va., to Portsmouth, O., who were recently manumitted by their masters. There were seven adults and six children. The male adults were freed some time ago, and they remained in the Old Dominion until they secured the freedom of their wives and families. There are sixty-nine more liberated bondsmen, women and children, to come from the same locality in Virginia, who will pass through there between now and Christmas.

POSTAL ARRANGEMENT WITH CANADA.—The recent postal arrangement between the United States and the Canadian government, which have been ratified by the Imperial authorities, provide that the Canadians shall carry the Western United States mails between Detroit and Liverpool, via Portland in the winter, and

via Riviere du Loup in the summer. There will be a saving of time by using the railroad instead of the steamer between Quebec and Riviere du Loup. Canada is to receive the full ocean rate on the Western United States correspondence for the service she is to perform, while she foregoes the inland rate of postage upon it—as do also the Americans the internal postage on Canadian letters between Portland and the Province line.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market is firm, and prices are well maintained. There is no export demand. The sales to the trade range from \$5 25 to 5 50 for mixed good brands up to \$7 for fancy lot. Nothing doing in Rye Flour or Corn Meal. The former is held at \$4 37½ and the latter at \$3 75 per barrel.

GRAIN.—The offerings of Wheat continue fair, but the demand is quite light; sales of 1000 bus. prime Delaware red at 133c per bushel; white at 135 a 140c. Rye is inactive at 86 cents. Corn is in fair demand, and 5,000 bushels new dry yellow sold 82 cts. in store, and at the depot at 78 a 80½ cents. Oats are steady; Delaware sold at 43½c, and Pennsylvania at 45.

CLOVERSEED is in fair demand at 5 12 a 5 25 per 64 pounds. Timothy sells in a small way at \$2 50, and Flaxseed at 1 56 per bushel.

A YOUNG WOMAN having had some experience in teaching, and possessing a certificate of qualification, is desirous of a situation in a family school. Address **C. CLEMENT,** Paulsboro, N. J. 12 mo. 17,—3t.

"SCRIPTURAL WATCHWORD"—a little book for daily reading, just issued and for sale by the publishers, Hays & Zell, 439 Market st., Philadelphia. Retail price 31 cents; per dozen \$3.36 cents. Single copies sent by mail, prepaid, for 37 cents. 12 mo. 17.

HEAVY BLEACHED SHIRTINGS made from AFRICAN COTTON, warranted in all respects the product of *Free Labor*. For sale by **ELI DILLIN,** No. 1218 Green st., opposite Ridge Avenue. 11 mo. 26, 1859.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The Winter Session of this institution will commence on the 14th of 11th mo. next, and continue twenty weeks.

Terms \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address **HENRY W. RIDGWAY,** Crosswicks P. O., Burlington Co., N. J. 9th mo. 24—3 m.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

GEO. A. NEWBOLD, Purcellville, Loudon Co., Va.

8th mo. 6, 1859.—6m.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, TWELFTH MONTH 31, 1859.

No. 42.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,

No. 324 South Fifth Street,

PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

SELECTIONS FROM THE LIFE AND EXPERIENCE OF THOMAS BULMAN.

(Continued from page 645.)

At a subsequent period Thomas Bulman was brought under great exercise of mind on account of one of his neighbors, of the Methodist persuasion, who appeared to be convinced of the truth of Friends' principles, but through fear of the cross, and the opposition of his family, was unfaithful to his convictions, and suffered much spiritual loss, and great weakness ensued. But through all, Thomas Bulman seems to have cherished a great regard for him, and to have labored much to bring him into a state of acquiescence to the Lord's will. The following letter was addressed to this individual:

Irthington, 28th of 1st mo., 1781.

My dear friend, In love to thy soul I am constrained to address thee. Often has my mind been pained on thy account, believing thou art stumbling at that which, if submitted to, would bring salvation to thy soul, even the cross of Christ, the power of God. Thou art neglecting that which has been my greatest blessing; and now it appears, thou art looking outwardly for Christ after the lo heres, and the lo theres! O, my friend, turn inward, know Christ within, the hope of glory: there behold Him who sits as a refiner with fire, and as a fuller with soap, to purge away all thy dross and tin. O, mind the pointing and leading of that divine Guide, which it was pronounced should be with the followers of Christ to the end of the world. Let thy obedience keep pace with knowledge, and whatever is made manifest to thee as a duty, do it with all thy might; for there is no work nor levice in the grave whither we are all hastening.

O, my friend, look not at the difficulty of any duty thou mayst be called to, but look at the strength of him who calls thee to it, and he will enable thee to go through every trying circumstance, and bring thee safe upon the banks of deliverance, where thou mayst sing to thy well-beloved, who is altogether lovely, and the chiefest of ten thousand. But I say unto thee again, look into thy own heart; for there must the work be wrought: for the end of all means is to direct men to Christ within, the hope of glory. It was said of the law, that that was only as a schoolmaster to bring us to Christ. Beware of seeing him in outward forms and ceremonies; turn to the revelation of his Spirit in the secret of thy own heart, for it is there that he manifests himself; there he is waiting to be gracious to the parting soul."

The experience which Thomas Bulman entertained his friend, in the preceding letter, to seek after, is doubtless that which Christ urged upon his disciples, when he said, "Abide in me and I in you." This glorious privilege he also asked for his disciples, when in solemn prayer to his Father he used the words, "I in them, and thou in me, that they may be made perfect in one." And this he declared shall be the privilege of those who have his words or commandments and keep them, even that he will love them and manifest himself to them; and that the Father will also love them, and, with the Son, will take up his abode with them. The apostle Paul, in addressing the Colossians, speaks of this privilege as "the riches of the glory of this mystery," which he says "is Christ in you, the hope of glory." John xv. 4. xiv. 21—23. xvii. 22, 23. Col. i. 27.

The individual to whom this letter was addressed, shrank from taking up the cross according to his own convictions of duty, and joining Friends, though still feeling great love to them, until at length he was laid upon a sick-bed. Here he was visited by Thomas Bulman, who told him he believed this sickness would be unto death, and this proved to be the case. It appears that the sick man made a request on this occasion, that he might be buried amongst Friends, but his own family were much against it. Thomas Bulman's kind intercession, however, prevailed; for after representing to them that the dying man's desire was still towards Friends, although he had not been faithful in

giving up to his duty in joining them, he said, that as this was the last and only testimony that the dying man could bear to the Truth, he trusted they would therefore submit, and that his request might be complied with, and that the few hours he had to live, might be peaceful. After some more conversation the family gave way; and when all was over, the remains of the halting man were decently interred in Friends' burial ground at Hetherside.

The following letter was addressed to John and Elizabeth Wigham, ministers who, under a sense of religious duty, had removed from Cornwood, in Northumberland, to Edinburgh:*

Irthington, 1st of 8th mo., 1784.

Dearly Beloveds: For so I can address you; how I long, how I thirst to hear how it is with you in a spiritual sense; time after time I have heard Friends telling how it fared with you as to the outward, but this gave me no relief, but rather added to my burden. My care is not for outward things; these were not your motives in removing to that land of darkness; but, my beloveds, how fares it with you in the better part? I am ready to cry as one did formerly to a faithful servant, O Daniel, is thy God able at all times to deliver thee? Yes verily, I believe he is able and willing to deliver, and will be with you, as he was with those of old. I doubt not, many will be your trials and deep your baptisms, my dear friends! deep calls to deep; we are far fallen; the seed lies low, and we must travail deeply for the rising of that ancient spring which our forefathers enjoyed. Be strengthened, be encouraged to hold on your way, for if the Lord your God be for you, who can stand against you? Yes, my dear friends, I believe he is with you, and that he will support you as you confide in him. I conclude in dear love to you both, and to your dear children, greatly desiring that they may become fruit-bearing trees in the garden of the Lord.

THOMAS BULMAN.

TO A PERSON UNDER CONVICEMENT.

Irthington, 1st mo. 10th, 1785.

Dear Friend, I ought to have paid thee a visit as I was coming from Allendale, where I have been seeing my dear friend, Rachael Wigham; but through diffidence, having no acquaintance with thy family, I disobeyed, and brought upon myself the load, of which, I suppose, by this time, thou hast got a hint from my sister. O, my dear friend, the cause of Truth is at a low ebb amongst us as a people, in this day of outward ease; many of the professors of it seem as if they had turned their backs in the

day of battle. But blessed be our God, he is still calling in others, to bear a testimony to his name. My dear child, let thee and me remember that he hath called us from the barren mountains of an empty profession, and has at times made us to taste of the wine of the kingdom. A cry is raised in my heart, that thou mayst not forfeit thy inheritance in the heavenly Jerusalem, by preferring the trifling amusements of this world; or like Esau, sell thy birthright for a mess of pottage, but mayst come up to the help of the Lord against the mighty. O, my child, as I passed from one place to another amongst you, my very soul mourned for the seed of life,—the plant that should have been the plant of renown in every heart; oh, how few there are that are fully engaged to come up in obedience to the standard of it raised in their own hearts. But my mind was turned to thee, to call unto thee, to keep near to that which smites thee for disobedience and comforts thee for obeying its requirements; I say keep to this, and it will lead thee on from one degree of grace to another, and enable thee to discern the emptiness of this world. Let us ever remember that saying recorded of old, "Israel shall dwell alone, and shall not be reckoned among the nations."

THOMAS BULMAN.

(To be continued.)

SOME ACCOUNT OF JOHN COOK.

Our valuable friend, John Griffeth, informed Robert Dudley that John Cook, one of the earliest and most distinguished ministers amongst the people called Quakers, was remarkable on many accounts, especially during the violent persecutions of that people in the reign of Charles the 2d, a large portion whereof fell to this man. It was observable that his gift in the ministry was such that he frequently in these times of great affliction, whilst free from imprisonment, continued his declarations in public meetings for upwards of three hours, during the whole of which such an increasing degree of authority attended as to convince many of his auditory that nothing short of a commission could produce the baptizing effects attending his ministry, in consequence whereof many were joined to the society he was a member of through his labors, and became ornaments thereof. He outlived those days of dark intolerance some years, much beloved from the remembrance of his past services and sufferings for the noble cause of religion, and frequently appeared in the meetings of his friends in very long testimonies of sound doctrine and pleasing expressions; but some deeply exercised minds among his friends observed with concern that energy of melting virtue that accompanied his gospel labors in former times to their great consolation, was now very little, if at all felt to attend his ministry. Two of those

* For further particulars respecting John and Elizabeth Wigham, see Memoir of John Wigham, by his son, Anthony Wigham, published in 1842, and some Account of the Rise of the Society of Friends in Cornwood, by George Richardson, 1848.

weighty elders, from a sense of duty, when they found their minds suitably qualified, waited on him, and with all the tenderness and deference due to his age, experience and great worth, communicated their fears on this head, and intimated their wish that he would look at this matter, and seek to that gracious Being in whose service he had been so effectually engaged for many years and with such remarkable success, for his blessed counsel on this subject, and at a suitable time favor them with the result of his deliberation on what they had laid before him. He received their communications with great meekness, and after some weeks waited on them in a broken, tender frame of mind, letting them know with many tears that their brotherly or rather fatherly conduct towards him was a kindness that he should never forget, and on deep thoughtfulness on the matter referred to him, he found there was ample cause for it, and he looked on them as messengers of love from his great Master to warn him of his dangerous situation, and then related how he found he had gradually and imperceptibly slid off in these times of public tranquillity from not receiving his ministry through that pure unmixed channel he had formerly received it. The spring of the ministry, he said, during the fiery trials of persecution, flowed copiously through him, that he felt little labor to come at it, but in these latter days of the churches tranquillity, he from the love he felt to the cause delivered words as they occurred to him in the public assemblies which he did not perceive, till their kind intimations to him, were only from his natural powers as a man, and not from the divine gift of gospel ministry as formerly, of which he was now fully convinced, and returned praises for his great deliverance, where first due, and gratitude to them as instruments thereof. He continued for three years after silent as a minister, and about that time again broke forth in a few words just as at his first coming out in the ministry, and gradually increased in his gift to the comfort of his friends, and was always very careful ever after not to exceed the measure of divine opening that he was favored with in the exercise of his gift.

Our aforesaid friend, I heard, was once brought by an informer before a Justice of the Peace for preaching in a meeting, and the Justice being a moderate man was loth to send him several miles to prison so late in the evening as he was brought before him, and told the informer to call in the morning and he would then hear his accusation; and told John Crook, as he appeared to be a decent man, he should have lodging in his house that night if he had no objection to be in a room his servant said was haunted, no other being unoccupied, as he had company on a visit to him. John expressed his acknowledgment for the favor, and accepted the Justice's offer. He was kindly entertained, and had much conversation

with the company on religious subjects, with which he and they seemed well pleased. He was shown his lodgings at the end of a long gallery by the Justice himself, and slept well till about one o'clock, and then awoke with the overflowings of sweetness and peace covering his mind, and such intimations of divine favor as greatly refreshed him. Just at this time a rattling noise was heard along the gallery, which held for some time, and on its ceasing, a shrill voice, as if coming through the keyhole of his chamber door, said, "you are damned," repeating it three times. John answered thou art a liar, for I feel this moment the sweet peace of my God flow through my heart. All the noise and voice ceased, and he soon after fell asleep, and did not awake till about his usual time of rising; he then walked about the garden waiting for the Justice rising. Soon after which a servant man came up to him and fell on his knees and begged forgiveness, and his prayer to God to forgive him, and then confessed that it was he who made the noise near his chamber in the night, and spoke those wicked words, but that his reply pierced him to the heart; and informed him how his master had been robbed by him and others for years past, and concealed discovery of their practice with the pretence of spirits haunting the house; all this, at John's request, the servant told his master with penitence, and obtained his pardon, as did John his dismissal from the informer; and this servant became soon after an honest Friend and minister.

With openness of soul, a man sees some way into all other souls that come near him, feels with them, has their experience, is in himself a people. Sympathy is the universal solvent. Nothing is understood without it.—*Friends in Council.*

From the British Friend.

DIED, 6 mo. 6, 1858, MICHAEL ROBSON, Hartland, New York, aged 94; an elder.

He was born in Yorkshire, England, of humble parentage, and had no knowledge of Friends until the 24th year of his age. His father died before he was four years old. His mother, however, sent him to school when quite young, and kept him there till he could read and write tolerably well. In this school the New Testament was used as a class book. Before completing his sixth year, he went with other boys to see a company of soldiers training. While there in the field, it struck him as a strange thing that men should be learning the business of killing men! Portions of the New Testament which he had read at school were brought to his mind, and the practice appeared to him to be strangely inconsistent with what he had there read, and the query was raised in his mind, "Can this be

right?" His mother died when he was in his tenth year, leaving him without means of support, and with but few friends to care for him.

Shortly after this an uncle, the captain and owner of a small vessel, proposed to him to go to sea with him, which he accordingly did for some time. While his uncle's vessel was laid up for repairs, he was apprenticed by his step-father to the captain of another vessel, which he afterwards regarded as an evidence of the protecting care of his heavenly Father, his uncle's vessel, with all on board, being lost the next voyage.

In the fifteenth year of his age, and during the American Revolution, his early impressions in regard to the inconsistency of war with the doctrines and precepts of the gospel were revived, strengthened, and confirmed. At this period many of the English merchant ships, for protection from American privateers, were provided with arms, a gun being put into the hands of each person on board. This was the case with the ship in which he sailed, and though a boy, he was furnished with a gun.

On this occasion some of the lessons which he had heard read at school were again brought to his mind, and the practice of the people of one nation trying to kill and destroy the people of another, appeared to him to be entirely at variance with the teaching of Christ. Not having yet heard of any who did not believe in the rightfulness of war, he was brought to the conclusion that there were no Christians in the world who obeyed the commandments of their Master in this respect.

In this sentiment he continued till the twenty-third year of his age. Being on shore one winter about this time, he attended a meeting appointed by some Friends in the neighborhood where he then was. In this meeting some familiar passages were quoted and enlarged upon to his satisfaction and comfort. This prepared the way for his seeking a further acquaintance with the doctrines of this Society.

An opportunity for this was soon presented, as a Friend, who had a few of their writings with him, joined the vessel as carpenter. These he read, and to his great joy found he had been mistaken in supposing there were no people in the world who held views in harmony with what he believed to be the doctrines of Christ on the subject of war.

He also then became acquainted with the reason why they differed in their dress and address from those of other persuasions, and says in his journal, "I did think at that time, if they were faithful to their different testimonies, they were the nearest to what Christ taught when personally on earth." While on this voyage he and his associate, the carpenter, experienced a remarkable deliverance from death. On returning from shore in a small boat, with three other sailors, they were capsized by a squall, and supported

themselves for six hours on the bottom of their boat, when they were taken off by the crew of another vessel. During this time one of their number perished from fatigue and exposure.

Almost immediately after this, being again on shore, he was, as is too often the case with sailors, about to enter a drinking house, when his friend admonished him, that after such a deliverance from a watery grave as they had just experienced, they should not be guilty of entering such haunts of vice. He instantly gave up all thoughts of it, and never again yielded to this temptation.

A few years after this he left the sea, became a regular attender of the meetings of Friends, was received into membership at Malton, and from that time to the end of an unusually extended life, was a consistent and worthy member, in whom is no guile."

Soon after his reception into membership he married, and settled on a small farm, where he remained some years, and then removed with his family to the western part of the State of New York.

Here he met with severe affliction, in the removal by death of his wife and two sons, leaving him with only one child: but trusting in the arm that had hitherto supported him, he was enabled to bear these trials with submission, his heart overflowing with thankfulness to Him who had been so strikingly his "Morning Light," and was now his "Evening Song."

In the record of this life it will be noticed that, at the early age of five or six years, a degree of light was spread over the contents of the New Testament which raised doubts, and at the age of fifteen resulted in a thorough conviction, under circumstances apparently the most unfavorable, that the almost universal sentiment of mankind in relation to war was wholly irreconcilable with the doctrines and precepts of Christ. Hence the obligation which must rest on parents, and those who have the charge of training young children, early to make them acquainted with the Holy Scriptures, and encourage them to cherish the secret intimations of the Holy Spirit in regard to what is right and what is wrong.—*American Annual Monitor.*

For Friends' Intelligencer.

MOSES HAIGHT.

Died, in the town of New Castle, Westchester county, New York, after a few days illness, Moses Haight, aged 65 years, a member of Chappaqua Monthly Meeting.

There are occasionally found in neighborhoods and communities, individuals who, while making no apparent effort, yet command the confidence, the esteem, and the affection of those with whom they are brought in contact, above that which is awarded to men in general; and when such men pass away, their loss is felt by the whole community among whom they moved.

To such a class belonged the subject of this notice. His ready and active sympathy, open hospitality and sound and discriminating judgment, caused him to be loved by those in whose society he was thrown; looked up to as a friend and benefactor, by those in indigent circumstances; and advised with, and listened to, by his brethren in the family, social, and religious circles where he was wont to associate.

Surrounded by an affectionate family, he mingled with them ever as a kind and loving husband, and a tender and indulgent parent.

Under such circumstances, life offered to him much that was desirable. "The lines had fallen to him in pleasant places," and possessing the blessing of health in the calculation of human wisdom there was for him a prospect of many years of usefulness and enjoyment.

Thus suddenly stricken down, it was in the few days of his illness that the brightest portion of his character was made manifest; and it is to afford to those still on the stage of action the lesson that was exhibited at the death-bed of our loved friend, that this notice of his character and some of his dying expressions have been penned.

Though the solemn messenger of death came to him at an unexpected moment, he was not found unprepared, his mind throughout remaining clear, calm, and resigned. That this state of preparation had cost him much labor, and close attention to the requisitions of the Divine mind, was evidenced, when he said, that during the latter years of his life he had been more thoughtful in relation to his future condition, (which had been observed by his family,) and that it had been his practice to sum up each day's account before going to sleep.

During the early part of his illness, he suffered much pain of body, yet continued the most of the time in fervent supplication to his Heavenly Father, expressing this language, "O Lord, thou knowest the sincerity of my heart, do with me as thou wilt." To his family he said, "If I should be taken from you, He will take care of you, if you will only be watchful and not admit other guests;" and desired them to remember that they, too, must sooner or later be brought to the same condition in which they saw him.

On one occasion he said, "I have transgressed and been sinful, but the Lord is gracious and will forgive." On another,—he believed he had not an enemy in the world; if he had, he wished them to forgive him. He remarked, that if his life should be prolonged, he might never be as well prepared again, adding, "we are poor, fallible creatures." After another interval,— "I may truly say I am not afraid to die," and frequently exclaimed, "peace, peace, all is peace."

On the evening preceding his death, he said to his beloved wife, "I grow weaker and weaker, but my faith in God grows stronger and stronger, and I have prayed that it might be so."

Thus we may discover that our beloved friend had, though surrounded by much that contributed to strengthen the ties that bind the mind to things of earth, not been neglectful to seek to lay up treasure in Heaven; so that when brought to the confines of earth, and the portals of eternity were opening to his vision, he was enabled to say, "All is clear, I see nothing in my way; the prospect looks pleasant;" feebly adding, "I must go up to the mountain of the Lord,—to the house of the God of Jacob; and he will teach us of his ways, and we will walk in his paths. Lord, come quickly, thy servant is ready."

EXTRACT FROM A LETTER FROM G. M. COOPER
TO A FRIEND IN THIS CITY.

Williamson, Wayne Co., N. Y., 12th mo., 1859.

The idea of a man professing to be opposed in principle to all physical wars and fightings, and at the same time aiding and assisting to promote it, and that *directly* too, is an absurdity. I am induced to believe that such a one stands more in the way of the establishment of peace on earth than the open and avowed advocate of human slaughter. I have thought that such people did not meditate—did not retire into the depths of their own souls, there to listen to the voice of the true Shepherd, for I cannot believe it possible that any one who had penetrated below the surface, could thus mar the exalted testimony they are pretending to bear to the world. If anything deserves the name of Hell, it is the scenes of the battle-field where human wretchedness and misery is seen in its most terrific form, where violence and anger and every evil passion are mingled with confused noise of the warrior, and with garments rolled in blood. Is God the author of this cruelty and outrage? Did he ever, or can he ever approve of the conduct of those who are engaged in them directly, or covertly causing the death of millions of human beings whom the battle-field hurries from time to eternity under the influence of depraved and revengeful feelings? No; this is no part of the moral government of a God of peace and love; neither can it ever be reconciled with any of his attributes. How long, my beloved brother, shall these delusions prevail over the better judgment or feelings of the many who *profess* a testimony against such outrages upon humanity? Can such a one, upon "second sober thought," ever after deposit a vote for the Commander-in-Chief of the army and navy?

No wonder to me that the Society of Friends has not made a greater moral mark in the world; their inconsistent conduct has retarded its progressive tendency. Straight is the way and narrow the gate that leads to love and righteousness.

I hope and trust, my brother, thou wilt do thy day's work in the day time; on this momentous

subject the duty is important—the laborers are few. Let us endeavor, with the help of the “Great Spirit,” to raise up a more faithful generation. How is peace, harmony and love ever to become triumphant, unless those who profess to do the will of the Father, are obedient to his requirings. The older I grow, and the more I become acquainted with the sad condition of humanity, the more earnest I feel for their re-generation.

I have experienced great variety of life. The first language I learned was profanity; and, from my earliest boyhood, my combativeness and destructiveness were encouraged by a father who thought it honorable to resist insult and violence by violence; and having commenced a seaman's life at the age of 16 years, and that before the mast, too, where, during my apprenticeship of five years, I associated with the lowest profligates of humanity, which, of course, did not improve a single moral principle. In 1812, at the commencement of the war with England, I entered the U. S. navy as a master, and passed through two wars, (the latter with Algiers) which still had a tendency to build up a war spirit—have met the enemy again and again, and contended for the mastery. And if any man in this world ought to *venerate, love* and *adore* that inward monitor, that speaks as never man spake, it is the humble writer of this letter, for, notwithstanding my education, I never departed from the line of moral rectitude, or, in other words, violated a law of the Infinite Father, but this reprover met me in the cool of the day; and when at last I yielded to its admonitions, a new life sprang up within me. I have often been led to think of the condition of Jesus in the parable of his being carried to the pinnacle of the temple and tempted with the honor and glory of the world. I have experienced all these temptations, and, by attending to the voice of the Great Teacher, I was enabled to say, get behind me thou tempter. By this means I have overcome much of my early education, and, in some degree, kept my rank in righteousness. Now, as I am no more the favorite of heaven than other children of our Father, God, I am led to believe that all are participants of the same regard; that this grace or favor has appeared unto all men as a teacher.

I am settled in the truthfulness of the philosophy that nothing can overcome evil but love. I have never yet seen the man, however depraved, who did not possess a redeeming quality—and this can be reached by the law of kindness rightly administered. I have greater faith in humanity than most people, for my experience satisfies me that the greatest prodigal has a spark of the Divinity remaining with him; and as like begets like, love can reach it.

I have no faith—no, not a *particle*, that man can be reclaimed by cruelty, by tyrannizing

over his misfortunes; he may be *restrained* for the time being, but not reformed. The Society of Friends might and would exercise a healthful and salutary influence in the world by adhering faithfully to the glorious testimonies they profess to believe emanated from a Divine source.

As thoughts have arisen, I have arrested them—others may present themselves. Fearful of becoming tedious, perhaps I had better close by wishing and desiring thy encouragement in the work of love in which thou art engaged.

For Friends' Intelligencer.

THE FIRST QUARTERLY MEETING HELD IN ILLINOIS.

I read with satisfaction in No. 38, of this month, the remarks of G. T., respecting Quarterly Meetings, and as I had previously felt inclined to make some notes of our own, I now attempt it.

At Clear Creek, near this place, on the 26th of last month, was convened the first quarterly meeting of Friends ever held in Illinois. There are many members of our Society in this State, spread over a large extent of country, some in numbers so near together as to enable them to hold meetings for worship; others, one, two, three families near together, and many of them from fifty to sixty and one hundred miles from this place.

The importance of some measure of sufficient interest to draw them together at suitable time and place, that by mingling together in worship, and also to manifest such care over and interest in one another as our meeting and discipline contemplates, was deeply felt by those among us who had long enjoyed the animating influence of being more closely united in Society.

Under this feeling our Monthly Meeting (Clear Creek) requested of our Quarterly Meeting to hold one or more of its sessions in this neighborhood. The *unselfishness* of the members of the two Monthly Meetings in Indiana was manifest in their uniting with and agreeing to it, when it made the attendance of the meeting so much more inconvenient to them. Only one desire prevailed, and that to promote the best interests of Society.

Our Monthly appointed a joint committee to inform our members far away, of the arrangement, and request their attendance, and when the time came we were not disappointed in the interest shown in it by the numbers convened. Friends from Blue River, Honey Creek, and Richmond, in Indiana, were in attendance, having come several hundred miles on the railroad to be at the meeting. Our own members came from twenty to fifty, sixty, and a hundred miles in their carriages, while those nearer home gathered in and made a goodly number, some of whom had not been at a Quarterly Meeting for twenty

years. One sad disappointment hovered around us, causing mournful feelings for ourselves, our children, and the Society. Our dear friend, Priscilla Cadwallader, was not with us, having been summoned to the "heavenly mansion prepared for her" a short time before. The interest she felt and expressed in this new movement in Society had encouraged us therein, and we hoped for her assistance to begin the work aright on this new soil, knowing that "a good beginning is half success."

The spirit that supported her and made her what she was in this life was with us, and the meetings of discipline as well as those for public worship, were good meetings. The gospel flowed freely, bearing its own evidence of "good will unto men," many were instructed and strengthened in the spiritual journey from the land of earthly-mindedness, from tradition, on reliance on opinions, on any outward thing, it being shown nothing but the Christ of God or *light within* having power to save, and present us faultless before the throne of God. The meetings of Discipline were interesting, more especially on account of the love and harmony that was manifest, and we look forward to another such meeting in this place with satisfaction.

The public meeting the day following (first day) was densely crowded, and many went away not able to get into the house, for though the day was pleasant, it was too chill to stand out. It was a good meeting; it may be said "truth reigned," and it closed in a feeling of solemnity, and will be long remembered by some that were there. On review of all the meetings, it seems to have been a time of spiritual joy; we feel a good beginning is made, and hope for steady progress.

Our numbers continue to increase by emigration and conviction; and as this is a pleasant country, blessed with a healthy and congenial climate, good soil for cultivation, and comfortable homes more easily obtained than in many other places, I look forward for Friends to become numerous, and in time many meetings to become established.

Friends removing to this State *desirous of securing the benefits of Society*, as well as *homes*, would do well to remove to those neighborhoods where there are meetings. Come either to this place, (Clear Creek,) to *Benjaminville*, near Bloomington, or to *Plainfield*, near Ipadia, Fulton county. All who come in a right mind will help the work along.

L. S. W.

Friends will perhaps be interested in the following account of a reading meeting in Leeds, somewhat similar in character to the Reading Association of Friends in our city.

LEEDS READING MEETINGS.

Leeds Preparative Meeting having come to the conclusion that it was desirable that the

Reading Meetings should be re-commenced and continued through the winter, appointed a committee to make and carry out such arrangements as they might deem necessary.

It was thought desirable that the meetings should be held once every fortnight, and that some paper prepared for the occasion, or extract from the writings of Friends, should be read. The committee were very solicitous that the gathering should have more of a social, as well as religious character, than had previously been felt in Leeds; they determined, therefore, to issue invitations to all Friends and attenders of meetings, to tea, provided in the library of the New School, on Third-day, the 11th of 10th Month. About 200 sat down to tea, after which they adjourned to the large school-room (the number being augmented to about 230), to hear a paper by Thomas Pumphrey, of Ackworth, on the Life and Character of the late Joseph Sturge. After the paper had been listened to with deep interest, a few remarks were made by individuals acquainted with the subject of the paper. The meeting was concluded by reading a portion of Scripture. The following papers have since been read, viz:—'Job and his Times,' by J. Hinde, of Nottingham; 'Job and his Times,' by T. Harvey, of Leeds; 'Life and Character of J. J. Gurney,' by F. Cooper, of Manchester.

Women Friends occupy the time in doing plain Dorcas work.—*Leeds, 11 Month, 11th, 1859.*

PARENTS must never put away their own youth. They must never cease to be young.—Their sympathies and sensibilities should be always quick and fresh. They must be susceptible. They must love that which God made the child to love. Children need not only *government*, firm and mild, but *sympathy*, warm and tender. So long as parents are their best and most agreeable companions, children are comparatively safe, even in the society of others.

WHAT LETTERS SHOULD BE.

Many people, and well-informed people too, sit down to write a letter as if they were about to construct a legal document or government despatch. Precision, formality, and carefully worded and rounded periods, are considered all essential, even though the epistle be intended for a familiar friend. Others appear to be writing for publication, or for posterity, instead of making epistolary communication a simple converse between friends. Away with such labored productions. A letter on business should be brief; to a friend, familiar and easy. I like Hannah More's ideas upon the subject. She used to say:

"If I want wisdom, sentiment, or information, I can find them better in books. What I want

in a letter is the picture of my friend's mind, and the common sense of his life. I want to know what he is saying and doing; I want him to turn out the inside of his heart to me, without disguise, without appearing better than he is, without writing for character. I have the same feeling in writing to him. My letter is, therefore, worth nothing to an indifferent person, but it is of value to the friend who cares for me. Letters among near relation are family newspapers, meant to convey paragraphs of intelligence and advertisements of projects, and not sentimental essays."

FRIENDS' INTELLIGENCER.

PHILADELPHIA, TWELFTH MONTH 31, 1859.

THE PAST YEAR.—Standing on the verge of a New Year, feelings and reflections, incident to the season, are naturally presented to the mind. Since the commencement of the 19th century no one revolution of our sphere has been rendered as memorable by the departure of so many of the gifted and the great. Stars have receded from every galaxy, and all departments have contributed their quota to the general loss.

Statesmen not a few, among the most eminent of whom was, perhaps, Thos. H. Benton, have gone to their final audit. Political chicanery and worldly wisdom will avail them nothing before that tribunal where every secret thing shall be unfolded. As they stand face to face with Almighty justice and mercy, may their earthly stewardship have been so tempered by these great attributes that the sentence of "Well done, good and faithful servants" may be awarded them.

Among the authors and historians who, within the same period, have been called from earth, are Herbert, Jay, and Ida Pfeiffer; Prescott, Hallam and Washington Irving. Gifted beyond the common lot with increase of talent, their accountability for the right employment and expenditure of those talents was proportionally augmented. In life's closing scene, how we have fulfilled this great trust, will be the only important consideration, and the applause and admiration of a receding world will seem of little moment in that hour when the future becomes a glorious reality.

The distinguished mechanic, the merchant, the painter, the sculptor, and the man of science have, alike, been followed to their last rest-

ing place "by those who, in their turn, shall follow them." We can no longer be interested and instructed by the active scintillations of the great and good Humboldt, though his works remain; yet the mind that once delighted in the unfolding of nature's simple and perplex laws, is probably rejoicing in the possession of more expanded powers, while the heart that responded to the pleasures of friendship is silent in the grave.

No situation has been exempt; those who, a few months ago, figured so prominently at some of the European courts, have "laid them down to their last sleep" in the same cycle as the "prince of cooks," and Ebenzer Williams, the reputed Bourbon.

Within the same period, Dred Scott, whose name will be famous in the annals of his country for the unjust decision which remanded him into bondage, has been liberated, and, we trust, found worthy to sing the song of freedom in a purer sphere.

In our own Society, the tear has often fallen, and the heart yet bleeds in memory of departed worth. The young, the strong, and the fully ripe have, alike, been removed, and during the past year many have been the exits recorded in our journal. May these painful yet salutary lessons so impress our minds with the mutability of time, that we may be constrained to place our dependence only on those things that perish not with the using. May the example of the faithful and the valiant who have passed through the temptations and endured the crosses of this present life, and who, we doubt not, are now enjoying the "rest prepared for the people of God," cheer us onward in the path of duty. Though dead, they yet speak—and the remembrance of their many virtues and the trials which, through faithfulness, they were enabled to overcome, should encourage us, who continue on the stage of action, so to persevere, that by similar obedience to the blessed principle manifested within us, we may eventually become free from the law of sin and death.

DIED.—On the 24th instant, at her residence in this city, of debility, after a short illness, ELIZABETH S. TAYLOR, wife of GEORGE W. TAYLOR.

In meekness of spirit she lived the life of a Christian, and in sweet composure and unwavering truth she committed her soul to her Heavenly Father; remarking,

near her close, in answer to a question as to her hope, "I just lean on the bosom of my Saviour."

This dear Friend was religiously concerned to maintain, practically, the principles and testimonies of Friends, including a frequent diligent perusal of the Holy Scriptures, waiting attentively on Divine illumination and guidance, and was constant in her attendance on Divine worship.

She was born in Burlington county, New Jersey, and was the youngest child of Benjamin and Hannah Sykes, and grand-daughter of John Sykes and Japheth Leeds, all members of the religious Society of Friends.

DIED, at Colerain Belmont County, Ohio, on the fifth of 11th month, FRANCIS D. FOX, in the 49th year of his age, an exemplary member of Concord Monthly Meeting.

For Friends' Intelligencer.
WASHINGTON IRVING.

Washington Irving was born in New York City on the 13th of 4th Mo. 1783. He received a common school education and at the age of 16 began the study of law. His first literary efforts were contributions to the Morning Chronicle, a periodical edited by his brother Peter Irving. These juvenile essays, under the signature of Jonathan Oldstyle, were afterwards published in a volume. In 1804, Washington Irving, in consequence of ill health, made his first visit to Europe, where he remained two years, travelling through the South of France and Italy.

On his return to his native city he was engaged in the preparation of a continuous series of whimsical papers. In 1808 he published a humorous history of New York, which purported to be from the pen of Diedrich Knickerbocker. The amusing portrayal of the primitive Dutch customs and the mock gravity of the early Dutch governors, and the sly allusions to the political humors of the day, at once gave the book an extensive popularity.

As the pursuit of letters has always been an uncertain dependence, to enable him to pursue his literary labors more advantageously, Washington Irving's brothers are said to have given him an interest in the large and lucrative trade with Liverpool in which they were engaged.

For several years he was editor of the Analectic Magazine, and in 1815 he revisited Europe for the purpose of making a second tour on the continent: but the commercial difficulties in which mercantile affairs were at that time involved, so affected his brothers, that he was not in a condition pecuniarily, to prosecute his intention.

Finding himself in Liverpool in embarrassed circumstances, he concluded to trust to the resources of his pen. After several ineffectual trials, he succeeded in finding a publisher for a collection of desultory essays, which appeared in 1820, under the unpretending title of the Sketch Book. These essays, so replete with humor and pathos, so graceful in style, so genial in feeling and elevated in sentiment, won the author a high

European reputation, and introduced him to the most distinguished British writers; while in his own country his literary success was fully acknowledged.

In 1825 he went again to the south of France and thence to Spain, to collect materials for the Life of Columbus, which he designed writing. Previous to this journey, and on his return, it is to be regretted, his talents were employed on trivial and unprofitable subjects. Employed romances were written in the same genial, his as his Sketch Book, and are free from any positively immoral tendency, they are calculated only to amuse, and must be classed with other fictitious writings, as deteriorating to the mind, because they enervate instead of strengthening it; they unwisely excite the imagination and create an unnatural interest in unreal things.

The life of Columbus evinced maturer powers, but the same unabated charms of style. In proof of its historic value, it may be mentioned that "its publication procured for the author one of the two fifty guinea gold medals instituted by George IV. for eminence in historical composition, the other having been given to Hallam.

After an absence of 17 years, Washington Irving returned again to New York, where he continued to pursue his literary labors. Among several publications of lighter literature, appeared his Tour of the Prairies and Astoria. The closing years of his life were chiefly occupied in writing the life of Washington, which he completed a few months previous to his death. He arose in what might be termed the early period of our literature, and he has completed his earthly course in a cycle rendered memorable by the crowd of luminaries who have finished their labors.

Of his private history we would know more, but from the glimpses which have been afforded of his home-life we cannot but feel assured that he who so beautifully and truthfully sorrowed for the dead, could not but be "faithful and affectionate in the discharge of his duties to the living." The touching recital which only a gentle heart could give, and the love and admiration with which he was universally regarded, are evidences that his life was not a selfish one.

H.

THOUGHTS ON LABOR.

BY T. PARKER.

(Continued from page 651.)

In labor, as in all things beside, moderation is the law. If a man transgresses and becomes intemperate in his work, and does nothing but toil with the hand, he must suffer. We educate and improve only the faculties we employ, and cultivate most what we use the oftenest. But if some men are placed in such circumstances that they can use only their hands, who is to be

blamed if they are ignorant, vicious, and, in a measure, without God? Certainly not they. Now it is a fact, notorious as the sun at noon-day, that such are the circumstances of many men. As society advances in refinement, more labor is needed to supply its demands; for houses, food, and apparel, and other things must be refined and luxurious. It requires more work, therefore, to fill the meshes. To aggravate the difficulty, some are simpler from their share of this labor, by superior energy, shrewdness, and cunning; others by fraud and lies, or by inheriting the result of these qualities in their ancestors. So their share of the common burthen, thus increased, must be borne by other hands, which are laden already with more than enough. Still farther, this class of mouths, forgetting how hard it is to work, and not having their desires for the result of labor checked by the sweat necessary to satisfy them, but living vicariously by other men's hands, refuse to be content with the simple gratification of their natural appetites. So Caprice takes the place of Nature, and must also be satisfied. Natural wants are few; but to artificial desires there is no end. When each man must pay the natural price, and so earn what he gets, the hands stop the mouth, and the soreness of the toil corrects the excess of desire, and if it do not, none has cause of complaint, for the man's desire is allayed by his own work. Thus if Absalom wished for sweet cakes, the trouble of providing them checks his extravagant, or unnatural appetite. But when the mouth and hand are on different bodies, and Absalom can coax his sister, or bribe his friend, or compel his slave to furnish him dainties, the natural restraint is taken from appetite, and it runs to excess. Fancy must be appeased; peevishness must be quieted; and so a world of work is needed to bear the burthens which those men bind, and lay on men's shoulders, but will not move with one of their fingers. The class of mouths thus commits a sin, which the class of hands must expiate.

Thus, by the treachery of one part of society, in avoiding their share of the work; by their tyranny in increasing the burthen of the world; an evil is produced quite unknown in a simpler state of life, and a man of but common capacities not born to wealth, in order to insure a subsistence for himself and his family, must work with his hands so large a part of his time, that nothing is left for intellectual, moral, æsthetic, and religious improvement. He cannot look at the world; talk with his wife; read his Bible, nor pray to God, but poverty knocks at the door, and hurries him to his work. He is rude in mind before he begins his work, and his work does not refine him. Men have attempted long enough to wink this matter out of sight, but it will not be put down. It may be worse in other countries, but it is bad enough in New England, as

all men know who have made the experiment. There must be a great sin somewhere in that state of society, which allows one man to waste day and night in sluggishness or riot, consuming the bread of whole families, while from others, equally well-gifted and faithful, it demands twelve, or sixteen, or even eighteen hours of hard work out of the twenty-four, and then leaves the man so weary and worn, that he is capable of nothing but sleep,—sleep that is broken by no dream! Still worse is it when this life of work begins so early, that the man has no fund of acquired knowledge on which to draw for mental support in his hours of toil. To this man the blessed night is for nothing but work and sleep, and the Sabbath day simply what Moses commanded, a day of bodily rest for Man, as for his Ox and his Ass. Man was sent into this world to use his best faculties in the best way, and thus reach the high end of a man. How can he do this while so large a part of his time is spent in unmitigated work? Truly he cannot. Hence we see, that while, in all other departments of nature, each animal lives up to the measure of his organization, and with very rare exceptions becomes perfect after his kind, the greater part of men are debased and belittled; shortened of half their days, and half their excellence, so that you are surprised to find a man well educated whose whole life is hard work. Thus what is the exception in nature, through our perversity becomes the rule with man. Every black-bird is a black-bird just as God designs; but how many men are only bodies? If a man is placed in such circumstances, that he can use only his hands, they only become broad and strong. If no pains be taken to obtain dominion over the flesh, the man loses his birthright, and dies a victim to the sin of society. No doubt there are men, born under the worst of circumstances, who have redeemed themselves from them, and obtained an excellence of intellectual growth, which is worthy of wonder; but these are exceptions to the general rule; men gifted at birth with a power almost superhuman. It is not from exceptions we are to frame the law.

Now to put forward the worst possible aspect of the case. Suppose that the present work of the world can only be performed at this sacrifice, which is the best, that the work should be done, as now, and seven-tenths of men and women should, as the unavoidable result of their toil, be cursed with extremity of labor, and ignorance, and rudeness, and unmanly life, or that less of this work be done, and, for the sake of a widespread and generous culture, we sleep less softly, dine on humbler food, dwell in mean houses, and wear leather, like George Fox? There is no doubt what answer common sense, reason, and Christianity would give to this question; for wisdom, virtue, and manhood, are as much better than sumptuous dinners, fine apparel, and splen-

did houses, as the soul is better than the senses. But as yet we are slaves. The senses overlay the soul. We serve brass, and mahogany, and beef, and porter. The class of mouths oppresses the class of hands, for the strongest and most cunning of the latter are continually pressing into the ranks of the former, and while they increase the demand for work, leave their own share of it to be done by others. Men and women of the humble prospects in life, while building the conubial nest that is to shelter them and their children, prove plainly enough their thralldom to the senses, when such an outlay of upholstery and joiners' work is demanded, and so little is required that appeals to reason, imagination, and faith. Yet when the mind demands little besides time, why prepare so pompously for the senses, that she cannot have this, but must be cheated of her due? One might fancy he heard the stones cry out of the wall, in many a house, and say to the foolish people who tenant the dwelling,—"O, ye fools, is it from the work of the joiner, and the craft of those who are cunning in stucco and paint, and are skilful to weave and to spin, and work in marble and mortar, that ye expect satisfaction and rest for your souls, while ye make no provision for what is noblest and immortal within you? But ye also have your reward!" The present state of things, in respect to this matter, has no such excellencies than it should not be changed. It is no law of God, that when sin gets a footing in the world it should hold on forever, nor can folly keep its dominion over society simply by right of "adverse possession." It were better the body went bare and hungry, rather than the soul should starve. Certainly the life is more than the meat, though it would not weigh so much in the butcher's scales.

There are remedies at hand. It is true a certain amount of labor must be performed, in order that society be fed and clothed, warmed and comforted, relieved when sick, and buried when dead. If this is wisely distributed; if each performs his just portion; the burthen is slight, and crushes no one. Here, as elsewhere, the closer we keep to nature, the safer we are. It is not under the burthens of nature that society groans; but the work of caprice, of ostentation, of contemptible vanity, of luxury, which is never satisfied—these oppress the world. If these latter are given up, and each performs what is due from him, and strives to diminish the general burthen and not add to it, then no man is oppressed; there is time enough for each man to cultivate what is noblest in him, and be all that his nature allows. It is doubtless right that one man should use the service of another; but only when both parties are benefitted by the relation. The smith may use the service of the collier, the grocer, and the grazier, for he does them a service in return. He who heals the body deserves a compensation at the hands of whomsoever he serves.

If the painter, the preacher, the statesman, is doing a great work for mankind, he has a right to their service in return. His fellow-man may do for him what otherwise he ought to do for himself. Thus is he repaid, and is at liberty to devote the undivided energy of his genius to the work. But on what ground an idle man, who does nothing for society, or an active man, whose work is wholly selfish, can use the services of others, and call them to feed and comfort him, who repays no equivalent in kind, it yet remains for reason to discover. The only equivalent for service is a service in return. If Hercules is stronger, Solon wiser, and Job richer than the rest of men, it is not that they may demand more of their fellows, but may do more for them. "We that are strong ought to bear the infirmities of the weak," says a good man. In respect, however, to the matter of personal service, this seems to be the rule; that no one, whatever be his station, wants, attainments, or riches, has any right to receive from another any service which degrades the servant in his own eyes, or the eyes of the public, or in the eyes of him who receives the service. It is surely unmanly to receive a favor which you would not give. If it debases David to do a menial service for Ahud, then it debases Ahud just as much to do the same to David. The difference between King and Slave vanishes when both are examined from the height of their common humanity, just as the difference between the west and north-west side of a hair on the surface of the earth is inconsiderable to an eye that looks down from the sun, and takes in the whole system, though it might appear stupendous to the motes that swim uncounted in a drop of dew. But no work, useful or ornamental to human life, needs be debasing. It is the lasting disgrace of society, that the most useful employments are called "low." There is implied in this very term, the tacit confession, on the part of the employer, that he has wronged and subjugated the person who serves him; for when these same actions are performed by the mother for her child, or the son for his father, and are done for love and not money, they are counted not as low, but rather ennobling.

(To be continued.)

FUEL.

The value of fuel as a heating material is determined by the amount of water which a pound will raise to a given temperature; thus one pound of wood will convert forty pounds of ice to boiling water, while a pound of coal will thus heat nearly eighty pounds of ice-cold water. Hence, pound for pound, coal is twice as good as wood for mere heating purposes. Coal at \$12 50 per ton of 2240 pounds is as cheap as the best wood at \$5 50 per cord. Wood is the healthiest, says *Hall's Journal of Health*, because it contains a

large amount of oxygen; coal has none, and therefore draws the oxygen necessary for its combustion from the air, which renders a room "close" and oppressive. The relative value of different kinds of wood, for heating purposes, is as follows: Shelbark hickory, 100; pignut hickory, 95; white oak, 84; white ash, 77; dog-wood, 75; scrub oak, 73; white hazel, 72; apple tree, 70; red oak, 69; white beach, 65; black walnut, 66; black birch, 62; yellow oak, 60; hard maple, 59; white elm, 58; red cedar, 50; wild cherry, 44; yellow pine, 74; chestnut, 52; yellow poplar, 52; butternut, 52; white birch, 49; white pine, 42.

LIGHT IN DARKNESS.

"All things work together for good to them that love God."—*Rom.* 8: 28.

How weary and how worthless this life, at times, appears!

What days of heavy musings, what hours of bitter tears!

How dark the storm clouds gather along the wintry skies!

How desolate and cheerless the path before us lies!

And yet those days of dreariness are sent us from above:

They do not come in anger, but in faithfulness and love;

They come to teach us lessons which bright ones could not yield.

And to leave us blest and thankful, when their purpose is fulfilled.

They come to draw us nearer to our Father and our Lord,

More earnestly to seek His face, to listen to His word.

And to feel, if now around us a desert land we see,
Without the Star of promise, what would its darkness be!

They come to lay us lowly, and humbled in the dust,
All self-deception swept away, all creature hope and trust;

Our helplessness, our vileness, our guiltiness to own,
And flee, for hope and refuge, to Christ, and Christ alone.

They come to break the fetters, which here detain us fast,

And force our long reluctant hearts to rise to heaven at last,

And brighten every prospect of that eternal home,
Where grief and disappointment and fear can never come.

Then turn not in despondence, poor, weary heart,
away,

But meekly journey onwards, through the dark and cloudy day;

Even now the bow of promise is above thee, painted bright,

And soon a joyful morning shall dissipate the night.

Thy God hath not forgot thee, and when He sees it best,

Will lead thee into sunshine, will give thee bowers of rest;

And all thy pain and sorrow, when the pilgrimage is o'er,

Shall end in heavenly blessedness, and joys for evermore!

SPITTA.

OMNIPRESENCE.

What throne may bear the eternal God,

Who fills unbounded space?

What palace boast his high abode

What world his dwelling place?

Ye stars that gem your glorious vault,

Above, beneath, around!

Who most your Maker's praise exalt,

Through nature's unknown bound!

Ye sons of light, your God's first-born!

Who saw, from distant spheres,

The dawn of this earth's natal morn,

And all its future years;

Ask ye where dwells the eternal God?

What planets bear his feet!

What clustered suns are his abode,

His burning, dazzling seat?

There is a throne your God will grace,

The pure and lowly heaven;

There will he choose his dwelling place,

And never thence depart.

A VISIT TO THE COUNT VON DER RECKE IN SILESIA, IN AUGUST, 1859.

[We are enabled, through the kindness of a friend, to present our readers with the following abridged account of a visit of the Count von der Recke, in whose philanthropic undertaking many Friends in this country have long been interested. The writer is an English gentleman, whose description may be relied on:—]

A walk of four and a half miles from the town of Militsch to Craschnitz was the very thing needed this fine autumn morning, after being jolted for a day and a night in one of the "King of Prussia's Post" coaches, and right pleasant and friendly looked the well-known features of the open landscape. The road leads through one of the gloomy pine-woods, and then across fields, poor-looking and hedgeless, bounded only by the ever-recurring forest, or the popular avenue of a cross-road. But the avenues look disfigured; for on one side the two years' growth of twigs and leaves is being cut off, and stacked in bundles at the foot of each tree to dry, and then be carefully garnered for winter food for sheep and cattle; each year one row of trees being thus stripped. The village of Wirschkowitz is passed through, which was built by emigrants from Wurtemberg at the end of the last century, and when I reached the well-known gate of the avenue, at the end of which stands the residence of the good Count von der Recke. A noisy recognition from the great watch-dogs—and then entering the open door, I am welcomed with that honest, simple courtliness which impresses more than any demonstration. The house is large, two-storied, with a recessed porch; the great bell stands on the variously colored roof, and is used, not to announce to the world that its owners are about to dine, but to call the neighbours, and all within hearing, to prayers, and on

Sunday to a larger service, both held by the Count in a large room set apart and fitted up for the purpose. Around the house are grass and lawns, bounded by trees and the farm-yard. As I have said, Militsch is the nearest post-town, and Breslaw, the capital of Silesia, is about twenty-eight miles distant. The Count's estate consists of about 6000 acres of forest and water, and about 4000 acres of farm land. There are four villages on the land, and as many farm-yards; no hedges divide the fields, and some one consequently must attend the cattle constantly to prevent their straying.

The ponds are the most curious part of the management. They are allowed to have water in them for three years. In that time the fish, viz., carp, pike, and shad, attain a marketable size: the water is drawn off, and the fish sold alive—then the pond is ploughed and sown with oats, and for three years is used as a field. Besides the fish, they produce bulrushes in great quantities from the shallow water, which are cut and harvested for thatching. Some of these ponds have a surface of 800 acres, one is of 1000 acres; the whole is let to a farmer. The great embankments separating them are planted with oaks, between which runs a narrow farm-road, overhung with the densely intertwining branches from the enormous old trunks.

The laboring men earn from four to six silver groschen a day, and the women about two; so of necessity their wants are simple, as from two to three shillings a week will not purchase meal even in Germany; yet they appear contented, though so poor. Their morality here is far higher than in other parts of Germany. Their worst criminal offences are stealing wood and poaching; but these are rare among the Count's people.

In the villages are always some poor old deserted creatures, whose relations have died or emigrated, and these seem to fall to the Count as their only refuge, and he has to keep them. A few of these live in the wretched hospital, which he is so anxious to rebuild; but his rich neighbors do not help him, and the Count cannot yet afford the expense, though he is earnestly desirous not to delay having a better shelter for them. The present hut has only one room, and stands in a very swampy meadow, yet there is no other place to serve as almshouse or hospital. You know he has established an asylum for poor girls, who are orphans or have been deserted: it is built on a hill above his residence. The girls nearly earn their own living by their labor on the land, and by sewing and other work indoors. And the Count cherishes the hope that he may, in time, get a boys' asylum on the same plan; and he would, I know, be heartily glad of any help towards this good object.

No one can in the least degree estimate the good this excellent man is doing, and has done, by sending forth among the working classes of

Germany, these girls trained up in the fear of God, and having a love of truth impressed on them, so that years of bad influences can scarcely impair their good education. (I would that some one could do as much for the nobles). The ordinary daily routine in the Count von der Recke's family is the simplest possible. The bell rings for prayers at seven, when all the family and servants, and often out-door laborers, assemble to sing a hymn, and hear the Count read a chapter from the Bible, then a short comment and an earnest prayer. After this comes breakfast, served in fine weather in a summer-house out of door,—a sunny place overlooking the flowers, and grass, and pond. Coffee, rye bread, butter, and simple preserved fruit, are sufficient, and then whatever work has to be done is done. A luncheon at eleven, and dinner at two, are as simple in character as the breakfast. After dinner a walk in the forests, or to the ponds, or to Wirschkowitz for letters, or a ride for a wider view of the solemn woods; then home by evening, and vesper meal at eight, also taken out of doors and perhaps the most enjoyable of all, as every evening the day's works are related, and all kinds of experiences have been undergone,—from visits to the sick to the chase of an unusually fine roebuck,—from the Count's success in tooth extraction to the prospect of a village marriage. All is discussed, and the daily newspaper from Breslaw adds its themes. Then again is the bell rung for evening prayers, the same as in the morning. Always charming is the patriarchal simplicity of this little society, and most so is it at the time of evening prayer, when the good Count's voice trembles as it tells of that great love that he is the means of making felt to many a one who would have been otherwise in doubt of its Almighty scope. The perfect stillness within and without, the subdued light, and the simple, honest attention of the little assembly, and, above all, the loving, tender, earnest words, coming as they do from such a true and faithful man, have their effect in making peaceful, holy feelings reign, and hold their sway long after he has ceased; aye, and for long years the influence of those evenings felt. On Sundays there is quite a long service in the afternoon, which is very well attended, and a Sunday school after the English manner is also a part of the day's duty. The Count von der Recke has seriously diminished his fortune by his benevolent acts, and is therefore much limited in his present efforts to do good; but his life alone must be looked on as not one of the least of his powers for doing good—for he has stood up for religion in profession and in life, when there were few indeed in Germany to join him; and to this day, when believing and professing Christians are not so rare as formerly, he is looked on with respect by all good and thoughtful men, as the representative of a great principle and a grand truth. As a consequence of this position, world-

ly men have few sympathies with him or his family, and seldom visit him, and so Craschnitz remains that peaceful, holy home, where the world does not come between its inhabitants and their duty.

J. S.

UTILIZING SMALL THINGS.

A correspondent of the Philadelphia *North American and Gazette* alludes to the saving of what is called "waste" at the Altoona machine shops of the Pennsylvania Railroad as follows: "Waste is cotton shreds and rags used for cleaning locomotives and other machinery. It soon becomes saturated with oil and dirt, and in that condition is useless. This article, seeming like a small item, adds, nevertheless, some eight thousand dollars to the expense account of the road. Some ingenious Yankee proposed washing this waste by steam, using soda or some other cleansing compound, afterwards drying it in a centrifugal drying machine. It was tried and proved that, by renewing, this item of expense can be reduced at least one-half. The degree of attention paid to these minutæ in detail, will, at any time, upon so extensive an undertaking, make the difference between a dividend or non-dividend-paying road."

It is surprising to what an extent seemingly useless articles are utilized in the manufacturing arts.

We will present a few examples to illustrate this point:

The prussiate of potash is made in quantities in Cincinnati, from hoofs, horns and other refuse of slaughtered grunTERS.

Cow hair taken from the hides in tanneries is employed for making plastering mortar to give it a sort of fibrous quality.

Saw-dust is daily sold in our streets for sprinkling the floors of markets; it is also used for packing ice for shipment.

The rags of worn-out shirting, calico dresses, and the waste of cotton factories are employed to make the paper upon which these lines are printed.

Old ropes are converted into fine note paper, and the waste paper itself, which is picked up in the gutters of our streets is again re-converted into broad white sheets, and thus does duty in revolving stages.

The paring of skins and hides and the ears of cows, calves and sheep are carefully collected and converted in Peter Cooper's famous glue made out at "Old Bushwick."

The finer qualities of gelatine are made from ivory raspings—the bones and tendons of animals.

Bones converted into charcoal by roasting in retorts are afterwards employed for purifying the white sugar with which sweeten our coffee, &c.,

The ammonia obtained from the distillation of

coal, in making gas, is employed for saturating orehil and cudbear in making the beautiful lilac colors that are dyed on silk and fine woolen goods.

Carbolic acid obtained in the distillation of coal-tar is employed, with other acids, to produce beautiful yellow colors on silk and wool.

The shavings of cedar wood used in making pencils are distilled to obtain the otto of cedar wood.

Brass filings and old brass kettles are re-melted, and employed to make the brass work of printing-presses and pumps.

Old copper scrape are used in the construction of splendid bronze chandeliers for illuminating our churches and mansions of the wealthy.

Old horse-shoe nails are employed to make the famous steel and twist barrels of fowling-pieces.

Coal tar is burned and made into lampblack used for printer's ink, common black paint and blacking for shoes, &c.

The cast-off gauze dresses of Parisian *belles* are purchased for a mere song and sent to the West India Islands, where they perform a second duty in decorating the sable daughters of the tropics.

Oyster shells are burned in kilns and afterwards used in making cements, their base being pure lime.—*Scientific American*.

One of the most peculiar and interesting applications of centrifugal force is seen in the separation of crystallized sugar from molasses—quite an ingenious process. When lump or loaf sugar has been bleached and purified, and crystallized, there still remains mixed up with the crystals a yellowish brown viscid liquid, which will not crystallize, and this must be separated before the beautifully white sugar is perfected in its quality and appearance. Under the old method, the sugar loaf mould was turned upside down, and liquid was made to trickle slowly through the sweet, spongy mass—this liquid being either water, or a solution of sugar and water; and the molasses, washed out by these means, escaped by a hole at the small end of the sugar mould. But it has been found that the same remarkable centrifugal action which drives out moisture from cloth, will do the same in respect to a mass of wet sugar. The crystallized or granulated sugar, steeped in a murky bath of molasses, is made still more moist with water. About half a hundred weight is put into a sieve-like circular vessel, which vessel is made to rotate one thousand or twelve hundred times in a minute, and the whole of the molasses and water is driven violently and quickly out of the mass, leaving the sugar in nearly a dry and pure state. A Belgian refiner has invented a machine, in which fifty sugar loaves are ranged radially in a kind of horizontal wheel, and then the whole is made to revolve with a speed of eight hundred revolutions in a

minute. The proper liquid is applied by an ingenious contrivance, and in about twenty minutes the loaves are perfected.

JUDICIAL TESTIMONY ON INTEMPERANCE.

Rowland Burr, justice of the peace in Toronto, and jail commissioner for nearly twenty years, in a statement to the Canadian Parliament, says that nine out of ten of the male prisoners, and nineteen out of twenty of the female, have been brought there by intoxicating liquors. He examined nearly 2,000 prisoners in the jails throughout Canada, two-thirds of whom were males, and nearly all signed a petition for a Maine liquor law, many of them stating that their only hope of being saved from ruin was to go where intoxicating liquors could not be sold. In four years there were 25,000 prisoners in the jails of Canada, 22,000 of whom were brought there by intoxicating liquors. He has kept a record of the liquor dealers of a single street in Toronto, 100 in number, for 54 years past. In these families there have been 214 drunkards, 45 widows, and 235 orphans left, 44 sudden deaths, 13 suicides, 203 premature deaths by drunkenness, 4 murders, 3 executions, 1,915 years of human life estimated to have been lost by drunkenness, and a loss of property once owned in real estate amounting to \$293,500.

ITEMS OF NEWS.

THE EUROPEAN CONGRESS.—During the past two centuries there have been no less than seventeen Congresses to settle the affairs of Europe. The earliest one of importance was that of Minister and Osnabruck, in 1644. The subsequent ones were those of the Pyrenees, in 1659, of Nimegnen, in 1678, of Ryswick, 1697, of Utrecht, in 1712, of Aix la Chapelle, in 1748, of Teachen, in 1779, of Rastadt, in 1797, of Ecfurt, in 1808, of Chatillon, in 1814, (which resulted in Napoleon's banishment to Elba,) the great one of Vienna, in 1815, (which reconstructed Europe on the ruins of his empire,) of Aix la Chapelle, in 1818, Carlsbad, in 1819, Troppau, in 1830, Laybach, in 1821, and Verona, in 1822, (all to adjust new questions arising under the decrees of that of Vienna,) and finally that of Paris, in 1856, to settle the hostilities in Russia, Turkey, and the Danubian Principalities.

EUROPE.—We gather the following items from a late list of foreign news:

THE CONGRESS.—Additional adhesions to the Congress had been received at Paris.

Le Nord says the exiled sovereigns and the present chiefs of the Governments of Central Italy will plead their cause before the Congress by notes and memorials.

Advices from Rome say that the official invitations to the Papal Government were to be presented simultaneously by the French and Austrian ambassadors. The Vienna invitation was not expected to reach Rome before the 10th inst.

Baron Schleinitz, it is asserted, will sit at the Congress as representative of Prussia.

M. Mon will be the second plenipotentiary of Spain. It is stated that the English and French Govern-

ments were consulting together upon an arrangement of the Italian question, which will not probably satisfy Austria, but which will encounter no serious objections at Berlin and St. Petersburg. Notwithstanding the objections urged against Count Cavour as the representative of Sardinia at the Congress, the report was persisted in at Paris that Cavour would be the plenipotentiary of the King of Sardinia.

AUSTRIA.—The pretensions of the Hungarians are represented to be of the increase. An impression prevailed among leading men that the restoration of the Constitution would not suffice, unless its maintenance was guaranteed by the Powers.

The ultra-montane journals of the Tyrol assert that any attempts of the Government of Austria to place all the Christian professions on an equality would cause general indignation among the Roman Catholics of the Tyrol.

The directors of the great ship company, in view of their embarrassment relative to the Great Eastern, called a meeting of the shareholders for the 15th of December, but they subsequently issued a notice of their intention to postpone the explanations they intended to make for a month. Great dissatisfaction existed among the shareholders at this proceeding, and it was expected that, notwithstanding the action of the directors, a full meeting would be held on the day first named. It is said the directors had resolved to borrow money on the security of the ship.

The London *Times* in its city article draws attention to the injustice of Government to the Liverpool, New York, and Philadelphia Steamship Company, which is the only British line of trans-atlantic steamers without a subsidy, and which suffers great hardships in the absence of those profits and facilities which a mail grant confers.

Great success had attended the efforts of divers at the wreck of the steamer, "Royal Charter." About £180,000 sterling, or nearly half the amount of gold shipped in her, had been recovered, and great hopes were entertained of obtaining the remainder. The expenses in the recovery had not exceeded £2,000.

FRANCE.—The pacific policy towards England appears to be making good progress. At a grand municipal banquet in Paris, the Prefect of the Seine spoke in a very eulogistic manner of the new pacific era on which he said France had entered.

CALIFORNIA.—A slight shock of an earthquake was felt at San Francisco on the 25th ult.

TELEGRAPH.—The submarine telegraph between Victoria and Tasmania has been carefully submerged, and Hobart Town is now in direct telegraphic communication with the other countries. A bill for the abolition of State aid to religion had passed the Tasmania Parliament, but an influential public meeting had been held to petition her Majesty to withhold her consent. The bill is supported by the Roman Catholics.

ANOTHER MARKET HOUSE.—A new market house for farmers is about to be erected on the north side of Market street, west of Twenty-first street. The building will extend from Twenty-first street west on Market street two hundred and fifty-seven feet, by one hundred and two feet deep. It is to be erected on brick piers twenty-five feet high, with a capitol arch twenty feet high, making 45 feet in height. The structure is to be divided into fifteen avenues each seventeen feet wide, running north and south, each containing twenty-two stalls, or three hundred and thirteen stalls in all. There will be one large avenue running east and west through the centre of the building. The

roof will be of gravel, upon planed and grooved boards, supported by substantial columns. The interior will be well ventilated by means of two large skylights. The whole outside of the building is to be painted and sanded in imitation of Pictou stone. The stalls are to be seven feet long, by two feet ten inches wide, and suitably distributed among farmers, victuallers, dealers, and others.

THE EXPULSION OF FREE NEGROES FROM TENNESSEE.—A bill is now before the Legislature of Tennessee to expel all the free negroes from that State, on penalty of being sold into slavery. It provides that all free negroes found in Tennessee after the first day of 5th month next shall be seized and sold if they are adults and that the children shall be bound out. If the adults agree to emigrate to Africa some slight assistance is to be afforded to them to reach that country; or they may seek a master and go into slavery.

FREE NEGRO BILL IN MISSISSIPPI.—A bill for excluding free negroes from the State of Mississippi passed the House on the 7th by a vote of 75 to 5. It provides that they shall leave the State on or before the 1st of 7th mo., 1860; or if they prefer to remain, that they shall be sold into slavery, with the right of choice of masters, at a price assessed by three disinterested slaveholders, the proceeds to go into the treasury of the county in which the provisions of the bill may require to be executed.

SLAVE TRADE IN LIBERIA.—Dates from Liberia, Africa, to the latter part of September, report a new and most extraordinary phase of the slave trade. The Rebecca, a Baltimore clipper, commanded by Captain Carter, arrived there in 7th mo. last, with forty-two colored immigrants from New Orleans, liberated from the McDonough estate. She was under charter from the Colonization Society; but having landed the free blacks she moved off to the southwest coast and took in a full cargo of slaves, with which freight she is now bound home. Small pox raged in New Georgia. President Benson was about to make war on the natives of the river Po, in consequence of their outrages on the Peddas.

SEVERE STORM ON CAPE COD.—A correspondent of the Boston Journal writes: "From Wednesday noon until midnight, there raged upon the whole extent of Cape Cod, one of the most severe storms of snow and sleet, accompanied with a heavy wind, which has occurred since the destruction of Minot's Ledge light. The storm had full sweep from Cohasset Narrows to Provincetown, leveling at least five hundred telegraph posts. A heavy rain prevailed next day, carrying away all the snow. The inhabitants upon the cape, from one end to the other, turned out to help repair the telegraph lines."

COLD WEATHER IN THE WEST.—The St. Louis Democrat says they have already had fine sleighing and intense winter weather in that city. Further west and north the season has opened still more severe. In Keokuk, last week, the mercury was only two degrees above zero, the river frozen over, and liquids generally in a state of frigidty, if we may credit the local papers. At Waverly, Missouri, on the 6th, it fell twelve degrees below zero, and remained nearly as low till the end of the week. At Council Bluffs, however, it is reported that the thermometer was *sixteen* below zero on the morning of the 7th. This beats the eastern cold weather out of sight thus far, and gives the northwest another triumph to crow over, though of a dubious quality. The icecutters are already in the field, cutting ice for summer.

DECLINE OF WHALING IN NANTUCKET.—There are at present only 21 ships, one brig, and one schooner employed in the whale fishery belonging to Nantucket, of an aggregate of 8022 tons. Twenty-five years ago there were 64 ships, of 21,268 tons.—*Boston Traveler.*

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market is inactive, but holders are firm in their demands. There is little or no shipping inquiry, and the sales are mostly confined to the wants of the home trade at \$5 37½ a 5 62½ for common and good superfine; \$5 75 a 5 87½ for extras; 6 a 6 50 for extra family; 5 62½ a 7 for fancy. No change in Rye Flour or Corn Meal, and no sales of either have been reported.

GRAIN.—There is a fair demand for Wheat, and the offerings being light, prices are well maintained. Sales of 2,000 bushels good and prime Pennsylvania and Southern red at 134 a 135 cts. per bushel; white is worth 140 a 150c. No change in Rye. Corn is dull and the receipts by Railroad are increasing. Sales of 1200 bushels prime dry new yellow in the ears, at 80 cts., and a lot of old yellow in store, at 92c.; 800 bus. damp new yellow sold 70 cts. Oats are steady at 43 cents for Delaware, and 45c. for Pennsylvania. 1200 busels Canada West Barley sold at 80 cents, and 1500 bushels Barley Malt at 90 cents per bushel.

A YOUNG WOMAN having had some experience in teaching, and possessing a certificate of qualification, is desirous of a situation in a family school. Address **C. CLEMENT,** Paulsboro, N. J. 12 mo. 17,—3t.

"SCRIPTURAL WATCHWORD"—a little book for daily reading, just issued and for sale by the publishers, Hays & Zell, 439 Market st., Philadelphia. Retail price 31 cents; per dozen \$3.36 cents. Single copies sent by mail, prepaid, for 37 cents. 12 mo. 17.

HEAVY BLEACHED SHIRTINGS made from **AMERICAN COTTON**, warranted in all respects the product of *Free Labor*. For sale by **ELI DILLIN,** No. 1218 Green st., opposite Ridge Avenue. 11 mo. 26, 1859.

CHESTERFIELD BOARDING SCHOOL FOR YOUNG MEN AND BOYS.—The Winter Session of this institution will commence on the 14th of 11th mo. next, and continue twenty weeks. Terms \$70 per session, one half payable in advance, the other in the middle of the session. No extra charges.

For further particulars, address **HENRY W. RIDGWAY,** Crosswicks P. O., Burlington Co., N. J. 9th mo. 24—3 m.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

GEO. A. NEWBOLD, Purcellville, Loudon Co., Va. 8th mo. 6, 1859.—6m.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, FIRST MONTH 7, 1860.

No. 43.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,

No. 324 South Fifth Street,

PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

SELECTIONS FROM THE LIFE AND EXPERIENCE OF THOMAS BULMAN.

(Continued from page 658.)

TO A YOUNG WOMAN.

10 month 1st, 1786.

My dear and well beloved Friend,—I feel such nearness and such love flowing towards thee, that I am constrained to call unto thee, come down, come down, into the valley of humiliation, where the dew lies long, where the children of the kingdom feed daily, where the Lambs of Christ find pasture. My soul is filled with love towards thee, desiring for thee that thou mayst join in with the visitation of heavenly love, which I am sensible is extended to thee. Oh close in with this visitation of God to thy soul; mind every pointing, every drawing of his good Spirit, however gentle, however small. And remember, my dear child, it is the little foxes that spoil the buddings of the tender vine,—the vine of life. Give up every thing that would hinder the flowing of divine love into thy soul. Sacrifice every Delilah, every Amalakite, that there may be no lowing of oxen, nor bleating of sheep heard when thy spiritual Samuel comes to comfort thee. The Lord is at work with some in this place.

Thy sincere friend,

THOMAS BULMAN.

TO A BROTHER AND SISTER-IN-LAW.

Dear Brother and Sister,—For whose welfare Zionwards I sincerely travail. When I received your letter and found that your trials and difficulties still increased, on account of so many straying from the path of life, I was moved with pity for you. But the way appointed for the righteous, in all generations, is, that through

many tribulations they shall enter the kingdom. I was pleased to find that you were engaged in the Lamb's warfare. Indeed, whenever I hear of any thus faithfully engaged, it is cause of rejoicing. The inhabitants of the Rock shall sing both of mercy and of judgment. Let us persevere, "forgetting those things which are behind, and reaching forth unto those things which are before," then at times, though it may be at distant intervals, we shall be permitted to meet at the well-spring of life, there to drink wine and milk, without money and without price. But we must not expect always to dwell there; because Israel has gone into captivity,—the seed is in bondage, so the called and chosen of the Lord have to go down with it, to suffer with it; but when Christ reigns we shall reign with him. Let us be willing to follow him wheresoever he leads; then when the evening is ushered in, and the curtains are drawn, all sorrow and sighing shall pass away, and we shall be centered in that happy state into which no trials, no difficulties, no complainings ever come; but the song of praise,—the song of Moses and of the Lamb is heard for ever and ever.

THOMAS BULMAN.

As Thomas Bulman's children grew up, he felt considerable difficulty in placing them at a suitable school; none but that in the village seemed within his reach; the master of this was much of a stranger to Friends; Thomas Bulman therefore wrote to him a letter, from which the following is an extract, desiring that while his children, were mixing with others they might be trained in the simplicity of the truth.

"My desire is that they may be encouraged both by example and precept, to turn the attention of their minds within, to Christ, 'the hope of glory' through whom all true and acceptable worship can be performed. I desire they may not be constrained to learn any forms of prayer, creeds, catechisms, formal graces, or bowing of the head to any one; or to say 'good morrow' or 'good morning,' because all days are good; when they take leave I wish them simply to say 'Farewell.' I wish them not to give vain or flattering titles to any man, or to say You, to a single person, seeing we address the word, Thou, to the Almighty, whose power and prerogative it is to have the sole rule and right in man. And I do desire, they may be

have and demean themselves to all, rich and poor, in such a becoming manner as is well pleasing in the sight of God, and of good men. I want them to be taught plain reading, writing, and common arithmetic. To name the days of the week, and months of the year, numerically, as First, Second, Third, &c., and not to follow the heathenish practice of calling them Sunday, Monday, or January, February, &c.

Thomas Bulman's care respecting the religious training of his children was much blessed to them. Three of them are now living, (1851,) are Friends in good esteem, and one of these, his son Thomas, is in the station of Elder.

TO A YOUNG FRIEND IN REPLY TO ONE FROM HER.

My dear Child,—I received thy letter and was well satisfied with its contents, especially as it indicated thy progress, in a spiritual sense. I feel a renewed exercise of mind to visit in spirit those little ones whom the Lord has visited, and is preparing for his own work, and fitting for his service. I have been drawn forth in prayer, that these may be preserved in the simplicity of the Truth, that they may grow up like willows by the water courses. So, my dear child, keep to the tender scruples of thy own conscience, in these deep, trying and proving seasons. It is good to keep close to God, who can deliver thee, and from whom alone cometh thy salvation. My hope has been revived in the little ones of the rising generation, that the Truth may yet shine forth in them in its ancient beauty; this makes me often breathe for their preservation, and especially that those called little things may not retard their progress. Unfaithfulness in these, like the ravages of the little foxes, spoils the tender buddings of the heavenly vine. Oh, my dear child! while I am writing, I am breathing for thy preservation, and for all my dear brethren and sisters, that they may be kept from unfaithfulness in these little things; beware, this unfaithfulness is of a devouring nature. It is in the visited ones that my hope lives. As for the generation now passing away, which should have been as waymarks, so many are settled on their lees, there is little hope of truth shining bright in them.

THOMAS BULMAN.

TO A FRIEND, YOUNG IN THE MINISTRY.
2ND OF 10TH MONTH, 1783.

My dear and well beloved Sister in Christ,—For so I can address thee. A few days ago, being at our Quarterly Meeting, and being once more favored with that love which unites all the children of God everywhere, my mind was drawn towards thee with most endeared affection, and I did believe, if thou hadst done right, thou wouldst have been there also. Oh, my child, I sympathise with thee; my soul longs for thy growth in the Truth; but, my dear, withhold not more than is meet, for it will tend to thy poverty. Many times thou mayest feel it very

difficult to get to the Quarterly Meetings, and often poor and low in thy mind; and looking to thy littleness, thou mayst be ready to conclude thy service of little avail. But my child, though thou mayst have many times to go forth weeping, yet bearing precious seed, if thou be faithful, thou wilt doubtless return again rejoicing, bringing sheaves of peace with thee—sheaves of peace in thy own bosom, even that peace which is of more value to the dedicated ones, than the increase of corn, wine, or oil. Oh how hath my soul been led to visit the little ones in Christ, that are scattered up and down, and to breathe to our holy Head for their growth and preservation in the Truth, that they may be faithful to the little that is revealed to them; and then I believe greater things will also be made known; then would they become valiant for the Truth, as were some in days of old, and there would again be judges as at the first, and counsellors, as at the beginning.

THOMAS BULMAN.

TO HIS BROTHER AND SISTER-IN-LAW.

Irthington, 1st of 11th month, 1788.

Dear Brother and Sister,—In that love which never changes or fades away, do I long for your welfare and preservation in the best things. We are far separated from each other, but this love cannot be confined; it often visits in spirit when absent in body. O, my beloveds, above all things, make your soul's welfare your greatest care; for, what shall we give in exchange for our souls? This has been a trying season to us, both inwardly and outwardly, but magnified be the Lord for such trials; he only does with his children according to the pleasure of his own will: and we can say, that all things work together for good to them that love him. Our trying, proving seasons, if rightly made use of, are our most profitable seasons, our times of best improvement. It was from the bottom of Jordan that the children of Israel had to bring stones of memorial, and when in the deeps, we shall experience the loving kindness of the Lord. I conclude in that love which desireth the health and salvation of all, and with the earnest wish, that you may be obedient to the holy and divine witness in your own hearts.

THOMAS BULMAN.

(To be continued.)

TO THE MONTHLY MEETING OF UWCHLAN.

Dear Friends:—In the gentle springing up of Gospel love and fellowship I salute you, my dear brethren and sisters, and hereby let you know that it is my fervent desire and prayer, that you may individually attend to the gift of God in your own hearts, and therein wait upon Him for the arising of his pure life and power, that therein and only thereby the affairs of the church may be transacted to the honor of truth and your own peace and safety. For, to speak in the

church to the business and affairs of truth, by the will, wisdom, and power of man (however knowing he thinks himself,) will lead into its own nature, and in the end minister strife and contention, and break the unity of the one spirit, wherein the peace of the church stands, wherefore I beseech you be aware thereof; and as I know there are among you such whom the Lord by his Spirit and gentle operation of his power is gradually preparing for his own work, in deep humility and holy attention of soul mind your calling, for in your obedience only you will be elected and chosen to the work whereunto he hath called you; so shall you be made as skilful watchmen and watchwomen placed on the walls of Sion, to discover the approach of an enemy in whatsoever subtle appearance, and enabled to give warning thereof to others. May each one of you stand upright in your own lots in the regeneration, waiting for the pouring forth of the Spirit and anointing of the Holy Ghost, by the renewing whereof a true qualification is given in the influence of the love of the Father rightly to oversee the flock and family of our God, amongst whom there are some plants with you worthy of your care.

I should have been glad to have sat with you in your monthly meeting, even from that love which I now renewedly feel to spring and flow towards you, but cannot well leave home. Do therefore at this time, in the pure refreshing stream thereof, again salute and bid you farewell, and remain your friend and brother

JOHN CHURCHMAN.

East Nottingham, ye 4th 1st mo., 1763.

TAKE NO THOUGHT FOR THE MORROW.

To a careless reader, the expression, "Take no thought for the morrow," is a very strange one. It seems to be at variance with a large portion of the Bible; it seems to contradict the calls to consideration and thoughtfulness which abound in the Bible. A glance at the true meaning of the passage removes the difficulty. We are to take no anxious distressing thought respecting our future temporal wants. We are not to distress ourselves by anxiously asking, what shall we eat? or what shall we drink? or wherewithal shall we be clothed? Our heavenly Father knoweth that we have need of these things, and will provide us with them if we follow his directions. The obedient child obeys the directions of his earthly parent, and looks to him for food and clothing. He has confidence that his father will supply his wants. When told to go and labor in the cornfield, he does not spend a part of his time and of his energies in indulging anxious thoughts respecting the supply of his wants for the morrow.

Now our heavenly Father has work for every one of his children; He says to every one, "Go work to-day in my vineyard." He appoints to

every one his own work; He promises to every man his wages. Bread shall be given him; his water shall be sure, and no good thing will be withheld from them that walk uprightly.

* * * * *

By his promises and his reasonings, God is pledged to supply the wants of those who do his work, and put their trust in him. We are to give our whole attention to present duty, and commit the future to the care of God. He will never see the righteous forsaken; He is able and willing to supply all their wants; He may not give them all that they think they ought to have, but He will give them all that infinite love, guided by infinite wisdom, shall think they ought to have.

An aged man was met by one whom he had not seen since their first entrance upon the active duties of life. He was asked if he had secured a competency. His reply was, "I have."

"Have you a farm?"

"I have not."

"What investments have you made?"

"None. I have brought up a large family. My children are all doing well. I have one son in the ministry."

"You look to your children to support you, then."

"I trust they will always be ready to help me, if I should need their help. I have no fear of coming to want; I serve a Master that never lets his servants want anything that is really good for them."

The aged disciple had provided for the future more surely than he could have done by any investments, even if it had been in his power to possess himself of lands or stock. It is in the power of every Christian to make the same provision.

In like manner preparations can be made for future trials. They are not the result of chance; they will come when God sees fit to send them. We cannot avoid them, any more than we can avoid death; but we can always be prepared for them. If we are always at the post of duty, they cannot take us at a disadvantage. We have always at hand the promise, "As thy days, so shall thy strength be."—*N. Y. Observer.*

Manners are the shadows of virtues; the momentary display of those qualities which our fellow creatures love and respect. If we strive to become, then, what we strive to appear, manners may often be rendered useful guides to the performance of our duties.—*Sydney Smith.*

Put no dependence on genius. If you have great talents, industry will improve them; if you have but moderate abilities, industry will supply their deficiency. Nothing is denied to well-directed labor; nothing worth having is to be obtained without it.

THOUGHTS ON LABOR.

(Continued from page 651.)

The law of nature is, that work and the enjoyment of that work go together. Thus God has given each animal the power of self-help, and all necessary organs. The same robin builds the nest and lives in it. Each lion has claws and teeth, and kills his own meat. Every beaver has prudence and plastic skill, and so builds for himself. In those classes of animals where there is a division of labor, one brings the wax, another builds the comb, and a third collects the honey, but each one is at work. The drones are expelled when they work no more. Even the ruler of the colony is the most active member of the state, and really the mother of the whole people. She is only "happy as a king," because she does the most work. Hence she has a divine right to her eminent station. She never eats the bread of sin. She is queen of the workers. Here each labors for the good of all, and not solely for his own benefit. Still less is any one an injury to the others. In nature those animals that cannot work, are provided for by love. Thus the young lion is fed by the parent, and the old stork by its children. Were a full-grown lion so foolish that he would not hunt, the result is plain, he must starve. Now this is a foreshadowing of man's estate. God has given ten fingers for every two lips. Each is to use the ability he has for himself and for others. Who, that is able, will not return to society, with his head or his hand, an equivalent for what it received? Only the sluggard and the robber. These two, the drones and pirates of society, represent a large class. It is the plain duty of each, so far as he is able, to render an equivalent for what he receives, and thus to work for the good of all; but each in his own way; Dorcas the seamstress at her craft, and Moses and Paul at theirs. If one cannot work through weakness, or infancy, or age, or sickness,—Love works for him, and he too is fed. If one will not work, though he can—the law of nature should have its effect. He ought to starve. If one insist simply upon getting into his hands the earnings of others, and adding nothing to the common stock,—he is a robber, and should properly meet with the contempt and the stout resistance of society. There is in the whole world but a certain amount of value, out of which each one is to have a subsistence while here; for we are all but life-tenants of the earth, which we hold in common. We brought nothing into it; we carry nothing out of it. No man, therefore, has a natural right to any more than he earns or can use. He who adds anything to the common stock and inheritance of the next age, though it be but a sheaf of wheat, or cocoon of silk, he has produced, a napkin, or a brown loaf he has made, is a benefactor to his race, so far as that goes.

But he who gets into his hands, by force, cunning, or deceit, more than he earns, does thereby force his fellow mortal to accept less than his true share. So far as that goes, he is a curse to mankind.

There are three ways of getting wealth. First, by seizing with violence what is already in existence, and appropriating it to yourself. This is the method of the old Romans; of robbers and pirates, from Sciron to Captain Kidd. Second, by getting possession of goods in the way of traffic, or by some similar process. Here the agent uses cunning, and not force; the instrument is a gold coin, and not an iron sword, as in the former case. This method is called trade, as the other is named robbery. But in both cases wealth is acquired by one party and lost by the other. In the first case there is a loss of positive value; in the latter there is no increase. The world gains nothing new by either. The third method is the application of labor and skill to the earth, or the productions of nature. Here is a positive increase of value. We have a dozen potatoes for the one that was planted, or an elegant dress instead of a handful of wool and flax. Such as try the two former ways consume much, but produce nothing. Of these the Roman says, "*fruges consumere nati*,"—*they are born to eat up the corn*. Yet in all ages they have been set in high places. The world dishonors its workmen; stones its prophets; crucifies its Saviour, but bows down its neck before wealth, however won, and shouts till the welkin rings again,—LONG LIVE VIOLENCE AND FRAUD.

The world has always been partial to its oppressors. Many men fancy themselves an ornament to the world, whose presence in it is a disgrace and a burthen to the ground they stand on. The man who does nothing for the race, but sits at his ease, and fares daintily because wealth has fallen into his hands, is a burthen to the world. He may be a polished gentleman, a scholar, the master of elegant accomplishments, but so long as he takes no pains to work for man with his head or his hands, what claim has he to respect, or even a subsistence? The rough-handed woman, who, with a salt-fish and a basket of vegetables, provides substantial food for a dozen working men, and washes their apparel, and makes them comfortable and happy, is a blessing to the land, though she have no education, while this fop with his culture and wealth is a curse. She does her duty so far as she sees it, and so deserves the thanks of man. But every oyster or berry that fop has eaten, has performed its duty better than he. "It was made to support nature, and it has done so," while he is but a consumer of food and clothing. That public opinion tolerates such men is no small marvel.

The productive classes of the world are those who bless it by their work or their thought. He

who invents a machine, does no less a service than he who toils all day with his hands. Thus the inventors of the plough, the loom, and the ship were deservedly placed among those whom society was to honor. But they also who teach men moral and religious truth; who give them dominion over the world; instruct them to think, to live together in peace, to love one another, and pass good lives, enlightened by wisdom, charmed by goodness, and enchanted by religion; they who build up a loftier population, making man more manly, are the greatest benefactors of the world. They speak to the deepest wants of the soul, and give men the water of life and the true bread from Heaven. They are loaded with contumely in their life, and come to a violent end. But their influence passes like morning, from land to land, and village and city grow glad in their light. That is a poor economy, common as it is, which overlooks these men. It is a very vulgar mind, that would rather Paul had continued a tent-maker, and Jesus a carpenter.

Now the remedy for the hard service that is laid upon the human race consists partly in lessening the number of unproductive classes, and increasing the workers and thinkers, as well as in giving up the work of ostentation and folly and sin. It has been asserted on high authority, that if all men and women capable of work would toil diligently but two hours out of the twenty-four, the work of the world would be done, and all would be as comfortably fed and clothed, as well educated and housed, and provided for in general, as they now are, even admitting they all went to sleep the other twenty-two hours of the day and night. If this were done, we should hear nothing of the sickness of sedentary and rich men. Exercise for the sake of health would be heard of no more. One class would not be crushed by hard work; nor another oppressed by indolence, and condemned, in order to resist the just vengeance nature takes on them, to consume nauseous drugs, and resort to artificial and hateful methods to preserve a life that is not worth the keeping, because it is useless and ignominious. Now men may work at the least three or four times this necessary amount each day, and yet find their labor a pastime, a dignity, and a blessing, and find likewise abundant opportunity for study, for social intercourse and recreation. Then if a man's calling were to think and write, he would not injure the world by even excessive devotion to his favorite pursuit, for the general burthen would still be slight.

Another remedy is this: the mind does the body's work. The head saves the hands. It invents machines, which, doing the work of many hands, will at last set free a large portion of human time from slavery to the elements. The brute forces of nature lie waiting man's command, and ready to serve him. At the voice

of genius, the river consents to turn his wheel, and weave and spin for the antipodes. The mine sends him iron vassals, to toil in cold and heat. Fire and water embrace at his bidding, and a new servant is born, which will fetch and carry at his command; will face down all the storms of the Atlantic; will forge anchors, and spin gossamer threads, and run of errands up and down the continent with men and women on his back. This last child of Science, though yet a stripling and in leading strings, is already a stout giant. The fable of Orpheus is a true story in our times. There are four stages of progress in regard to labor, which are observable in the history of man. First, he does his own work by his hands. Adam tills the ground in the sweat of his own face, and Noah builds an Ark in many years of toil. Next he forces his fellow mortal to work for him, and Canaan becomes a servant to his brother, and Job is made rich by the sweat of his great household of slaves. Then he seizes on the beasts, and the bull and the horse drag the plough of Castor and Pollux. At last he sets free his brother; works with his own hands; commands the beasts, and makes the brute force of the elements also toil for him. Then he has dominion over the earth, and enjoys his birth-right.

Man, however, is still in bondage to the elements; and since the beastly maxim is even now prevalent, that the strong should take care of themselves, and use the weak as their tools, though to the manifest injury of the weak, the use of machinery has hitherto been but a trifling boon in comparison with what it may be.

There is a melancholy back ground to the success and splendid achievements of modern society. You see it in rural villages, but more plainly in large cities, where the amount of poverty and wealth is summed up as in a table of statistics, and stands in two parallel columns. The wretchedness of a destitute mother contrasts sadly with a warehouse, whence she is excluded by a single pane of glass, as cold as popular charity and nearly as thin. The comfortless hutch of the poor, who work, though with shiftless hands and foolish head, is a dark back ground to the costly stable of the rich man, who does nothing for the world, but gather his treasures, and whose horses are better fed, housed, trained up and cared for than his brother. It is a strange contrast to the church of God, that, with thick granite walls, towers up to Heaven near by. One cannot but think, in view of the suffering there is in the world, that most of it is the fault of some one; that God, who made men's bodies, is no bankrupt, and does not pay off a penny of satisfaction for a pound of want, but has made enough and to spare for all his creatures, if they will use it wisely. Who does not sometimes remember that saying, Inasmuch as you have not done it unto the least of these, you have not done it unto me.

(To be concluded)

For Friends' Intelligencer.

NO APOLOGIES SHOULD BE MADE IN BEHALF OF
SLAVERY.

Among the many self-evident and important truths delivered by the blessed Jesus, is one in which He bore an emphatic testimony to the brotherhood of man. "One is your Master, even Christ, and all ye are brethren."

The system of slavery as now agitating the country, could only have been established and perpetuated by the most palpable violation of this testimony: inasmuch as we are all brethren, children of one common parent. If one man has imparted to him, by a gracious God, the to liberty and the multiplicity of enjoyments dependent upon it, then every other man has the same right; otherwise God must be partial, or imperfect in the administration of his gifts. But he is neither partial nor imperfect.

It is we, (his creatures,) who, through inattention to the wholesome discipline of the divine laws, have become covetous and unjust, and, under such influences have been induced to make merchandize of our fellow men.

To secure so odious an act from reprobation, the strong arm of law has been thrown around the system of slavery. This has blinded thousands, and still continues to obstruct the vision of many who might otherwise see its enormity. But does the solemn sanction of law make it right? Does it impart a particle of justice to the system?

The law in question, with its various provisions, is based upon fraud and violence. Therefore, all claim under such a law is as spurious as it is unjust.

The slave has, to-day, as just a claim of property in his master, as the master has in him, in a moral point of view.

Is it a wonder that such a legalized wrong and aggression should agitate the country? The wonder is that the people have not been agitated long before.

However alarming this agitation may seem, it is the precursor of the downfall of slavery. Before the extinction of the slave trade in England, great agitation prevailed. I think one member of Parliament said, he had not known so great excitement in that house in thirty years as on that occasion.

But, however exciting the subject, however unjust and tyrannical the laws may be, consistent Christians are not at liberty to attempt their abolishment, or to resist them by physical force and violence. The Christian's weapons "are spiritual, and mighty, through God, to the pulling down the strongholds of sin and satan. The sword of the Spirit is the most potent weapon—and it would be difficult to conceive a case more requiring its use: for what stronger hold of sin and satan can be found than is embraced in the

slave system—productive, as it is, of evil, "and that continually."

It is the Christian's service to bear testimony to the truth. Those laws that are inhuman and wholly aggressive, however popular or of long standing, are not to be approved. But this iniquity is to be exhibited to an observing world. Oppression should be rebuked, the way-side sufferer relieved, and those in bonds remembered, as bound with them.

We may be told that the slave system has some redeeming features, and is not as bad as some would represent it. If so, I have yet to learn it. Is it not a wrong without a parallel? The same acts of injustice on which the system is based, if committed without the sanction of law, would be deemed cruel and inhuman crimes. The foreign slave trade being illegal, is punishable with death; but the home trade, made legal, excites little serious reflection.

When I hear a man undertaking to set forth the benefits of the system, viz: "that in traveling through the slave states fifteen hundred miles, the slaves, without exception, appear comfortably clad, well shod, and the services required per day, no more than could be accomplished in half a day, with the reiteration of other slave-holding apologies, I say to myself, that man has never had the teaching which Solomon Northup received in his twelve years' apprenticeship under "the peculiar institution." When he was first kidnapped, being lodged in a Washington jail, and there nearly flogged to death, for claiming to be, as he was, a freeman, he never after could see anything good in such a system. Neither has he had the experience of Peter Still, who, at the age of six years was stolen from New Jersey, and was a learner forty years: he ultimately succeeded in purchasing himself, and, finally, his wife and children, at the enormous cost of five thousand dollars, thus attesting the estimation in which he held the system, and his "irrepressible" desire to be clear of it.

It is perfectly natural for those involved in slave-holding, to apologize for the system, but it is an act of unkindness in others to encourage them in it.

There is no doubt but that some slave-holders, in spite of the bad influences of the system, have comfortably clothed and fed their slaves; and what of that? A judicious man takes good care of his horse, for his own interest. Does the feeding and clothing atone for aggression upon the rights of man, and the deprivation of his liberty?

Man has been made a thinking, intelligent being, designed for nobler and higher purposes than the mere feeding and clothing these animal bodies.

The great business of life, is, by grace, to "work out the soul's salvation, and so to glorify a gracious God while here, as to be prepared to

enjoy him in a future state. But to enslave a man is to attempt to rob him of his free agency, and reduce him to the character of a beast of burthen, to be bought and sold as merchandize. If this is not an effort at defeating the sublime purposes of divine goodness, then we know not what is. The master may claim as a virtue that he feeds and clothes his slaves, but those who deny his right to hold them, should see that the acts of feeding and clothing are based upon the right of holding slaves, and are but a part of the system. It is the slave's right to feed and clothe himself, in his own way,—and if done by his master, should be viewed as a usurpation of that right.

I verily believe the system to be wrong in every part, and far worse than most take it to be. A system at variance with morality, Christianity, and the peace and best interests of the inhabitants of these United States.

"The way of the transgressor is hard." Slaveholders are to be pitied. The direful effects of the system they cannot escape. Slavery and its evils are inseparable. It cherishes selfishness, pride, idleness, unchastity, intemperance and all that is calculated to degrade a human being, and not only embitters this life, but tends to obstruct a right preparation for that life which is to come.

The best manifestations of pity for the slaveholder is to labor to convince him of the injustice and error of his ways; and the efficiency of this service will materially depend upon how clean handed we are ourselves. If we are doing our full share,—prompted by interest and circumstances in sustaining slavery,—will not this fact greatly neutralize the most powerful and eloquent appeals that may be made in behalf of the rights and liberty of the down-trodden and oppressed? Will it not give to the master too much reason for saying "physician heal thyself?" However large, as is the field for anti-slavery labors, non-participancy with the slaveholder seems to be the only consistent starting-point. This would give vitality and force to all other proper measures.

It is neither for envy or for pleasure that the slave is held in bondage. It is simply to obtain his labor without compensation. So that we see the system is sustained by finding a market for its products, which the master has no moral right to sell, or the consumer to purchase.

How clear it is, therefore, that to extinguish such a market, would be to extinguish slavery, just as the extinction of slavery would abolish the slave-trade. It surely would be difficult to discern the difference between the sale of slave-labor produce, by the master, and the purchase of the same by the non-slaveholder, each being sustained only by law, custom, and popularity.

Have not these victims of oppression heavy and valid demands upon the store-houses in the free states, filled, as they are, with the proceeds

of their unrequited toil? Unhappily, we are not in the habit of weighing the slave's and free-man's rights in the same scale.

Jesus drew a simile which is very appropriate to the subject under consideration: "Why beholdest thou the mote that is in thy brother's eye, and considerest not the beam that is in thine own eye; thou hypocrite, first cast the beam out of thine own eye, and then shalt thou see clearly to cast the mote out of thy brother's eye."

If we non-slaveholders were to adopt this recommendation, and wash our hands of that which is represented by the beam in our eye, can we believe that our labors for casting the mote of slavery from our brethren's eyes would not be crowned with a speedy and complete success?

To me the case is so plain, that I cannot see how it is possible, any candid, reflecting mind, should be at a loss in discovering the path of duty.

D. I.

Dutchess Co., 12th mo., 1859.

TRUE AND FALSE CHARITY.

Christmas and New Year's—the season of festivity and enjoyment—are the season also of the severest and most forbidding destitution and suffering. The wealthy and fortunate sit down to a daily feast, combining all that can gratify the palate with all that may nourish the frame, while thousands of the young and innocent pace the streets from day to day in anxious quest of even the driest crust, and at length go hungry to what must serve them as an apology for bed. Thousands of youth of both sexes will this winter take their first lessons in depravity and crime under the impulse of destitution and despair.

This is a fearful truth; but it is an equally important fact that *Alms-giving will never cure the evil*. If there were ten times as much of what is vaguely termed Charity as there is, we doubt that the aggregate of human wretchedness would be sensibly diminished. For it must never be forgotten that, while there are thousands of sufferers utterly guiltless and nobly deserving, yet improvidence is the general cause of destitution. Some, indeed, lack the capacity, the faculty, essential to finding work and earning a livelihood in a great city; but indolence, inefficiency, waste of time, prodigality, intemperance, debauchery, lie at the root of most declensions into utter pauperism. The artisan or mechanic in some factory village, who has lost a good situation by a drunken spree, and thereupon plunged into a great city to obtain work, complains that he can get nothing to do, when he had no right to expect anything in this quarter. An Indian might as reasonably come to a city and complain of the dearth of game there, as a white man or youth thrust himself into a city and murmur at finding no work there. There is almost always, but especially at the beginning of winter, an

enormous overplus of labor seeking employment here; he who don't know and calculate on this knows far too little to qualify him for gaining a livelihood in our city. If two or three millions will insist on living within sight of Trinity steeple, they must starve each other out—that is to say, one half of them must starve out the other—for there is no practicable alternative.

Far be it from us to stay the hand of Charity. There will and must be Alms-giving; We do not think there is too, much of it, but we could wish it more carefully, discreetly bestowed. You can hardly do a man a greater wrong than to make him think he can beg a living or a dollar more easily than he can earn one. Our experience with beggars is tolerably extensive; and it is our sad conviction that a majority of the dollars given do no real good to the receiver nor to any one else. All who have anything that they can spare should give liberally for the relief of the suffering; but be very careful of giving to strolling beggars. The best way is to compute your income of available means, purge away all needless outgoes, and then judge how much you can fairly afford to contribute toward the relief of the needy and suffering. Having decided this point, divide the sum among such well-managed public charities as you have most faith in—saving a fraction to be given personally in cases of pressing want where there is reasonable assurance against imposture.

But the truest and highest manifestation of charity is not made through Alms-giving. It is that which teaches and helps the destitute to help themselves. He who should plan and erect a gigantic workshop, wherein every one who could do anything whatever would find temporary employment at a low remuneration, would do more for the Poor than all the John W. Farmers that ever established or sustained soup-houses. What we most urgently need to-day is the nearest possible approximation to this end. A workshop wherein each child of ten years could earn even ten cents per day, each robust woman twenty-five, each man thirty to fifty, being paid the exact value of their labor or product at the close of the day's work, would be worth ten soup-houses, no matter how gigantic; though the soup-house might be a good thing combined with the workshop, supplying a nourishing bowl at bare cost to all who by labor had earned it. For the great mass of our unfortunates are as devoid of industrial capacity as of food. They are "willing to do anything"—which implies that they know how to do nothing. Give them, bread for work, and they would soon qualify themselves for earning more than you could give them and thenceforward go on without your aid. Now they lack habits of regular industry and skill in any useful vocation, and giving them alms is confirming and hardening them in the evil way whereinto they have fallen.

Once more we entreat our wealthy, capable, philanthropic citizens to take up this problem of Pauperism, trace out all its ramifications, study its cause, and indicate (if possible) its cure. In no other way could they spend their time more usefully to man or more acceptably to God. Simply as tax-payers, it is their urgent duty to institute and prosecute this inquiry. Public Pauperism has cost our City directly Three Quarters of a Million in 1859; indirectly a good deal more; while the amount filched from Thrift by Knavish Beggary and squandered on idleness, intemperance and vice, must be computed by Millions. Yet there is proof on record that this is a wanton, lavish, needless outlay—that the paupers might be made to earn one-half to three-fourths of their own livelihood under an efficient Workhouse system. James Brewster's experiment in New-Haven is of itself conclusive on this point. If every pauper in our Alms-House were made to earn his own living, so far as possible, the number to be supported would rapidly and lastingly fall off; while many, who now know only how to eat, would soon be qualified to earn their own living outside the Alms-House.—*N. Y. Tribune.*

FRIENDS' INTELLIGENCER.

PHILADELPHIA, FIRST MONTH 7, 1860.

THE NEW YEAR.—To each and to all our readers we "wish a happy New Year." For the young we desire those bright and joyous feelings incident to the season of innocent youth, and both for them and for the more mature we crave that calm happiness which follows the right performance of every known duty.

In the review of our motives and actions during the past twelve months, it may be well for us all to examine how we have employed our time, and to what extent we have shared our various gifts, whether of mind or worldly wealth, with those less advantageously situated than ourselves. The position of the members of our religious society is one of great responsibility. The profession which they make of simplicity in their manner of living, dress, and pleasures, releases them from many of the demands upon their time and purse, to which the generality of other denominations think themselves bound to yield. This fact claims serious thought, and it may be profitable for all to inquire whether in their care to provide for themselves and families they are not sometimes induced to lay by more of their yearly income than prudence requires,

and whether a part of this overplus might not be expended in promoting the comfort and improvement of those around them. Even the interesting and profitable reading to which those who live in large cities, especially, have access, may be made the means of selfish indulgence, unless the desire is continually kept alive to share with others the benefits derived from intellectual pursuits.

The Society of Friends has always impressed upon its members the importance of individual responsibility, and in all its teachings it points them to the inward guide as the director of their motives and actions. A faithful adherence to this guide led early Friends to administer to the moral and mental, as well as to the spiritual wants of those around them, and it is reasonable to suppose that an equal dependence upon the same inward monitor would lead the members of the present day into a life of greater mental activity, having for its object the good of others. They would thus be enabled to appreciate and direct the pure and high impulses of the youthful members, and ways would be opened in which these might associate with their older friends to mutual benefit; the gravity and experience of age tempering the ardor and vivacity of youth.

We fear if this encouragement is withheld, many of our young people will be led to seek a sphere of exercise for their good impulses in associations, where, along with much that is excellent, they are in danger of imbibing the forms, ceremonies, and creeds, out of which our fathers were called, and which often obstruct the clear shining of the Divine light.

These thoughts have presented themselves as we leave the old and enter upon the new year, and we trust the suggestions may meet a response with some of our readers.

MARRIED, at Hillside, 27th of 12th mo., 1859, with the approbation of Rensselaerville Monthly Meeting, JOHN U. RUSHMORE and SARAH P. DRAKE, both of Albany county, New York.

DIED, suddenly, on 2d day 11th of 7th mo., 1859, at her residence in Byberry, REBECCA THORNTON, aged 63, widow of the late James Thornton; members of Byberry Monthly Meetings.

—, On 1st day 27th of 11th mo., 1859, in Byberry, RACHAEL PAUL, aged 84 years and 4 months; a member of Byberry Monthly Meetings, and widow of Samuel Paul.

—, On 7th day 3d of 12th mo., 1859, JOSEPH L. ROBERTS; a member of Chester Monthly Meeting, N. J.

He was the eldest son of Hannah and the late Reuben Roberts, of Virginia. From very early life he was afflicted with "hip disease;" the suffering consequent upon this he was enabled to bear with remarkable patience and resignation; his mind was preserved in great serenity and with seeming confidence, that he would enter into that "rest prepared for the people of God," he quietly passed away, in the 24th year of his age.

The funeral met at Friends' meeting-house, Moores-town, on 3d day following.

DIED, On 1st day 11th of 12th mo., 1859, SARAH SINGLEY, about 86 years old; a member of Byberry Monthly Meeting, and widow of John Singley. She was a remarkable instance of plainness and simplicity; a short time before her death, she expressed a wish "to die," and requested that her funeral should meet at the meeting-house (Byberry); that she should be buried in a plain coffin; if pine, the better; no "case;" and that there should be no costly, or even good clothing buried with her, remarking, that she was opposed to so much being used about the dead, that might be of use to the poor.

From the Leisure Hour.

THE BLACKBURN FARMER.

About the middle of last century there resided in the village of Blackburn, in Lancashire, a farmer of small means, but of good natural capacity, of a reflective habit, and endowed with a spirit of persistent perseverance rarely found in his walk of life. He tilled a few acres of land, the produce of which sufficed to support his family, whom he accustomed to fare humbly and labor hard. As for himself, he cared not how much he worked, nor to what employment he turned his hand. Anything that promised a remuneration for his industry, he would attempt; if it prospered, and he obtained the proposed remuneration, it was well; and if it failed, and he got no remuneration, still he extracted experience out of it, and was in a condition to enter on a new experiment with a better chance of success. This patience and good-humored self-possession, under all circumstances, was inherent in the man, and it proved in the end a most valuable quality, as we shall see. He was naturally fond of experiment; and in the evenings of winter, when farming operations were unavoidably suspended, was accustomed to exercise his ingenuity, of which he possessed a more than average share, in mechanical contrivances, either for diminishing labor, or for rendering its operations more satisfactory and complete.

At that period, all Lancashire and the manufacturing districts of the north were more or less excited on the subject of the cotton manufactures, which the inventions of Hargreaves and others had brought to a state of perfection that promised to make this country the commercial centre of the world. It is no wonder, therefore, that the farmer turned his attention to this branch of manufacture. Being struck with the clumsy tediousness of the process by which the cotton wool was brought into a state fit for spinning, he set

about contriving a quicker and more satisfactory method of doing the work. Before long he was led to the adoption of a cylinder, instead of the common hand-cards then in use; and in the end produced machines of simple construction, by which the work of carding was not only performed more effectually, but at a much more expeditious rate. The success of his endeavors in this direction was so decided, that he now found it his policy to relinquish his farm, and devote himself entirely to the new employment which he had thus created for himself.

The cotton fabrics which were produced at this period were far different in appearance from those with which the last three generations have been familiar: they were, in fact, only cotton cloths, either indifferently white, or dyed in such homely colors as the dyers of the time could impart to them. Though useful for a variety of domestic purposes and for under-garments, the idea of making them the materials of personal adornment and elegant attire seems as yet to have suggested itself to no one. But now the Blackburn farmer conceived that idea, and, inspired by his success in the wool-carding department, resolved to carry it out with all the energy at his command.

To talking he was not much given, and to boasting not at all, and on this occasion especially he shrewdly kept his plans to himself. Procuring a stout block of wood, ten inches long by five inches wide, and some two inches thick, he drew with a pencil, on the smooth side of it, the exact representation of a parsley-leaf gathered from his garden. He then set to work, with pen-knife and small chisels, and such other tools as he could purchase, and with his own hands cut away all those parts of the wood not covered with the drawing, leaving the spray of parsley standing in relief; or, in other words, he made a wood-engraving of the leaf, differing in no other respect from the wood-engravings of the artist of to-day, but in the rough coarseness of the work, unavoidable in a first attempt. In the back of the block he fixed a handle, and at each of the four corners of it he inserted a little pin of stout wire. His next step was to mix a lively green color, well ground up with alum, to a consistency fit for printing. The color was contained in a tub, and upon its surface lay a thick woollen cloth, which of course became thoroughly saturated with the coloring matter. Laying a blanket on a stout kitchen table, and stretching the white calico cloth on the top of that, the ingenious farmer applied his wooden block to the saturated woollen cloth, dabbing it repeatedly, until it had taken up a sufficient quantity of the color. He then laid the block squarely on the stretched cloth, and gave it a smart blow on the back with a mallet, thus printing the impression of the parsley-leaf. The four little pins, fixed at the corners of the block, served to guide him in ap-

plying it squarely at each consecutive impression; and thus he worked away, until the whole surface of the cloth was covered with the parsley leaves, and he had produced the *first piece of printed cotton* the world had ever seen.

The parsley-leaf pattern succeeded so well, that he soon found himself called on for others of various designs, which also he made with his own hands, thus keeping his secret to himself, and shutting out rivals in the trade which his own ingenuity had created. And now the demand for his novel wares grew so urgent, that he could not produce them fast enough for his customers. As a matter of course he had impressed the services of his whole family—his sons aiding in the printing, and his wife and daughters working early and late in ironing out of the printed cloths after the coloring matter was dry. This ironing process took a great deal of time; and though the women bent over the flat-irons early and late, they could not meet the urgency of the case, and thus the execution of the orders that poured in was continually delayed.

To overcome this obstacle, the farmer set his wits to work to contrive a machine to supercede the use of the flat-irons. Remembering the advantage he had derived from the use of a cylinder in carding the cotton-wool, he turned again to the cylinder to effect his present purpose. He instructed a carpenter to make a large oblong frame, with a smooth bed of solid planking, supported on upright posts, and with a raised rail or ledge on either side. Running from side to side he placed a roller, with a handle to turn it, and round the roller he wound a rope spirally. Each end of the rope was fastened to a strong oblong box, as large as the bed of the frame; and the box being filled with bricks and paving stones, was heavy enough to impart a powerful pressure. Instead of ironing his pieces of printed cloth, the farmer now wound them carefully round small wooden rollers, which he placed in the smooth bed beneath the box of stones, drew that backwards and forwards over them, by means of the handle affixed to the cylinder, which had the rope coiled round it, and so, without the use of the hot flat-irons, gave the desiderated finish to his work. And thus it was that the *first mangle* came into the world.

This machine answered its purpose admirably, and, by releasing the wife and daughters from the ironing table, increased by so much the producing power of the family. The farmer worked on now with redoubled diligence; the more cottons he printed, the more people wanted them; and as he had taken especial care that no man should become master of his mystery, he retained the trade in his own hands. As years flowed on, wealth poured in, and the small farmer of the village became the principal of one of the largest and most prosperous manufacturing houses in the country. He took his eldest son

into partnership, and applying his capital to the production of machinery to facilitate cotton printing, was enabled to transfer his patterns from blocks to cylinders, and thus to print, in a few minutes only, a piece of cloth which it would have taken a week to complete under the old process with the mallet and blocks.

The farmer's son became a man of vast wealth and influence. It was but a trifle to him, when the burden of war weighed heavily upon his country, and the national emergencies were most oppressively felt, to raise and equip, at his own expense, a regiment of horse for the defence of the country, and present them to the government. This he did; and the government, in return for his generous patriotism, made him a baronet.

The patriotic baronet had a son, who, though inheriting the thorough working faculty and persistent perseverance of the family, was not brought up to the manufacturing business, with the view of adding to the family wealth. The grandson of the Blackburn farmer was placed under skilful instructors, and in due time sent to college, where he set a noble example of subordination and diligence, displayed abilities of the highest order, and won distinguishing honors. He afterwards obtained a seat in Parliament, where he served the country for a period exceeding the average duration of human life, and served it, too, with a fidelity, proof not only against the seductive influence of party, but against his personal interests, and in opposition to the cherished friendships of a whole life. He obtained, and for a long period enjoyed, the greatest honor which it is possible for a sovereign to confer upon a subject. As the prime minister of England, he devoted himself to the welfare of the people, working steadily for the emancipation of industry, the amelioration of the poor man's lot, and the cheapening of the poor man's loaf. In this cause he signally triumphed, dying in the midst of his success, by what seemed the sudden stroke of accident, and leaving behind him a name and a fame dear to Britain and honored throughout the world.

We need scarcely add, that the name of the small Blackburn farmer, the wealthy and patriotic baronet, and of the champion of free trade, is one and the same, and that it will be found carved on the pedestal of the statue of Robert Peel.

THE TELESCOPE.

Previous to the invention of this wonderful instrument, science had reached such a stage, that we must either give up the explanation of the heavens, or (1) the astronomer must be lifted up toward the skies, or else (2) the stars must be brought down toward our earth. Both of the latter ends seemed impossible of attainment, but

by means of the telescope the difficulties have vanished, and science is triumphant.

Suppose that by refining the sense of hearing we could at this distance catch the sound of the debates in Washington or in the British House of Parliament, even then this power would be nothing like so great as the stretch of sight we have acquired by means of the telescope. In the Arabian story the professor of the magic carpet could, by placing himself upon it, with a simple wish, be borne whithersoever he pleased; but the space-penetrating force of the telescope gives greater real result than even the fable imagines. Another great power of the telescope is its capacity for revealing the character of the physical Universe. Before its invention the stars seemed but like light sparks of dust, but when the telescope is brought to bear, they swell out to the huge dimensions of globes like ours, or vaster still. The moon, under the influence of its force, becomes a world like ours, and I have brought its surface within one hundred and forty miles of my eyes fixed at the instrument.

Then have I seen its black craters like those of extinct volcanoes; I have seen the sunlight begin to tip the mountain tops, and at sunset the shadows have gathered and deepened, and flung a deeper gloom over its chasms and valleys. These phenomena have seemed so close that with a rod of ten feet I could have touched the surface of the orb. We know by means of the telescope the longitude and latitude of the moon better than we do that of the earth; of the earth's surface not one thousandth part is visible to us, but the entire circumference of the moon swells out before the eye of the astronomer. If we could fully grasp the magnificent dimensions of the sun, they would swell out until our horizon was covered with its expanse. The telescope reveals to us "spots" on its surface so gigantic that our earth could pass through these dark chasms without even touching the sides. I have watched those "spots" when they were ten times as large as our earth, and thus a glimpse was seen of the upheavals, the convulsions, and other forming movements of the physical world.

The planet Mars resembles our earth in so many particulars that it seems as if it might possibly have its inhabitants like our world. Its seasons are like ours; its revolutions on its axis and its orbit are similar to our earth's. I have seen its winter, shown in a snowy zone expanding as the cold increases and contracting as the summer approaches, until it has entirely disappeared!

The planet Jupiter, under the power of the telescope, is so immense that the moon looks like a mere spot of light upon its surface. Saturn, which is nine hundred millions of miles from our earth, presents one of the most delicate and glorious spectacles of the entire universe of God. The exquisite clearness and delicacy of its rings is

perfectly marvellous, and I have seen their fine shadows accurately defined, as they were thrown on the surface of the planet. I have seen Saturn's eight circling satellites pass through the rings as they swung round in their harmonious and beautiful orbits. I have seen the plane or edge of the rings turned toward our earth, so that they seemed finer than a spider's web, presenting a golden line of light more delicately thin than the power of human skill could create. A spider's web appears like a mighty cable in comparison with these golden lines of light.—*Professor Mitchell.*

THE CLOSING YEAR.

BY GEORGE D. PRENTICE.

'Tis midnight's holy hour, and silence now
Is brooding, like a gentle spirit, on
The still and pulseless world. Hark! on the winds
The bell's deep tones are swelling, 'Tis the knell
Of the departed year. No funeral train
Is sweeping past, yet, on the stream and wood
With melancholy light the moonbeams rest
Like a pale, spotless shroud. The air is stirred,
As by a mountain's sigh, and on you cloud
That floats so still and placidly through heaven,
The spirits of the seasons seem to stand;
Young Spring, bright Summer, Autumn's solemn form,
And Winter with his aged locks, and breathe
In mournful cadences, that come abroad
Like the far wind-harp's wild and touching wail,
A melancholy dirge o'er the dead year,
Gone from the earth forever. 'Tis a time
For memory and for tears. Within the deep
Still chambers of the heart, a spectre dim,
Whose tones are like the wizard voice of Time,
Heard from the tomb of ages, points its cold
And solemn finger to the beautiful
And holy visions that have pass'd away,
And left no shadow of their loveliness
On the dead waste of life. That spectre lifts
The coffin-lid of hope and joy, and love—
And, bending mournfully above the pale
Sweet forms that slumber there, scatters dead flowers
O'er what has passed to nothingness. The year
Has gone, and with it, many a glorious throng
Of happy dreams. Its mark is on each brow,
Its shadow in each heart. In its swift course
It waved its sceptre o'er the beautiful,
And they are not. It laid its pallid hand
Upon the strong man, and the haughty form
Is fallen, and the flashing eye is dim.
It trod the hall of revelry, where throng'd
The bright and joyous, and the tearful wail
Of stricken ones is heard, where erst the song
And reckless shout resounded. It passed o'er
The battle plain, where sword and spear, and shield
Flashed in the light of mid-day—and the strength
Of serried hosts is shivered, and the grass,
Green from the soil of carnage, waves above
The crushed and mouldering skeleton. It came
And faded, like a wreath of mist at eve:
Yet, e're it melted in the viewless air,
It heralded its millions to their home,
In the dim land of dreams. Remorseless Time!
Fierce spirit of the glass and scythe—what power
Can stay him in his silent course, or melt
His iron heart to pity? On, still on,
He presses and forever. The proud bird,
The Condor of the Andes, that can soar

Through heaven's unfathomed depths, or brave
The fury of the northern hurricane,
And bathe his plumage in the thunder's home,
Furls his broad wings at night-fall, and sinks down
To rest upon his mountain craig,—but Time
Knows not the weight of sleep or weariness,
And night's deep darkness has no claim to bind
His rushing pinion. Revolutions sweep
O'er earth, like troubled visions on the breast
Of dreaming sorrow; cities rise and sink
Like bubbles on the water; fiery isles
Spring blazing from the ocean and go back
To their mysterious caverns; mountains rear
To heaven their bald and blackened cliffs, and bow
Their tall heads to the plain; now empires rise
Gathering the strength of hoary centuries
And rush down, like the Alpine avalanche
Startling the nations; and the very stars
That bright and burning blazonry of God,
Glitter awhile in their eternal depths,
And, like the "Pleiad," loveliest of their train,
Shoot from their glorious spheres and pass away,
To darke in the trackless void,—yet, Time—
Time, the tomb builder, holds his fierce course
Dark, stern, all pitiless, and pauses not
Amid the mighty wrecks that strew his path
To sit and muse, like other conquerors
Upon the fearful ruin he has wrought.

"Unto Thee, O' Lord, do I lift mine Eyes."—Ps. xxv.

Fountain of light and living breath,
Whose mercies never fail nor fade;—
Fill me with life that hath no death,
Fill me with light that hath no shade;
Appoint the remnant of my days
To see thy power and sing thy praise.

Lord God of Gods, before whose throne
Stand storms of fire! O, what shall we
Return to heaven, that is our own,
When all the world belongs to thee?
We have no offerings to impart,
But praises and a wounded heart.

O thou, that sit'st in heaven, and seest
My deeds without, my thoughts within—
Be thou my prince, be thou my priest,
Command my soul, and cure my sin;
How bitter my afflictions be
I care not, so I rise to thee.

BRIEF MAXIMS FOR THE YOUNG.

He that does good, for good's sake, seeks neither praise nor reward; though he will be sure of both at last.

God is better served in resisting a temptation to evil, than in any formal prayers.

Be not fond of praise, but seek virtue that leads to it.

Inquire often, judge rarely, and thou wilt not often be mistaken.

He who conceals his opinion, has nothing to answer for; not that the reserved are to be admired; for they are next to unnatural that are not communicative: and if reservedness be at any time a virtue, it is in throngs, or in ill company.

Beware, also, of affectation in speech; it often wrongs matter, and always shows a weak side.

Speak properly, and in as few words as you can; but always plainly, for the end of speech is not for ostentation, but to be understood; and good sense never fails to give them that have it words enough to make them understood.

Keep close to the meeting of God's people, and diligently whilst in them, to feel the heavenly life in your own hearts. Look for that more than for words in ministry, and you will profit most thereby.

Avoid discontented persons, unless to inform or prove them.

Abhor detraction; 'tis the sin of fallen angels and the worst of fallen men.

A BEETLE IN A TRAVELLER'S EAR.

The whole interior of the tent became covered with a host of small black beetles, evidently attracted by the glimmer of the candle. They were so annoyingly determined in their choice of place for peregrinating, that it seemed hopeless my trying to brush them off the clothes or bedding, for as one was knocked aside, another came on, and then another, till at last, worn out, I extinguished the candle, and with difficulty—trying to overcome the tickling annoyance occasioned by these intruders crawling up my sleeves and into my hair, or down my back or legs—fell off to sleep. Repose that night was not destined to be my lot. One of these horrid little insects awoke me in his struggle to penetrate my ear, but just too late; for in my endeavor to extract him, I aided his immersion. He went his course struggling up the narrow channel, until he got arrested for want of passage-room. This impediment evidently enraged him, for he began with exceeding vigor, like a rabbit at a hole, to dig violently away at my tympanum. The queer sensations this amusing measure excited in me surpassed description. I felt inclined to act as our donkeys once did, when beset by a swarm of bees, who buzzed about their ears and stung their heads and eyes until they were so irritated and confused that they galloped about in the most distracted order, trying to knock them off by treading on their heads, or by rushing under bushes, into houses, or through any jungles they could find. Indeed, I do not know which was the worst off. The bees killed some of them, and this beetle nearly did the same for me. What to do I knew not. Neither tobacco oil, nor salt, could be found; I therefore tried melted butter; that failing, applied the point of a penknife to his back, which did more harm than good; for though a few thrusts kept him quiet, the point also wounded my ear so badly, that inflammation set in, and severe suppuration took place, and all the facial glands extending from that point down to the point of the shoulder became contorted and drawn aside, and a string of bobus decorated the whole length of that region. It was the most painful thing I

ever remember to have endured; but more annoying still, I could not open my mouth for several days, and had to feed on broth alone. For many months the tumor made me deaf, and ate a hole between the orifice and the nose. Six or seven months after this accident happened, bits of the beetle, a leg, a wing, or parts of the body, came away in the usual way. It was not altogether an unmixed evil, for the excitement occasioned by the beetle's operations acted towards my blindness as a counter-irritant by drawing the inflammation from my eyes. Indeed, it operated far better than any other artificial appliance.—*Journey of a Cruise on the Tanganyika Lake, Central Africa.*

AVALANCHES.

Travellers are frequently disappointed on witnessing the spectacle. Brought into cheating proximity by the purity of the air, and deluded by the colossal proportions of a mountain landscape, they have been known to treat the phenomenon as of a very trumpery description. Even poetical minds find it difficult to believe that the white spirt and thin streak which suddenly appear on a distant rock are the true representatives of the deadliest missiles contained in the arsenal of Frost. "From some jutting knob, of the size of a cricket ball," says Talfourd, "a handful of snow is puffed into the air, and lower down, on the neighboring slant, you observe veins of white substance creaming down the crevices—like the tinsel streams in the distance of a pretty scene in an Easter melodrama, quickened by a touch of magic wand—and then a little cloud of snow, as from pelting fairies, rises from the frost-work basin; and then a sound as of a thunder-clap!—all is still and silent—and this is an avalanche! If you can believe this—can realize the truth that snow and ice have just been dislodged, in power to crush a human village, you may believe in the distance at which you stand from the scene, and that your eye is master of icy precipices embracing ten miles perpendicular ascent; but it is a difficult lesson, and the disproportion between the awful sound and the pretty sight, rendered it harder."* Occasionally, however, the spectacle is exhibited on a scale so splendid, that the cravings of the anxious sight-seer are fully appeased. Crossing the Wengern Alp, directly in front of the Jungfrau, whose precipitous flanks are famous for their snow-falls, Dr. Cheever was privileged to behold two glorious specimens. "One cannot command any language (says he) to convey an adequate idea of their magnificence. You are standing far below, gazing up to where the great disc of the glittering Alp cuts the heavens, and drinking in the influence of the silent scene around. Suddenly, an enormous mass of snow and ice,

* Talfourd's "Vacation Rambles and Thoughts."

in itself a mountain, seems to move; it breaks from the toppling outmost mountain's ridge of snow, where it is hundreds of feet in depth, and in its first fall of perhaps two thousand feet, is broken into millions of fragments. As you first see the flash of distant artillery by night, then hear the roar, so here you may see the white flashing mass majestically bowing, then hear the astounding din. A cloud of dusty, misty, dry snow, rises into the air from the concussion, forming a white volume of fleecy smoke, or misty light, from the bosom of which thunders forth the icy torrent in its second prodigious fall over the rocky battlements. The eye follows it delighted, as it ploughs through the path which preceding avalanches have worn, till it comes to the brink of a vast ridge of bare rock, perhaps more than two thousand feet perpendicular. Then flows the whole cataract over the gulf with a still louder roar of echoing thunder. Another fall of still greater depth ensues, over a second similar castellated ridge or reef in the face of the mountain, with an awful majestic slowness, and a tremendous crash in its concussion, awakening again the reverberating peals of thunder. Then the torrent roars on to another smaller fall, till at length it reaches a mighty groove of snow and ice, like the slide down the Pilatus, of which Playfair has given so powerfully graphic a description. Here its progress is slower, and last of all you listen to the roar of the falling fragments as they drop out of sight, with a dead weight, into the bosom of the gulf, to rest there forever."*

Avalanches admit of a certain classification. First, there are those which consist of snow recently fallen, and therefore loosely compacted. Set in motion by the first competent wind which arises, the powdery mass is impelled down the mountain declivities, shrouded in its own white spray, until it finds a lodgment in some cleft or hollow of the rock. Comparatively harmless as these "draft avalanches" are, the mere rush of air they occasion has been known to whisk a vehicle containing thirteen persons over the brow of a precipice.

Class number two comprehends the rolling avalanches. These are literally great snow-balls formed of snow partially thawed, and therefore reduced to such a clammy state that the missile gradually increases in bulk as it advances. Schoolboys would be delighted stand on the summit of a lofty hill, and mould a lump which would pick up fresh material at every step of its progress, until, issuing from the region of perpetual winter, it crashed through the forests and exploded like a monster shell before it could reach the floor of the valley. Travellers who slide down mountains like the Slidehorn, or who indulge in playful excursions on a Russian ice-

hill, can form some idea of the tremendous impetus which these projectiles acquire. Should a poor chalet stop the way, the frail fabric dissolves in a shower of chips, and the occupants are destroyed ere they have time to mutter a prayer. It was by a fall of this description that eighty-four persons were killed in 1820, at Ober Gestelen, in the Canton Wallis, and now lie interred in the same grave.

Avalanche number three is produced by the thawing of snow in consequence of the sun's heat, or the warmth of the winds. The water which percolates through the bed renders the rock slippery, and destroys the adhesion of the mass. Resting upon an inclined plane, whole sheets are thus set in motion, and away they glide, heaping up the material before them in great waves, and then pouring over precipices in broad, majestic cascades—Niagaras of snow." This species of avalanche is termed the "sliding," to distinguish it from the last, or "rolling" avalanche.

There is another form of the phenomenon. When the summer sun is playing hotly upon a glacier, it must frequently lose some of the tall, overhanging blocks which give such a jagged but piquant look to these frozen streams. Shattered into atoms by the fall, the particles stream down the slope until their march is arrested by some obstacle, or their momentum is gradually exhausted. Passing along the far-famed Vale of Chamouni the other day, we had the fortune to witness an admirable sample of number four. Suddenly the deep-toned snap which denotes that an avalanche is about to descend—the signal given by the mountains when they are preparing to launch their thunderbolts of snow—was heard from the foot of the Mer de Glace. Down toppled a crag of ice. It broke into millions of fragments. The course of the white stream was distinctly visible to the eye, whilst the ear listened eagerly for the grand rushing noise, which distance, however, subdued into a hail-like rustle. In a moment all was still again, except the hiss of the cascade and the clamor of the furious Arve "raving ceaselessly." But to judge of the terrors of an ice-fall, you must grapple with it on closer terms. "We had reached a position," says Professor Tyndall, in his account of an ascent of the Glacier de Geant, "where massive ice-cliffs protected us on one side, while in front of us was a space more open than any we had yet passed; the reason being that the ice-avalanches had chosen it for their principal path. We had just stepped upon this space, when a peal above us brought us to a stand. Crash! crash! crash! nearer and nearer, the sound becoming more continuous and confused as the descending masses came! boulders, half a ton and more in weight, leaping down with a kind of maniacal fury, as if their sole mission was to crush the seracs to powder. Some of them, on striking the ice, rebounded like elastic balls, described parabolas

* Cheever's "Wanderings of a Pilgrim in the Shadow of Mount Blanc."

through the air, again madly smote the ice, and cattered its dust like clouds in the atmosphere. Some blocks were deflected by their collision with the glacier, and were carried past us within a few yards of the spot where we stood. I had never before witnessed an exhibition of force so all comparable to this, and its proximity rendered that fearful which at a little distance would have been sublime."*

Now, abrupt and capricious as snowfalls may appear, they have their times and seasons, like many a sedater phenomenon. Those of the first class generally occur when winter commences; the last are limited to the months of summer. Numbers two and three usually reserve their strength for the spring, because then the fetters of frost begin to relax: and when avalanches are in season on any particular mountain, the hours of descent on its several sides, may be ascertained with tolerable precision. From ten to twelve is your time, if you wish to witness an exhibition on the eastern slope; from twelve to two on the southern; from three to six on the western; and still later in the day if you expect to enjoy a northern discharge. It need scarcely be said that this regularity of action is due to the influence of the sun. Some avalanches, too, have beaten tracks; so that, by attending to the rules which govern their launching, the peasants not only know when to look out for squalls, but can traverse their paths without danger. Nor is man wholly powerless against these rushing monsters, for in some cases he can control their fury, or even guide them harmlessly away. In certain localities which are much haunted by avalanches, stout posts have been driven into the ground, in the neighborhood of their breeding-place, or embankments thrown up at perilous points, in order to divert their course, and induce them to travel in ruts of comparative safety. Some bold peasants have even ventured to build their houses, or store-huts, in the very teeth of the glacier, defending the edifices by high walls, which are furnished with jetting angles, in the hope that these will divide the snow-torrent like wedges, and compel it to flow innocuously past. Others have been known to surround their elevated sheds with sloping bulwarks, which they sprinkle with water; so that, when frozen smooth, the mountain missiles may glide over the building without injury. In some places the grass is left unmown, in order that the blades, when stiffened with frost, may serve as frail pegs to detain the winter snow; in others, the inhabitants are forbidden to cut trees within the protecting belt of forest. On many roads you pass through galleries hewn out of the solid rock, at points where the avalanche is known to stalk; and here and there, as at Leukerbad, which is provided with a rampart

nearly seven hundred feet long and seventeen high, you find a village fortified against this subtle foe as carefully as ancient towns used to be against military engines and human depredators.

(To be continued.)

THE NECESSITY OF EXERCISE.

The benefits of exercise to those whose occupation does not lead them to make any physical exertion can hardly be too highly estimated. The body must undergo a certain amount of fatigue to preserve its natural strength, and maintain all the muscles and organs in proper vigor. This activity equalizes the circulation, and distributes the blood more effectually through every part. Cold feet or a chill anywhere, shows that the circulation is languid there. The muscles during exercise press on the veins, and help forward the currents by quickening every vessel into activity. The valves of the heart are in this way aided in the work of sending on this stream, and relieved of a certain amount of labor. When exercise is neglected, the blood gathers too much about this central region, and the oppression about the heart, difficulty of breathing, lowness of spirits, anxiety and heaviness, numerous aches and stitches, are evidences of this stagnation. People are afraid to take exercise, because they fancy they want breath, and feel weak. But the very effort would free the heart from this burden, by urging the blood forward to the extremities: it would ease their breathing by liberating the lungs from the same superabundance; it would make the frame feel active and light, as the effect of equalized circulation and free action.—“*The Laws of Health,*” by J. W. Mailler.

ITEMS OF NEWS.

EUROPEAN NEWS.—The steamer North Britain, from Queenstown, arrived at Portland, on the 30th ult. She brings the intelligence that the representatives to the European Congress were arriving at Paris. Arrangements are being negotiated with the Belgian, Prussian, Austrian, and Bavarian Governments, for the transmission of mails to the United States, by the Canadian line of mail steamers via Queenstown, in the same manner as adopted by the French Government.

Among the passengers who arrived, at New York in the Arago, is Senator Seward.

WATER AT THE CONTINENTAL HOTEL. The Mammoth Continental Hotel, at the south east corner of Ninth and Chestnut streets, now very nearly completed, will require an immense quantity of water to supply its necessities. An attempt was made to procure the requisite supply, by means of an artesian well, and a deep bore was made; but the attempt was a failure, no water having been obtained. An arrangement has been made with the Water Department of the city to supply the building. The water tax has been fixed at one thousand dollars for the first year, and during that period the quantity of water consumed will be ascertained by means of an ingenious meter. The water tax will then be permanently fixed by the datum

* “Peaks, Passes, and Glaciers. A series of Excursions by Members of the Alpine Club.” Edited by John Ball.

thus obtained. Several miles of pipes, and several hundred faucets will be required to distribute water through the huge building. There are three hundred chambers, each of which will be supplied with hot and cold water. There will be fifty bath rooms supplied in the same manner. There are also fifty water closets, and twenty-four stationary wash stands below stairs. There are also the kitchens and other portions of the property to be supplied with water; while on the top of the structure there are tanks calculated to hold 60,000 gallons of water. These will supply pipes furnished with screws, by which hose may be attached in the event of fire. It is expected that the hotel will be in readiness to receive guests in the second month next.

LAUER's artesian well, in Reading, Pa., has now attained a depth of 1464 feet with the drill still working through hard black slate rock. The water continues about the same—rising to within thirteen feet of the surface. Fifteen hundred feet will complete the present contract. It is proper to add, that the supply of water already procured, is thought to be sufficient for all ordinary purposes.

RICHARD RANDOLPH'S WILL, which dedicated all his property, amounting to \$75,000, to purchasing the freedom of the living Randolph's slaves in Virginia, has been sustained. It was his own brother who labored to break the instrument, upon the ground that the testator was crazy.—*Louisville Journal*.

THE MISSISSIPPI RIVER was crossed on the ice by foot passengers, from Danleith, Illinois, to Dubuque, Iowa, on the 3th inst., and at La Oroses, Wisconsin, by horses and wagons, in safety.

RATHER COOL.—On Tuesday morning last, the thermometer in some localities in Augusta, Me., indicated eighteen degrees below zero. The river is, of course, frozen over, and teams cross upon the ice.

H MAMMOTH FROG.—In blasting some rocks, lately, in England, which the geologists say were deposited long before the creation of man, the Jones of a frog were found, which must have weighed, when alive, from 800 to 1000 pounds.

The Sea Coast (Miss.) *Democrat* learns from "good authority" that a cargo of African slaves is expected in the ship Island Harbor, the latter part of the present month. They will, if they arrive safe, be landed without any attempt at secrecy, the consignees trusting to the sentiment in Mississippi as to the necessity of increasing the number of laborers, for a triumphant acquittal in the event of a Government prosecution.

THE DELAWARE TERMINUS DETERMINED ON.—We learn that the Board of Directors of the Pennsylvania Railroad Company have fixed upon the foot of Prime (or Washington) street, Southwark, as the Delaware terminus of the road. The cars will cross the Schuylkill by the Gray's Ferry bridge. It will be remembered that the Baltimore Railroad Company have a double track upon this street, which extends from the Delaware to the Schuylkill. It is expected that in the course of a few months the foreign freight of the Pennsylvania Railroad will reach the Delaware by this route, instead of being dragged by mules through the heart of the city.—*The Press*.

REDUCING FREE PEOPLE TO SLAVERY.—We learn that the bill before the Missouri Legislature to reduce the free negroes of that State to the condition of slaves, have passed the Senate by a very decided majority. The measure has been made a test of democracy, and there is no reason to doubt its passage in the House, as that body is strongly democratic. In St. Louis, we

understand, the subject forms the leading topic of conversation, and the action of the legislature meets with almost universal execration.

In the year 1850, there were 2618 free negroes in Missouri. The number now in the State is probably less than 2500, a law seriously affecting the rights of that class having driven many of them from the State since 1850. Similar bills are pending in the legislatures of Tennessee, Alabama, and three or four other slave States. The strongest argument which the advocates of the measure have yet advanced in its favor is this, that as it is the intention of the democrats to re-open the African slave trade, and obtain such legislation from Congress as will protect slavery both in the territories and the free States, it will be much cheaper to supply the first demand for slaves by reducing the free negroes already here to slavery, than to go all the way to Africa for them.—*Chicago Press and Tribune*.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market presents no new feature. There is very little inquiry either for export or home consumption, but holders are firm in their demands. The only sales are in a small way to the trade at \$5 50 a 5 62½ per barrel for superfine; 5 75 a 5 87½ for extra; 6 a 6 50 for extra family, and 6 62½ a 7 25 for fancy lots. Nothing doing in Rye Flour or Corn Meal. We continue to quote the former at 4 25 and the latter at 3 75 per barrel.

GRAIN.—There is a fair demand for Wheat, and the offerings being light, prices are well maintained. Small sales of good red at 135 a 136 cts. per bushel. White is worth 145 a 152c. Rye is steady at 92c for good Pennsylvania; comes forward slowly, but is ample for the demand. Sales of 2000 bushels prime dry new yellow, at the depot, at 75c; damp lots are not wanted. The last sale was at 70 cents. Oats are unchanged. Pennsylvania are worth 45c, and 43c per bushel for Delaware. No further transactions in Barley or Barley Malt.

CLOVERSEED is coming forward more freely, but the demand for it is less active. Sales of 400 bushels in lots, at 5 12½ a 5 37½ for 64 lbs. No change in Timothy or Flaxseed.

A YOUNG WOMAN having had some experience in teaching, and possessing a certificate of qualification, is desirous of a situation in a family school. Address C. CLEMENT, Paulsboro, N. J. 12 mo. 17,—3t.

HEAVY BLEACHED SHIRTINGS made from AFRICAN COTTON, warranted in all respects the product of Free Labor. For sale by ELI DILLIN, No. 1218 Green st., opposite Ridge Avenue. 11 mo. 26, 1859.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo. Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, FIRST MONTH 14, 1860.

No. 44.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,

No. 324 South Fifth Street,

PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

SELECTIONS FROM THE LIFE AND EXPERIENCE OF THOMAS BULMAN.

(Continued from page 676.)

It is a striking and encouraging feature of Christian love, that the true followers of Christ living as they do near to the Fountain of all good themselves, are led in a remarkable manner into a brotherly feeling and fellowship, one with another, under suffering, and more especially, when that suffering is for the Cause of Truth. This is often the case even when the parties are personally strangers to each other, and thus Thomas Bulman, having heard of some Friends being cast into prison, in York Castle, at the suit of George Markham, the Vicar of Carlton near Skipton, for refusing to pay tithes, was constrained to address them by letter, to comfort and encourage them in faithfully suffering in the maintenance of their testimony against this anti-christian impost.

The names of these prisoners were Joseph Brown, John Wormall, John Stansfield, Henry Wormall, Henry King, John Wilkinson, Wm. Hartley, and James Walton.

The following portions of Thomas Bulman's correspondence with them will be read with interest:

TO JOSEPH BROWN AND HIS FELLOW PRISONERS, FOR CONSCIENCE SAKE, IN YORK CASTLE.

Irthington, 23d of 2d mo., 1796.

Dearly beloved Friends.—I have often heard of your imprisonment, and have been sorry for you; but now am drawn more near in spirit to you, and have travailed in secret for your preservation, in the best sense.

O, my dear friends, look unto the Lord for strength and support, in this very sore and bitter conflict; he can bear you up; he only can work your deliverance in every respect.

When I was first drawn to visit you in spirit, it was to exhort you to an inward watchfulness before the Lord. Breathe unto Him who knows all your wants, who sees all your afflictions, who is well acquainted with all your sighs and groans, yea, who also has a bottle for your tears. Be watchful against anything of hardness against your persecutors, lest it hinder your clear access to the Fountain of grace.

I am not against any outward means being used, in the Truth, for your deliverance, but would be glad to hear of it. But O, my friends, if you do experience your well to be in the Lord, and your peace to flow like a river, in all your trying moments, turn in and refresh yourselves at it. Had we as a society, been faithful, from the time we were first a people, the Truth, I have said, would have overspread the whole earth before this day. But the unfaithfulness of many has caused great suffering to some, and will cause great suffering to others. But to whom shall these sufferers make their moan, or before whom shall they spread their cause, but the Lord alone? I desire that you may ever be preserved blameless in his sight. It is he who can turn the hearts of the sons of men, as a man turns the watercourse in his field, and can work your deliverance when all human help fails.

I am sensible that the good-will of Him that formerly dwelt in the bush, is toward you, and clear I am, that the end of your affliction will be peace, and the honor of the Lord, if you continue faithful. So to the Lord I leave you, and desire to be your companion in tribulation, in this vale of tears, and that we may meet in the mansions above.

From your brother,

THOMAS BULMAN.

Irthington, 26th of 7th mo., 1796.

Dearly Beloveds.—Though in outward bonds! My long silence may make you doubt whether I have forgotten you; but O, my dear friends, I have not forgotten you before the Throne of Grace, but am often breathing to the Lord for your preservation. Look unto the Lord for your deliverance,—look unto him for your support under the present trials. O my dear children, you are bearing the burden in the heat of the day; but I have felt the Lord's power; and he is willing and able to support you in the midst of all, if only your trust be in him. With the Lord's blessing, and our close attention to His Holy

Spirit in our souls, we may be supported under our trials in this life, and hope to meet, in that Heavenly Canaan, where all tears shall be wiped from our eyes. This, for you, is the sincere and earnest travail of the soul of

Your affectionate friend,
THOMAS BULMAN.

John Wilkinson died in the prison; the other Friends were liberated after about two years' imprisonment, and distrains were made upon their property to satisfy the claims made against them. Henry Wormall continued, after his liberation, to correspond with Thomas Bulman, whom he informs, that when the dstraint was made upon him, £240 were taken from him, which was nearly his all, but adds, "They returned my wife the cradle and the rocking-chair." Such were the sparings of the ruthless hand of ecclesiastical persecution!

At a subsequent period, Henry Wormall had taken the Sheffield Iris, a newspaper edited by James Montgomery, who, on the charge of a political offence, in connexion with an article published in this paper, was committed to York Castle, and was a prisoner there at the same time with these Friends. On Henry Wormall's property becoming reduced, he wrote to James Montgomery, to inform him that he was unable to continue to take the paper. After informing Thomas Bulman of this circumstance, Henry Wormall sent him a copy of James Montgomery's reply, which is as follows, adding, in reference to this letter, "He knew my trembling hand, and how difficult it was for me to write."*

LETTER OF JAMES MONTGOMERY, TO HENRY WORMALL.
Sheffield, Jan. 7th, 1808.

My dear friend Henry,—I have just received your letter, which both delighted and affected me exceedingly. The newspaper shall be discontinued according to your order, but not my friendship to you. It did not hang on so slight a thread. No! Henry, I feel as if it was formed for eternity. Our hearts have often flowed together, and been as one in conversation; and mine still burns within me whenever I write to you. The money was right, and I thank you for it. I am very sorry to learn that you have suffered so much affliction from lameness, but you trust in God; continue to trust in Him; for he will never leave you nor forsake you.

As a token of His remembrance, I have en-

* In a journal kept by Henry Wormall, during his imprisonment in York Castle, the following record occurs:—"7th mo. 5th, 1796. Went from this place, James Montgomery, a very kind and social young man; he was to me a pleasing companion, and he has left a good report behind him. Although he is qualified with good natural parts, and has had a liberal education, yet he was instructive and kind to me. I think I never had an acquaintance with any one before, that was not of my persuasion, with whom I had so much unity. I was troubled, and thought it a loss to part with him."

closed a five pound Bank of England note, which I hope will be seasonable and serviceable to you in your present low estate. Accept it, Henry, not from me, but from Him, who, though he was rich, yet, for our sakes, he became poor, and by suffering all the ills of poverty, (for he had not whereon to lay his head) sanctified them to his people. For His sake, and in His name receive it; for His sake and in His name I send it. I assure you, my dear friend, that I feel far more pleasure in being, on this occasion, the minister of his bounty to you, than I could possibly derive from any other disposal of this small sum, which I considered to be as sacredly your property, from the moment when He put it into my heart to send it, as it had been mine before. I can well spare it from that little portion of worldly wealth of which he has made me steward; and I know that the prudent use of it will add something to your temporal comforts.

But I am ashamed to say so much about it. God, who gives it, bless it to you! It will oblige me if you will inform me, by post, of its safe arrival to your hands. I shall, therefore, anxiously expect to hear from you in the course of a few days; a single line will be sufficient: I charge you not to distress yourself with writing a long letter.

Farewell. Peace to you and all your family.

I am very truly your friend,

JAMES MONTGOMERY.

RELIGIOUS MAXIMS.

The hidden life, which God imparts to his accepted people, may flourish in solitudes and deserts; far from the societies of men and the din and disturbance of cities. From the cave of the hermit, from the cell of the solitary recluse, the fervent prayer has often arisen, which has been acceptable in the sight of God. But it would be a strange and fatal misconception, that religion, in its most pure and triumphant exaltations, can flourish nowhere else. The home of holiness is in the heart, irrespective of outward situations and alliances; and therefore we may expect to find it, if there are hearts adapted to its reception and growth, in the haunts of business as well as in the silence of retirement; in the palaces of Rome, as well as in the deserts of the Thebais. It is a fatal mistake to suppose that we cannot be holy except on the condition of a situation and circumstances in life such as shall suit ourselves. It is one of the first principles of holiness to leave our times and our places, our going out and our coming in, our wasted and our goodly heritage, entirely with the Lord. Here, O Lord, hast thou placed us, and we will glorify thee here.

Let Christ's ambassadors beware of *lightness* in their speech.

ON THE INWARD TEACHING OF THE SPIRIT OF GOD.

It is certain from the Holy Scriptures (*Rom. viii., John xiv.*) that the Spirit of God dwells within us, acts there, prays without ceasing, groans, desires, asks for us what we know not how to ask for ourselves, urges us on, animates us, speaks to us when we are silent, suggests to us all truth, and so unites us to Him that we become one spirit. (1 *Cor. vi. 17.*) This is the teaching of faith, and even those instructors who are farthest removed from the interior life, cannot avoid acknowledging so much. Still, notwithstanding these theoretical principles, they always strive to maintain that in practice the external law, or at least a certain light of learning and reason illuminates us within, and that then our understanding acts of itself from that instruction. They do not rely sufficiently upon the interior teacher, the Holy Spirit, who does everything in us. He is the soul of our soul; we could not form a thought or a desire without Him. Alas! what blindness is ours! We reckon ourselves alone in the interior sanctuary, when God is much more intimately present there than we are ourselves. * *

Without the actual inspiration of the Spirit of grace, we could neither do, nor will, nor believe any good thing. We are, then, always inspired, but we incessantly stifle the inspiration. God does not cease to speak, but the noise of the creatures without, and of our passions within, confines us and prevents our hearing. We must silence every creature, including self, that in the deep stillness of the soul we may perceive the ineffable voice of the Bridegroom. We must lend an attentive ear, for his voice is soft and still, and is only heard of those who hear nothing else!

Ah, how rare is it to find a soul still enough to hear God speak! The slightest murmur of our vain desires, or of a love fixed upon self, confounds all the words of the Spirit of God. We hear well enough that he is speaking, and that he is asking for something, but we cannot distinguish what is said, and are often glad enough that we cannot. The least reserve, the slightest self-reflective act, the most imperceptible fear of hearing too clearly what God demands, interferes with the interior voice. Need we be astonished, then, if so many people, pious indeed, but full of amusements, vain desires, false wisdom, and confidence in their own virtues, cannot hear it, and consider its existence as a dream of fanatics? Alas! what would they with their proud reasonings? Of what efficacy would be the exterior word of pastors, or even of the Scriptures themselves, if we had not within, the word of the Holy Spirit giving to the others all their vitality? The outward word, even, of the Gospel, without the fecundating, vivifying, interior word would be but an empty sound. It is the *letter* that alone kill-

eth (2 *Cor. iii. 6.*), and the *Spirit* alone can give us life.

O! eternal and omnipotent word of the Father, it is thou that speakest in the depth of our souls! The word that proceeded from the mouth of the Saviour, during the days of his mortal life, has only had energy to produce such wondrous fruit, because it has been animated by that Spirit of life which is The Word itself. Hence it is that St. Peter says: "*Lord, to whom shall we go? Thou hast the words of eternal life.*" (*John, vi. 68.*)

It is not, then, the outward law of the Gospel alone which God shows us internally, by the light of reason and faith; it is his Spirit that speaks, touches, operates in and animates us; so that it is the Spirit which does in us and with us whatever we do that is good, as it is our soul that gives life to our body, and regulates all its movements.

It is, then, true, that we are continually inspired, and that we do not lead a gracious life, except so far as we act under this interior inspiration. But O God! how few Christians feel it! how few are they, who do not annihilate it by their voluntary distractions, or by their resistance!

Let us recognize, then, the fact that God is incessantly speaking in us. He speaks in the impenitent also, but, stunned by the noise of the world and their passions, they cannot hear Him; the interior voice is to them a fable. He speaks in awakened sinners; they are sensible of remorse of conscience, which is the voice of God reproaching them inwardly for their sins. When they are deeply moved, they have no difficulty in understanding about this interior voice, for it is it that pierces them so sharply. It is in them that *two-edged sword* of which Paul speaks as *piercing even to the dividing asunder of soul and spirit.* (*Heb. iv. 12.*) God causes himself to be perceived, enjoyed, followed; they hear that sweet voice that buries a reproach in the bottom of the earth, and causes it to be torn in pieces. Such is true and pure contrition.

God speaks, too, in wise and enlightened persons, whose life, outwardly correct, seems adorned with many virtues; but such are often too full of themselves and their lights, to listen to God. Every thing is turned into reasoning; they substitute the principles of natural wisdom and the plans of human prudence, for what would come infinitely better through the channel of simplicity and docility to the word of God. They seem good, sometimes better than others; they are so, perhaps, up to a certain point, but it is a mixed goodness. They are still in possession of themselves, and desire always to be so, according to the measure of their reason; they love to be in the hands of their own counsel, and to be strong and great in their own eyes.

I thank thee, O my God, with Jesus Christ,

that Thou hast hid thine ineffable secrets from these great and wise ones, whilst Thou takest pleasure in revealing them to feeble and humble souls! It is with babes alone that Thou art wholly unreserved; the others Thou treatest in their own way; they desire knowledge and great virtues, and Thou givest them dazzling illuminations, and convertest them into heroes. But this is not the better part; there is something more hidden for thy dearest children; they lie with John on thy breast. As for these great ones who are constantly afraid of stooping and becoming lowly, Thou leavest them in all their greatness; they shall never share thy caresses and thy familiarity, for to deserve these, they must become as little children, and play upon thy knees.

I have often observed that a rude, ignorant sinner, just beginning to be touched by a lively sense of the love of God, is much more disposed to listen to this inward language of the Spirit of Grace, than those enlightened and learned persons who have grown old in their own wisdom. God, whose sole desire is to communicate Himself, cannot, so to speak, find where to set his foot in souls so full of themselves, who have grown fat upon their own wisdom and virtues; but, as says the Scripture, "*his secret is with the simple.*" (Prov. iii. 32, vulg.)

But where are they? I do not find them; God sees them and loves to dwell in them; "*My Father and I,*" says Jesus Christ, "*will come unto him and make our abode with him.*" (John. xiv. 23.) Ah! a soul delivered from self, and abandoned to grace, counting itself as nothing, and walking, without thought, at the will of that pure love which is its perfect guide, has an experience which the wise can neither receive nor understand!

I was once as wise as any; thinking I saw everything, I saw nothing; I crept along feeling my way by a succession of reasonings, but there was no ray to enlighten my darkness; I was content to reason. But when we have silenced everything within, that we may listen to God, we know all things without knowing anything, and then perceive that, until then, we were utterly ignorant of all that we thought we understood. We lose all that we once had, and care not for it; we have then no more that belongs to self; all things are all lost, and we with them. There is something within that joins with the spouse in the Canticles in saying; "*Let me see thy countenance, let me hear thy voice; for sweet is thy voice and thy countenance is comely.*" (Sol. Song ii. 14.) Ah! how sweet is that voice; it makes me all tremulous within! Speak, O beloved, and let none other dare to speak but Thee! Be still, my soul; speak, Love!

Then it is that we know all things without knowing anything. Not that we have the presumption to suppose that we possess in ourselves all truth. No! on the contrary, we feel that we see

nothing, can do nothing, and are nothing: we feel it and are delighted at it. But in this unreserved abandonment, we find everything we need from moment to moment, in the infinity of God. There we find the daily bread of knowledge, as of everything else, without laying up; then the unction from above teaches us all truth, while it takes away our own wisdom, glory, interest, yea, our own will; it makes us content with our powerlessness, and with a position below every creature; we are ready to yield to the merest worms of the dust, and to confess our most secret miseries before the whole world, fearing unfaithfulness more than punishment and confusion of face.

Here it is, I say, that the Spirit teaches us all truth; for all truth is eminently contained in this sacrifice of love, where the soul strips itself of everything to present it to God.—*Fenelon.*

FOOLISH THOUGHTS OF GOD.

We are apt to believe in Providence so long as we have our own way; but if things go awry, then we think if there is a God, He is in heaven, and not on earth.

The cricket in the spring builds his little house in the meadow, and chirps for joy, because all is going so well with him. But when he hears the sound of the plow a few furrows off, and the thunder of the oxen's tread; then the skies begin to look dark, and his heart fails him. The plow comes crouching along, and turns his dwelling bottom side up; and, as he is rolling over and over without a home, his heart says—

"Oh, the foundations of the world are destroyed, and everything is going to ruin!"

But the husbandman, who walks behind his plow, singing and whistling as he goes, does he think the foundations of the world are breaking up? Why, he does not so much as know there was any house or cricket there. He thinks of the harvest which is to follow the track of the plow; and the cricket, too, if he will but wait, will find a thousand blades of grass where there was but one before.

We are all like the crickets. If anything happens to overthrow our plans, we think all is going to ruin.—*H. W. Beecher.*

THE SILENT CONFLICTS OF LIFE.

A triumph in the field is a theme for poetry, for painting, for history, for all the eulogistic and aggrandizing agencies whose united tribute constitute Fame; but there are victories won by men over themselves, more truly honorable to the conquerors than any that can be achieved in war. Of these silent successes we never hear. The battles in which they are obtained are fought in solitude without help save from above.

The conflict is sometimes waged in the still watches of the night, and the struggle is often fearful. Honor to every conqueror in such a warfare! Honor to the man or woman who fights temptation, hatred, revenge, envy, selfishness, back to its last covert in the heart, and thence expels it forever.

THOUGHTS ON LABOR.

BY T. PARKER.

(Concluded from page 677.)

The world no doubt grows better; comfort is increased from age to age. What is a luxury in one generation, scarce attainable by the wealthy thy, becomes at last the possession of most men. Solomon with all his wealth had no carpet on his chamber floor; no glass in his windows; no shirt to his back. But as the world goes, the increase of comforts does not fall chiefly into the hands of those who create them by their work. The mechanic cannot use the costly furniture he makes. This, however, is of small consequence; but he has not always the more valuable consideration, TIME TO GROW WISER AND BETTER IN. As society advances, the standard of poverty rises. A man in New England is called poor at this day, who would have been rich a hundred and fifty years ago; but as it rises, the number that falls beneath that standard becomes a greater part of the whole population. Of course the comfort of a few is purchased by the loss of the many. The world has grown rich and refined, but chiefly by the efforts of those who themselves continue poor and ignorant. So the ass, while he carried wood and spices to the Roman bath, contributed to the happiness of the State, but was himself always dirty and overworked. It is easy to see these evils, and weep for them. It is common also to censure some one class of men—the Rich or the Educated, the Manufacturers, the Merchants, or the Politicians, for example—as if the sin rested solely with them, while it belongs to society at large. But the world yet waits for some one to heal these dreadful evils, by devising some new remedy, or applying the old. Who shall apply for us Christianity to social life?

But God orders all things wisely. Perhaps it is best that man should toil on some centuries more before the race becomes of age, and capable of receiving its birthright! Every wrong must at last be righted, and he who has borne the burthen of society in this ephemeral life, and tasted none of its rewards, and he also who has eaten its loaves and fishes and yet earned nothing, will no doubt find an equivalent at last in the scales of divine Justice. Doubtless the time will come when labor will be a pleasant pastime; when the sour sweat and tears of life shall be wiped away from many faces; when the few shall not be advanced at the expense of the many; when

ten pairs of female hands shall not be deformed to nurse a single pair into preternatural delicacy, but when all men shall eat bread in the sweat of their face, and yet find leisure to cultivate what is best and divinest in their souls, to a degree we do not dream of as yet; when the strong man who wishes to be a Mouth and not a Hand, or to gain the treasures of society by violence or cunning, and not by paying their honest price, will be looked upon with the same horror we feel for pirates and robbers, and the guardians who steal the inheritance of their wards and leave them to want and die. No doubt it is a good thing that four or five men out of the thousand should find time, exemption from labor, and wealth likewise to obtain a generous education of their Head and Heart and Soul, but it is a better thing, it is alone consistent with God's law that the world shall be managed, so that each man shall have a chance to obtain the best education society can give him, and while he toils, to become the best and greatest his nature is capable of being, in this terrene sphere. Things never will come to their proper level so long as Thought with the Head, and Work with the Hands are considered incompatible. Never till all men follow the calling they are designed for by nature, and it becomes as common for a rich man's son to follow a trade, as now it is happily for a poor man's to be rich. Labor will always be unattractive and disgraceful, so long as wealth unjustly obtained is a distinction, and so long as the best cultivation of a man is thought inconsistent with the life of the farmer and the tailor. As things now are, men desert a laborious occupation for which they are fitted, and have a natural fondness, and seek bread and honor in the "learned professions," for which they have neither ability nor taste, solely because they seek a generous education, which is thought inconsistent with a life of hard work. Thus strong heads desert the plough and the anvil, to come into a profession which they dislike, and then to find their duty pointing one way and their desire travelling another. Thus they attempt to live two lives at the same time, and fail of both, as he who would walk eastward and westward at the same time makes no progress.

Now the best education and the highest culture, in a rational state of society, does not seem inconsistent with a life of hard work. It is not a figure of speech, but a plain fact, that a man is educated by his trade, or daily calling. Indirectly, Labor ministers to the wise man intellectual, moral, and spiritual instruction, just as it gives him directly his daily bread. Under its legitimate influence, the frame acquires its due proportions and proper strength. To speak more particularly, the work of a farmer, for example, is a school of mental discipline. He must watch the elements; must understand the nature of the soil he tills, the character and habits of the plants he rears, the character and disposi-

tion of each animal that serves him as a living instrument. Each day makes large claims on him for knowledge, and sound judgment. He is to apply good sense to the soil. Now these demands tend to foster the habit of observing and judging justly; to increase thought, and elevate the man. The same may be said of almost all trades. The sailor must watch the elements, and have all his knowledge and faculties at command, for his life often depends on having "the right thought at the right time." Judgment and decision are thus called forth. The education men derive from their trade is so striking, that craftsmen can express almost any truth; be it never so deep and high, in the technical terms of the "shop." The humblest business may thus develop the noblest power of thinking. So a trade may be to the man, in some measure, what the school and the college are to the scholar. The wise man learns more from his corn and cattle, than the stupid pedant from all the folios of the Vatican. The habit of thinking, thus acquired, is of more value than the greatest number of thoughts learned by rote, and labelled for use.

But an objection may readily be brought to this view, and it may be asked, why then are not the farmers as a class so well instructed as the class of lawyers? Certainly there may be found farmers who are most highly educated. Men of but little acquaintance with books, yet men of thought, observation, and sound judgment. Scholars are ashamed before them when they meet, and blush at the homely wisdom, the acute analysis, the depth of insight and breadth of view displayed by laborers in blue frocks. But these cases are exceptions. These men were geniuses of no mean order, and would be great under any circumstances. It must be admitted, that, as a general rule, the man who works is not so well educated as the lawyer. But the difference between them rises not so much from any difference in the two callings, as from this circumstance, that the lawyer enters his profession with a large fund of knowledge and the habits of intellectual discipline, which the farmer has not. He therefore has the advantage so long as he lives. If two young men of the same age and equal capacity were to receive the same education, till they were twenty years old, both taking proper physical exercise at the same time, and one of them should then spend three years in learning the science of the Law, the other in the science of the Farm, and then both should enter the full practice of their two callings, each having access to books if he wished for them, and educated men and women, can any one doubt that the farmer, at the age of forty, would be the better educated man of the two? The trade teaches as much as the profession, and it is as well known that almost every farmer has as much time for general reading as the lawyer,

and better opportunity for thought, since he can think of what he will when at his work, while, the lawyer's work demands his thought all the time he is in it. The farmer would probably have the more thoughts; the lawyer the more elegant words. If there is any employment which degrades the man who is *always* engaged in it, cannot many bear the burthen—each a short time—and so no one be crushed to the ground?

Morality, likewise, is taught by a trade. The man must have dealings with his fellows. The afflicted call for his sympathy; the oppressed for his aid. Vice solicits his rebuke, and virtue claims his commendation. If he buys and sells, he is presented with opportunities to defraud. He may conceal a fault in his work, and thus deceive his employer. So an appeal is continually made to his sense of Right. If faithful, he learns justice. It is only by this exposure to temptation, that virtue can be acquired. It is in the water that men learn to swim. Still more, a man does not toil for himself alone, but for those dearest to his heart; this for his father; that for his child; and there are those who out of the small pittance of their daily earning contribute to support the needy, print Bibles for the ignorant, and preach the Gospel to the poor. Here the meanest work becomes Heroism. The man who toils for a principle ennobles himself by the act.

Still farther, Labor has a religious use. It has been well said, "an undevout astronomer is mad." But an undevout farmer, sailor, or mechanic, is equally mad, for the duties of each afford a school for his devotion. In respect to this influence, the farmer seems to stand on the very top of the world. The laws of nature are at work for him. For him the sun shines and the rain falls. The earth grows warm to receive his seed. The dew moistens it; the blade springs up and grows he knows not how, while all the stars come forth to keep watch over his rising corn. There is no second cause between him and the soul of all. Everything he looks on, from the earliest flowers of spring to the austere grandeur of a winter sky at night, is the work of God's hand. The great process of growth and decay, change and reproduction, are perpetually before him. Day and Night, Serenity and Storm visit and bless him as they move. Nature's great works are done for no one in special; yet each man receives as much of the needed rain, and the needed heat, as if all rain and all heat were designed for his use alone. He labors, but it is not only the fruit of his labor that he eats. No; God's exhaustless Providence works for him; works with him. His laws warm and water the fields, replenishing the earth. Thus the Husbandman, whose eye is open, walks always in the temple of God. He sees the divine goodness and wisdom in the growth of a flower or tree; in

the nice adjustment of an insect's supplies to its demands; in the perfect contentment found everywhere in nature—for you shall search all day for a melancholy fly, yet never find one. The influence of all these things on an active and instructed mind is ennobling. The man seeks daily bread for the body, and gets the bread of life for the soul. Like his corn and his trees, his heart and mind are cultivated by his toil; for as Saul seeking his father's stray cattle found a kingdom, as stripling David was anointed king while keeping a few sheep in the wilderness, and when sent to carry bread to his brothers in the camp slew a giant, and became monarch; so each man who, with true motives, an instructed mind, and soul of tranquil devotion, goes to his daily work, however humble, may slay the giant Difficulty, and be anointed with gladness and possess the Kingdom of Heaven. In the lowliest calling he may win the loftiest result, as you may see the stars from the deepest valley as well as from the top of Chimborazo. But to realize this end the man must have some culture, and a large capital of information at the outset; and then it is at a man's own option, whether his work shall be to him a blessing or a curse.

DECLINE OF FEMALE CONVERSATION.—An English writer declares the fact—that the women of our day do not “converse”—and then attributes it to the multiplicity of studies and the evening confinement to books and school companions. It says:

“It should be as much a matter of duty and of conscience to insist on out-door exercise, and in-door social recreation, as upon any of the regular exercises of the school-room. School studies should be confined absolutely to school hours. To allow them to encroach upon the later hours of the day, and upon the graceful household duties and recreations, which either are, or ought to be provided for every girl at home; in other words, to subordinate the home-training to the school-training, or to intermit the former in favor of the latter, is a most palpable and ruinous mistake. It is bad even in an intellectual point of view. To say nothing of other disadvantages, it deprives girls of the best opportunities they can ever have of learning that most feminine, most beautiful, most useful of all accomplishments—the noble art of conversation. For conversation is an art as well as a gift. It is learned best by familiar intercourse between young and old, in the leisure unreserve of the evening social circle. But when girls are banished from this circle by the pressure of school-tasks, talking only with their school mates till they “come out” into society, and monopolized entirely by young persons of their own age, they easily learn to mistake chatter for conversation,

and “small talk” becomes for life their only medium of exchange. Hence, with all the intellectual training of the day, there never was a greater dearth of intellectual conversation.”

OLD FASHIONED COMFORTS.—Our ancestors were a frugal, self-denying people, inured to hardship from the cradle—they were content to be without almost all the luxuries of life, but they enjoyed some of its comforts to which many of us are strangers,—old-fashioned comforts, we may term them,—and among these the old fireplace, as it used to be termed, held no mean rank. How vividly the picture of one of those spacious kitchens of the olden times comes to our mind with its plain furniture, and sanded floor, innocent of paint, but as white as the neatest of housewives could make it. In one corner stood the old clock, its very face wearing an aspect of good cheer, and seeming to smile benignantly upon a miniature moon over its head, which tradition said had, at a remote period, followed the rising and setting of its great prototype in the heavens, though its days of active service were long ago over.

But the crowning glory of that kitchen was not its white sanded floor, nor the high desk with its pigeon holes, and secret drawers which no venturesome youngster ever dared invade, nor yet, the old clock ticking so musically in one corner, but it was the old-fashioned fire-place with its blazing embers, huge backlog and iron fire-dogs, that shed a glory over the whole room, gilded the plain and homely furniture with its bright light, and rendered the place a fit type of true New England homes in “ye olden time.”

Never were there such apples as those which swung round and round upon strings before the bright fire of a winter's evening,—never such baked potatoes as those buried deep in the ashes upon the hearth,—never such corn-stalks as those which caught a golden hue from the blazing embers, or turkeys like those turned slowly upon a spit, filling the room with savory odors so suggestive of a dainty repast.

Before the fire was the wooden settle, and here the children were wont to sit in the long evenings, telling stories, cracking nuts, conning their lessons for the morrow, or listening in silence to the words of wisdom that fell from the lips of their superiors;—and anon gazing in silence into the bright fire and conjuring up all sorts of grotesque and fanciful images from among the burning coals. No fabled genii, with their magic lamps of enchantments, could build such gorgeous palaces, or create such gems as the child could discern amid the blazing embers of the old fashioned fireplace.

And we must not neglect the chimney corner, where sat our grandfather in his accustomed seat—his hair silvered with the snows of many winters,—a venerable man, to whom old age had

come "frostily, but kindly," and whose last days were like those of an Indian Summer, serene and beautiful, even till the stars appeared in heaven.

How pure was the air of the room in these days! The huge fire-place, with its brisk draught, carried off the impurities of the atmosphere and left the air pure, life-giving and healthful. Now we crouch around hot cooking-stoves and think it strange that we feel so stupid and drowsy of an evening; or we huddle about air-tight stoves and wonder that the air seems burnt and impure; or we sit down in chilly rooms heated by a furnace, and marvel that with all our costly furniture, soft carpets, bright mirrors, and damask curtains, they are such cheerless places, so little like our ideas of a New England home.

Alas! that with all the so-called improvements of our advanced civilization, the fire should be permitted to go out forever in our old fashioned fire places, thus burying in the ashes of the past so many means of health, home-comfort, good cheer and happiness.—*Exeter News Letter.*

FRIENDS' INTELLIGENCER.

PHILADELPHIA, FIRST MONTH 14, 1860.

From a Report of the Commissioner on Indian Affairs we extract some interesting particulars. There is considerable evidence of a humane desire for the welfare of these people on the part of government, but the justice meted out to them is not always even-handed and impartial. The attempt to dispossess the Indians of Red river of their fertile and valuable lands, because they lie directly on the commercial route of the Hudson Bay Company, is only one among the many acts of injustice for which, we fear, our country will one day have a fearful reckoning.

The agent for the Indians remaining in the State of New York reports favorably of their continued but gradual improvement. These Indians comprise the remnant left of the once famed and formidable confederacy of the Six Nations, whose dominion and despotic sway at one time extended from the shores of Lake Michigan to the Carolinas, and from the St. Lawrence river to the Wabash. Though much reduced in number, their decline in that particular has been far less than that of most, if not all, the tribes who have suffered the evils of continued removal from place to place as the white population has advanced. At the commencement of the war of the Revolution they were estimated to have numbered not more than 9,000. Their present population is about 4,000. They are comfortably located on reservations in differ-

ent parts of the State, where laws, especially enacted for the purpose, effectually protect them in their persons and property. The State has also extended to them the advantages of her free school system—there being twenty-one schools of that description in successful operation among them, six of which are taught by Indians. It is hoped that this good example of considerate and philanthropic regard for the rights, interests, and welfare of the Indians will be followed by the other States within whose limits portions of the race remain permanently located.

The number of scholars in the above-mentioned schools is 825—470 boys and 355 girls. There is also an Asylum for Orphans, a most excellent institution, sustained by the Society of Friends, who have for many years watched over the interests and welfare of these Indians, and which is very appropriately named the "Thomas Asylum," in honor of the venerable Philip E. Thomas, of Baltimore, who has been the active and efficient agent of the Society during the whole period of its watchful care over the Indians.

The policy of concentrating the Indians of Michigan on small reservations, with the view of training them to industrial pursuits, is being successfully prosecuted, and, if aided by such legislation on the part of the State as may be necessary for the protection of their rights and interests, and to prevent their being supplied with ardent spirits, confident hopes may be entertained of an early and material improvement in their condition.

The Oneidas in Wisconsin are anxious to have the lands in their reservation surveyed and limited portions thereof allotted to them in severalty; the remainder to be disposed of for their benefit. Their agent gives good reasons why this should be done, and it being in conformity with the now firmly established policy of the Department, they should be gratified in their reasonable wishes in this particular.

The Stockbridges and Munsees have manifested some dissatisfaction with the lands assigned to them by the treaty of 1856, because, as they have alleged, of their unfitness for agricultural purposes, and a portion of their tribe have heretofore refused to go there, in consequence of which the Department has not felt justified in paying over their removal and improvement funds, not considering them entitled thereto, unless they all united in complying with the obligations of the treaty. Though not satisfied that their objections to their new country were well founded, the Department was willing to gratify them in a desire which they expressed to be located with the Oneidas on their reservation, if the arrangement could be made upon reasonable terms. The Oneidas, however, demanded so exorbitant a price for the lands necessary for the purpose, that it had to be

abandoned, since which all of the Stockbridges and Munsees, their agent reports, have removed to and are now on their own lands.

The agent reports that the Menomonees are beginning to make some progress in the adoption of agricultural and other industrial pursuits, in the new home provided for them by the treaty of 1854; and that they desire to have their lands partitioned among them in severalty, which may be regarded as an evidence of a dawning consciousness on their part of an entire change in their mode of life being necessary for their welfare and happiness.

I would respectfully call your attention to the considerations presented in the reports of the agent for the Mississippi Chippewas, and the superintendent for the Northern Superintendency, in favor of a treaty with the Red Lake Chippewas, and the Indians of the Red River of the North, for the extinguishment of their title to the lands which they own in that region, embracing, it is estimated, some 13,000 square miles. These lands though remote, are represented to be fertile and valuable. They lie between our northern settlements in Minnesota and the boundary line between us and the British Possessions. The extension of our settlements in that direction has been stimulated and accelerated by the important and valuable commerce which has sprung up with the considerable population on the other side of the line, and which, for the benefit of our citizens, is entitled to protection and safe transit through the country of these Indians, but which cannot be given to it while the lands remain theirs. The importance of this route as a channel of commerce is seen in the fact that the Hudson's Bay Company now transport over it the supplies required for their numerous trading posts to the northwest. The Indians in question are not under treaty pledges and obligations, without which they cannot, of course, be brought under the necessary control, and subjected to our molified reservation policy. The negotiation of a treaty with them would, therefore, seem to be required, as well for their benefit and welfare as for the protection and advancement of the interests of our own citizens.

In the reports of Superintendent Cullen and Agent Brown, herewith, will be found most interesting accounts of a remarkable revolution now going on among the Sioux Indians of Minnesota, in regard to their dress, habits, and pursuits. In common with the other members of the great Dakota tribes, they have heretofore been regarded as among the most wild and intractable, as they have been among the most warlike Indians within our borders, or on this continent, and but very faint hopes have been entertained of their ever being domesticated and civilized. But, through the good management and unremitting efforts of the above-named officers, the policy of restricting them to small re-

servations, of dividing their lands among them in severalty, and providing them with comfortable abodes thereon, and of supplying them with stock, implements and other means and facilities of adopting agricultural pursuits, has been attended with the most gratifying results. They are rapidly putting aside their barbaric costume and ornaments, and adopting the dress as well as the habits and pursuits of civilized life. The plan devised by the Superintendent and Agent of having them signify their determination to do this in an open and formal manner by being shorn of their scalp-locks—the peculiar and distinctive badge of the savage warrior—and assuming the dress of the white man, is well calculated, not only to confirm the transformation in those making the change, but also to have a powerful effect and influence upon their brethren to follow their example. It is stated that among those who have so changed are many of the chiefs and members of the most influential men of the tribe; that two hundred men with their families, making together seven hundred persons, have done so within the last year; that five hundred more are now preparing for it, and that the confident expectation is that at the end of three years the Blanket Indians will number less than did those who wore civilized costumes two years since, before the new movement commenced. And it is most gratifying to know that the change is not confined to dress alone, but that it includes also the industrious habits by which civilization is made and maintained; that in aiding to procure the material for their houses and improvements, and in the construction thereof; the cultivation of the soil, and in the management and care of their stock and implements, they evince a degree of energy, industry and intelligence, which gives promise of the most hopeful results.

The great and sudden influx of population into Kansas, embracing a large class of persons having but little regard for the obligations of law, and none whatever for the rights and welfare of the Indians, has rendered the administration of the affairs of this branch of the public service in that territory peculiarly embarrassing and onerous. Constantly recurring complaints, and difficulties growing out of lawless conduct of the whites toward the Indians, rendered it expedient and advisable that I should visit the territory in order to become personally acquainted with the actual condition of things, to ascertain what remedies could be devised for the better protection of the Indians and their rights, and what further measures, if any, could be adopted for their more rapid and certain domestication and improvement. Treaties not having been consummated with several of the tribes, it also became necessary to ascertain whether they could not be induced to enter into conventional arrangements pursuant to the act of 1833, which had become

the more necessary, because, from the increase of population it was no longer possible, in their scattered condition, to protect them in their rights.

From want of sufficient time, I was able to visit in Nebraska only the confederate tribes of Ottos and Missouris. These Indians, not having yet had the lands in their reservation allotted to them in severalty, have made no progress in agriculture; but the chiefs are now in favor of it, and it should be done as soon as practicable. I visited most of the tribes in Kansas, and was gratified to find a better state of things existing among them than I had anticipated. They are all favorably located, and many of them are making commendable efforts to improve their condition, by adopting agricultural and other industrial pursuits. A rigid and determined adherence to the system of policy adopted in regard to them, to which I have already referred, will, I think, result in greatly improving their condition in the course of a very few years, provided they can be more effectually protected from intrusions upon their lands, and other acts of wrong and injustice by lawless white persons. For this purpose more stringent laws are necessary, as also the transfer of jurisdiction over offenders, under the trade and intercourse laws, from the United States Court in Missouri, where it now rests, to those in Kansas and Nebraska, which measure was urged in the annual report of last year. And in view of the probability of the admission of a new State, embracing the great body of these Indians within its limits, I would suggest the necessity, in that event, of the General Government retaining exclusive jurisdiction over their reservation, in order to preserve that full and entire control over them and their affairs, which is indispensably necessary for the protection of their rights and the promotion of their prosperity and welfare. In conformity with the stipulations of treaties, they were specially excepted from the operation of the law organizing the territory, and they cannot, unless with their previous assent, be brought under State jurisdiction and laws, without a violation of the honor and pledged faith of the United States. While in Kansas I succeeded in negotiating treaties with the Kansas or Kaw tribe of Indians, and the Sacs and Foxes of the Mississippi, by which they cede a large portion of their reservations in trust, to be disposed of for their benefit. The quantity ceded by Kansas is 200,000, and that by the Sacs and Foxes 300,000 acres. These treaties were made in conformity with the provisions of the act of 1853, under which no conventional arrangements had been consummated with these Indians; and from the extent of their reservations, and the large quantities of land which they could not occupy and were of no use to them, it was impossible to prevent settlements being made thereon. As many as two hundred and fifty persons

had settled within the limits of the Kansas reservation. This was a source of constant complaint and difficulty, which, it is hoped, can hereafter be entirely obviated, so far as these Indians are concerned, if the treaties are ratified.

The great southern tribes, located west of Arkansas and southern Missouri, continued to present in their orderly conduct, their regular, stable, and well administered governments, and in their general prosperity, the same marked and gratifying evidences of advancement and improvement that have so repeatedly been noticed in former reports.

The same policy which isolated the tribes in Kansas also placed these Indians separate and apart by themselves; but had they not become imbued with the impulse, and adopted many of the habits and pursuits of civilized life in their former southern homes, it is doubted whether they would now be any further advanced than when first removed. Civilization is not to be taught and acquired by precept alone, but mainly by practical example, and immediate and constantly recurring evidence of its blessings and advantages. Could there have been mingled with the tribes so mistakenly isolated an orderly, industrious and enterprising white population, all theorizing speculation as to the best means of accomplishing their civilization would by this time, probably, have been at an end. That desirable result would, at least, have been so far realized as to relieve us of our present anxiety concerning their future condition and welfare.

The reports of the condition of the Indians in Utah present a melancholy picture. The whites are in possession of most of the little comparatively good country there is, and the game has become so scarce as no longer to afford the Indians an adequate subsistence. They are often reduced to the greatest straits, particularly in the winter, which is severe in that region, and when it is no uncommon thing for them to perish of cold and hunger. Even at other seasons numbers of them are compelled to sustain life by using for food reptiles, insects, grass seed, and roots. Several farms have been opened for their benefit in different localities, and many of them have manifested a disposition to aid in their cultivation, but, unfortunately, most of the crops were this year destroyed by the grasshoppers and other insects.

Many of the numerous depredations upon the emigrants have doubtless been committed by them in consequence of their destitute and desperate condition. They have at times been compelled to either steal or starve. But there is reason to be apprehended that, in their forays, they have often been only the tools of the lawless whites residing in the territory. In some of the worst outrages of this kind, involving the lives as well as the property of our emigrants,

the latter are known to have participated. That this was the case in the atrocious and dreadful massacre at "Mountain Meadows," in September, 1857, the facts stated in the report of the Superintendent, in regard to that occurrence, leave no room for doubt. The lives of from 115 to 120 peaceable emigrants, of all ages and both sexes, were inhumanly and brutally sacrificed on that occasion, some young children only being spared. These children, 17 in number, were afterwards, under instructions from the Department, found, and taken possession of by the Superintendent, and Congress having made an appropriation to defray the expense, 15 of them have been brought back and restored to their relatives in Arkansas. The remaining two are now probably on their way in.

DIED, Suddenly, on Fourth day morning, 4th inst. THOMAS H. YARDLEY, M. D., in the 60th year of his age.

—, On Third day morning, 3d inst., GEORGE ABBOTT, in the 52d year of his age.

BEAUTIFUL INCIDENT.

The Cliff Swallow is not, we believe, a regular sojourner in these parts. His visits are believed to be only occasional—few and far between. At any rate, we are informed that he has no regular haunts. The farm that he gladdens this year, may not be cheered by his presence for many coming seasons.

We have an excellent anecdote to tell of these interesting birds. It was related to us, (if not by an eye-witness,) by one who received it from an undoubted source. These birds, as do nearly all the birds of this latitude, take their departure hence with the summer for the warmer skies. Several years since a large number of them had their nests upon a barn in the south part of Deerfield. At the usual period their northern homes were abandoned, and the tribe took its flight for the tropics. After a time a solitary individual was seen lingering among the forsaken habitations. Various conjectures were started to account for its tarrying. It might be that he had not strength enough for so distant an expedition; or he might have been accidentally left behind in the general migration, and found himself too timid to encounter the perils of the journey alone. The autumn passed away and still that solitary stranger remained, braving the frost and peltings of the storms of winter. Spring came, and yet he was there. An occurrence, so singular, and contrary to the habits of the migrating tribes, caused his motions to be watched with more attention. At length another head was observed protruded from one of the nests, which seemed to be the abode of the bird which had been marked with so much interest.

On examining that nest, the mystery was beautifully solved. Another swallow was found there

a prisoner. One of the legs had become entangled by a thread of horse-hair which had been used in the lining of the nest, and held it there a captive. Yet it was not deserted by its faithful mate. Through all the long and dreary winter, his patient, self-devoting love supplied her wants. He saw without regret but, for his hapless consort, the deepening gloom of the fading year; he braved without feeling, but for her, the advancing rigour of winter, and if he at times remembered the sunny skies of the south, and the pleasures his tribe were there enjoying, it was only to sigh that she could not partake them. By night and by day, in sunshine and in cloud, in the calm and the tempest, he was with her ministering to her wants, and cheering the hours of her hopeless captivity, by his caresses and untiring devotion.—*Exchange paper.*

THE GULF STREAM AS A FERTILIZING AGENT.

We read in *Once a Week*: If we follow the Gulf Stream across the ocean, we perceive how fully it fulfils the purpose for which it was designed. Sir Walter Scott tells us that the pools in the Orkneys are never frozen, the effects of the grand hot-water warming apparatus of a far distant shore being sensibly felt even in these islands, which are situated in latitude nearly ten degrees further north than the ice-bound coast of Labrador. We all know that in Great Britain there is an extraordinary difference between the eastern and western coasts—so great indeed as to induce completely different systems of agriculture. The Emerald Isle owes her splendid grazing land to the soft west breezes born of the Gulf Stream which strikes full upon her shores; the western shores of England are robed in bright green pastures nourished with the warmth and moisture issuing from the same tropical source. The dairy produce of Great Britain has its root and issue in this steadfast hot-water river in the ocean, the limits of which modern science has so accurately mapped; nay, the florid plump looks of our people, and the large size of our domestic animals, are but effects of that moist and genial atmosphere which finds its birthplace in the beneficent Gulf Stream.

And in order to bring the effects of this extraordinary marine phenomenon closer home to the stomach of our reader, we may perhaps be permitted to ask him, how it is that of late years he has purchased peas, potatoes, and broccoli so many weeks before their season in Covent Garden Market? Peas in May were once thought to be an extravagance, only allowable to a duke. Now any moderate man may indulge in them to his heart's content. Well, these vegetables are forced—but in a hot-house atmosphere of nature's own contriving. Where the tail of the British dolphin dips into the Atlantic, there the effects of the Gulf Stream are most felt; it is bathed with the

warm moist air, heated by the far-off Gulf cauldron, and we may say, with exactness, that the majority of our early vegetables sold in the open market are forced in hot-houses in Cornwall and Portugal, (the seaboard of the more southerly promontory,) by means of a boiler situated beyond the West Indian Archipelago, the conducting hot-water pipe of which runs for nearly four thousand miles between the cold walls of the surrounding ocean. Had the ancients been aware of this property of the ocean, it would have modified the representations of the Pagan Olympus, and we should have been familiar with the spectacle of—Neptune turned gardener.

THE HERMIT OF THE THEBAID.

O, strong upwelling prayers of faith,
From inmost founts of life ye start—
The spirit's pulse, the vital breath
Of soul and heart!

From pastoral toil, from traffic's din,
Alone, in crowds, at home, abroad,
Unheard of man, ye enter in
The ear of God.

Ye brook no forced and measured tasks,
Nor weary route, nor formal chains;
The simple heart that freely asks
In love, obtains.

For man the living temple is:
The mercy-seat and cherubim,
And all the holy mysteries,
He bears with him.

And most avail the prayer of love,
Which, wordless, shapes itself in deeds,
And wearies Heaven, for naught above
Our common needs.

[At noon, the Thebaid hermit leaned
O'er record of Christ's loving word:]
Was it an angel or a fiend,
Whose voice he heard?

It broke the desert's hush of awe,
A human utterance, sweet and mild,
And, looking up, the hermit saw
A little child.

A child, with wonder-widened eyes,
O'erawed and troubled by the sight
Of hot, red sands and brazen skies
And anchorite.

"What dost thou here, poor man? No shade
Of cool, green downs, nor grass, nor well,
No corn nor vines." The hermit said:
"With God I dwell.

"Alone with Him in this great calm,
I live not by the outward sense:
My Nile his love, my sheltering palm
His providence."

The child gazed round him. "Does God live
Here only?—where the desert's rim
Is green with corn, at morn and eve,
We pray to him.

"My brother tills beside the Nile
His little field; beneath the leaves
My sisters sit and spin, the while
My mother weaves.

"And when the millet's ripe heads fall,
And all the bean-field hangs in pod,
My mother smiles, and says that all
Are gifts from God.

"And when to share our evening meal,
She calls the stranger at the door,
She says God fills the hands that deal
Food to the poor."

Adown the hermit's wasted cheeks
Glistened the flow of human tears:
"Dear Lord?" he said, "Thy angel speaks,
Thy servant hears."

Within his arms the child he took,
And thought of home and life with men;
And all his pilgrim feet forsook
Returned again.

The palmy shadows cool and long,
The eye that smiled through lavish locks,
Home's cradle hymn and harvest song,
And bleat of flocks.

"O, child!" he said, "thou teachest me
There is no place where God is not;
That love will find where'er it be,
A holy spot."

He rose from off the desert sand,
And, leaning on his staff of thorn,
Went with the young child, hand in hand,
Like night and morn.

They crossed the desert's dreary line,
And heard the palm-tree's nestling fan,
The Nile bird's cry, the low of kine,
And voice of man.

Unquestioning, his childish guide
He followed, as a small hand led
To where a woman gentle-eyed,
Her distaff fed.

She rose, she clasped her truant boy,
She thanked the stranger with her eyes:
The hermit gazed in doubt and joy
And dumb surprise.

And lo!—with sudden warmth and light
A tender memory thrilled his frame;
New-born, the world-lost anchorite
A man became!

"O, sister of El Zara's race,
Behold me!—had we not one mother!"
She gazed into the stranger's face:
"Thou art my brother!"

"Taught by thy child, whom God hath sent,
That love is more than fast or prayer,
I come, toil, care and pain, content
With thee to share."

Even as his foot the threshold crossed,
The hermit's better life began;
Its holiest saint the Thebaid lost,
And found a man!

WHAT THE YEAR HAS LEFT UNDONE?

It is not what my hands have done
That weighs my spirit down,
That casts a shadow o'er the sun,
And over Earth a frown;
It is not any heinous guilt,
Or vice by men abhorred,
For fair's the fame that I have built,
A fair life's just reward,
And men might wonder if they knew
How sad I felt with "sins so few."

Alas! they only see a part
When thus they judge the whole;
They do not look upon the heart—
They cannot read the soul.
But I survey myself within,
And mournfully I feel
How deep the precipice of sin
Its root may there conceal,
And spread its poison through the frame
Without a deed that men would blame.

They judge by actions which they see
Brought out before the sun;
But conscience brings reproach to me
For what I've left undone.
For opportunities of good
In folly thrown away,
For time misused in solitude,
Forgetfulness to pray,
And thousand more omitted things
Whose memory fills my breast with stings.

And therefore is my heart oppressed
With thoughtfulness and gloom,
Nor can I hope for perfect rest
Till I escape this doom.
Help me, thou Merciful and Just!
This fearful doom to fly,
Thou art my strength, my peace, my trust,
Oh help me, lest I die!
And let my full obedience prove
The perfect power of faith and love.

H. WARE.

AVALANCHES.

(Continued from page 687.)

One peculiar feature in the proceedings of an avalanche is the blast by which it is accompanied. Driving the air before it with great velocity, a considerable commotion must necessarily be produced in the atmosphere. Probably the effects have been greatly overrated, but the mischief occasioned by these terrible visitors sometimes assumes a form which can only be explained on the principle of ærial concussion. Trees are frequently stripped or levelled on each side of their track, though standing far beyond the reach of the hurrying snow. "The current of air," says Friedrich Körner, "extends many hundred paces beyond the lawine, and overshoots it with a violence which the solid cliffs can scarcely resist. The strongest trees are torn to strips, men and animals are hurled into the abyss, or borne unhurt to some neighboring ridge; houses are unroofed, and beams, lumps of ice, and fragments of stone are sent clattering through the

air."* It is stated that the eastern spire of the convent of Dissentis was prostrated by the breath of an avalanche, which dashed past the place at the distance of a quarter of a mile. On the 27th of December, 1819, an enormous mass swept down into the valley of the Visp from the Biesgletscher, as if eager to devour the little hamlet Randa, which lies on the opposite slope. Fortunately the vast missile took a direction to the north of the village, marking its path with a spray of icy fragments and lumps of stone, which desolated the neighboring fields at the time. The curé of the parish was awakened by a shock which tossed up his bed as if a young earthquake were gambolling in his apartment. A terrible rush of wind succeeded, and this was supposed to be the recoil of the air from the rocks which fronted the avalanche. Chimneys were thrown down; roofs were peeled from the houses; the garnered hay was whirled up the mountain side, or strewn over the woods; a timber hovel, containing a couple of old women, was carried bodily to a distance of more than a hundred yards, without inflicting any injury upon its occupants; and upwards of a hundred buildings were damaged or destroyed. When Leukerbad—so famous for its steaming tanks, filled with a promiscuous throng of invalids, who present one of the uncouthest spectacles we have ever witnessed—was invaded by an avalanche in the year 1719, four of its inhabitants were whisked into the air, and transported by the blast to some distant meadows, where their corpses were subsequently discovered.

Frantic, however, as these great masses of snow may appear in their movements, there is at times something excessively quaint in their doings. A forest growing on one side of the valley of Calanca, in the Canton of the Grisons, was torn up by an avalanche, and conveyed to the other, where it was left standing as if on its native site. Apparently by way of frolic, a fir-tree was hoisted to the top of the parsonage house, and planted there as a souvenir of the visit. In 1800, an avalanche dashed into the valley of Vorder Rhein, near Trons, crossed it to the opposite slope, destroying many trees and chalets in its progress; then rebounded, mounting the declivity which it had just descended; and thus oscillated until at the fourth vibration it fell upon Trons, where it expended the residue of its wrath. The inhabitants of the hamlet of Rueras, in the valley of Tawich, in the same canton, went to sleep as usual on a certain evening in the year 1749, but, on awaking next morning, they found themselves enveloped in darkness. Concluding that the sun had not yet risen, they waited for the coming of the day. The day, however, came not. Surprised at its postponement, some of them went to their doors, and discovered, to their great horror,

* Die Wunder der Winter Welt." Von Friedrich Körner.

that their houses were buried in snow. An avalanche had swept them away in the night, yet so gently, that their rest had not been disturbed. Assistance being rendered, sixty persons were rescued, but forty had already perished.

Many a wonderful case of deliverance from the jaws of the avalanche might be related. The store-hut of a herdsman in the Canton Wallis was overwhelmed by a fall from the Diablere-Gletscher—himself being in the place at the time. The roof groaned and gradually bent beneath the load, whilst the poor trembling owner, cowering in one corner, awaited the moment of fracture. At last all was still, but it was the frightful stillness of a living grave. After a while, by dint of great exertion, the captive contrived to force an opening through the side of the hovel, but, on endeavoring to probe the snow with a pole, he found that its thickness precluded all reasonable expectation of escape. Dismayed, he shrank back into his hut, and prepared himself to die of hunger and of suffocation. Horrible were the hours he spent in solitude and despair. Recovering a little, however, he resolved to make a vigorous struggle for life. He seized his hatchet and began to excavate a path. The snow and ice were so compact, that excessive labor was required, and the great blocks of stone which the poor man encountered, compelled him to make frequent *détours*. Returning to the hut when exhausted, and supporting himself by means of some cheese which he had in store—the air contained in the crevices of the snow affording sufficient pabulum for the lungs—he persisted in his task until the edge of the axe was worn away. How time flitted in the world beyond, he could not conjecture; but reckoning by his meals, he concluded that six weeks had already elapsed, when at length the material about him became spongier in its texture, and from this circumstance he drew brighter auguries of his release. Dig, dig—he proceeded with his blunted weapon, until at the expiration of another fortnight he emerged from his prison-house, and stood, with torn clothes, swollen face, and lacerated limbs in presence of the setting sun! The joy of that moment was worth half a lifetime of woe. Rapidly he made his way into the valley, and soon reached the door of the cottage where his wife and family resided. By this time it was dark. He looked through the window, tapped gently, and murmured the words, "Open, Maria! thy husband yet lives: he is here." But nine weeks of absence had constrained the inmates to regard him as dead, and the sight of that excoiated countenance, with its two wild staring eyes peering through the casement, extorted a cry of terror. Believing that they were troubled by an apparition, they ejaculated a prayer to the Virgin for protection, and fastened both window and door upon the glowering phantom. All attempts to obtain admittance being vain, the

peasant proceeded to the house of the curé, who, on hearing the marvellous tale, gave the poor wife his guarantee that the visitor was no goblin, but a genuine husband, composed, like other husbands, of veritable flesh and blood.

But if a soft substance like snow is thus appalling in its effects, what must be the case when the avalanche consists of huge masses of rock? Almost every Alpine valley is strewn with great boulders, which have been torn from the neighboring cliffs, and hurled, amidst smoke and thunder, into the smiling pastures beneath. The sides of the hills are scored by stoney streams, which look as if they had cut their way through the fine forest zones, and then been arrested at a stroke. Occasionally an entire mountain-top may be said to give way. Let it rest in an inclined position upon a bed of soft, slippery material, like clay, and if the water should wash out sufficient soil to affect its stability, down it will rush with that awful impetus which sweeps away men as if they were motes, and mows down whole villages as if they were grass under the scythe. The Rossberg landslip is one of black memory in the history of Switzerland. From the summit of the Right, the eye may observe the huge scar which was made in this ill-omened mountain upwards of fifty years ago; and though the spectator stands in the presence of an army of hills, such as the world cannot well match—though he sees the sun kindle each distant peak, with a light which seems unearthly in its beauty, though glancing downwards he perceives the morning mists floating with snowy wings over each fair lake and stream, like guardian spirits hovering over their sleeping charges,—and who that has once hung over that magical map will forget its varied fascinations?—yet, if the gazer had learnt the story of the catastrophe of Arth, he will turn with a shudder to the terrible wound still gaping in the landscape, and sorrowfully track the course of the great furrow along which death drove his ploughshare, in September, 1806. On the second of that month, about five o'clock in the afternoon, according to Dr. Zay,* who witnessed the scene, the upper part of the mountain seemed to be set in motion. A mass of earth and rock, three miles in length, a thousand feet in breadth, and a hundred in depth, swept madly into the vale beneath, crushing three villages wholly, and a fourth partially, beneath its stony billows. Part of the *debris* was hurled into the lake of Lawertz, at a distance of five miles, where it filled up one extremity, and produced a wave upwards of sixty feet in height, which deluged the villages on its shores. Flights of stones, some of them of enormous dimensions, swept through the air like showers of cannon-balls. Torrents of mud accompanied the eruption. Few escaped who were entrapped. Several travellers from Berne, enter-

* Goldan and seine Gegend." Von Dr. Karl Zay.

ing Goldau just at the time of the slip, were buried in the ruins. Between three and four hundred buildings of various kinds were destroyed, and upwards of four hundred and fifty human beings perished. A few minutes (not more than five) sufficed for this terrible transaction. At one moment the landscape lay placid and beautiful in the lap of the treacherous mountain; at another its loveliness had vanished, and nothing remained but a number of shapeless hillocks, beneath which hundreds of men and women had been sadly and suddenly sepulchred.

(To be concluded.)

THE POPPY.

Walking on a summer's day, my thoughts occupied by the anticipation of an event I was anxiously looking forward to, and a feeling of impatience arising at the uncertainty of its result, and the probable time which would elapse before it could be ascertained, I almost unconsciously picked a poppy in the bud, and opening it, was astonished and delighted to observe that beneath the unsightly exterior the flower was complete in form and color, the leaves being folded up in the neatest manner ready to open. Thus it is, I thought, with events that perplex us; the God of providence superintends our mean affairs. He prepares and completes all, and at the proper time they will be developed; and, like this flower, burst the bud and appear to our view. Gracious God, I bless thee for this lesson; enable me to submit to thy will, and wait thy time for the unfolding of every event.

ITEMS OF NEWS.

EUROPE.—We have intelligence that the European Congress will meet on the 20th. It is stated that the belligerent Powers will only be represented at the European Congress by the Ministers of Foreign Affairs, and the remaining powers are to send plenipotentiaries. The Paris *Press* mentions a rumor that Prince Gortschakoff will decline to attend the Congress unless England is represented by some important member of her cabinet.

The *Presse* contains an article to the effect that England and Sardinia must obtain serious guarantees before sending definite answers to the invitation of France, and also that a Congress would be impossible if the principle of non-intervention has not been accepted by all the Powers.

The Paris *Pays* publishes the following official list of the plenipotentiaries to the Congress of Powers:

Austria—Reichberg and Metternich.
Great Britain—Cowley and Wodehouse.
Prussia—Schleinitz and Pourtales.
Russia—Gortschakoff and Kisseleff.
France—Walewski and De Auverhue.
Spain—De la Rosa and Mons.
Portugal—Lavaradio and De Paiva.

The Federal Council of Switzerland intends to ask the Congress that the neutrality of Savoy may be guaranteed by the Italian Confederation, as it is already by Piedmont, in virtue of the treaty of 1815.

A majority of the representatives to the Congress have expressed themselves favorable to the admission

of plenipotentiaries from Switzerland, when the Congress deliberates on the application for the neutrality of Savoy.

It is rumored that the Emperor Napoleon will inaugurate the new year by fresh pacific demonstrations.

A conflict in Hungary seems imminent—one hundred and eighty Protestant noblemen and gentlemen have been imprisoned.

The weather has been very severe in both Great Britain and France. In the former, canal navigation had been suspended by ice, and in both countries railway travel has been impeded by snow. The river Seine, at Paris, was full of ice at the latest advices.

SUEZ CANAL.—It is stated that the demand of the French Ambassador for a firman favorable to the Suez Canal project, had been supported by the ministers of Austria, Prussia, Russia, and Sardinia. Fuad Pacha confessed he had formally engaged himself to refuse an authorization to the project. The Turkish cabinet, after a stormy discussion of the matter, agreed to the request of the Powers which had made the above demand, to come to an understanding with England in the matter.

The London *Post*, Lord Palmerston's organ, asserts that if De Lesseps obtains a firman from the Porte, sanctioning the Suez canal, he will have succeeded in severing Turkey from Egypt. If the firman confers on the company the absolute possession in plain language, the sovereignty of several miles of the banks is ceded, and the right conferred of erecting fortresses, it forms no part of the policy of England that the independence of a friendly State shall be assailed. It forms no part or the interest of England to assist in carrying out a scheme wholly impracticable, or of which the practicability would be shown in creating, for the especial benefit of France, an Egyptian Dardanelles or an Egyptian Gibraltar, and such result we may venture to add is not yet contemplated by the statesmanship of Lord Palmerston.

THE SANDWICH ISLANDS.—A recent assessment shows that the total valuation of all the real estate and personal property in the Hawaiian Kingdom is over seven millions of dollars. The total amount of taxes levied for general purposes was \$70,015; for the schools, \$33,568; and for the roads, \$30,247.

Up to 11th mo. 9, seventy-seven whale ships had arrived from the Arctic and Kodiak fleets, with a total catch of 24,735 bbls. of oil, averaging 461 to each vessel; fifty-six from the Ochotsk fleet, with 3,003 bbls., averaging 607 to each vessel, and four vessels from the sperm whale grounds, with 1,140 bbls. Sixty nine more vessels were expected before all the fleet of 1859 was in. Oil at Honolulu was 43c. a gallon.

ICEBERGS IN LAKE SUPERIOR.—The beauties of our northern clime, says the Ontonagon *Miner*, have commenced forming along the lake shore, not immediately on the edge, but varying from 50 to 200 yards from the beach, owing to the depth of water. Near the shore, where the water is shallow, small cakes of ice are crowded together, presenting an uneven surface, and so still extending out until the force of the waves in deeper water disputes the further encroachments on their territory. Here the ice forms in a ledge, and the constant dashing of the waves over it, and the congelation of the water, continue to pile up the bergs higher and higher, until at length their summits rise above the reach of the billowy element which created them. Some years since, a berg was formed near Ontonagon sixty feet in height from the level of the water.

THE BOSTON NORTH ATLANTIC TELEGRAPH EXPEDITION.—T. P. Shaffner, writing to the London *Times* under date of "Latitude of 54 deg. 30 min., Hamilton

Inlet, coast of Labrador, Sept. 16," says: My expedition for the survey of the North Atlantic Telegraph route, sailed from Boston on the 29th ult., and arrived here on the 11th inst., having very successfully passed some thousand icebergs at sea. My vessel, the barque Wyman, sails finely, and I hope to reach Glasgow early in November. This expedition has in view an examination of the route of the telegraph proposed by me under grants awarded to me by their Majesties the Kings of Denmark, Norway and Sweden. I have examined this coast, and find the mouth of Hamilton's Inlet to be the best. A telegraph cable can be brought from the sea into the inlet through a very deep channel with a fine sandy bottom. This entrance is so deep that bergs cannot reach the cable at the bottom. The weather is very fine. We have no frosts, snow or ice to interfere with our work. I have seen enough to satisfy me that so far as this coast is concerned there will be no difficulty in bringing a telegraph cable to a safe landing. I expect to sail from here on the next change of wind for South Greenland, and will sound the ocean as I go along. I will then visit Iceland, the Faroe Isles, and thence to Glasgow.

I send this by a fisherman to Newfoundland, for it to be mailed from there, and I have no means of paying the postage.

NORTHERN SCHOOL TEACHERS.—The Virginia Legislature met last Tuesday, and inaugurated its proceedings in the House of Delegates by passing a resolution, that the committee of schools and colleges inquire into the expediency of reporting a bill prohibiting school commissioners throughout the commonwealth from subscribing to any teacher, male or female, who hails from the north of Mason and Dixon's line, unless they shall have resided in the State of Virginia for at least ten successive years previous."

THE NAUTICAL SCHOOL IN BOSTON.—The Boston Journal states a ship has been purchased for \$12,000, as a Nautical School for the boys of the Reform School. The ship will be conveniently fitted up, with good light and ventilation, and will accommodate 150 boys and the necessary officers. A practice vessel, brig-rigged, of one hundred tons, is also to be purchased for the use of the school. The fitting up of the ships will be immediately commenced, and the school will probably be in operation in the course of the coming spring.

AFRICAN COTTON.—A cargo of African cotton is reported to have been received at Boston, and it is said to be equal to the best Mississippi, in length and fineness of staple.

STRAW PAPER PERFECTED AT LAST.—It is stated in a late English journal that Dr. Collyer has succeeded in manufacturing a paper from straw, which is in every respect equal to rag paper—many reams having already been finished. By his mode of treating the straw he splits it and separates the silica and gluten without in any way injuring the fibre. Baron Liebig has pronounced a very favorable opinion of the invention.

A UNIVERSAL LANGUAGE.—A Serb, named Moses Paitsch, is now in Vienna, where he is endeavoring to bring to the notice of the world a uniform mode of writing all languages which he has discovered. The basis of his system is the Arabic alphabet.

THE STEAMER VIGO.—A meeting of the Corn Exchange was held recently to adopt measures to facilitate the arrival of the Vigo from Liverpool which left that port for Philadelphia on the 22d ult. The Vigo will reach port next week. A Committee were appointed to confer with other bodies upon the subject, while \$300 were appropriated if necessary, to employ

a proper tug to carry the ship through the ice in the river if it then exist.

COAL OIL.—We learn from the Kanawha Republican that M. de Bellot des Minieres and other French gentlemen, who have been residing for some time past in Charleston, Kanawha county, Va., with a view of ascertaining the mineral and agricultural resources of western Virginia, are about to commence part of their industrial operations for the purpose of developing the mineral resources of that section of the State, by the erection on Cold river, during the summer, of large oil works, of about one hundred retorts, and also, at the same time, works for the fabrication of ammoniacal salt and coke, from the rich bituminous coal of that region.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market presents no new feature. There is very little inquiry either for export or home consumption, but holders are firm in their demands. The only sales are in a small way to the trade at \$5 50 a 5 75 per barrel for superfine; 5 75 a 6 00 for extra; 6 a 6 50 for extra family, and 6 75 a 7 50 for fancy lots. Very little doing in Rye Flour or Corn Meal. We continue to quote the former at 4 25 and the latter at 3 75 per barrel.

GRAIN.—There is a fair demand for Wheat, and the offerings being light, prices are without change. Small sales of good red at 135 a 136 cts. per bushel. White is worth 140 a 150c. Rye is worth 93c with a very light supply coming forward. Sales of 3000 bushels prime dry yellow, corn in the cars at 75c. Oats are unchanged. Pennsylvania are worth 45c and 46c and 43c and 44c for Delaware.

CLOVERSEED is coming forward more freely, and the demand for it is active. Sales of 560 bushels at 5 25 a 5 44 for 64 lbs. No change in Timothy or Flaxseed. The latter is wanted at 1 56 per tushel.

A YOUNG MAN, Member of the Society of Friends from the country, wishes a situation in some kind of business in this city; among Friends is preferred. Please inquire of W. W. M., 324 south Fifth St., Phila., 1st mo. 7, 1860.

LAKE SCHOOL FOR BOTH SEXES. The 2d semi-term of 20 weeks is to begin 20th of 2d month. The charge, in full, for board and tuition, per term of 20 weeks, is \$45, or at the rate per week of \$2½.

Circulars with references sent by applying to either subscriber

SIDNEY AVERILL,

ELMINA AVERILL,

West Vienna, Oneida Co., N. Y.,

1st mo. 8, 1860.

Proprietors.

A YOUNG WOMAN having had some experience in teaching, and possessing a certificate of qualification, is desirous of a situation in a family school. Address
G. CLEMENT,
12 mo. 17,—3t. Paulsboro, N. J.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, FIRST MONTH 21, 1860.

No. 45.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,

No. 324 South Fifth Street,

PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

SELECTIONS FROM THE LIFE AND EXPERIENCE OF THOMAS BULMAN.

(Continued from page 690.)

Joseph Brown, who was one of the prisoners, died at his house in Lothersdale, in 1803, and Henry Wormald sent his friend Thomas Bulman the following interesting biographical notice of this individual, of whom there is an account in *Piety Promoted*, Part X. page 155.

“Joseph Brown was born in Lothersdale, in the 5th month, 1751, of honest and religious parents, professing the Truth as held by us, and they brought him up in the same way. There appeared in him, when very young, something of extraordinary talent, even beyond that of most I have ever known. He obtained a knowledge of reading and writing by his own industry. His father was a mason, and trained up his son as a builder of field walls, in which business he improved to an admirable degree of swiftness and perfection. But alas, in his youth, he became much addicted to the foolish fashions, pleasures and amusements of this world, to the grief of his parents and friends; and to so great a length did he go, that he was cut off from the Society. I have heard him say, that at one time, he could sing three score and ten vain songs. But after such scenes of mirth and jollity, great was his remorse, and he believed if he continued in that course of life he would be lost forever. Then he was enabled to cry unto God, and to beg for mercy; and the Lord was pleased to answer him in the time of great distress, and to enable him to forsake his former ways and acquaintance. He became very industrious in his business, for the support of his family; he also was diligent in attending meetings, both on First-days and

other days of the week; and was often highly favored when thus met with Friends. About this time it was made known to him that it would be required of him to preach the Gospel; but he was fearful of being misled in so weighty a matter. He felt encouraged, however, to make application to be reinstated in membership and unity with Friends, which was soon granted. When the time was come that he believed it his duty to speak in meetings, he stood up in fear and trembling, but spoke audibly, and his communication was acceptable to his friends who heard it. He frequently afterwards had a few words in meetings; but sometimes great fear came upon him when his former conduct came before him. He was helped over this difficulty by these words passing through his mind with great power, “Be not afraid of the faces of men,” after which he could speak boldly and without fear. He was diligent in attending his own meeting, and seldom missed either Monthly or Quarterly meetings, and twice attended the Yearly meeting in London, which I believe was always acceptable to his friends, and brought peace to his own mind. He was engaged several times in visiting the families of Friends in our Monthly meeting, and once in that of Knare-boro’. Both in meetings and in families, he was careful to wait to receive power from on high. Thus life did arise with his ministry, to the comfort and encouragement of the living members, wheresoever his lot was cast. He was a rightly qualified minister, and prophet also; very useful in the discipline of the church, though he did not meddle much except when he was influenced by the Lord’s Holy Spirit; a peacemaker amongst his neighbors, and useful to them in many respects. He was also a good example when confined in York Castle on account of tithes, and serviceable to his companions there, administering admonition, advice and counsel, and often had to hand forth a cup of consolation to spirits in prison. He had many afflictions and troubles to pass through, and it was not one of the least, to know that some of his children (he had ten in number) did not walk so orderly as he desired for them. But in general he was supported with Christian fortitude of mind. Once he was permitted in the wisdom of Providence to be depressed almost below hope; when he was tempted and tried to an extraordinary degree, even to despair of the mercy

of God. But He who is infinite in wisdom, adorable in mercy, and unlimited in power, appeared again for his deliverance, and brought him up from the depths, to the great joy and comfort of his beloved wife and friends; and his gift in the ministry was not long impaired by this trial. He was a loving, affectionate husband, a kind and indulgent father, a true-hearted and honest Friend. The time of his last illness was about two weeks, sharp and painful, during which he did not express much. Two Friends calling to see him previous to their setting out for the Quarterly meeting, to them he said a few words to the following import: "Give my dear love to Friends there; I had thought of being with them, but we are poor short-sighted creatures and cannot foresee the ways of Providence. But I never felt more love toward Friends than at this time." He then added, that he thought a few days ago, he had a view of his burial day, but said, "At present all foreknowledge is hid from me: but the Lord has been wonderfully good, and has supported me through many difficulties, to my own admiration. If it should please the Lord to take me at this time, I am easy, and resigned to his will. If I should be raised up again, I hope to dedicate the remainder of my days to the praise of my Creator." When his children stood about his bed, he looked at them with fatherly affection, and then turning to his wife said, "They stand about me, but I seem to have nothing to say to them; thou dost much for me and will be rewarded for it." He bore his sickness with a pleasing composure of mind, and his innocent purified spirit quietly departed on the 28th day of 6th month, 1803, and now, I trust, is centered in that happy place, where not one of its inhabitants can say, I am sick. He was buried on the 3d of 7th month, in Friends' Burial Ground, in Lothersdale, aged about 52 years, a minister upwards of 20 years.

HENRY WORMALL."

This notice Henry Wormall sent to his friend Thomas Bulman, with the following touching lines, composed by James Montgomery, on the death of Joseph Brown:

"Spirit leave thine house of clay,
Lingering dust, resign thy breath,
Spirit cast thy chains away,
Dust, be thou dissolved in death."

Thus thy Guardian Angel spoke,
As he watched thy dying bed,
As the bonds of life he broke,
And the ransomed captive fled.

"Prisoner long detain'd below,
Prisoner now with freedom blest,
Welcome from a world of woe,
Welcome to a land of rest."

Thus thy Guardian Angel sang,
As he bore thy soul on high,
While with hallelujahs rang,
All the region of the sky.

Ye that mourn a father's loss,
Ye that weep a friend no more,
Call to mind the Christian cross,
Which your friend, your father bore.

Grief, and penury, and pain,
Still attended on his way,
And Oppression's scourge and chain,
More unmerciful than they.

Yet, while travelling in distress,
('Twas the eldest curse of sin)
Through the world's waste wilderness,
He had Paradise within.

And along that vale of tears,
Which his humble footsteps trod,
Still a shining path appears,
Where the mourner walked with God.

Till his Master from above,
When the promised hour was come,
Sent the chariot of his love,
To convey the wanderer home.

Saw ye not the wheels of fire,
And the steeds that cleft the wind,
Saw ye not his soul aspire,
When his mantle dropp'd behind?

Ye who caught it as it fell,
Bind that mantle round your breast;
So in you his meekness dwell,
So on you his spirit rest.

Yet rejoicing in his lot,
Still shall memory love to weep,
O'er the venerable spot,
Where his dear, cold relics sleep.

Grave, the guardian of his dust,
Grave, the treasury of the skies,
Every atom of thy trust,
Rests in hope again to rise.

Hark! the judgment trumpet calls,
"Soul rebuild thine house of clay,
Immortality thy walls
And eternity thy day."

(To be continued.)

For Friends' Intelligencer.

"God made man upright, but he hath sought out many inventions."

It was the will of God when he made man, that he should be led and guided by His spirit. "My spirit shall not always strive with man;" the flesh then (as ever since) striveth against the spirit, and the spirit striveth against the flesh.

"God made man upright," thus man, before he fell, could look to God, could commune with his Maker; but such was the effect of his fall, that he hid himself in the trees of the garden, and was afraid. God seeks in the present day, as he did then, to bring him back; Adam where art thou? Man where art thou? When God speaks, do we listen? are we not now disposed to hide in the trees of the garden? have we not sought out many inventions? Look at the various sects among Christians; look at the different opinions and beliefs now abounding in the

world. It is written, "Man was made subject to vanity, not willingly, but by reason of Him who has subjected the same in hope;" if man had nothing to conquer, if he had no cross, there would be no crown. And thus early spake the Most High to that tempting spirit that still seduces man to eat of the forbidden fruit, "I will put enmity between thy seed and its seed, (which is Christ formed in man) it shall bruise thy head, and thou shalt bruise his heel." Yes, we must all feel the force of temptation, not with the design that we should yield, for man was made to govern all his propensities. "Cease to do evil, learn to do well," is written on the conscience of every man that cometh into the world; and one of the Apostles says, "If we are wise unto that which is good, and simple concerning evil, the God of peace shall bruise Satan under our feet shortly." If, then, we are fallen by *our iniquities* may we seek to be renewed in the spirit of our minds. Marvel not, said the blessed Jesus, that I said unto you ye must be born again. "Except ye eat my flesh, and drink my blood, ye have no life in you." My words, said He, "they are spirit and they are life." This is what is most wanting amongst us, the work of regeneration, redemption, and entire sanctification by the spirit of God, a manifestation of which is given to *every man* that cometh into the world. Well was it said, "Work out your own salvation, knowing that God (by his spirit) worketh in us, both to will and to do of his good pleasure. Truly might it be said, "Salvation is of the Lord," for the spirit of Christ, and the spirit of God are one. I in them and thou in me, that they may be made perfect in one. May we then seek to be preserved in this oneness of spirit, which is the bond of peace. In this state of being we have different degrees of religious experience, some of us seem to look through a glass darkly; but ere long we shall see face to face; and we should watch against it as a temptation when inclined to accuse a fellow being of evil, because he sees not as we see.

If through Divine grace we are enabled to do justly, love mercy, and walk humbly with our God, we are made desirous that all should be as fully persuaded in their own minds, and walk by the same rule, and mind the same thing. What a delusion prevailed in the world when it needed a miracle to be performed to show that unto the Gentiles God had also granted repentance unto life. There is neither Jew nor Greek, Barbarian, Scythian, bond or free, but God is alike good unto all, and we shall all be judged, not according to what we have not, but according to that which we have. And thus said an Apostle (to whom I would say double honor is due), "Though I speak with the tongue of men and of angels, and have not charity, I am become as sounding brass, or a tinkling cymbal; and though I have the gift of prophesy, and understand all myste-

ries, and all knowledge, and though I have all faith so that I could remove mountains, and have not charity, *I am nothing.*"

"And now abideth Faith, Hope and Charity, these three, but the greatest of these is Charity."

J. W.

Canada West, 1st mo. 1, 1860.

"GOD IS LIGHT."

If God is light, then all that occurs is reconcilable with the idea that he is worthy of confidence. What he does may seem dark to us, but we may be assured that it is all light with him. A cloud may come between us and the sun; but beyond the cloud the sun shines with undimmed splendor, and soon the cloud itself will pass away. At midnight it is dark to us; but it is not because the sun is shorn of his beams, or is extinguished. He will rise again upon our hemisphere, in the fulness of his glory, and all the darkness of the cloud, and of midnight, is reconcilable with the idea that the sun is a bright orb, and that in him there is no darkness at all. So with God. We may be under a cloud of trouble, but above all that the glory of God shines with splendor, and soon that cloud will pass away, and reveal him in the fulness of his beauty and truth.

We should, therefore, at all times exercise a cheerful confidence in God. Who supposes that the sun is never again to shine when the cloud passes over it, or when the shades of midnight settle down upon the world? We confide in that sun, that it will shine again when the shades of night have been driven away. So let us confide in God, for with more absolute certainty we shall yet see Him to be light, and shall come to a world where there is no cloud.—*Albert Barnes.*

EXTRACTS FROM THE JOURNAL OF MARGARET WOODS.

27th 3d mo., 1774.—Hearing some persons mention that their preference of silent meetings was increasing, I was led to consider the happiness of having bread in our own houses, and water in our own cisterns; when we need not the help of man, but can worship, in awful silence, the Father of spirits, in spirit and in truth. For my own part, I feel at present far from this desirable attainment; clouds and darkness seem to overshadow me. In this state of mind, outward help is frequently beneficial; and if the spring lies deep, and we have no strength to dig, the joint labor of others assists us in coming to that refreshment which we know not how to obtain. Nevertheless, I am well convinced that a dependence on outward help will avail us nothing. If we are nourished by the bread of life, it must be by sinking deep into our own hearts, and experiencing the living powerful word to be near us, which

will guide us into all truth. We are too apt to let a careless negligence take hold of our minds when assembled together for the purpose of worship; instead of keeping them diligently fixed on the supreme Author of our being, and endeavouring to wait in the silence of all flesh, to hear that inspeaking word which would not only show us our states and conditions, and inform us what we ought to do, but, in his own good time, prepare a sacrifice acceptable to himself, and cause us to rejoice in the overshadowings of His love.

2d 10th mo., 1774.—“As I have lived so I shall close, with the most unshaken assurance, that we have not followed cunningly devised fables, but the pure, living, and eternal substance.” These expressions of S. Fothergill brought to my mind sentiments that have often occurred, respecting our faith being strengthened by the assurance of a departing friend; who can testify, that the way to arrive at a glorious immortality, is by taking heed, and diligently attending to that light, or inward manifestation of the Divine will, which is given us to direct our steps. Few of us, who seriously consider our latter end, can pass through this probationary state, without some seasons of doubt and anxiety. The fear of being led by a false light, or thinking those things essential which are not so, will sometimes prevail; and, from beholding the variety of sentiments in the world, we are ready to halt between two opinions, instead of giving up implicitly to divine instruction. But when we consider the end of those who have most diligently given themselves up to follow that which they believed to be their duty; their pleasing reflections on every instance of obedience, and satisfaction from having acted to the best of their knowledge, it seems to inspire us with resolution to pursue the same conduct, and to run with cheerfulness and alacrity the race which is set before us.

Though my mind seems, at times, enveloped in darkness, and thick clouds gather all around, yet can I, from a degree of experience, close in with the above sentiments, that in obeying that inward teacher, the light of truth, I have not followed cunningly devised fables, but have felt that peace which is an earnest of acceptance with God. O that my mind were but more diligently engaged, to seek this divine light, and to be guided by it in every action of life!

However easy and negligent we may be in the days of health and prosperity, yet, in the days of adversity, keen reflections will take place; and when stretched on the bed of sickness we shall count all but as dross in comparison of gaining Christ; of having an assurance, that when this tabernacle of clay is dissolved, we shall obtain an admittance into his kingdom. Then it is, when divested of all earthly enjoyments, we behold things in their true light; we perceive the littleness and vanity of everything here, and are

convinced that the only object worth our earnest pursuit, is that blessedness which shall be hereafter. I often think, if we did but use as much diligence to make our calling and election sure, as many of us employ in settling our worldly affairs, we should not be so much unprepared for our final period. But the mind of man is apt to busy itself about trifles, whilst things of real importance remain unnoticed. We fix our eyes on those things that nearly surround us, without being sufficiently attentive to prepare for the time of our dissolution, which we are generally inclined to behold as afar off.

From the Leisure Hour.

HEALTHY OLD AGE.

In the question, how vitality may best be maintained and prolonged into old age, we must look mainly to *four general conditions*, which may be said to include all that is most essential to the fulfilment of this problem. These are air, as belonging to respiration—aliment—exercise of the body—and exercise of the mental functions.

The first of these topics—that of the air we breathe—presents more difficulties than might be supposed, owing in no small part to the vague notions and prejudices current on the subject, and which science has hitherto but partially corrected. The contingencies of climate, for instance, whether hot or cold, wet or dry, equable or variable, are made the subject of endless common-places, unfounded in fact, and often of injurious application. Since the continent of Europe has been laid open to universal travel, local interests and fashions have tended further to distort the truth; and health is run after, whether from climate or mineral waters, upon the most ignorant plausibilities, and with little regard to other circumstances, which often more than contravene the benefit sought for. The lungs may gain good from a warm atmosphere; but this may be paid for by gastric disorders scarcely less noxious. Heat is too commonly regarded as a panacea for all our bodily ills. In truth, cold has an equally fair title to take its place in the class of remedies; for in many cases where health is inertly loitered away under southern suns, the frame might have gained vigor and vitality among our own northern mountains. A comparison of the registers of mean mortality in these respective localities goes far to sanction this judgment.

But we must not deal with this subject as represented by climate only. The amount and purity of the air we breathe is a question belonging to every place, and of far more interest to the great mass of mankind. We do not here enter into the chemical theory of respiration, or the controversies it has engendered. What concerns us is the fact, that a certain num-

ber of cubic inches of air should be taken into the lungs at each inspiration, and that this air be of a certain purity, as conditions necessary to the healthy existence and full vitality of the individual being. The imperfect attainment of these conditions throughout the whole, or a part of life, tends, in the same proportion, to enfeeble the vital power, and to abridge, more or less, the term of existence. The insufficient production and maintenance of this power impairs longevity, not less than its too lavish expenditure in the various abuses and vices of social life.

Hence the vast importance of all that may be done by open-air exercise, ventilation of dwellings, and removal of noxious exhalations, on behalf of this great function of life. These things are better understood than they were, and more is attempted and effected for their attainment. But still much remains to be done. Medical science is called upon to prevent disease, as well as to restore health. We confidently believe that more might be effected to this end, as well for individuals as for communities, were the healthy state of respiration cultivated with the same care which is given to the actions of the stomach and alimentary organs. We doubt not that this function is capable of being restored, improved, and maintained in efficiency, by well-ordered exercises of the lungs, and by due attention to the mechanism of these organs in all that belongs to the habits of life. It may not occur to our readers, and yet it is strictly true, that the familiar conditions of posture of body, speaking, singing, etc., are deeply concerned in this matter, the more so from the very familiarity of every-day use. If forty cubic inches of air taken into the lungs at each inspiration are required for the purposes of their function, and thirty or twenty only are inspired, it is certain that the blood will not be duly changed, and that every organ in the body will suffer more or less by the deficiency. To enlarge the quantity, then, in such cases, is an object of high importance, not sufficiently regarded, we may add, in the medical practice of our day.

On the value to health of the purity of the air we breathe, it is hardly necessary to speak. Free ventilation is here the mean agent in our hands, whether we look to the replacement of air despoiled of its oxygen, or to the removal of noxious matters present in it.

Looking next to *aliment*, in its connection with health, and therefore, with longevity, we encounter a topic which has been endlessly discussed and written upon, and made the subject of various and perplexing opinions. All this is natural and inevitable. For the subject in question embraces not only what is necessary to human existence, but also what belongs to man's luxury and sensuality; and is, moreover, connected with all those changes of bodily condition, whether healthy or morbid in kind, which are

most open to common observation. Including further, under the same head, those many forms of liquid, from simple water to the strongest alcoholic drinks, which the natural or perverted ingenuity of man has mingled with his aliment, we come upon a new class of effects, of deep interest not only to individuals, but to the welfare of social life.

Vague though it may seem, and common-place, we can find no more fitting word than *moderation*, to express what is best in diet, in its relation to health and length of life. No specification of the wholesome or unwholesome in food can be of avail for good, unless in subordination, more or less, to this one condition. As in the relation of the lungs to air, so the digestive organs require a certain quantity of food—varying in different individuals, and in the same person at different periods—to maintain the healthy state and sufficiency of the blood, and through them the due action of all the organs of the body. And nature, where unspoiled by vitiated habits, furnishes a rule and measure, which every one, whatever the diversity of temperament, may safely and expediently consult for himself. Here especially, however, men are more prone to be governed by faulty habits and injurious maxims, than to be convinced by reason or instructed by experience. That appetite, for which the old epicure would pay any price, is too much regarded as a condition to be instantly suppressed by food. Even under disease, when nature resumes her rights, and rejects with loathing the aliment which the stomach has no power to digest, the mischievous zeal of friends comes in, feeding the disorder and not the body, by what they force upon the patient. The catalogue of ills which indigestion directly or indirectly involves, might seem sufficient to enforce a rule, were they duly recognized in their origin.

But while thus associating moderation of life with length of life, we are bound to add that there may be excess even in this laudable direction. A constant and anxious care for existence, and rigid rules of living founded upon this, tend in their own way to curtail what it is sought to prolong. There is some practical truth in the story in the "Spectator," of the gentleman who cut short his life by weighing or measuring every article of his food. The truth we consider to be—and it is a physiological fact—that whatever leads the mind to give close and minute attention to the stomach and organs of digestion, does more or less embarrass that great function, and impair the nutrition of the body. Temperance must not be made to march in manacles and fetters, or with steps of unbroken uniformity. We degrade the virtue by this manner of using it; and attempt what is impossible under the endless changes incident to the life of man.

It remains for us to speak of *exercises of the body*, in their reference to longevity. Under

the definition of vitality already given, it will be obvious that whatever tends to maintain the organs generally in their healthy state, tends in the same proportion to preserve and prolong life. Exercise is one of the great means to this end. An organ destined to a particular function is best kept in its integrity by the exercise of this function, with a due regard to those progressive and inevitable changes which time brings upon every man. If we take the term exercise in its ordinary sense, as expressing the muscular action of the body, the conclusion is the same—rendered still more explicit by our knowledge of the influence of these actions in maintaining the vigor and equality of the circulation throughout the system, and thereby keeping all the organs in healthy balance and relation to each other. The changes, fitting or necessary, as old age comes on, cannot be measured by years only. The time and the necessity vary for the constitution of every individual, and must be determined for each by a just observation of himself. A wise man will find steps and stages in the descent of life, on which to repose a while, without sudden or entire relinquishment of those bodily habits which, discreetly used, conduce to health and preservation at this period, as well as in youth and middle age. The discretion needful is that suggested by experience. Whatever amount of exertion is felt to exhaust the bodily powers, is fitly to be avoided; whatever can be done without such effects is certainly safe, and probably beneficial to health.

A story is current of Lord Mansfield, who himself lived to eighty-nine, that whenever very aged witnesses appeared in the court over which he so long presided, it was his wont to interrogate them as to their habits of life; and with the result that in no one habit was there any general concurrence, except in that of *early rising*. Anecdotes of this kind are for the most part either untrue or exaggerated in degree. Early rising is doubtless in many ways favorable to health; but it cannot be taken as a guarantee for longevity. Even were the story in question true, it is more probable that the vigorous vitality in these instances maintained the habit, than that the habit maintained the vitality.

What has just been said about exercises of the body in relation to longevity will in great measure apply to the mental functions also.

The memory is undoubtedly the mental faculty which is first and most obviously affected by old age. This wonderful intermedium between body and mind, varying so greatly in different individuals, and so strangely capricious in the same individual from the accidents of the day or hour, would seem to partake more of mere mechanism than any other of the intellectual powers. It undergoes changes more explicitly from physical causes; and both its excellencies and defects are marked by peculiarities which

appear to belong to conditions of organic kind. The anomalies of memory in advanced life are familiar to every one, especially so the facts of the early forgetfulness of names, and the frequent retention of things long past, while recent events flit away, like shadows, leaving scarcely a trace behind. Or more strangely still (though never, perhaps, without some morbid changes of brain), the obliteration of certain classes of events, or certain subjects of memory, as if by a sort of mechanical separation from everything else abiding in this mysterious receptacle.

The importance of preserving memory in its integrity, as long and as far as it can be done, will probably be admitted. Some may urge that an oblivion of things past is the best security for a tranquil old age. But this virtually reduces man to a mere moiety of existence; and the same reasoning might be used to prove that utter imbecility of mind is a blessing in this latter stage of life. Such imbecility, from natural causes, often occurs; but we have no title to consider it a good, or to neglect any means which may obviate or retard it. We will not venture to say that these means are many or certain. As regards memory in particular, all that can be done at this period of life is to aid in giving it the direction which circumstances make desirable, and to spare it those painful efforts at recollection which seem to weaken the very faculty they exercise. The latter remark we believe to be of valuable application to other periods, long antecedent to old age, but especially, perhaps, to that time when the faculty is first felt to decline in clearness and power.

RUSSIAN AGRICULTURE.

Russia is pre-eminently a corn-producing country, and the south of Russia the corn-producing district; and it may be interesting to note the way in which the agricultural districts of the country are cared for. We have always imported corn in considerable quantity from Odessa, and alarmists have from time to time expressed their fears for the provision of Western Europe, should any stop be put to that importation. The time is now come; and when we see the picture of the district—of its agricultural science and its commercial prospects—set before us by one of the most intelligent of recent travellers, we shall at least be satisfied of the barbarism of the province, whatever may be said of the consequences of the war.

No new inventions are permitted to contaminate the ancestral customs of agricultural Russia. Manure is floated down the rivers or used "to mend the roads." No one seems to have any idea that it may be useful to make the ground more fertile; the corn grows, they observe, without it. Roads there are none; and as the land is of little value, it does not seem to be of much

consequence over how wide a tract their carts are driven. "You are on one of their roads, as they are termed. Elsewhere, a road, good or bad, means something that has been made, or a line upon which has been gathered material for binding and clasping, and below which there is some kind of draining; bad or good, the road is, as compared with the adjacent land, dry, compact and elastic. Dismiss all such ideas from your mind, or rather drag your limbs for an hour behind that corn wagon, and such ideas will disappear of themselves. Dead and helpless seems that woe-begone track, creaking and drawling over which comes the bullock wagon, all wood, and built precisely as wagons were built a thousand years ago. The driver sits in front, occasionally lashing the grey bullocks, more by way of form than with any idea of hastening them; and his massy beard hangs down over a species of censer, whence arise fumes of an unsavory kind. But it is not in luxury nor in imitation of his eastern neighbors, that this peasant keeps this odor-breathing vessel under his nose.

The contents are an abominable mixture for greasing the wheels of his waggon, and by which you may track it through many a yard of tainted air. Why he has placed the vessel exactly between his legs I know not, unless it be to remind himself more forcibly of the necessity of an operation, without the incessant performance of which his clumsily built car would be on fire in four different places at once. Contrast this wretched machine with the well contrived iron mounted cart of the German Colonists, a few miles hence. But on goes the waggoner, jolting and creaking along the unhelpful soil, and singing some of those old airs in which, rude as they are, there is a certain melody; or saying prayers to one or other of the multifarious national saints. On he goes, and so he and his predecessors have gone since corn was grown in Russia. Rickety cart, knotted rope harness, drowsy bullocks, wretched road; so crawls the loaf towards the Englishman's table."

On the manner in which the demarcation between estates, which have no visible boundary, is known and remembered, Mr. Brooks says: "Those divisions would more than puzzle the acutest land surveyor who ever fixed a rental upon rods, poles and perches. 'We have no hedges for jumping over by hunters,' said an informant whom I have already quoted, who seemed to think we were at last making some little progress in agriculture in England, when I told him that many English farmers were beginning to consider the hedge as a thing to be 'put down.' Nor have the Russians stone walls, like those which Irish horses go over like cats, touching the top. It would be difficult for a stranger to say that the estates were divided at all." But a description obligingly furnished him by a friend, explained how that was managed in brief. A

large estate was to be divided, and it afforded an excuse for great feasting and hospitality for several days, until one morning a sort of procession, with flags and music, bailiffs and surveyors, set to work in earnest, and proceeded to the division of the estate. "Presently we came to a sort of long mound, which I should hardly have noticed, but which, it appeared, marked one side of the estate; and the authorities conferred together, and by certain signs and references to the points of the compass, agreed upon its identity. I had scarcely remarked that a great number of the peasantry had long slender wands in their hands, but at this moment all these wands were shaken as by common excitement, and the bearers rushed towards the mound, all apparently trying to hit a blow at something. I heard a desperate screeching, drowned in shouts of laughter; pushing my horse into the crowd, I saw, trying to escape from the mound on which he had been tossed, a boy of twelve or fourteen, who was certainly receiving as sound a flagellation, though administered amid roars of merriment, as a young gentleman of that age would desire.

"Well, the lad, having received a goodly memento of the place, was allowed to go away, which he did, running and roaring in good style. Requesting a little enlightenment, one of the most animated of the operators said 'He will say to his grandson that is the south boundary of the land. I know it well, and I never shall forget it, for I was well whipped upon it fifty years ago.—*English paper.*

THE INSANE IN THE ALMSHOUSE.

The Insane Department of the Philadelphia Hospital (Almshouse) contains about 450 patients, most of whom have nothing to do to while away the listless hours, but sit on the hard benches, or pace the bare floors,

"Washing their hands with invisible soap,
With imperceptible water,"

brooding over their unfortunate condition. We are finding employment for those who can work, but a large portion of the patients cannot be depended on for any kind of manual labor.

Our good missionary, Mr. Jones, holds a short service on Sabbath and Thursday afternoons, which is well attended, and on Tuesdays reads in the several wards to those willing to hear, but we need a supply of books and plates, from which to instruct and amuse the patients during their lucid intervals. We have a few children, and for them we need cards, easy lessons and story books, from which they may be taught. How many *children* there are whose attention may be called to this appeal, whose shelves are groaning with the burden of holiday and birth-day gifts of past years, which are useless to them but would do a great deal of good here.

We want a library of good substantial books in

each sitting-room, pictures to adorn the walls, and carpets for the floors. A supply of suitable material for making carpets would enable us to give employment to the patients in preparing it for the looms in the establishment, where it could be woven into carpets.

In fine, contributions of any kind, calculated to relieve the monotony of bare floors, bare walls, and nothing to do, will be thankfully received. Direct to the undersigned, at the Office of the Guardians of the Poor, 36 North Seventh street.

S. W. BUTLER, M. D.,
Physician and Superintendent.

Dec. 26, 1859.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, FIRST MONTH 21, 1860.

MARRIED, At Fall Creek Meeting of Friends, Indiana on the 20th of 10th month, 1859, BENJAMIN S. COCKAYNE and MARIA JANE COOK, daughter of George W. and Elizabeth Cook.

—, At same place, on the 15th of 12th month, 1859, NATHAN W. COCKAYNE and MARGARET W. OLDHAM, daughter of John G. and Anna W. Oldham.

DIED, At Millville, Columbia Co., Pa., on the 25th of 7 mo., 1859, WILLIAM WATSON, aged a little over 90 years. He was the son of Amos and Phebe Watson, of Falls township, Bucks County, and removed from that place to Muncy, while a young man, near the close of last century. He resided there until 1841, when he retired from his farm, and with his family removed to Fishing Creek, where he spent the remainder of his days. He was an active member of the Society of Friends, and for many years an elder therein. He possessed a robust constitution, and was a very industrious and worthy citizen. The many deeds of charity he rendered were a real test of his Christian benevolence, and as parent, neighbor and friend, he was well known for many excellent traits, and especially for his decision of character. For the last year or more his powers of body and mind gradually declined, and being full of years, he at last sunk quietly to his peaceful rest, having survived his wife about nine years.

—, At his residence, in Easton, Talbot Co., Maryland, on the 9th inst. ISAAC ATKINSON in the 80th year of his age; a member of Third Haven Monthly Meeting. He was the oldest resident among Friends in that place, and his hospitable mansion was always open for their entertainment. For the last few months his health had been declining, and he frequently remarked to the family his stay here would be short. He was extensively known and loved, and will be greatly missed in his neighborhood.

—, on the evening of the 30th ult., MILTON WILKINS, son of Richard and Grace P. Wilkins, aged 27 years.

Be not afraid of those trials which God may see fit to send upon thee. It is with the wind and the storm of tribulation that God, in the garner of the soul, separates the true wheat from the chaff.—*Molinos*.

None has any proper knowledge of God, unless he inwardly worships Him.—*Benson*.

Extracts from an article on the Foreign Slave Trade, published in the Presbyterian Review, of Columbia, S. C.

The principal points along the sea coast where this traffic was formerly concentrated, were at or near the mouths of the rivers Pongas, Gallinas, Sestos, Asaini, Poppi, Lagos, Benin and Bonny, in Upper Guinea; and at Old Calabar, Cameroons, Gaboon, Cape Lopez, Mayumba, Loango, Congo, Loando and Benguela, in Lower Guinea. So long as there was no prohibition of the traffic, vessels were in the habit of collecting their cargoes by touching at all or most of these points, and purchasing such slaves as might happen to be on hand. Sometimes a cargo was obtained by robbing some other vessel that had collected one, but which happened to be without the means of defence. The trade has always been characterized by piratical proceedings, and would, no doubt, be so in all future times, even if it were legalized. The mode of obtaining slaves had to be changed, however, after the British squadron was stationed on the coast for the purpose of suppressing the traffic. Vessels could no longer proceed leisurely along the coast, touching at these well known points, without multiplying the chance of seizure and confiscation. This led to the establishment of factories, or barracoons, as they are called, at one or more of these points, where slaves could be gradually collected, and could be taken away without detaining the vessel in which they were shipped more than a few hours at any one place. It has usually required six months or a year to collect a full cargo at any one of the above mentioned points; and a much longer period, if there happened to be rival factories at the same place.

A double pallisaded inclosure is always constructed for the confinement of the slaves as they are brought together, one portion of which is covered with thatch, to defend the inmates from the sun and rain, but in other respects it is perfectly open, and when filled with wild savages reminds one of a great menagerie. No person of humane feelings would wish to visit one of these establishments a second time. The slaves are not only locked up in these inclosures, but they are further secured by being chained together in pairs, or in bands of five or six. They are brought to the factory from day to day, and are bartered for just as any article of native produce would be. The buyer asks no questions about how they have been obtained, and the seller volunteers no information on the subject. It is enough for the former to know that they are of suitable age, have sound and healthy constitutions, and will command a fair price in the market for which they are destined. Tobacco, rum, guns, powder, cutlasses, and cotton cloths, are the articles usually demanded and given in exchange, the value of which varies from fifteen or twenty to thirty or forty dollars.

But the question which mainly concerns our argument is, how are these slaves obtained for the market? This is a vital, all-important point, and no honest man will wish to evade it. Here we speak from personal knowledge, and it is on this point mainly that we feel constrained to testify.

We reply, in the first place, that, with a few exceptions, they are not persons who were born in a state of servitude. I know that this is the prevailing opinion, but so far as my knowledge and observations go, it is a mistake. This class of persons, home-born slaves, are of all others the least liable to be sold into foreign servitude. From what this exemption proceeds, whether it is the kindlier feelings of the people, their superstitious fears, or the dread of some apprehended retribution, we were never able fully to ascertain. But of the fact itself, especially in Southern Guinea, we have no doubt. We know that an African slave-dealer would almost as soon sell his own son as a bond slave born in his own house. Indeed, they are regarded more in the light of children than slaves. If only slaves, those previously reduced to this condition, were transported across the ocean, then we would admit the force of the argument, that there is no essential difference between the African and the domestic, or inter-State trade. But when it is remembered that, in the former case, men must be reduced to the state of servitude for the first time, and through fraud, violence, or bloodshed, whilst in the latter case, it is a mere transfer of ownership from one individual to another, or from one section of the country to another, without any material alteration in their outward condition, the matter assumes an entirely different complexion, and no man can contend for the parity of the two cases without denying the clearest decisions of reason and common sense.

Persons are doomed to foreign servitude in Africa for various causes, and in a variety of ways. In the great majority of cases it is professedly for crimes or misdemeanors. Murder is always punished in this way, if a slave factory is within reach. Theft and adultery, although ordinarily doing no great violence to the moral sense of the people, are sure to be magnified into crimes of the deepest dye, if there is any possibility of selling the offender. A refractory wife, if suspected of infidelity to her husband, is very apt to be hurried away to a slave-factory before the blood-relations can possibly interfere in her behalf.

The most prolific source of all, however, is to be found in the charge of witchcraft. This superstition has an existence in Africa farther back, and entirely independent of the slave trade; and none but those who have been initiated into the mysteries of African life, can form any right conception of the absolute authority which it exercises over that race. The belief in it is one of

the first, the deepest, and most enduring of all the impressions made upon their childhood. It grows with the growth of every man and woman in the land, and finds something to fasten its hold upon the popular feeling in every day's experience and observation. It insinuates itself into the usages, the laws, the religion, and indeed into the entire fabric of the moral and social system. It undermines all the deep foundations of society, and keeps every family and community in a state of uneasiness and perturbation. No worse suspicion can possibly affix itself to any man's character. It breaks in twain the strongest bonds that hold human society together. The child is discharged from all filial duty, and the father or mother from all parental obligation, if the slightest taint of this suspicion rests upon the character of either. The brother will denounce the sister, or the sister the brother, if either falls under the condemnation of public opinion. The husband will thrust from his bosom the most cherished wife, if she does not, upon the first insinuation of a suspicion, purge her character by a resort to some of the appointed tests of witchcraft. Hundreds and thousands of innocent men and women are annually put to death in Africa in obedience to the demands of this foul demon.

If the slave-trader could get to the rescue of this class of persons, and confine his operations to them alone, then indeed his calling would be one of mercy. But, unfortunately, his presence and avocation but adds fuel to the flame. Direful as are the fruits of this insane superstition, they are rendered tenfold more so under the stimulation of this cruel traffic. Under its influence the charge of witchcraft is multiplied a hundred-fold, and when the work of crimination and recrimination is fairly started in any community, it produces a state of society that scarcely has any parallel, and can neither be described nor understood. Old grudges are started into life, and every possible means is employed to obtain revenge through the medium of this subtle agency. Avarice comes forth in all her might, and hesitates not to ally herself with this all-prevailing superstition for the accomplishment of her purposes. The defenceless stranger, under the sanction of her authority, is hurried away to the slave-factory, never to see his home or kindred again. The silent traveller is suddenly seized by men who have waylaid his path, and after a hurried and mock trial, finds himself in the hands of a white man—the representative of the Christian world—who listens to no protestations of innocence, and knows not how to relax his grasp. The unfortunate wife who has incurred the displeasure of her lord is accused of this great crime, and without the formality of a trial, is handed over to the slave-trader, and thus doomed to perpetual servitude in a foreign land. A family burdened with the care of a feeble or

idiotic member, will countenance the charge of witchcraft against him by others, for the twofold object of sharing in the profits of his sale, and getting rid of the care and expense of a burdensome member. A man who has excited the cupidity or the envy of his fellow-men by his superior wealth, is liable to be brought under condemnation, and be sent abroad, from nothing but a desire for plunder on the part of others.

Of course these acts of cruel injustice do not go unrevengeed. Those who bring about the downfall of others, through mere motives of envy or cupidity, must expect to reap the bitter fruits of their own sowing. The friends of the stranger who has been so unceremoniously bartered away, will seek revenge by murdering the chief actor in the affair, or some townsman, and thus throw the whole responsibility upon the original offender. And when these deeds of retaliation commence, no one can tell where they will end. I have myself heard the midnight discharge of eight or ten muskets in the same neighborhood, each of which told of a slain victim, and all to revenge the sale of a single individual to a slave-factory the day before. Indeed, the very presence of a slave-factory in any community is but the sign and symbol of perpetual disturbance and petty warfare. Jealousy and distrust reign in every heart, and no one feels secure of life and limb. No man lies down to sleep without planting a loaded musket at the head of his bed. The silence of the night is constantly disturbed by screams that are intended to frighten away lurking enemies. No man will venture fifty rods from his own door during such periods of excitement, without being armed. The women of any town may not venture to the common watering-place, or visit their little farms for the purpose of getting the fruits of their previous labors, without being accompanied by an armed escort. The sound of a distant car, or the rustling of a banyan leaf, will cause a panic of fear, and throw a whole community into the utmost perturbation.

But this disturbed state of society, and these acts of perpetual violence, are scarcely more to be deprecated than the moral insensibility that is engendered by the traffic. Cases do occur, though we are glad for the sake of humanity that they are not very frequent, where parents have consented to the sale of their own children. The other relationships of life are less regarded. I have known two young men from a distant part of the country, professed friends, to visit the neighborhood of a slave factory for the purpose of curiosity, or for general observation, when one has secretly bartered away the other, and gone home and divided the proceeds of his sale with his own friends. It is not uncommon in the history of this business, for a man to find himself in the same barracoon along by the side of individuals whom he himself had sold there only a few days or weeks previously. I have known a com-

pany of six or eight men, at the beginning sworn friends, who have successively conspired against each other, and in almost every case on the charge of witchcraft, until the last man was sold by some one else, and the whole company carried away in the same cargo. And this state of insensibility and treachery, let it be remembered, is brought about among a people who are naturally kind, affectionate, and confiding, and who would live in peace and comparative happiness, if it were not for the disturbing element we have under consideration.

There are great wrongs and injuries also inflicted upon these people during their imprisonment on the sea-coast. The owner of the factory intends to be kind to the slaves he has purchased. It is his interest to provide wholesome food, and use all the means the circumstances of the case will allow, to preserve their lives and health. But, unfortunately, he partakes of the insensibility that his avocation almost always produces. Any murmuring or attempt to escape on the part of his imprisoned subjects, is very apt to be punished with instant death—yes! death inflicted without even the formality of a trial, and under circumstances sometimes of great cruelty. Sickness, too, often makes great havoc in the ranks of these unfortunate beings. No sooner does death take place (and in many cases even before life is extinct,) than the miserable victim is dragged out in the open field, to putrify or to be devoured by beasts. I have myself walked over fields that were strewed with the bones of those who had been thrown out of these factories. There is, or was, a few years ago, on the island of Coriseo, a mound of human bones, that were gathered there from a neighboring slave-factory, and no doubt many were laid on that pile before the light of reason, or the breath of life, had been extinguished. This is a painful picture, but not more painful than true; and it ought to be attentively considered by those who advocate the revival of this wicked traffic.

JOURNEY OF W. H. SEWARD FROM EGYPT TO PALESTINE.

JERUSALEM, Sept. 16, 1850.

I have already mentioned one monastery or more in the Holy Land. The early European Christians conceived that there was great merit in visiting, by way of pilgrimage, the scenes of the sufferings of the Saviour, but found the whole country in the hands of ferocious and savage enemies to the religion of the Cross. Travel could not be safely performed here, nor could entertainment be found. European strangers and religious men founded monasteries everywhere, very often strongly fortified, as places of safety for the pilgrims and of hospitality, and these yet remain.

They are Catholic, Greek, Protestant, Armenian

and Abyssinian; and inasmuch as the dangers of travel still remain in large districts, and there are few taverns for the accommodation of Europeans, they are the resort of the traveller of the present day. You are received and lodged, generally supplying your own provision. They furnish you security and a place to eat and sleep. If you have any peculiar claim to respect or consideration, they furnish you everything else gratuitously in all cases, but all right-minded persons, on leaving them, present a gift to the establishment equal to the cost of the accommodations. These exceedingly useful institutions are located, with pious reverence, on the sites of the most memorable events in the life of the Saviour and his apostles, and, having been so early located, they are interesting monuments.

But Palestine in its social condition presents other and more reliable monuments of the same character. You see a party of Syrians or Arabs at rest in their camp, or on their march, and you have exactly before you the rest or the progress of a party of persons in the same country two thousand years ago. Patriarchs, women, children, maidens, amid swarms of camels, asses and goats. Loathsome lepers meet you as you enter or depart from the gates of the city, begging bread, but there is no divine person here now to heal them. The blind, the lame, the epileptic, are always in your way, soliciting relief. Medical aid, or medicine that will afford relief is expected by the sick at the hands of any person of condition who passes by. You see two intimate friends meet or depart. They cover each other with kisses. You see a party at dinner or at supper. There is one dish which is always liquid. Each eats by dipping a sop into the common dish. So you see how rational and probable are the histories of the betrayal of our Lord by Judas.

But I must on with my Journal:—

We left the good Monks of Kamiah at five o'clock on Thursday morning, and, through inconceivably crooked and narrow pathways, emerged into the plain of Sharon. An hour or two sufficed to bring us into the mountains of Jordan and the Dead Sea. The ascent is steep, the mountains are a mass of system, irregular and almost unrelieved by vallies. In fact all of Palestine, including the site of Jerusalem, and the scenes of Scripture history, consists of these mountains, except the beautiful plain of Sharon, which lies between them and the Mediterranean Sea. Ten weary hours we toiled in making our way up these mountains to find the Holy City. Reaching the summit of one, we decended it only to ascend another still higher, and the roads often sharp, steep, stone stairways, which only a trained animal can ascend safely. Nor have you ever seen any such mountain scenes. Gardens, fields, trees, plants and shrubs, disappear, chalky rocks lie heaped on heaps, no house or habitation

of man or beast, no verdure, except here and there a tuft of brown dead bushes or grass withered for want of water or shade—no sign of life, except here and there a shepherd, armed, with his reed, and his dog and his flock of sheep and goats, which extract some juices from the roots of this dwindled and stunted vegetation. Then once in a long way we find a ravine where water is detained during the dry season, and here are small fields and gardens, but the general and almost exclusive aspect of the scene is one of desert and desolation.

Further on I descended into the valley of Jeremiah, which is held to have been the birth-place of the Prophet who most touchingly struck the chords of the hearts of his earnest devotional countrymen. Descending the next mountain I found caves and seemingly tombs, in a hamlet which contains half a dozen families, but the ruins of many habitations. This is the village of Kamatha, the birth-place of Samuel, and the place where he received the sublime call of God, and I almost fancied that I stood over the cave of the witch of Endor, when she called up the dead at the entreaty of Saul. I walked through the brook, now all dried up, where David took the five pebbles to supply the sling, with which he conquered the Giant of the Philistines. I did not refuse to believe when they told me I was now in the valley where Abraham dwelt with his family and flocks, and now on the summit of the mountain where the sun was stopped in his course at the command of Joshua to prolong the battle which was to result in the victory of the people of Israel.

It was a weary journey through a sad and mournful land, relieved by an occasional rest under the shade of a rock, or of a solitary olive tree, for Jerusalem seemed to be a myth—ever promised but unattainable—when we reached at last at 4 o'clock the summit of a hill higher than all we had passed, and right before me on the rocky plain at a distance of a mile stood the Holy City. It was not the ancient Jerusalem, not a vast metropolis, not even a medieval city like Rome, but a modern built town of small circuit, enclosed with a graceful military wall and surmounted with a citadel, towers, steeples, and monuments beautiful to look upon, but disappointing the conceits I had formed in regard to its aspect. Filled with veneration for it by its wonderful history and expecting to find its sacred monuments everywhere spreading their own great explanation, I could not consent to enter it rashly or rudely. I dismounted and sat down upon a rock surrounded by tombs and contemplated the scenes I was about to enter, under the favor of the declining sun. We dismissed our equipage and walked slowly on, passing by half the city to find a gate in the wall. The road, like all I had travelled, was only a camel's path over loose stones and fixed rocks up and

down, but at length we found the hole in the wall. Turkish sentinels on guard, and a narrow, low, vulgar, rough street, through the middle of which, along the gutter, we made our way, jostling now against the horses, asses, camels, Turks, Arabs, Jews and Christians, all differing from each other in costume and address, but all equally out and bizarre, while the voices, cries, disputes and contentions of a crowded population added to the confusion of the scene. This was "Christian street," but a street that no Christian of any civilized state would own. A fairer town without than Jerusalem I never saw; a barer town within, I hope never to see.

We made our way around the southeast corner of the walls, and then turned to the westward, and descended to Mount Moriah by a winding camel road, having the Mosque of Omar, which stands on the site of the ancient Temple, and the Beautiful gate, directly at our side. We descended into the Valley of Jehoshaphat, and crossed the brook Kedron. We could see before us its winding course and underneath, the tombs of hundreds of generations, until it reaches the Pool of Siloam, now not only without healing waters, but almost without any water at all. We rose on the southern side of Kedron, and stood upon the declivity, looking over the wall into the Garden of Gethsemane, with its few relics of olive trees, and after a pause for contemplation of the scene, I resumed my way, and ascended the Mount of Olives.

This side of the Mount of Olives is an easy grade, and it towers so high as to overlook the Mount Moriah and most of the city. Olive trees grace the declivity, and the "site of Transfiguration" is now covered with a monastery. The features of the country around the Holy City are bold and distinct. I wondered, as I looked down into the vale of Gehenna or Tophet, that I had not recognized these scenes without a guide. The hill sides are covered with tombs of every age and every nation, from those closed yesterday until you get back to the period of early antiquity. Indeed, those who live at Jerusalem speak as if antiquity was only of yesterday. Centuries of history are brought into near review by the habit of studying antiquity with the aid of tradition. I was roused from meditations on the perverseness of man, which always rejects instructions the most benevolent, and persecutes most bitterly those who come to avert its evils, by finding that I had quite lost sight of the Holy City, and was pursuing my way along a rough road towards Bethany, the village of Mary and Martha and Lazarus.

An hour and a half brought us to that interesting place, which is situated on the eastern declivity of Mount Olivet, looking down into a dark, deep ravine. I had already seen in the distance the Dead Sea, which was twenty-seven miles distant—now the intervening mountains

closed the prospect suddenly. Bethany is a ruin. Some twenty dilapidated houses are occupied by Bedouin Arabs. Nothing of culture or comfort was seen, only a tomb and a burying ground around it showed any accord with the existing habits of society. Here the Sheik, or chief of the tribe of Bedouins who possess the land below Jerusalem and the Dead Sea, joined us on horseback, with five of his mounted and armed men, and, with this force, we proceeded down one mountain, up another, by the most intolerable road mortal ever travelled, all day long—seeing no fields, no houses, no man, no trees—nothing but barren rocks with dried tufts of grass and shrubs, until, at a depth of 2,500 feet below the level of Jerusalem, I stood on the beach of the Dead Sea, near to where it receives the waters of Jordan. On its eastern side, the mountains rise as abruptly as on its western shore. The western shore is the land of Canaan, the eastern the land of savage enemies.

The sun was shining brightly upon the mysterious lake, but a wholesome and genial breeze came off from its surface, and it looked, for all the world, like Cayuga or Seneca Lake. But its waters were acid and bitter to the taste, and painful to the touch. Two absolutely naked Arabs were carrying skins of the Dead Sea water to some cabins of theirs in the rocks, and they were the only human beings whom I saw during the whole day—from Bethany to the Dead Sea.

The sailors baffled in the lake and found its waters buoyant. The land of Moab was as desolate as the land of Judea. Its mountains are even higher. We gathered our party together after an hour's rest, and rode across the dry, sandy, desolate white plain, two hours, until we found ourselves in front of long rows of trees and shrubbery, refreshing to the sight, and heard the rushing of waters beneath them. Following the path along this pleasant shade, we came to a place where the banks were low, and we all rushed incontinently into the River Jordan. It was the only running stream we had seen in Judea, and it was the second place where we found water for our animals in the whole march. I found it both natural and inevitable that the inhabitants of Syria should deem their only river a sacred one. We drank of its waters, we bathed in them, we felt that they were not only refreshing, but healing. But the Jordan, like Jerusalem, is a mourner. We could see the valley through which it flowed for many miles—flat, intervale land, covered with white sands. We could see the steep mountain on either side for fifty miles in length, but there is not one plantation or habitation there. Tearing ourselves away reluctantly from the River, we hastened over the sands, seeing only one living being on our way, and that a wild boar—ascending the mountain side on the west, until we attained a plain at ten o'clock at night, where we found some half a dozen cottages with

fires outside the door. Passing thence, we arrived at the banks of a spring, from which flowed a small rivulet. On the side of this stream, upon the dry sand, without protection of roof, or shrub, having dismounted our horses, we spread our blankets and laid down under a bright starry sky to sleep, in what once was, and yet bears the name of Jericho.

Our Arab guides had determined to beg of us a sheep as a backshish; we resisted. We ate our simple supper, while they, improvident and avaricious, hungered, said their prayers, and then rallied at us in Arabic, because, after paying them the tribute for permission to go through their country and compensation for their protection and defence, which they had asked us, we would not give them, as a *douceur* a sheep for their supper.

At two o'clock in the morning, the Sheik called us up; we mounted and proceeded on our way backward toward Jerusalem by starlight, up and down all kinds of staircases. The sun rose, and the day's heat began before we reached the Mount of Olives. At eleven we reached Jerusalem, after a ride of twenty-one hours out of twenty-eight in the saddle.—*Albany Journal*.

Ah! when did wisdom covet length of days,
Or seek its bliss in pleasure, wealth, or praise?
No; wisdom views with an indifferent eye
All finite joys, all blessings born to die.
The soul on earth is an immortal guest,
Compelled to starve at an unreal feast;
A spark that upwards tends by nature's force;
A stream diverted from its parent source;
A drop dissevered from the boundless sea;
A moment parted from eternity!
A pilgrim panting for a rest to come;
An exile, anxious for his native home.

H. K. White.

*For Friends' Intelligencer.

UPWARD AND ONWARD.

Dweller in the marshy lowland, dim with fog, and damp and chill,
Judge not thou thy hardy brother, leaving thee to climb the hill.
Soon he calls thee to come with him; he is breathing purer air;
Prospects bright are spread before him, which he fain would have thee share.
Linger not in thy low dwelling, where no prospect thou canst see,
Save one dead unvarying level, which seems all the world to thee.
Up and climb the steep before thee, with a strength till then unfelt;
Looking down with grateful wonder, at the spot where thou hast dwelt.
Thou wilt find thy brother told thee no wild fancy of his brain,
When he said the sun was rising, shedding light on hill and plain.
Thou wilt feel the bracing current give new life to every limb;
And, instead of gloomy murmuring, thou wilt now rejoice with him.

Toiling on, tho' rough the road be, work and prayer divide the day;
Thou wilt find no time to idle, or mark out a brothers way.
If he stumble, pause and stay him; help him grasp the nearest limb;
Haply e'er the journey's ended, thou mayst need such aid from him.
Thorns may tear thee, footing fail thee, sliding back a little space,
Heed not, take the next step firmer, thou wilt reach a resting place.
Worn and wearied, here repose thee; still awhile thy panting breast;
Higher peaks are still before thee, this is not thy final rest.
Still as higher thou ascendest, plainer seems the path thou'st trod;
And the prospect lies before thee, resting in the light of God.

1st mo. 12th, 1860.

S.

THE WINTERS.

BY FRANCES BROWNE.

We did not fear them once—the dull gray mornings
No cheerless burden on our spirits laid;
The long night watches did not bring us warnings
That we were tenants of a house decayed;
The early snows like dreams to us descended;
The frost did fairy-work on pave and bough;
Beauty, and power, and wonder have not ended—
How is it that we fear the winters now?

Their house-fires fall as bright on hearth and chamber;
Their northern starlight shines as coldly clear;
The woods still keep their holly for December:
The world a welcome yet for the new year;
And far away in old remembered places
The snow-drop rises and the robin sings;
The sun and moon look out with loving faces—
Why have our days forgot such goodly things?

Is it that now the north wind finds us shaken
By tempests fiercer than its bitter blast,
Which fair beliefs and friendships, too, have taken
Away like summer foliage as they passed,
And made life leafless in its pleasant valleys,
Waning the light of promise from our day,
Fell mists meet even in the inward palace—
A dimness not like theirs to pass away?

It was not thus when dreams of love and laurels
Gave sunshine to the winters of our youth,
Before its hopes had fallen in fortune's quarrels,
Or Time had bowed them with its heavy truth—
Ere yet the twilights found us strange and lonely,
With shadows coming when the fire burns low,
To tell of distant graves and losses only—
The past that cannot change and will not go.

Alas! dear friends, the winter is within us,
Hard is the ice that grows about the heart;
For petty cares and vain regrets have won us
From life's true heritage and better part.
Seasons and skies rejoice, yea, worship rather;
But nations toil and tremble even as we,
Hoping for harvests they will never gather,
Fearing the winter which they may not see.

As cheerfulness is the most natural effect of real goodness, it is also its most powerful recommendation.

AVALANCHES.

(Continued from page 701.)

There are avalanches of mud also. A heavy shower of rain—and showers are not dainty drizzles in mountain regions—brings down a torrent of clayey material mixed with stones, and the viscid stream rolls on until it reaches some low level, where it converts the landscape into a sort of Irish bog. Travellers entertain a strong objection to this dirty phenomenon. The repairers of roads feel themselves greatly aggrieved by its appearance, and regard it as a highly indictable demonstration. Not long ago, after passing through the grotesque old town of Altorf, where William Tell shot the famous apple from his son's head—and the site of this renowned piece of archery is still indicated by two fountains—we traversed a stream of mud which had recently arrested the progress of vehicles, and still required the services of numerous laborers to keep the highway practicable. The adjoining orchards and pastures had been inundated by the filthy tide, and chalets lay miserably imbedded in the stiffening compound. On the road from Grindelwald to Interlachen, however, we were compelled to make the acquaintance of a mud avalanche on more provoking terms. After proceeding a few miles beyond the former place, the voiture was brought to a sudden halt. Entertaining some doubts respecting the perfect sanity of our charioteer, whose frantic management of the drag, down hill, would have made a good point in any commission of lunacy, we were half prepared for some nice little catastrophe. What should it be? Was the vehicle—apparently as infirm a production as the Shem-and-Ham buggy over which Sydney Smith made so merry—about to founder disgracefully in the high-road? Were we to be hurled into the meadows below? And, in that case, should we be let off with a sprained ankle, or must a leg and a couple of ribs be inexorably broken? Or had some real live bandit rushed out of his den, and ordered our coachman—himself a bandit on the box—to surrender his fate at discretion? On looking out, however, it appeared that several carriages before us had been brought to a similar stand. The cause was soon ascertained to be a mud torrent, which lay across the road like a huge black snake. Well, why not try to drive through it? The voituriers declared it to be impossible. Then, why not procure implements, and attempt to clear a path? The voituriers looked at you compassionately, as if you were insane. Or, could we not be permitted to pass over the neighboring fields? The voituriers seemed indignant. In short, these gentry were of opinion, one and all, that the whole file of carriages, with their passengers—French, English, German, Russians—must return to Grindelwald for the night; that is, in plain terms, every one must hand over a little more money to the hotel-keepers of the place, and next day pay

a further fee to the cormorant coachmen themselves. Now, there is undoubtedly great pleasure in being cheated—that point is settled upon good authority; but the joy of the operation consists in its being executed neatly, skilfully, handsomely, and with a subtle sort of audacity which floors whilst it fascinates. You must be tickled at the same time that you are plundered. Metaphorically speaking, a good practitioner in the art will throw you into a pleasing state of being, by drawing a feather to and fro under your chin with one hand, whilst he plunges the other deep into your pocket. But here the artifice was too transparent. The voituriers resigned themselves so meekly to the terrors of that mud torrent—which a few British “navvies” would have vanquished in a trice—that several of the travellers resolved to abandon their vehicles, though a storm was obviously impending, and prosecute their journey on foot. Fortunately, after an hour's walk, carriages were found at the village of Zweilutschinen; and with the rain hissing around us, and the lightning gleaming incessantly on the brawling river beside us, we arrived late in the evening at the beautiful little town of Interlachen.

Shall we say then that the avalanche is wholly a pestilent and malignant thing? At the first glance it might seem to have no other mission in nature but to scourge and destroy. Like some fierce dragon of fabled time, the white monster lies ambushed in its mountain lair till the moment comes when it can pounce upon its human prey, and strew the green valley beneath with ruin and death. Then, moved by a sound or a sunbeam, with a roar which rouses every echo, and a rush which vies in speed with the lightning's flight, shrouding its huge form in the foam which it scatters from its sides, as charging squadrons veil themselves in the dust and smoke of battle—it dashes headlong into the haunts of men, hurling their frail fabrics to the ground with the blast of its breath, and strangling whole communities in its stern, icy embrace. But its path is not always deadly. Hundreds of avalanches fall harmlessly each day. Nature indeed has need of their services. They are her true retainers, and must be allowed to take rank amongst her liveried phenomena. For, were the vapor which is precipitated as snow above the frontier line of perpetual congelation permitted to accumulate, much valuable fluid would be withdrawn from the great system of aqueous circulation, and locked up in localities where there is neither man, nor beast, nor herb to profit by the store. But the avalanche is ever relieving the crags of their load, and transporting it from the peak to the plain. There, dissolved by the warm atmosphere of the valleys, the ground gladly drinks in the soft drops, and repays the blessing by the smiling swards of summer and the golden crops of autumn. Thus the slow-footed glacier, crawling

down the mountain side with sure but imperceptible step, and the winged avalanche, whose swoop is swifter than eye can follow, are both engaged in the same important task; for the charge which has been given to them as sworn servitors, is that they should convey to the regions of human life and industry the surplus of those snowy deposits which would lie valueless if simply hoarded amongst the everlasting hills.

THE PRESS OF LIBERIA.

It has often been remarked, and generally with truth, that a correct opinion of the growth of a place can be formed by marking the progress of newspaper establishments. One hundred years after the colonization of America, there were but three newspapers to be found in the Colony. The English settlement of Sierra Leone, established seventy years ago, on the West Coast of Africa, has issued in it but one or, perhaps two; while its American neighbor, Liberia, not one-half as old, publishes four newspapers regularly. These are the *Cavalla Messenger*, of Cape Palmas, and the *Christian Advocate*, *Star of Liberia* and *Liberia Herald*, of Monrovia. The latter appears every two weeks; the others are monthly. All are edited and published by persons of color, except the *Messenger*, which is under the charge of the Episcopal white missionaries. The *Advocate* is printed by a native African, who obtained his knowledge of the "art preservative of all arts," in New York. They are well conducted, contain much local intelligence, and the *Herald* especially presents an appearance of neatness and good taste creditable to any people or country.—*Col. Herald*.

ITEMS OF NEWS.

TERRIBLE CALAMITY.—On the evening of the 10th inst., at about five o'clock, the Pemberton Mills, at Lawrence, Mass., suddenly fell, while from six to seven hundred operatives were at work, burying nearly all of them in the ruins. The building was five stories high, 280 feet long by 70 feet wide, with a wing 45 feet square. There were 30,000 spindles running, and 960 operatives were employed.

A portion of the operatives had left for supper previous to the falling of the building—about 600 remaining.

The building has never been considered as stanch. It was built seven years since, and it was then considered a sham. Indeed, before the machinery was put in, the walls spread to such a degree that twenty-two tons of stays had to be put in to save it from falling.

The building appeared to crumble and fall first from the eastern corner. It fell inwards, as if powerfully drawn that way. The firemen of the city at once repaired to the spot and set at work to remove the rubbish. They soon reached some of the rooms, so that the dead and wounded were taken out as fast as possible.

At about half past nine o'clock a fire was discovered in the ruins.

The great mass of pitch-pine timber, and plank, and other dry and inflammable material, resting upon

piles of brick and crushed machinery, caused it to burn most rapidly, and forced the thousands of people laboring to extricate the sufferers, to flee for their own lives from the raging fiery furnace.

The *Lawrence Sentinel* makes the number of dead, 99, missing, 107; total, 206. Badly wounded, 109; slightly wounded, 199.

A large portion of the killed are young girls, many of them being the main support of their parents.

In noticing this calamity the *N. Y. Tribune* remarks: "The harrowing narrative of the Lawrence catastrophe surpasses in horror anything of the sort we ever read. It is paralleled by no railroad disaster, by no shipwreck, awful as many of these have been. Its like can only be found in cities shaken in pieces by earthquakes, overwhelmed by volcanoes, or sacked and devastated by horrid war. We find the victims of this calamity not only bruised, and battered, and maimed, and crushed; but roasted, scalded, and smothered alive, and by inches. We hear of people hacking and hewing their own throats to escape their misery, in the lack of a destroying fire or a friendly ocean into which to plunge and end their sufferings. So ghastly a picture has not sickened and shocked the country in a generation."

EUROPEAN NEWS.—The death of Thomas Babington Macaulay is announced.

It is vaguely reported that Austria, Spain and Naples will not send Plenipotentiaries unless the Pope is represented, regarding which there have been doubts started.

Advices from St. Petersburg mention that the Russian Government is negotiating for the purchase from the Emperor of Japan, of the southern half of the Island of Saghalien, the upper half of which they already hold.

A system of free emigration of Chinese to the West Indies had been organized by an agent of the British government, with the approbation and co-operation of the Chinese authorities at Canton.

STEAMSHIP VIGO.—This steamship arrived here on the 11th inst., having put into New York for coal, she leaves this port for Liverpool on the 21st. Many citizens entertain the hope that the successful trip at this season of the year may hasten the establishment of a regular line of steamships between Philadelphia and Liverpool.

SAMPLES OF COTTON FROM DR. LIVINGSTONE, WEST AFRICA.—J. Aspinall Turner, M. P., has kindly forwarded to the offices of the Cotton Supply Association, Manchester, an interesting case of samples of cotton and cotton yarn, which he has just received from Dr. Livingstone. The sample of cotton is excellent; but the most surprising sample is a ball of yarn spun by the natives, weighing 16½ oz., the cost of which is one foot of calico, or one penny. The other samples of yarn are well spun and very strong. This cotton was grown in the valley of the Shire, which is one hundred miles long by twenty broad. The natives spin and weave it for their own use, and we are informed that so abundant is the cotton in this valley that a vast number of cotton trees are annually burned to the ground. The navigation of the Zambesi and the Shire is open to this cotton valley during a great portion of the year. It is evident, therefore, that a large supply of cotton may be readily obtained from this part of Africa, by the adoption of an effective agency. Dr. Livingstone deserves the utmost support, both of the government and of his countrymen, in his most zealous efforts to develop the vast productive resources of the regions he has now opened to commercial enterprise. The samples above referred to are on view at the offices of the Cotton Supply Association, Manchester.—*Manchester Guardian*.

SLAVERY AS IT IS.—At the April term, 1859, of the Circuit Court for Cecil county, Md., a free colored man, about 20 years of age, named John Scott, was tried for going out of the State and returning thereto contrary to law, and convicted of the offence. He was sentenced to pay a fine of \$20 and costs of suit, and in default thereof to be sold as a slave. The fine was not paid, and about a week ago John Scott was sold at Elkton, at public sale, to the highest bidder, for \$975. He was sold as a slave for life, and is no doubt ere this on his way to a Southern market. The purchaser was a man named Fairbank, from Baltimore. Does a more unjust and iniquitous law than the one under which this man was sold into a life-long bondage disgrace the statute-books of any other country?

JAPAN.—It is now decided that the Japanese Government will send Commissioners to America, to start on the 22d of next month, in the Powhatan, which will convey them to Panama, where they will cross the Isthmus and take a Government steamer to Washington direct.

Among the recent importations at San Francisco from Japan are some of the staple articles of that country, such as sacks of sweet potatoes, equalling those of North Carolina; a large quantity of rapeseed oil, which finds a good market for supplying better burning fluid for the light houses on the Pacific than any other used; samples of leaf tobacco, exceedingly delicate, and resembling the Havana leaf; and fruits, isinglass, chestnuts, &c.

NEBRASKA.—A bill abolishing slavery was passed by the Nebraska Territorial Legislature on the 3d inst. Governor Black has vetoed it.

A bill providing for a Constitutional Convention passed the House on the same day.

SCHOOLS IN THE CAUCASUS.—A letter from St. Petersburg states that the Emperor of Russia has ordered the establishment of six schools in six different places in the Caucasus, and has decided that the Russian language, writing, and arithmetic, geography, history and drawing shall be taught in them. He has also decided that in each school there shall be 420 pupils, 245 of them to be maintained at the expense of the State, and 150 of these 245 to be natives, the remainder children of Russian functionaries.

BUFFALO ROBES.—The St. Louis Democrat says, in regard to Buffalo robes, that it is an interesting fact, and new to many, that all these buffalo robes are dressed by Indian squaws, scattered over the great west. The number of robes is decreasing annually, not so much by the lessening of the immense buffalo herds, as by the extinction of the Indian race, or the occupancy of their grounds by the whites. Some years as high as 120,000 robes are brought to St. Louis—usually about 110,000—but this year only 85,000, besides the buffalo calf skins, which are also quite numerous.

STEAM WAGONS FOR THE DESERT.—There has recently been constructed in Leeds, England, one of Bursan's fraction engines for common roads. It is to be used to travel sixty miles back and forth across the desert, carrying its own water, and conveying ore from and provisions to the Mariposa copper mines, a work hitherto and at present done by mules, driven by halfbreed Mexican Indians. It drew thirty-five tons of pig iron and 120 men at the rate of five miles per hour, on a level road.

FREE NEGROES LEAVING ARKANSAS.—Arrival of a large party in Cincinnati.—At the late session of the Arkansas Legislature, an act was passed giving the free negroes of that State the alternative of migrating before 1860, or of becoming slaves. As the time of probation has now expired, while some few individuals

have preferred servitude, the great body of the free colored people of Arkansas are on their way northward. We learn that the upward bound boats are crowded with them, and that Seymour, Indiana, on the line of the O. and M. R. R., affords a temporary home for many others.

A party of forty, mostly women and children, arrived in this city last evening by the Ohio and Mississippi Railroad. They were welcomed by a committee of ten, appointed from the colored people of the city, by whom the refugees were escorted to the Dumas House, on McAllister street, between Fourth and Fifth, at which place a formal reception was held. They were assured by the chairman of the reception committee, Peter H. Clark, that if they were industrious and exemplary in their conduct, they would be sure to gain a good livelihood and many friends. The exiles, as before stated, are mostly women and children, the husbands and fathers being held in servitude. They report concerning the emigration, that hundreds of the free colored men of Arkansas have left for Kansas, and hundred more are about to follow.—*Cin. Gaz.*

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The Flour market presents no new feature. There is very little inquiry either for export or home consumption, and holders are generally disposed to yield. The only sales are in a small way to the trade at \$5 50 a 5 62 per barrel for superfine; 5 75 a 6 00 for extra; 6 25 a 6 50 for extra family, and 6 75 a 7 25 for fancy lots. Very little doing in Rye Flour or Corn Meal. We continue to quote the former at 4 25 and the latter at 3 75 per barrel.

GRAIN.—There is a slight demand for Wheat, but the offerings being light, prices are without change. Small sales of good red at 135 a 136c per bus. Good white is held at 140 a 150c. Rye is worth 93c with a very light supply coming forward. Sales of 1000 bushels prime dry yellow corn in the cars at 76 a 77. Oats are unchanged. Sales of Pennsylvania at 45c, and a choice lot at 46c per bus. No sales of Barley. A sale of 1500 bushels Barley Malt at 90 cents per bushel.

CLOVERSEED is still coming forward freely, but the demand for it is less active. Sales of 400 bushels at 5 00 a 5 25 for 64 lbs. No change in Timothy or Flaxseed. The latter is wanted at 1 60 per bushel.

A YOUNG MAN, Member of the Society of Friends from the country, wishes a situation in some kind of business in this city; among Friends is preferred. Please inquire of W. W. M., 324 south Fifth St., Phila. 1st mo. 7, 1860.

LAKE SCHOOL FOR BOTH SEXES. The 2d semi-term of 20 weeks is to begin 20th of 2d month. The charge, in full, for board and tuition, per term of 20 weeks, is \$45, or at the rate per week of \$2½.

Circulars with references sent by applying to either subscriber

SIDNEY AVERILL,
ELMINA AVERILL,

West Vienna, Oneida Co., N. Y.

1st mo. 8, 1860.

Proprietors.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, FIRST MONTH 28, 1860.

No. 46.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,

No. 324 South Fifth Street,

PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

SELECTIONS FROM THE LIFE AND EXPERIENCE OF THOMAS BULMAN.

(Continued from page 706.)

Thomas Bulman was brought into great exercise of mind respecting the state of his own meeting; and referring to past seasons, he says, "At that time we were favored with a living ministry, and oh, the many precious opportunities we had together! Many flocked to the meeting like doves to the windows. How do I mourn when I remember the days that are past, when I was so favored with the inshinings of the Lord's precious love, that on my return from meeting, like one of old, I had to go on my way rejoicing.

But in process of time, many of our members, through unwatchfulness, and a neglect of the Holy Witness in themselves, began to depend too much on instrumental means; so then, the Holy Head and High Priest of our profession saw meet to remove these from us, in order that we might be more inward and spiritual in our exercise when thus assembled. But O, instead of being led more closely home to the teachings of the Holy Spirit, many, yea many, have turned slothful and lukewarm as to any right exercise in meetings; some ready to fall asleep; others sitting in an unconcerned state of mind, dry and barren; others have almost declined attending our meetings." He then offers up this petition, "O Lord, our state is mournful; be pleased to look upon us with compassion, and help and strengthen the small remnant which is left; for still, I trust, there is a remnant left who are travelling for the prosperity of Zion, and the praise of Jerusalem's king. Mayst thou, O God, be near unto these in their most tried seasons; and if it please thee, make us again to shine bright-

ly. The travail of my soul is for the dear youth. Be thou pleased to draw them as with the cords of thy love, that there may be a succession of testimony bearers, when those who now stand faithful to thy Truth are no more."

He then pursues his meditations, and thus expresses his concern for the rising generation; "Dear children, in feeling for your preservation through this weary pilgrimage, the apostle's counsel has opened to my mind, 'Be diligent in business, fervent in spirit, serving the Lord.' The more this right diligence is observed in your outward concerns, keeping them in their proper places, in due order; not pursuing them in a hurry, or confusion, but with composed minds, the more likely are your spiritual faculties to become susceptible of divine impressions; and oh, how sweet are the incomes of divine love to the soul! And when your outward affairs are brought into good and regular order, you may say, as you leave them, to go to your solemn meetings, as Abraham did to his servants, when he went towards the mount to offer up his son Isaac, "Stay you here, till I and the lad go yonder to worship, and come again to you." Dear children, when you can leave all these fading things behind you, when you go to worship the God of heaven and of all the earth, then what shall hinder the divine blessing distilling on your tender minds, even as the dew on Hermon's hill, to the instructing and strengthening of you to withstand the many temptations that may assail you; and if you are faithful to the manifestations of the Spirit of God in your hearts, it will enable you to become as pillars in his church, to the reviving of his blessed work on the earth. O, this is the desire of my soul for you. I shall greatly rejoice to see Zion prosper, and Jerusalem become a praise, yea, the praise of the whole earth."

At a subsequent period when he was no longer able, by reason of bodily infirmity, to meet with his friends for public worship, he addressed the following letter to the Friends of Kirklington and Solport Preparative Meeting, to be held the 15th of 6mo., 1818.

Dear Friends,—I am deprived of the privilege of assembling with you in your meetings, yet my love still increases, with fervent desires for your preservation and growth in the blessed Truth. Oh, my dear friends! when gathered together in your solemn meetings for divine worship, let

each individual seek after that spring of life which can make glad the whole heritage of our God. There every one of you sitting under his own vine and his own fig tree, where none can make him afraid, feeding on Christ who is also the heavenly shepherd and bishop of souls, will have to acknowledge on your return, that it was good for you to have been there; and your conduct and demeanour amongst your neighbors will raise this testimony in their hearts. These people have been with Jesus. That this may be the happy experience and enjoyment of each of you, is the desire of your friend and well-wisher,

THOMAS BULMAN.

The following was addressed to the Friends of Kirklington meeting, to which he belonged, with the request that it might be read in each family, so that, if any good should arise from it, the dearly beloved youth, the beauty of this generation, and the hope of the next, might be profited by it.

Dear Friends,—Although I am absent from you in body, I am at times present with you in spiritual travail for your preservation and growth in the blessed Truth. I have been introduced into a mournful state of mind, because some amongst you have brought a reproach on our holy profession. O, my dear friends! this truth has revived in my mind, that our heavenly Father was the same, and is the same, yesterday and to day, and will be so for ever, to those who love and fear him. Now my dear Friends! let us remember what it was that first gathered us to be a people. Were not our first Friends weary with formal worship? Did they not then gather together in solemn silence to wait upon the Lord, to know his will revealed concerning them? Now my dear Friends! it is only by the like concern to seek after the Lord in spirit, through Jesus Christ, and to abide faithful under his teachings in the heart, that we, in this day, can be preserved, and become a praise to his name. Satisfied I am, if this be the ardent, sincere travail of your souls, and you are obedient and faithful to this in all things, living in the Spirit, and walking in the Spirit, you will adorn our holy profession, and be preserved as a people formed for the Lord's praise. That this may be your happy experience is the sincere desire of your brother in all your exercises.

THOMAS BULMAN.

TO A FRIEND AND HIS WIFE, ON ONE OF THEIR CHILDREN TURNING ASIDE FROM THE PATH OF RECTITUDE.

Dear and well beloved Friends,—I have felt great sympathy with you in your tried situation, on account of your dear child, and it has been to me a time of sadness and distress, as if the seed was in suffering in the hearts of some dear unto me. Before, however, the tidings reached my ears, all sorrow and distress of mind were removed; and dwelling under my own vine and

fig tree, I found that nothing there could make afraid. O, the condescension of our heavenly Father to his little ones! A bit of bread, of heavenly bread,—a cup of water, if from the heavenly spring, can comfort and support when distress is approaching. And now, my dear friends, my exercise is turned towards you, that you may be kept in patience, and in quietude of mind, till way opens to endeavor to draw the attention of the dear children to the grace of God, and to the washing of regeneration, which only can cleanse the heart and make it a fit temple for the Lord to dwell in. If we who are parents get into impatience and anger, this will not reach the tender Witness in the hearts of our children, so it cannot nourish it, nor bring it up into dominion over every thing contrary to the Lord's holy will. I want not to encourage any wrong doing. My sufferings for this transgression have been heavy; but he is your child, and if he could be brought to a due sense of his missteps, I could forgive him, and rejoice at his return, as the father did, when his prodigal son returned. But my beloved friends, if the dear youth cannot, by all our labors and exercises, be brought at this time to submit to the grace of God, let us continue to retire and to pray to the Lord our God, that he may bring him to repentance; then leave all in the hand of Him who has been our help in times of need; and it may be that when we are laid in the silent grave, our exercises and our labors may prove as bread cast upon the waters, and return after many days.

THOMAS BULMAN.

TO TWO FRIENDS ENGAGED IN A RELIGIOUS VISIT TO THE HIGHLANDS OF SCOTLAND.

Dear Friends,—I have been in measure a partaker with you in your arduous travails, and exercises for gathering souls to God; and my desire is that you may not faint, but hold on your way. I have remembered how it was with Mordecai of old; though he was clothed with the king's royal robes, and sat upon the king's horse, and rode thus through the city, yet afterwards he had to sit at the king's gate, and to mourn. And why? Because the true seed—the Israelitish seed, was in captivity. And so, my beloved friends, it may be with you. You may at times be clothed as it were with the robe of righteousness, and be made to triumph over all, and to experience a fulness of joy from the Lord's life-giving presence; but when the seed in the hearts of the people amongst whom you labor, suffers, you must suffer with them. The true ministers must sit where the people sit, and thus be made to feel their state and condition, in order to be able to point out the way for their deliverance.

T. BULMAN.

TO THE SAME FRIENDS.

Dearly beloved Friends,—You have felt very near and dear unto me, both when sleeping and

waking, and I am comforted in feeling assured that your labors and travail are for the advancement and spreading of the Truth. It has often opened in my mind, when looking towards you, what was the distress of the Israelites, when the Red Sea was before, the mountains on each hand, and the Egyptians behind. Then they murmured against Moses; but when Moses cried unto the Lord, his answer was, Stand still, and you shall see deliverance from your enemies.

In your greatest difficulties be quiet and still, until the Lord opens a way for you, and then you will have to rejoice on the banks of deliverance. Beware of murmuring! If your Lord should see meet to strip and leave you, in order for a trial of your faith, or to prepare you for some future engagement in his service, you may mourn till he returns, but not murmur.

THOMAS BULMAN.

Thomas Hall of Low Mosser, near Cocker-mouth, who selected the chief part of the matter brought under notice in this little volume, from the original manuscripts, and placed it in the hands of the editor, and who was personally acquainted with Thomas Bulman, says of him: "To my mind he was a beautiful example of patriarchal life, walking with God, and commending the doctrines of our Lord to all who knew him, by his lovely, consistent example. For truly, in a remarkable degree, the meek, gentle and lowly spirit of the dear Master, with which this humble disciple was clothed, shed a salutary influence around him. He combined great diligence in business, with fervency of spirit in serving the Lord; and a judicious economy, with true Christian hospitality, and generous liberality; loving all for the blessed Master's sake, and, as was in his power, doing good to all, he was remarkably beloved."

It is to be regretted that few of the expressions of this humble devoted Christian, when passing through great bodily suffering towards the close of life, have been preserved. But the Lord, to whom he had dedicated the strength and vigor of his days, was graciously near to comfort and support him in the time of trial. The following short petition appears to be the last record in his memorandums, and probably was written in a time of acute suffering:

"O Lord, grant me patience to be resigned to the lot and path thou hast assigned me, for the few days I may have to remain in this vale of tears. Under whatever suffering it may please thee to afflict me, do thou preserve me, that I may bring no reproach upon my holy profession. Grant me a peaceful quietude of mind till thou art pleased to release me."

His bodily sufferings were at times severe; and under them he frequently expressed a desire to be preserved from a murmuring disposition, lest he should bring dishonor on that precious cause which he had long been concerned to ad-

vocate; and through all his trials he was favored to feel his mind anchored in divine love, and in reliance on the mercy of God through his beloved Son, Jesus Christ. At one time he said, "Oh, what shall I render unto thee, O Lord! for thy loving-kindness to me. Thy love did flow into my soul, even in the night season, to the refreshing and strengthening of me to hold on my way through this vale of tears." "Eye hath not seen, nor ear heard, nor hath it entered into the heart of man to conceive the goodness of the Lord to all those who love and fear him."

He died at Irthington, on the 5th of 7th month, 1821, aged 74 years.

Ann Bulman, the widow of Thomas Bulman, survived her husband four years. She died at Irthington, on the 26th of 7th mo. 1825, aged 66 years.

For many years previous to her decease, she was much secluded from her friends in consequence of bodily infirmity; but the love which she had long cherished to them and to the cause of Truth, continued unabated. She often expressed an affectionate solicitude that her children might continue to live in mutual love, and keep to the truth as it is in Jesus, and thereby experience preservation. She was enabled to bear her sufferings to the end of her days, with patience and resignation, and was favored with a peaceful assurance that a place was prepared for her by her Saviour, in one of the mansions of his Father's house.

ALMOST HOME.

This is one of the most joyous expressions in the English language. The heart of the long absent husband, father, or son, not only homeward bound, but almost arrived, fills with rapturous joy, as he is on the point of receiving the embraces and greetings of the dear ones at home. So it is with the aged Christian, as, in the far advance of his pilgrimage, he feels that he is approaching the boundary line, and will soon cross over to the land of promise. Many of his best friends have crossed over before him, and they have long been beckoning him upward and onward. They await his arrival with the joyful welcome of holy ones. And as tokens multiply on either hand that the land of Beulah is near, he feels that he is *almost home*. The ripe fruit of a long Christian life is about to be gathered into a heavenly garner. Few sights on earth are more pleasing than aged, faithful Christians, strong in the Lord, almost home. We have some such among us, revered and beloved, whose prayers bring down blessings on our heads. They speak of many friends, most of whom have preceded them—but the reunion will soon come. Blessings be upon the fathers and mothers in Zion. And may their mantles fall on us!

CHARITY.

Among those principles which the human mind receives as consequent upon following the dictates of the Allwise and Infinite Ruler, there is none which adorns it more, or which brings to it a deeper, holier, and purer satisfaction, than that of charity, when it is allowed to exercise its full power over the mind, and it becomes the medium through which we view the actions of our fellow-men.

It is a principle to which the unregenerate mind is a stranger, because such a mind is governed by its own selfish caprices, and in order to arrive at that condition in which the spirit of charity covers a multitude of faults in others, it is necessary that all those promptings of the human heart which cause it to seek its own aggrandisement, regardless of others, shall be subdued and brought under the direction and government of a power superior to man, a power which acts from unselfish motives, and a power that is able, and not only able, but willing to direct the soul into a path in which it may know this blessed principle to dwell within it.

In the revelations I have received by an attention to the operation of the Divine Spirit, I am led to believe that our heavenly Father is a being replete and complete without man, and that in adapting the laws which he has instituted for the government of man, to each state and circumstance under which the human race is, or has been placed, these laws and their adaptation are designed solely for the happiness of man. It will neither detract from nor add to the great Creator, whether man obeys or disregards those laws; hence I am irresistibly led to the conclusion that God is not only an Omnipotent, Omniscient, and Omnipresent, but an entirely unselfish Being, and in order that man may become likened unto Him, and be fitted to enjoy the highest attainable happiness, He requires him to walk in, or seeks to lead him in the path of self-denial, so that in all his actions towards and among his fellow-men, whether in temporal matters, or in concerns of a religious nature, he may be actuated by purely unselfish motives. Then as he becomes willing and careful to obey the directions of the Divine Master, and to walk in the path He points out, he feels his soul filled with that love which is the essence of Deity, and that love to flow forth towards his brethren and sisters of every kindred, tongue and people. In this state he feels no spirit of judgment to rise against a brother for a difference of view, no aristocracy of feeling towards those who may be inferior to him in intellect, or in possession of that which earth calls wealth, but recognizes all to be his brethren, children of one common Father, and equally the objects of His regard. When under the direction of the spirit of Christ, when a way is opened for him to assist his brethren, he ex-

tends the necessary aid unselfishly, looking for no praise or reward from the object of his care, but entirely satisfied with the consciousness of having done his duty under the influence of that love of God which pervades his soul. And as he is careful to abide in this willing and obedient condition, his mental vision will be enlarged, and he will discover that this state of mind is not peculiar to himself, but that as every other individual of the human family is under the care of the same universal Parent, so when they become obedient to His requisitions they too will experience the same principle of love to pervade their spirits and flow forth towards their fellows. He will also discover that there are diversities of gifts, but the same Lord; there are differences of administrations, but the same spirit; there are diversities of operations, but the same God, who worketh all in all. And this will lead him to be careful how he passes judgment upon views differing from his own, lest he be condemning those who have either received greater light or have advanced to a higher state of experience than himself. Or in consequence of the peculiar circumstances in which they have been placed, are permitted to embrace that as essential, which he has been led to see as non-essential for him.

He now feels the true principle of charity to pervade his heart, and perceives that it covers up a multitude of what the human understanding calls faults, failings, or wrongs in others, and learns to be content with simply doing his individual duty without undertaking to bring others into his path, and becomes willing to cast his whole trust and confidence upon God without inquiring "what shall this man do?" As his experience has taught him that He will order all things for his good, he is content in believing that He will do so for other men.

When I have reflected upon the devastation which that spirit of bigotry and intolerance, which is diametrically opposed to true charity, has made in the Christian church, my spirit has yearned towards the professors of the name of Christ in our day, that we all may come to this blessed experience and realize this true Christian feeling in order that the sectarian barriers which now divide us may be removed; and though we might worship our Creator in different forms, we might feel that each was endeavoring to fill the sphere in which he was called to move by the Great Disposer.

And more especially have I desired the clothing of this spirit for the members of the Society of Friends, whose faith in the immediate teachings of Christ within should lead them into the exercise of this holy principle. My secret petitions have been raised to the Eternal, the Infinite, that the spirit which has at all times made its appearance amongst us, rising into judgment and condemning all as unsound which comes not up to its standard of purity, may be-

come willing to leave this condition which ever brings its own unhappiness, because the more it is indulged, the farther the soul becomes removed from that blissful state of mind produced by charity, which thinketh no evil and which delighteth in the happiness of others.

When it becomes the chief object to build up instead of pulling down, and when rightfully qualified to encourage each other to attend to our own gifts, and to extend the mantle of charity over one another, we shall become united under one banner, and that will be love. Then the strong can bear the infirmities of the weak, and when reproof and rebuke become necessary, being given under the direction of the Master and at the time he dictated, it would be so clothed with love and charity, that its effects would be to restore. Under this happy condition of things there would be a growth experienced, and we could then bear our testimonies before the nations availingly, because no internal dissensions would weaken our influence, and the people would have cause to repeat the proverbial saying in relation to our early Friends, "see the Quakers, how they love one another."

Then, dear reader, let it be our chief concern to endeavor to arrive at that degree of experience wherein we can witness that we feel our entire dependence to be upon God, and that He will care for all his creatures as he cares for us, for herein we will know every root of controversy removed, and we will be brought into the unity of the sons of God, and if sons, then heirs of the heavenly kingdom. JOHN J. CORNELL.

Mendon, 12th mo. 14th, 1859.

"TIME AND TIDE WAIT FOR NO MAN."

How fleeting is time, ceaseless it moves on, hourly and daily it glides along, until months and years are gone, verifying the Scripture declaration, that our life is even a vapor, which appeareth for a little time, and then vanisheth away.

Such has been the reflection since the coming of the new year, and the importance felt of redeeming time; seeing that all flesh is as grass, and all the glory of man as the flower of grass. The grass withereth, and the flower thereof falleth away.

Many are the repeated evidences that we have no continuing city here. The pale messenger, who rides upon the white horse, invades all ranks and conditions, and summons them one by one to their eternal home. Some are called in the bloom of youth and loveliness, others in the vigor and usefulness of manhood, while some linger to old age; and all proclaim the warning, "Be ye, therefore, ready also; for the Son of man cometh at an hour when ye think not."

Oh time, most sacred! the gift and boon of

Heaven, to work out the soul's salvation; let us be diligent therein, doing the will of our heavenly Father; and while the potsherds of the earth strive together, know experimentally that the weapons of our warfare are not carnal, but mighty through God, to the pulling down of strong holds; casting down imaginations, and every high thing that exalteth itself against the knowledge of God, and bringing into captivity every thought to the obedience of Christ.

Thus redeemed from the spirit of the world, its strifes and commotions, we may realize the precious privilege of sitting under our vine and fig tree, as some in days of old, where none can make afraid, having the blessed hope that beyond this fleeting world, this changing scene, there is a mansion of rest in that glorious city whose walls are described as being "salvation, and whose gates are praise." R. P.

1st mo. 12, 1860.

A MOTHER'S LOVE.—HOME.

Many of us—most of us, who are advanced beyond the period of childhood—went out from that home to embark on the stormy sea of life. Of the feelings of a father, and of his interest in our welfare, we have never entertained a doubt, and our home was dearer because he was there; but there was a peculiarity in the feeling that it was the home of our mother. While she lived there, there was a place that we felt was *home*. There was one place where we would always be welcome, one place where we would be met with a smile, one place where we would be sure of a friend. The world might be indifferent to us. We might be unsuccessful in our studies or our business. The new friends which we had supposed we had made might prove to be false. The honor which we thought we deserved, might be withheld from us. We might be chagrined and mortified by seeing a rival outstrip us, and bear away the prize which we sought. But there was a place where no feelings of rivalry were found, and where those whom the world overlooked would be sure of a friendly greeting. Whether pale and wan by study, care, or sickness, or flushed with health and flattering success, we were sure that we should be welcome there. Though the world was cold toward us, yet there was one who always rejoiced in our success, and always was affected in our reverses; and there was a place to which we might go back from the storm which began to pelt us, where we might rest, and become encouraged and invigorated for a new conflict. So have I seen a bird, in its first efforts to fly, leave its nest, and stretch its wings, and go forth to the wide world. But the wind blew it back, and the rain began to fall, and the darkness of night began to draw on, and there was no shelter abroad, and it sought its way back to its nest, to take shelter

beneath its mother's wings, and to be refreshed for the struggles of a new day; but then it flies away to think of its nest and its mother no more. But not thus did *we* leave our home, when we bade adieu to it to go forth alone to the manly duties of life. Even amidst the storms that then beat upon us, and the disappointments that we met with, and the coldness of the world, we felt that there *was* one *there* who sympathized in our troubles, as well as rejoiced in our success, and that whatever might be abroad, when we entered the door of her dwelling we should be met with a smile.

It makes a sad desolation, when, from such a place, a mother is taken away, and when, whatever may be the sorrows or the successes in life, she is to greet the returning son or daughter no more. The home of our childhood may be still lovely. The old family mansion,—the green fields—the running stream—the moss covered well—the trees—the lawn—the rose—the sweet briar—may be there. Perchance, too, there may be an aged father, with venerable locks, sitting in his loneliness with every thing to command respect and love; but *she* is not there. Her familiar voice is not heard. The mother has been borne forth to sleep by the side of her children who went before her, and the place is not what it was. There may be those there whom we much love, but she is not there. We may have formed new relations in life, tender and strong as they can be; we may have another home dear to us, as was the home of our childhood, where there is all in affection, kindness and religion to make us happy, but *that* home is not what it was, and it will never be what it was again. It is a loosening of one of the cords which bound us to earth, designed to prepare us for our eternal flight from everything dear, here below, and to teach us that there is *no* place here that is to be our permanent home.—*A Barnes.*

The following was forwarded to us for insertion by our friend J. F.:

Dear Friend:—I think I have often been brought into a state of near feeling with and for thee, much desiring that thou mayest be brought to a true sense of thy situation (which at present I fear is not the case), and in order thereto I believe it very important that thou endeavor to be still. Yea, I believe that in this alone thy strength will consist, and that weakness will be increased by giving way to a reflecting disposition and continued exertions to justify thyself. The truth doubtless needs not the aid of any human exertions to defend it, but is stronger than all, and will have the victory. We may remember that it was prophesied concerning Christ and also fulfilled, that "he was brought as a lamb to the slaughter, and as a sheep dumb before her shearers, so he opened not his mouth; in his

humiliation his judgment was taken away." Oh! what a striking example, and how moving his prayer, "Father, forgive them, they know not what they do." It does not appear that he was under any concern about bringing witnesses, or in any way defending his innocence, but entirely resigned to his Father's will, and I conceive that all his true followers that suffer for his sake will experience his supporting power, to preserve them in a measure of the same spirit, reconciling them to anything that may be permitted to come upon them; and I believe there is no other way for thee to become restored to the unity of the body of Friends, without submitting to have thy judgment taken away. Mayest thou not, therefore, through fear of death, be all thy lifetime subject to bondage. Cease, therefore, I entreat thee, from all that is of man, either in thyself or others, for this I believe to be the place from whence thou hast fallen; that if thou hast any strength, I desire thou mayest make use of it in treading back the ground as speedily as thou canst, for it is the best and safest when we have missed our way to go back to the place where we first turned aside, for by trying to get across some nearer way we may entirely lose sight of the right path, get further and further from it, and wander we know not where.

Now, my dear friend, I am sensible that I am but a child, that I have nothing to boast save infirmities, and I feel the necessity there is for all who think they stand to take heed lest they fall; but I trust all those who are concerned to keep on the watch-tower, trusting in the Lord with all their hearts, and leaning not to their own understanding, will experience preservation.

As these things have opened on my mind, I was willing to impart them to thee in as few words as I could; and if they have the desired effect, I shall rejoice and be glad; and if not, I shall so far be clear in having done what I could. I felt as though I should have been willing to have answered some of the queries proposed by thee, but not feeling liberty so to do, believing that this kind of reasoning or contention, or whatever it may be called, will have a tendency to draw the mind from its proper centre, and lead it to a dependence upon outward consistency. This I believe to be the door by which much weakness has been introduced into the Society, a snare in which some of the foremost rank have been taken, that of exerting the natural powers to bring the truth into a conformity to their outward views, and depending upon performances and sacrifices of their own preparing, and thus living above the pure witness in their own minds they must consequently be destitute of a capacity to comprehend divine mysteries, and they cannot endure sound doctrine.

Let me, therefore, once more impress it on thy mind to lay down all carnal weapons, and cease to repose thy trust in man, and then I am

encouraged to believe thou wilt find thy way back to the unity of thy friends, who I believe will be ready to receive thee with open arms.

MARTHA CLEAVER.

EXAMPLE.—One watch set right will do to try many by; but, on the other hand, one that goes wrong may be the means of misleading a whole neighborhood; and the same may be said of the example we individually set to those around us.

For Friends' Intelligencer.

THOMAS BABINGTON MACAULAY.

This distinguished essayist and historian has followed the many eminent writers who have recently passed into the spirit land. Hallam, Prescott, Irving, Macaulay, alike have rested from their literary labors. "When will be found their compeers?" Seldom have four names equally illustrious been chronicled in one generation.

The literary fame of Macaulay is perhaps universally acknowledged. His Trial of Warren Hastings, his magnificent sketch of Lord Clive, and his graphic and beautiful Miscellanies, place him chief among essayists. His style of composition, though not peculiarly adapted to historical narrative, is replete with rhetorical beauties, but too minute and gossiping to be implicitly relied on, or to interest the uncultivated reader. With wonderful stores of knowledge and abundant facilities for arriving at the truth, he had not always the magnanimity to be just in his portrayal of character.

Macaulay was born at Rothley Temple, in Leicestershire, in 1800, and graduated at Trinity College, Cambridge. His first literary effort, which attracted much attention, was an essay on Milton, which appeared in the Edinburgh Review in 1826, to which periodical he contributed during a period of twenty years. He subsequently composed several ballads, the most popular of which, "Lays of Ancient Rome," is founded on romantic events related by Livy.

In 1830, Macaulay was elected a member of the House of Commons, and soon assumed a leading position in Parliament. When appointed a member of the Supreme Council of Calcutta, he resigned his seat in Parliament, and proceeded to the East; and during his three years' residence in India the materials were collected for some of his most popular essays. On his return, he was again elected a member of Parliament from the City of Edinburgh, but resigned his seat in 1856, thus intimating his intention to retire from public life.

This temporary withdrawal from office gave him leisure to prosecute his long projected design of writing a history of England. In 1848, the first and second volumes of this history appeared, and edition after edition was printed and

read with the greatest avidity. The third and fourth volumes were published in 1855; and it has recently been announced that two more volumes of the history were nearly ready for publication.

His unjust aspersions on the irreproachable character of William Penn, have considerably abated the confidence of the public in the veracity of his statements, and it will ever be a matter of regret that the prejudiced historian was not magnanimous enough to retract his baseless slanders against that great and good man. The high regard to duty, by which the life of Wm. Penn was regulated, and the evidence of Christian principle so nobly set forth in that "treaty which was not ratified by an oath and never broken," are living and powerful refutations of the ignominious charges of Macaulay.

On account of his intellectual celebrity, the Peerage was conferred upon him by Victoria; but as he lived a bachelor, it dies with. He was interred in Westminster Abbey. H.

1st mo. 20th, 1860.

INDIAN MOUNDS.

At first the eye mistakes these mounds for hills; but when it catches the regularity of their breast works and ditches, it discovers at once that they are the labors of art and of men. When the evidence of the senses convinces us that human bones moulder in these masses; when you dig about them, and bring to light domestic utensils, and are compelled to believe that the busy tide of life once flowed here; when you see at once that these races were of a very different character from the present generation,—you begin to inquire if any tradition, if any the faintest records, can throw any light upon these habitations of men of another age. Is there no scope, besides these mounds, for imagination, and for contemplation of the past? The men, their joys, their sorrows, their bones, all are buried together. But the grand features of nature remain. There is the beautiful prairie over which they "strutted through life's poor play." The forests, the hills, the mounds, lift their heads in unalterable repose, and furnish the same sources of contemplation to us that they did to those generations that have passed away.

These mounds must date back to remote depths in the olden time. From the ages of the trees on them we can trace them back six hundred years, leaving it entirely to the imagination to descend further into the depths of time beyond. And yet, after the rains, the washings, and the crumbings of so many ages, many of them are twenty-five feet high. Some of them are spread over an extent of acres. I have seen, great and small, I suppose, an hundred. Though diverse in position and form, they all have an

uniform character. They are, for the most part, in rich soils, and in conspicuous situations. Those on the Ohio are covered with very large trees. But in the prairie regions, where I have seen the greatest numbers, they are covered with tall grass, and are generally near beaches,—which indicate the former courses of the rivers, in the finest situations for present culture; and the greatest population clearly has been in those very positions where the most dense future population will (probably) be.—*T. Flint.*

FRIENDS' INTELLIGENCER.

PHILADELPHIA, FIRST MONTH 28, 1860.

The sentiments contained in the piece called "The Contrast," are excellent, but they do not possess enough poetical merit for our paper.

MARRIED, According to the order of Friends, on 4th day the 28th ult., EDWIN CRAFT, of Upper Greenwich, N. J., to ELIZABETH GASKILL, of Green Street Monthly Meeting, Philadelphia.

DIED, At Reading, Pa., on the 8th inst., ANN GRISCOM, widow of Samuel Griscom.

—, At Brooklyn, N. Y., on 3d day, 1st mo. 3d, 1860, CARRIE, only daughter of Robert C. and Phebe S. Embree, aged 6 years and 7 months, grandchild of James F. and Avis C. Birdsall.

—, Near Waynesville, on the 12th of the 12th mo. 1858, MARGARET KELLY, daughter of Samuel and Achsah Kelly, a member of Miami Monthly Meeting. Her illness was short and severe, which she bore with much patience, leaving behind her a consoling evidence of a peaceful close. She was a kind and affectionate child, and fond of attending religious meetings. Her loss is severely felt.

EXTRACTS FROM THE MESSAGE OF GOVERNOR W. F. PACKER TO THE LEGISLATURE OF PENNSYLVANIA.

The annual report of the Superintendent of Common Schools, with the tables and documents accompanying it, will exhibit the condition of the vast engine of social improvement to which it relates. The number of pupils, in all the public schools of the State, is 634,651—of schools, 11,485—and of teachers, 14,071. The schools have been in operation, on an average over the whole State, five months and nine days. The average salary of male teachers is \$24 36, and of female teachers \$17 79, and the cost of instruction, per pupil, fifty-three cents per month. The average tax for tuition, &c., is about five and a half mills, and for building purposes, about three and one sixth mills, on the dollar. Including the city of Philadelphia, the entire cost of tuition, &c., was \$2,047,661 92; the building expenses \$531,413 85; and the

whole expense of the system in the State, for the year, \$2,579,075, 77.

Though the school year ending on the first Monday of June last was one of unusual difficulty in money affairs, yet the system manifests an encouraging activity in all its departments, while the rate of taxation, both for tuition and buildings, would appear, from the official report, to have somewhat decreased. But, it is by a contrast of the present condition of the system, with that of 1854, when the agencies now operating so beneficially were created, that results are most plainly seen. Within that period the whole number of pupils has been increased nearly one-seventh—teachers, one-thirteenth—and the salary of teachers, the best index of improvement, one-sixth for males, and one-fourth for females. These results, with the others which the official report will exhibit, unerringly point to the duty, as well as necessity, of the utmost care and attention, on the part of all public agents, to this primary social institution—primary in importance, no less than in the career of each citizen. To strengthen, to retain pure, and to properly direct, this fountain-head of social influence, is, it seems to me, the great duty of the law maker, in his highest and most responsible capacity, as the framer of the future of the State.

The attention of the General Assembly was called, somewhat at length, to the existing condition and further requirements of our school system, in the annual message of last year. It is not, therefore, necessary to repeat the suggestions and conclusions then presented. They are again, however, commended to your favorable consideration; the events and experience of the intervening period having increased the conviction of their propriety. This is especially the case, in regard to the plan devised by the act of 20th of May, 1857, for the due training of teachers for the common schools of the State. A full supply of competent teachers is admitted by all to be the great need of the system, and the first want to be provided for. Unerring indications, in every quarter not only establish this fact, but point to the general adoption of the proposed means, at no distant day. The efforts of the teachers, themselves, for professional improvement, encouraged and sustained by all who duly estimate the value and influence of the teacher's office, not only foretel this, but the strong public sentiment in favor of institutions for the purpose in question, confirms the probability of this result. In every quarter indications of this kind are perceived—more or less strong in proportion to the force of local circumstances. In the Second Normal district, composed of the counties of Lancaster, York and Lebanon, an institution up to the full requirements of the law of 1857, has been established and officially recognized, and is now in successful operation, as a State Normal school. For its details the Legislature is re-

spectfully referred to the annual report of the Superintendent of Common Schools; but, I should do injustice to the intelligent enterprise which moulded, and the enlarged philanthropy which produced, this noble institution, as well as to my own feelings, were I to forbear congratulating you upon the result. It is the first fruit of a law which seems to be as much in accordance with the cautious yet generous character of our people, as it is admirably adopted to effect the great end in view.

All that seems requisite to give full effect and general success to the plan, is, at this juncture, to guard it from mutilation or radical change. If the intelligent and liberal minds that are now weighing the project, and contemplating its extension to other parts of the State, be assured that this is the settled policy, their efforts will be concentrated, their activity increased, and final success be hastened. Whereas, radical or important changes will destroy this growing confidence, crush the hopeful efforts now being made, and postpone for years, if not totally destroy, all hope of success in this essential department of public instruction. The true course will be to cherish the law, and bring it into general operation, by holding out the certainty of State aid to each institution established under it, as soon as a certain number, to be fixed by law, shall have been legally recognized and are in full operation. The money of the State, appropriated in this manner, will effect more benefit, in proportion to the outlay, than any other of the operations of the system. The instruction of the child is a duty; but the instruction of the teacher is economy as well as duty. It will probably be advisable to make such appropriations, payable only when the schools are legally recognized and in full operation. This course will have the double effect of guarding against loss by the State, and of stimulating into early existence a sufficient number of institutions to supply the existing want in every quarter of the State.

The period for the third election of County Superintendents is rapidly approaching, and the public mind will naturally be turned to the results of the office. My own observation, as well as information from various reliable sources, leads to the opinion that this office, when filled by the proper person, and its duties discharged in full compliance with the design and spirit of the law creating it, has been of great advantage to the schools. Indeed, no candid person can deny the fact, apparent to even slight observation, that more improvement has been effected in the workings and results of the system, since the creation of the office of County Superintendent, than in any previous period of even double duration. It is true, that when exercised by incompetent officers, or crippled by insufficient compensation, little, if any, advantage has accrued. But this is no argument against the office itself; and it

is to be hoped that the directors of counties thus heretofore deprived of the benefits of this agency, will, at the next election, acting under the teachings of experience at home, and the light of success from other parts, correct this evil, and realize the full benefits of this provision of the law.

The increasing ease and soundness of our financial condition will, at no remote period, justify an addition to the common school appropriation. The general policy of the State has been that each district shall raise within itself the main support of its own schools; but an annual donation, distributable amongst them all, in proportion to population, has also been a part of that policy. The object of this State grant seems to be two-fold: First;—It is a means of securing regularity in the proceedings and reports of the several districts, so that the Department of Common Schools shall have the requisite information for the due discharge of its functions; and, second—It lightens, in some degree, the burden of local taxation, to the relief of the poorer and more sparsely peopled districts. An increase of the annual appropriation would enhance both these objects and whenever the finances of the government will justify it, commends itself to the favorable consideration of the Legislature.

The aid which the Legislature has hitherto extended to the establishment of the Farmers' High School of Pennsylvania strongly evinces their high appreciation of the advantages which it is anticipated will grow out of that institution. While it must be admitted that knowledge is as essential to the art of farming as it is to all the other employments of life, we cannot but feel deeply interested that a community so peculiarly agricultural as we are should have all the advantages of an education which combines in itself, as well the knowledge of the practical art of agriculture, as scientific acquirements in all those branches of learning which are especially applicable to its profitable pursuit. A school where agriculture is practically taught is a new field to which our attention has been called, and one which, because of its great importance, well deserves our attention.

It embraces the principle that, while youth are taught habits of industry, they are impressed with the consideration that the labor of their own hands contributes to their acquisition of knowledge. And thus, too, education is brought within the reach of many a bright genius, who would otherwise struggle and languish for the want of means of acquiring it. Our school, within its limited means, has been in successful operation during the past year; having under its charge one hundred boys, who, while they are carefully instructed in all those branches of science which pertain to a high order of education, are daily engaged in all the practical operations of the farm—fitting them to return to rural life, and

to infuse throughout the State an amount and kind of knowledge which must ultimately produce a most beneficial influence upon this most cherished branch of industry. The practical workings of the school, for the past year, have impressed the trustees, who have it in charge, with the highest hopes of its complete success. The great interest which is everywhere felt throughout the commonwealth, in the further extension and progress of the institution, commends it to our care and protection.

The State Librarian will report to you the completion of the descriptive and classified catalogue of the books in the State library, authorized by the act of the 16th of April, 1858—a work from the details it embraces of much labor, but which will greatly facilitate the use of the library. It will be seen, from his report, that the origin of the library dates far back in the history of the Provincial government, and that it received the fostering care of the commonwealth during the period of the revolution. It is gratifying that, notwithstanding the waste to which it has been subject in past years, owing to the want of proper attention, under the careful supervision of the present librarian, it has, since he has had the charge of it, nearly doubled its number of volumes, and now contains in all 22,000 volumes—the largest State library in the Union, with the single exception of that of the State of New York. The collection of law books, and especially law reports, is considered by those competent to judge, among the best in the country. The library, from its intrinsic value and importance, and its historic relations, deserves, and I trust it will receive the continued liberality of the legislature.

From Chambers's Journal.

SELF-HELP.

A handy and amusing volume on *Self-help*, by the author of the *Life of George Stephenson*, has lately been published. Its main value consists in an enforcement of the distinct principle, that, unless there be stimulus to exertion from within, help is of little use, and may in reality be enfeebling and hurtful. As a general truth, neither laws nor institutions, neither friends nor acquaintances, neither schools nor books, can render any active aid in pushing people on. The utmost that anything exterior to ourselves can do, is to give us freedom to think and act. The want of a proper conviction on this primary point leads to much disappointment. How many men in a humble position are seen looking for something that is to take place by which they are to cut a figure, while all the time they are neglecting the very means which can alone advance them one way or another. "It is every day becoming more clearly understood," says Mr. Smiles, "that the function of government is negative and restrictive; being resolvable princi-

pally into protection—protection of life, liberty, and property. . . . There is no power of law that can make the idle man industrious, the thrifless provident, or the drunken sober; though every individual can be each and all of these if he will, by the exercises of his own free powers of action and self-denial."

A recognition of these truths, however, only comes with an awakening intelligence. Just in proportion to the ability to think, is the power to act; and it is only when this ability has been attained, that the man can be said to be properly developed. Exempted in a remarkable manner from official interference, and but slightly affected by social considerations, also favored by a healthful and bracing climate, the English, as a people, are placed in circumstances peculiarly favorable for promoting mental along with bodily activity, on which account it seems to be very much the fault of the individual if he continues doomed to inaction and obscurity. Undoubtedly, not a small share of disappointment as regards an advance in circumstances, may spring from the want of courage to encounter a certain hazard. Shrinking from taking a step which common sense would appear to recommend, a man allows the world to walk over him; with all his intelligence, he is found in the end of his days precisely in the position in which he originally set out in his career. It is true, all cannot reach distinction; but within each of us are faculties and tastes susceptible of improvement; and what is clearly desirable is the wish to make the very best of the faculties and tastes with which we are endowed—leaving consequences in the hands of Providence. Perhaps, not devoid of the wish to do what is right in this matter, some commit the mistake of looking for sudden and great moves in fortune; whereas, it may be learned from a thousand biographies that distinction has been attained only by simple means through a long course of patient exertion and endurance.

We are in the habit of ascribing high accomplishment in the prosecution of art, science, or literature to an inherent faculty called genius, while those who seem to have gained distinction through the efficacy of this natural gift, uniformly repudiate the notion that they are indebted to anything like genius, and ascribe their whole success simply to earnest and persevering diligence. "Some," says our author, "have even defined genius to be only common sense intensified. A distinguished teacher and president of a college spoke of it as the power of making efforts. John Foster held it to be the power of lighting one's own fire. Buffon said of genius—it is patience. . . . Newton said: 'If I have done the public any service, it is due to nothing but industry and patient thought.' Sir Joshua Reynolds was such a believer in the force of industry, that he held that excellence in art, 'however expressed by genius, taste, or the gift

of Heaven, may be acquired.' Writing to Barry, he said: 'Whoever is resolved to excel in painting, or indeed any other art, must bring all his mind to bear upon that one object from the moment that he rises till he goes to bed.' And on another occasion he said: 'Those who are resolved to excel must go to their work, willing or unwilling, morning, noon, and night; they will find it no play, but very hard labor.' There is truth in these remarks of Sir Joshua and others, but probably not the whole truth. No doubt, distinction is not obtainable without intense application, but at the outset, as one would think, there must be the capacity to labor along with the resolute will to overcome obstacles—in other words, there must be a quality in the mind susceptible of being urged into activity, without which a life-long struggle for success may be fruitless. Such we assume to be the more correct explanation; yet so persistently is it reasserted by successful men of alleged genius, that they owe everything to labor, that we are entitled to press this view of the matter on the attention of youthful aspirants. Genius or no genius, all adventitious circumstances go for nothing, unless a man sets doggedly to work. The art of continuance is indispensable for proficiency in all arts. Deficient in continuance, the cleverest are "outstripped in the race of life by the diligent and even the dull." * * * * *

Speaking of the originally humble circumstances of men of note, reference is made to "Michael Faraday, the son of a poor blacksmith, who was in early life apprenticed to a bookbinder, and worked at his trade until he reached his twenty-second year; he now occupies the very first rank as a philosopher, excelling even his master, Sir Humphry Davy, in the art of lucidly expounding the most difficult and abstruse points in natural science." Our author very properly remarks that the House of Commons has always possessed a number of self-made men. "When the late Joseph Brotherton, member for Salford, in the course of the discussion on the Ten Hours Bill, detailed with true pathos the hardships and fatigues to which he had been subjected when working as a factory-boy in a cotton mill, and described the resolution which he had then formed, that if ever it was in his power, he would endeavor to ameliorate the condition of that class, Sir James Graham rose immediately after him, and declared, amid the cheers of the House, that he did not before know that Mr. Brotherton's origin had been so humble, but that it rendered him more proud than he had ever before been of the House of Commons, to think that a person risen from that condition should be able to sit side by side, on equal terms, with the hereditary gentry of the land. There is a member of the present House of Commons whom we have heard introducing his recollections of past times with

the words: "When I was working as a weaver-boy at Norwich;" and there are many more who have sprung from conditions equally humble."

In the depths of society, unknown, yet happy in the prosecution of departments of science, there must be many men of energetic purpose, of whom the following is a pleasing example: "Not long ago, Sir Roderick Murchison discovered at Thurso, in the far north of Scotland, a profound geologist, in the person of a baker there, named Robert Dick. When Sir Roderick called upon him at the bakehouse in which he baked and earned his bread, Robert Dick delineated to him, by means of flour upon a board, the geographical features and geological phenomena of his native country, pointing out the imperfections in the existing maps, which he had ascertained by travelling over the country in his leisure hours. On further inquiry, Sir Roderick ascertained that the humble individual before him was not only a capital baker and geologist, but a first-rate botanist. 'I found,' said the Director-general of the Geographical Society, 'to my great humiliation, that this baker knew infinitely more of botanical science, ay, ten times more than I did; and that there were only some twenty or thirty specimens of flowers which he had not collected. Some he had obtained as presents, some he had purchased, but the greater portion had been accumulated by his industry, in his native county of Caithness; and the specimens were all arranged in the most beautiful order, with their scientific names affixed.'" William Smith, the father of English geology, began life under circumstances of a kind as adverse as the Caithness baker; and his rise was owing altogether to diligent application. * *

The most remarkable instance of a prodigiously hard-working statesman is that of Lord Brougham, who, though now in his eighty-second year, leads as laborious a life as he did when he was a young man. Applying himself to law, literature, politics, and science, he has achieved distinction in them all. "How he contrived it, has been to many a mystery. Once, when Sir Samuel Romilly was requested to undertake some new work, he excused himself by saying that he had no time, 'but,' he added, 'go with it to that fellow Brougham, he seems to have time for everything.' The secret of it was, that he never left a minute unemployed; withal, he possessed a constitution of iron. When arrived at an age at which most men would have retired from the world to enjoy their hard-earned leisure, perhaps to doze away their time in an easy-chair, Lord Brougham commenced and prosecuted a series of elaborate investigations as to the laws of light, and he submitted the results to the most scientific audiences that Paris and London could muster. About the same time, he was passing through the press his admirable sketches of the *Men of Science and Literature of the Reign of George III.*, and

taking his full share of the law-business and the political discussions in the House of Lords. Sydney Smith once recommended him to confine himself to only the transaction of so much business as three strong men could get through. But such was Brougham's love of work—long become a habit—that no amount of application seems to have been too great for him; and such was his love of excellence, that it has been said of him, that if his station in life had been only that of a shoe-black, he would never have rested satisfied until he had become the best shoe-black in England."

TIME wears slippers of list, and his tread is noiseless. The days come softly dawning, one after another; they creep in at the windows; their fresh morning air is grateful to the lips as they pant for it; their music is sweet to the ears that listen to it; until, before we know it, a whole life of days has possession of the citadel, and time has taken us for his own.

For Friends' Intelligencer.

Review of the weather, &c. for TWELFTH month.

	1858.	1859.
Rain during some portions of the		
24 hours,	5 days	3 days.
Rain all or nearly all day,	7 "	5 "
Snow, including very slight falls,	3 "	7 "
Cloudy without storms,	7 "	7 "
Ordinarily clear,	9 "	9 "
	—	—
	31	31

TEMPERATURES, RAIN, DEATHS, &c.

Mean temperature of the month at Penna. Hospital,	37 43 deg.	32 80 deg
Highest do. during month do.		71 "
Lowest do. do do do.		10 "
RAIN during the month,		3.49 in.
DEATHS, during month, counting four current weeks for each year,	715	937*
The average of the mean temperatures of this month for the past 70 years is		32 15 deg.
Highest do. during that entire period, 1848,		45 "
Lowest do. do do.	1832,	25 "

It will be seen by the above that the number of *clear* and *total cloudy* days for the month in each year, were just the same, while the *temperature* of 1859 was about *four and one-half degrees less* than the preceding, though a trifle above the average for seventy years past.

This being the last month of the year, many interesting matters of comparison with previous years might appropriately be introduced, but want of time forbids it at present; while a press of business has postponed the compilation of what is here presented later in the month than was intended. J. M. E.

* In reference to the comparison of deaths, the number recorded above for the present year is slightly erroneous, without the means of correction immediately at hand, while it will also be observed that one year chronicles *four* and the other *five* weeks.

PEACE I LEAVE WITH YOU.

BY MRS. WARING.

Source of my life's refreshing springs,
Whose presence in my heart sustains me,
Thy love appoints me pleasant things,
Thy mercy orders all that pains me.

If loving hearts were never lonely,
If all they wish might always be,
Accepting what they looked for only,
They might be glad, but not in Thee.

Well may Thy own beloved, who see
In all their lot their Father's pleasure,
Bear loss of all they love, save Thee,
Their living, everlasting Treasure.

Well may Thy happy children cease
From restless wishes, prone to sin,
And in Thy own exceeding peace,
Yield to Thy daily discipline.

We need as much the cross we bear
As air we breathe—as light we see;
It draws us to thy side in prayer;
It binds us to our strength in Thee.

ABDEL-HASSAN.

The compensations of calamity are made apparent after long intervals of time. The sure years reveal the deep remedial force that underlies all fact.—EMERSON.

ABDEL-HASSAN o'er the Desert journeyed with his caravan,—

Many a richly laden camel, many a faithful serving-man.

And before the haughty master bowed alike the man and beast;

For the power of Abdel-Hassan was the wonder of the East.

It was now the twelfth day's journey, but its closing did not bring

Abdel-Hassan and his servants to the long-expected spring.

From the ancient line of travel they had wandered far away,

And at evening, faint and weary, on a waste of Desert lay.

Fainting men and famished camels stretched them round the master's tent;

For the water-skins were empty, and the dates were nearly spent.

All the night, as Abdel-Hassan on the Desert lay apart,
Nothing broke the lifeless silence but the throbbing of his heart;

All the night he heard it beating, while his sleepless, anxious eyes

Watched the shining constellations wheeling onward through the skies.

When the glowing orbs, receding, paled before the coming day,

Abdel-Hassan called his servants and devoutly knelt to pray.

Then his words were few and solemn to the leader of his train:—

"Thirty men and eighty camels, Haroun, in thy care remain.

"Keep the beasts and guard the treasure till the needed aid I bring.

God is great! His name is mighty! I, alone, will seek the spring.

Mounted on his strongest camel, Abdel-Hassan rode away,

While his faithful followers watched him passing, in the blaze of day,
 Like a speck upon the Desert, like a moving human hand,
 Where the fiery skies were sweeping down to meet the burning sand.
 Passed he then their far horizon, and beyond it rode alone;—
 They alone with Arab patience, lay within its flaming zone.
 Day by day the servants waited, but the master never came, —
 Day by day, in feebler accents, called on Allah's holy name.
 One by one they killed the camels, loathing still the proffered food,
 But in weakness or in frenzy slaked their burning thirst in blood.
 On unheeded heaps of treasure rested each unconscious head;
 While, with pious care, the dying struggled to entomb the dead.
 So they perished. Gaunt with famine, still did Haroun's trusty hand
 For his latest dead companion scoop sepulture in the sand.
 Then he died; and pious Nature, where he lay so gaunt and grim,
 Moved by her divine compassion, did the same kind thing for him.
 Earth upon her burning bosom held him in his final rest,
 While the hot winds of the Desert piled the sand above his breast.—
 Onward in his fiery travel Abdel-Hassan held his way,
 Yielding to the camel's instinct, halting not, by night or day,
 'Till the faithful beast, exhausted in her fearful journey, fell,
 With her eye upon the plam-trees rising o'er the lonely well:
 With a faint, convulsive struggle, and a feeble moan, she died,
 While her still surviving master lay unconscious by her side.
 So he lay until the evening, when a passing caravan
 From the dead incumbering camel brought to life the dying man.
 Slowly murmured Abdel-Hassan, as they bathed his fainting head;
 "All is lost, for all have perished!—they are numbered with the dead!
 "I, who had such power and treasure but a single moon ago,
 Now my life and poor subsistence to a stranger's bounty owe.
 "God is great! His name is mighty! He is victor in the strife!
 Stripped of pride and power and substance, He hath left me faith and life."—
 Sixty years had Abdel-Hassan, since the stranger's friendly hand
 Saved him from the burning Desert, lived and prospered in the land;
 And his life of peaceful labor, in its pure and simple ways,
 For his loss fourfold returned him, and a mighty length of days.
 Sixty years of faith and patience gave him wisdom's mural crown;
 Sons and daughters brought him honor with his riches and renown.
 Men beheld his reverend aspect, and revered his blameless name;

And in peace he dwelt with strangers, in the fulness of his fame.
 But the heart of Abdel-Hassan yearned, as yearns the heart of man,
 Still to die among his kindred; ending life where it began.
 So he summoned all his household, and he gave the brief command,—
 "Go and gather all our substance; we depart from out the land."
 Then they journeyed to the Desert with a great and numerous train,
 To his old nomadic instinct trusting life and wealth again.
 It was now the sixth day's journey, when they met the moving sand,
 On the great wind of the Desert, driving o'er that arid land;
 And the air was red and fervid with the Simoom's fiery breath:—
 None could see his nearest fellow in the stifling blast of death.
 Blinded men from prostrate camels piled the stores to windward round,
 And within the barrier herded, on the hot, unstable ground.
 Two whole days the great wind lasted, when the living of the train
 From the hot drifts dug the camels and resumed their way again.
 But the lines of care grew deeper on the master's swarthy cheek,
 While around the weakest fainted and the strongest waxed weak;
 And the water-skins were empty, and a silent murmur ran
 From the faint, bewildered servants through the straggling caravan:—
 "Let the land we left be blessed!—that to which we go, accurst!—
 From our pleasant wells of water came we here to die of thirst?"
 But the master stilled the murmur with his steadfast, quiet eye:—
 "God is great," he said, devoutly,—“when *He* wills it, we shall die.”
 As he spake, he swept the Desert with his vision clear and calm,
 And along the far horizon saw the green crest of the palm.
 Man and beast, with weak steps quickened, hastened to the lonely well,
 And around it, faint and panting, in a grateful tumult fell.
 Many days they stayed and rested, and amidst his fervent prayer
 Abdel-Hassan pondered deeply that strange bond which held him there.
 Then there came an aged stranger, journeying with his caravan;
 And when each had each saluted, Abdel-Hassan thus began:—
 "Knowest thou this well of water? lies it on the travelled ways?"
 And he answered,—“From the highway thou art distant many days.
 "Where thou seest this well of water, where these thorns and palm-trees stand,
 Once the Desert swept unbroken in a waste of burning sand;
 There was neither life nor herbage, not a drop of water lay
 All along the arid valley where thou seest this well to-day.

Sixty years have wrought their changes since a man
of wealth and pride,
With his servants and his camels, here, amidst his
riches, died.
As we journeyed o'er the Desert, dead beneath the blaz-
ing sky,
Here I saw them, beasts and masters, in a common
burial lie;
Thirty men and eighty camels did the shrouding sand
infol;—
And we gathered up their treasure, spices, precious
stones, and gold;
Then we heaped the sand above them, and, beneath
the burning sun,
With a friendly care we finished what the winds had
well begun.
Still I hold that master's treasure, and his record, and
his name;
Long I waited for his kindred, but no kindred ever
came.
Time, who beareth all things onward, hither bore our
steps again,
When around this spot were scattered whitened bones
of beasts and men;
And from out the heaving hillocks of the mingled sand
and mould
Lo! the little palms were springing, which to-day are
great and old.
From the shrubs we held the camels; for I felt that
life of man,
Breaking to new forms of being, through that tender
herbage ran.
In the graves of men and camels long the dates unheed-
ed lay,
Till their germs of life commanded larger life from
that decay;
And the falling dews, arrested, nourished every tender
shoot
While beneath, the hidden moisture gathered to each
wandering root.
"So they grew; and I have watched them, as we
journeyed year by year;
And we digged this well beneath them, where thou
seest it, fresh and clear.
"Thus from waste and loss and sorrow still are joy
and beauty born,
Like the fruitage of these palm-trees and the blossom
of the thorn;
"Life from death, and good from evil!—from that
buried caravan
Springs the life to save the living, many a weak, des-
pairing man."
As he ended, Abdel-Hassan, quivering through his
aged frame,
Asked in accents slow and broken, "Knowest thou
that master's name?"
"He was known as Abdel-Hassan, famed for wealth
and power and pride;
But the proud have often fallen, and, as he, the great
have died!"
Then, upon the ground before them, prostrate Abdel-
Hassan fell,
With his aged hands extended, trembling to the lonely
well,—
And the sacred soil beneath him cast upon his hoary
head,—
Named the servants and the camels,—summoned
Haroun from the dead,—
Clutched the unconscious palms around him, as if they
were living men,—
And before him, in their order, rose his buried train
again.
Moved by pity, spake the stranger, bending o'er him
in his grief:—

"What affects the man of sorrow? Speak,—for
speaking is relief."
Then he answered, rising slowly to that aged stranger's
knee,—
"Thou beholdest Abdel-Hassan! They were mine,
and I am he!"
Wondering, stood they all around him, and a reverent
silence kept,
While, amidst them, Abdel-Hassan lifted up his voice
and wept.
Joy and grief, and faith and triumph, mingled in his
flowing tears;
Refluent on his patient spirit rolled the tide of sixty
years.
As the past and present blended, lo! his larger vision
saw,
In his own life's compensation, Nature's universal
law.
"God is good, O reverend stranger! He hath taught
me of His ways,
By this great and crowning lesson, in the evening of
my days.
"Keep the treasure,—I have plenty,—and am richer
than I see
Life ascend, through change and evil to that perfect
life to be,—
"In each woe a blessing folded, from all loss a greater
gain,
Joy and hope from fear and sorrow, rest and peace
from toil and pain.
"God is great! His name is mighty! He is victor in
the strife!
For he bringeth Good from Evil, and from Death com-
mandeth Life!"

Atlantic Monthly.

EXAMINING BOTTOMS OF WELLS.

It is not generally known, we think, how easy
a matter it is to examine the bottom of a well,
cistern, or pond of water, by the use of a common
mirror. The New Hampshire Journal of Agri-
culture says:

"When the sun is shining brightly, hold a
mirror so that the reflected rays of light will fall
into the water. A bright spot will be seen at
the bottom, so light as to show the smallest ob-
ject very plainly. By this means we have ex-
amined the bottoms of wells fifty feet deep when
half full of water. The smallest straw or other
small object can be perfectly seen from the bot-
tom of ponds and rivers, if the water be some-
what clear and not agitated by winds or rapid
motion. If a well or cistern be under cover, or
shaded by buildings, so that the sunlight will
not fall near the opening, it is only necessary to
employ two mirrors, using one to reflect the light
to the opening, and another to send it down per-
pendicularly into the water. Light may be
thrown fifty or a hundred yards to the precise
spot desired, and then reflected downward. We
have used the mirrors with success to reflect the
light around a field to a shaded spot, and also to
carry it from a south window through two rooms,
and then into a cistern under the north side of
the house. Half a dozen reflections of the light
may be made, though each mirror diminishes the
brilliancy of the light. Let any one not familiar

with this method try it, and he will find it not only useful, but a pleasant experiment. It will, perhaps reveal a mass of sediment at the bottom of a well which has been little thought of, but which may have been a fruitful source of disease by its decay in the water."

ITEMS OF NEWS.

The steamship *Africa* arrived at New York on the 23d inst., with dates to the 7th inst.

Nothing definite had transpired relative to the Congress, and it still looked doubtful whether it would assemble or not.

The last news was to the effect that Prince Gortschakoff had set out from St. Petersburg for Paris; but a telegraphic despatch in the official Dresden journal denies this, and states that his departure had been postponed indefinitely.

ENGLAND.—An enthusiastic reform meeting was held at Birmingham on the 6th instant. John Bright was the principal speaker. A resolution adopted calls for a large extension of the franchise and the adoption of the ballot system.

An address to Lord Palmerston, praying the Government to use its influence in maintaining the integrity and independence of the Pope's dominions, was in course of signature by the Roman Catholics in Ireland.

The London *Times* regards the dismissal of M. Walewski from the French Ministry, as a declaration that Napoleon is disposed to commit himself to a more liberal and generous line of policy, to cast himself into the Italian cause, and to maintain it against all the powers of despotism, and all the hostility of the Church.

The *Times* warns the Emperor that although he may count on the sympathy of England in his stand for the Italians, he must not expect that she will join him in an offensive alliance against other Powers.

FRANCE.—The London *Herald's* Paris correspondent states that Walewski was positively dismissed. His successor was regarded as antagonistic to England.

A report had been drawn up by the most eminent juri-consults of the French bar, which establishes the right of Frenchmen to petition the Senate for changes in the existing laws.

The friends of free trade in Paris had petitioned the Emperor for leave to re-establish the Association for obtaining a reform of the Customs tariff. They had also adopted measures for establishing a journal to defend their principles.

FEMALE MATHEMATICIAN.—A pension of £50 a year has been granted to Janet Taylor, an authoress whose works are well known to, and are appreciated by, the mercantile marine of England. She is the authoress of an "Epitome of Navigation and Nautical Astronomy;" "Improved Lunar Tables;" "Planisphere of the Stars;" "Hand-book to the Local Marine Board Examinations;" "Guide to the use of Maury's Charts," &c. In fact, she is the Mary Somerville of the marine world. She also keeps a Nautical and Mathematical Academy at the east end of London, the upper school of which is devoted to the preparation of masters and mates in the navy and merchant service.

It may possibly afford surprise to some of our readers to hear of one who indoctrinates practical seamen not only with the principles of ordinary navigation and the most approved methods of determining the latitudes, but can initiate them into the mysteries of spherical trigonometry, and its application to great circle sailing.—*N. Y. Tribune*.

FREE NEGROES LEAVING NEW ORLEANS FOR HAYTI.—

The bark *Laurel*, Captain Pierce, cleared yesterday, and will leave to-day for Port-au-Prince, Hayti, having on board, as passengers, eighty-one free persons of color, who are emigrating from this State to try their chances in Hayti. These people are all from the Opelousas parishes, and all cultivators—well versed in farming, and in all the mechanical arts connected with a farm. Among them are brickmakers, blacksmiths, wheelwrights, carpenters, &c. Some of them are proficient weavers, who have long been employed making the stuff called Attakapas cottonade, so favorably known in the market. They take along with them the necessary machinery for that trade, and all sorts of agricultural and mechanical implements.

These eighty-one persons—twenty-four adults and fifty-seven children and youths—compose fourteen families, or rather households, for they are all related, and the eighty-one may be called one family. They are all in easy circumstances, some even rich, one family being worth as much as \$50,000. They were all land owners in this State, and have sold out their property with the intention of investing their capital in Hayti.

KENTUCKY EXILES.—Twelve families, embracing in all thirty-nine persons, have arrived from Berea, Madison Co., Kentucky, whence they were forced to move on account of entertaining views and opinions in opposition to slavery. Believing they had acted in accordance with the laws of religion and humanity, they were ready to suffer all things, and awaited the future without fear, though ignorant of what it might bring forth. They are from the humble walks of life, and the most of their property has been left behind them, as in their hurried departure they had hardly opportunity to collect their wearing apparel.

The settlement of Berea, for some time past, has been a centre for anti-slavery men, John G. Fee, as delegate of the American Missionary Union, having organized several Churches on strict anti-slavery principles. A seminary, in which anti-slavery doctrines were taught, was also established about a year since, and at the time of the outbreak at Harper's Ferry was in successful operation. It is here proper to remark that both Mr. Fee and his associates have constantly disavowed all desire to interfere with slavery or to bring about its destruction by any except moral means. Regarding it as contrary to the teachings of the New Testament, they believed Scriptural truth the best refutation of its claims.—*Cincinnati Gazette*.

CAMELS.—Recently in Montgomery, Alabama, quite a crowd assembled near the capitol to witness a camel ploughing match. To test the comparatively strength of the camel and mule one of the latter was obtained, and the contest became spirited and exciting. The result in this particular case was decidedly in favor of the camel.

SEWING MACHINES.—They have become one of the domestic institutions of the country. They are introduced with great rapidity into all parts of the land, and into thousands of families. The following table shows the growth of the business. The principal companies making them are Wheeler & Wilson, I. M. Singer & Co., and Grover & Baker. Of the machines made by them, there were sold in 1853 about 2000; 1854, 5,000; 1855, 3,600; 1856, 7,400; 1857, 12,785; 1858, 17,659; 1859, 46,910. Of this vast number sold in 1859, Wheeler & Wilson sold 21,305; I. M. Singer & Co. sold 10,280; Grover & Baker sold 10,280. Nearly one-half of all that have been sold since the invention have been sold during the past year.—*Observer*.

EMANCIPATION OF THE SERFS.—The work of emancipation in Russia progresses. A large proprietor in

Stardub, a Russian village, has voluntarily emancipated his 181 serfs, and has given to them one-third of his land, requiring from them capitation taxes and all subsisting imposts. This large hearted man, his name is Herr Nicolai Furgeniev, at the end of the contract, declares that the peasants are at liberty to withdraw from the arrangement as soon as the negotiations between the government and the nobility shall offer them more favorable conditions.

In a recent address to the nobility of Pskow, the Emperor said:

"The question, the freeing of the serfs, is going forward to its solution, and I hope that you expect its consummation with the same reliance on me that I manifested when addressing myself to you, and with the full persuasion that this matter will be concluded to the mutual advantage of both parties—so that the interest of the nobles will be, as far as possible, secured, and, at the same time, the condition of the peasants improved. I am persuaded that you will justify my confidence in you."

EMANCIPATION OF SLAVES IN JAVA.—The great work of emancipation of Dutch slaves in Java has begun. The plan adopted is modelled on the act of 1834, which put emancipated negroes in the British Colonies on the footing of apprenticed laborers. By a subsequent act (Vic. c. 19) all apprentices were to cease after 1st August, 1840, but the Colonial legislature passed acts anticipating the day. In Java the apprenticeship is to last for six years, from the beginning of 1860 to 1866, after which date full liberty will be conceded. Owners receive 150 francs for slaves worth 1,000 francs each.

A negro preacher has been fined \$50 in Detroit, Michigan, and, in default of bail, is to be imprisoned 90 days, the penalty awarded by law for negro preaching in that State. The *Free Press* says the authorities are determined to prosecute every violation of this law.

EDUCATION IN IOWA.—The educational status of Iowa is shown to be good by the report of Thomas H. Benton Jr., Secretary to the Board of Education. There are in the State about 1000 school districts, and 4574 sub districts 240,431; persons between the ages of five and twenty-one years, of whom 142,849 have attended the public schools; 2620 school houses, worth \$1,049,747.41. There are about 3000 teachers in the public schools, who were paid last year \$383,589 29.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The receipts of Flour have fallen off, but the market is quite dull—there being little export or speculative inquiry, and not much demand for home consumption. Small sales of superfine at \$5 50 a 5 62½; extras at 5 75 a 6; extra family at \$6 12½ a 6 50 and fancy at \$6 25 a 7 00. There is no demand for Rye Flour or Corn Meal. The former is held at \$4 25, and the latter at \$3 75 per barrel.

GRAIN.—Wheat is dull and prices are moderately firm. Sales of 1500 bushels prime Pa. red at 134 a 135 cents per bushel. White is worth 140 a 150c. The market continues bare of Rye, at 93c. Corn comes forward very slowly, but there is not much demand for it. Sales of 2000 bushels at 75c. for yellow and 70 cents for white—both in the ears. Oats are dull at 41½ a 45 cts. for prime Pennsylvania, in store, and 43 cents per bushel for Delaware. Barley is steady at 83 cents. Sales of Barley Malt at 80 cents per bushel.

CLOVERSEED is more abundant and less active. Sales of common and prime quality at \$5 a 6½ per 64 lbs.

Timothy and Flaxseed are scarce. The latter at 156 a 158.

WANTED a situation as Assistant Teacher in a school of either white or colored children, by a young Woman, a member of the Society of Friends. Inquire at this office.
1st mo. 28, 1860.

WANTED by an experienced Teacher from Massachusetts, a situation for a Select School, in a Friends' neighborhood, where the advanced English studies are required to be taught. Address
L. VINING, Tuckerton, New Jersey.
1st mo. 28th, 1860.—3t.

ANNE CHURCHMAN'S BOARDING AND DAY SCHOOL, No. 908 Franklin street above Poplar.
1st mo., 28, 8t.

BYBERRY BOARDING SCHOOL FOR GIRLS. The Spring Session of this School, taught by Jane Hillborn and Sisters, will commence the 20th of 2d mo., 1860, and continue twenty weeks. The course of instruction embraces all the branches of a liberal English education.

Terms \$60 per Session, one-half payable in advance. For Circulars containing further particulars, address
JANE HILLBORN,
Byberry P. O., Penn.

1st mo. 28, 1860.—2 mo.

EATON ACADEMY, KENNETT SQUARE, CHESTER COUNTY, PA. The Winter Term of the above Institution will expire on the 15th of the 3d mo. next, but, in order to meet the desire of many of the Pupils, and friends and patrons of this Institute, the undersigned have concluded to re-open the School for both sexes, on 2d day the 19th following, and continue it a period of ten weeks, or half a Session, at the present rates, which are \$65 per Term for Tuition, Boarding, &c., and \$16 for Tuition only, one-half payable in advance.

Catalogues, containing further particulars, will be sent to those desiring the same. Apply to
WILLIAM CHANDLER,
Principal and Proprietor,
Or to WILLIAM A. CHANDLER,
Principal Instructor.

1st mo. 28, 1860.

LAKE SCHOOL FOR BOTH SEXES. The 2d semi-term of 20 weeks is to begin 20th of 2d month. The charge, in full, for board and tuition, per term of 20 weeks, is \$45, or at the rate per week of \$2½.

Circulars with references sent by applying to either subscriber
SIDNEY AVERILL,
ELMINA AVERILL,
West Vienna, Oneida Co., N. Y.,
1st mo. 8, 1860. Proprietors.

SPRINGDALE BOARDING SCHOOL, FOR BOTH SEXES, Loudon Co., Va. The next session will commence the 3d of 10th mo.

Terms \$115 for 40 weeks, payable quarterly in advance. Languages and Drawings extra.

It is hoped that Friends interested will avail themselves of the preference by entering pupils early. Apply, for particulars, to

GEO. A. NEWBOLD,
Purcellville, Loudon Co., Va.

8th mo. 6, 1859.—6m.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, SECOND MONTH 4, 1860.

No. 47.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,

No. 324 South Fifth Street,

PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

A TRUE TOUCH-STONE.

BY HUGH TURFORD.

Many professors of christianity seem to think that godliness consists in hearing, reading, praying, praising, &c. These are all good exercises, if rightly performed, and may be called christian duties; because that all true christians, by the good Spirit of God in their own hearts, are often drawn to perform them. Howbeit, the performance of these and such like things alone, is no certain proof of godliness; and christianity cannot be known thereby. For, as there was a more excellent righteousness than what was found in the zealous pharisees, so there is a more excellent godliness than what appears in most professing christians.

Hearing, reading, praying, praising, with other exercises of that nature, may be imitated: the ungodly as well as the godly, the formalist as well as the sincere, may be found in the practice of such things: but true godliness cannot be imitated,—being the natural effect of the rule and government of a right spirit, and may be truly called “the issues of life,”—which none can bring forth but such who are christians indeed.

True godliness is supernatural; and so above the reach of men that are servants to sin. We must be reduced or brought into a god-like nature, before we can bring forth a godly conversation. Grapes cannot be expected from thorns, nor figs of thistles: the tree must be made good, before the fruit can be good. A righteous life is the natural effect of a right spirit. Our lights cannot shine forth before men, until we are enlightened with the light of Christ. Without a true conversion, there can be no true conversation; for all who are in the state of fallen Adam,

being ungod-like until they are raised by Christ the second Adam, cannot live god-like.

All true christians who have the spirit of Christ, may find the nature and life of Christ in themselves. Others may have some sense thereof by reading and well considering the contents of the fifth, sixth and seventh chapters of Matthew—where it is said that Jesus, “seeing the multitude, went up into a mountain, and when he was set, his disciples came unto him, and he opened his mouth and taught them.” And what he taught his disciples then, he teacheth all true christians now: for though he ascended, the holy Spirit that dwelt in him descended, and did then, doth now, and to the end of the world will tabernacle with all the Lord’s children, to be their teacher; and as many as walk after this Spirit are taught of Christ, and walk in his footsteps. For, as no vine beareth one kind of grapes, and the branches another; so every member of Christ answereth the life of Christ in their conversations. They are consequently humble, lowly, meek, merciful, patient, peaceable, just, upright, honest and faithful. A christian is not known so much by his words or his devotion, as by his works, his nature, his life and his conversation.

In order to show this I shall insist chiefly on the five following exhortations, or commands of Christ; the least of which, as a true trial of christianity, is more to be observed than that command, Luke xxii. 19, which says, “this do in remembrance of me:” for the proud as well as the humble, the cruel as well as the merciful, the fraudulent as well as the just, the ungodly as well as the godly, can observe the one, but cannot conform to the others.

The true trial of christianity is to be found in the life and nature of Christ. If the spirit of Christ hath the rule in us, these following fruits will be brought forth by us:

First. In all our communications, our yea will be yea, and our nay, nay: the word that goeth out of our lips will be true and sure.

He that is a christian indeed, hath no necessity in himself, nor need to be urged by others, to bind his soul with an oath to perform his word: for the law of the Spirit of life in his heart constrains him so to do.

Christians, in their communications, weigh their words before they utter them, together with their capacities to perform them; knowing

that a promise cannot be broken, without violating the righteous law of God in their own hearts. For, whenever such violence is done, terror ensues; and this makes good men, who live under the government of Christ, dread much more to break their words, than others do to forfeit their bonds. This holy dread, and principle of truth, makes our yea to be yea, and our nay to be nay. This makes us cautious in our promises, and careful in our performances. The exhortation may be read in scripture, but the binding tie must be known in our own hearts.

All that have the scriptures have this rule; but unless we have a principle of life and truth in ourselves, we cannot walk by this rule: and we must not only have such a principle, but we must also improve it by a continual practice, until it becomes our life, our centre, and our nature. For, till this is the case, we may say, these things we should do, but cannot say, these things we do: and so we witness against ourselves, that though we have the scriptures, we walk not according to the scriptures;—though we have the words of Christ; we are not in the life and nature of Christ;—our yea is not yea, and our nay, nay, in our communication;—our words and our promises are not steadfast and sure.

Swearing, in the communications of christians, is superfluous; for where Truth rules in the heart, there cannot be falsehood in the lips. Prove a professed christian by this rule; measure him with this line; weigh him in this balance. If his yea be yea, and his nay, nay, in all his communications;—if he is a man of his word at all times;—if his performances are one with his promises,—he abides in the doctrine of Christ; and this is an evident demonstration that he is a christian indeed. But if these performances are wanting,—though we have a christian name, we are not in the christian nature: for, as said before, what manner of grape the vine beareth, the branches thereof (if they continue in the vine) bear the same.

The second exhortation or command of Christ was this, "Resist not evil." And this was not only his doctrine but his life and nature; as we may plentifully read in scripture. Though he met with revilings, reproaches, buffetings and cruel usage, we do not find that he was ever moved thereby; much less that ever he resisted, but gave his cheek to the smiter; and when he was led as a lamb to the slaughter, "he was as a sheep dumb before the shearer; he opened not his mouth" so much as to say, What have I done? or why is it thus?

Now the fruits of the Spirit in the head and members, the captain and followers, Christ and christians, are one in nature. For, as Christ was humble, lowly, meek, patient and peaceable under all his sufferings, so are christians, if christians indeed. They render not evil for evil; they desire not an eye for an eye, nor a tooth for

a tooth; and revenge of any kind is far from them. But as patience and forbearance was the life and nature of Christ, so it is the life and nature of all true christians, as they grow in grace, and come to the fulness of the stature of Christ.

By this also, professors of christianity may prove themselves, whether they are christians indeed; for it is the deed that manifests the spirit. Now, bad men may have good words,—forms may be imitated;—but the patience, the meekness and forbearance that dwelt in Christ, and may be found in all true christians, cannot be imitated. If any vice hath got head in us, make what profession we will, the fruit of the vice will be brought forth by us. We shall be proud,—we shall be covetous,—we shall be envious; if we are reviled, we shall revile; if we are smitten, we shall smite; if we are sued at the law causelessly, we shall sue: and whilst it is so, we are in the world's nature,—its spirit hath the rule over us, and not the lowly, meek, lamb-like spirit of JESUS.

The third exhortation or command of Christ was this: "Love your enemies; bless them that curse you; do good to them that hate you, and pray for them who despitefully use you, and persecute you."

This also was not only the doctrine but the life and nature of Christ: and as it is the life and nature of Christ, so it is the life and nature of christians who are thoroughly leavened with the spirit of Christ. No man having this spirit and living under the government thereof, can hate the person of any man; for by creation, we are all the workmanship of God's hands: and all true christians know that enmity, hatred, cursing, spite and persecution, proceed not from men or women, as they are the Lord's creation in his own image, but because they have lost that image, and are become emptied of good, and filled with evil. Thus, as an evil spirit comes to have the rule over us, evil fruits are brought forth by us.

Could we but impartially see ourselves;—did we but observe our own natures and dispositions, with the fruits we bring forth in our lives,—we might easily judge of ourselves and others, whether we were converts to christianity or not;—whether the spirit of Christ, or the spirit of this world, had the rule in us and over us. For the course of our lives (especially in times of trial) declares who are led by the meek spirit of Jesus, and who are not;—who are leavened with the leaven of righteousness, and who are not;—who lead a sober, upright, godly life, and who do not. For it is not our words, but our conversation and manner of life, that manifests what spirit hath the rule in us and over us.

Until our natures become changed by conversion, we can not love enemies, but shall have the same enmity against them as they have against us: we cannot bless them,—we cannot pray for

them, and we shall be forward to do them hurt ; but far from doing them good.

Come, professors of christianity, lay aside your forms that you have long contended about ;—measure yourselves by this line,—try yourselves by this touchstone. Are you reduced to such a frame of spirit as to “love your enemies—to bless them that curse you—to do good to them that hate you, and to pray for them that despitefully use you and persecute you” ? This is the true character of christianity ;—this declares us to christians indeed.

But if our natures are averse to these things, let our profession be what it may,—we bear not the image of God,—we are not the children of our heavenly Father : “for he maketh his sun to rise on the evil and on the good, and sendeth rain on the just and on the unjust.” If we were but truly converted—if our natures were thoroughly changed, our lives would be conformable to the spirit of Christ,—we should be christians indeed.

A fourth branch of the life, nature and doctrine of Christ, was manifested in these words : “Take no thought what ye shall eat, or what ye shall drink ; nor yet for your body, what ye shall put on. But seek ye first the kingdom of God and his righteousness.”

And what is this kingdom that all true christians should *first seek* ? It cannot be any thing above our reach ; it must be that kingdom which Jesus compared to a lost piece of silver ; it must be an acquaintance with that Spirit and the government thereof, which from the beginning the great God placed in the hearts of men to be their instructor in the path of righteousness.

This spirit was abundantly manifested in Christ the second Adam ; and so in scripture is called the spirit of Christ, for that it always dwelt in him, and was not only his life, but the life that is given to all true believers for their ransom from the power of sin. Hence, it and its government in us is necessary to be *first sought* ; because, until an humble, lowly, meek, lamb-like spirit is raised in us, and comes to have the rule over us, we know not the Lord, nor can we depend on his providence. But the rule and government of this Spirit reduces every member to an excellent qualification ; and as many as are taught and governed thereby, learn in all states to be content.

This was the life and nature of Christ. “The foxes have holes, and the birds of the air have nests, but the son of man had not where to lay his head ;” yet was he content. His thoughts ran not out into anxious care about things pertaining to the body. It was his meat and his drink to do his Father’s will, and to finish the work he was sent to do, namely, the fulfilling of all righteousness, by doing those things which were right in the whole course of his life, as a precedent and example to all his followers.

As many as have found the kingdom of God

and his righteousness, and are come to live under the rule and government of his Spirit,—have the mind of Christ : and though they live in the world, their thoughts run not out after the world.

A true christian conversation is to be diligent in our callings, moderate in our expenses, and content with our estates. Whosoever are reduced to a state of true temperance and moderation, take but little thought what they shall eat, or what they shall drink, or wherewithal they shall be clothed. They delight in justice, equity, truth and faithfulness ; and their thoughts are exercised therein ; they rest on God’s providence, and their honest endeavours are attended with his blessing.

And herein, professors of christianity may also prove themselves. This is a true measuring line,—a path that no man can walk in but such as have the spirit of Christ. All ungodly men seek the world first (I may say, first and last)—the riches of the world,—the honor of the world,—the pleasures of the world, and the praise of the world. They inquire what they shall eat, and what they shall drink, to please their appetites,—what they shall put on to be accounted great in the world, and to have the preeminence above and before their fellow-creatures. Their thoughts are occupied far more how they shall be conformable to the fashions of the world, than how they shall become conformable to the life, nature and doctrine of Christ. Their state is more heathenlike than christian-like, and is not without much covetousness and dishonesty.

This is the natural state of the sons and daughters of men whilst they continue in a state of degeneracy, as aliens to the commonwealth of God’s true Israel, and strangers to the covenant of promise that the Lord made with the house of Jacob : and to a better state none can come, but by seeking and finding the kingdom of God and his righteousness,—or the rule and government of the spirit of Christ in their own hearts. There, the seed is sown,—there, the leaven is laid,—there, the pearl of great price is found ; but not without digging deep : for, while vice is uppermost, virtue is lower-most ;—while sin reigns, the power of grace does not rule. The bringing down of the one, is the exaltation of the other.

There must be a death unto sin, before there can be a new birth unto righteousness ; and there must be a growth in righteousness, before we can centre in that content which takes no thought what we shall eat, what we shall drink, or wherewithal we shall be clothed. Hence, it ought to be every man’s principal concern, *first* to seek the kingdom of God and his righteousness ;—*first*, to know the rule and government of a right spirit in ourselves ; for this qualifies us, and makes us capable of leading a christian life, and of performing all our christian duties, both to God and man.

(To be continued.)

JUVENILE MEMOIR.

Memoir of Samuel W. Clarke, given by his mother.

Our beloved son was born on the 14th December, 1805. The first year of his life he suffered much from the complaints incident to infants, though with the outward appearance of health. After being weaned he became rather slender, but was very active. I devoted myself to his comfort and amusement, and was happy in tracing the first dawning of the various faculties of nature, and the first expanding of the affections of the heart. His father observed with pain an inequality of his animal spirits, and early determined to endeavor to regulate and form his habits to some pursuit, that should, as far as possible, counteract and destroy his tendency to extremes, already discernible in our dear child. From infancy to six or seven years of age, there was nothing very extraordinary in his character or conduct, except his attachment to old people.

He was tender in his feelings, unusually mild in his temper, affectionate to his parents and sisters, quick in his apprehension, and endowed with an accuracy of observation and memory, which not only promised usefulness, but excellence. Quick, strong, and permanent in his attachments, he was an object of more than common interest to all that knew him. When about seven years old, our dear son's mind was much affected and engaged on the subject of religion.

I had, till this time, lived without the true and living knowledge of God in the heart, (though what the world calls a believer), but the day-star then, I trust, began to arise in my soul, and the day-spring from on high to visit me, and I became deeply anxious to instruct my children in the great and momentous doctrines of truth, on which I now rested the salvation of my own soul, and all those so very near and dear to me; endeavoring to lead their young and tender hearts to a crucified Saviour, who died that they might live; enlarging much on eternity and the final day of judgment. I was happy to see them comprehend these sublime doctrines, more than I had believed possible, and to witness in their conduct some good effects.

Our dear son seemed earnestly engaged on these subjects: his mind was in a most extraordinary manner illuminated and absorbed in these great truths; and his conversation being clear, connected and fluent, surprised us all. He addressed himself to old and young, to the servants as well as his companions; insisting, usually, on obedience to our Heavenly Father, and love to his Son, as the only foundation for happiness hereafter, and painting in the language of the Scriptures the dreadful state of those who were disobedient.

He seemed particularly interested for black people. On a visit to his uncle Maxwell's, he conversed with an old woman, belonging to him. She was pious, but could not read the Bible; he

wished much to instruct her, but finding it difficult, he abandoned the idea, and said he would tell her what was in it.

When his aunt saw me, she mentioned the great alteration in his conversation, and their surprise at his piety and fervor, so uncommon at his age, and so consistent with the Scriptures. She acquainted me that the black woman said, my dear boy "would not live long, he was already God's child." He endeavored to instruct his sisters, and I have often wept over the precious aspirations of the Holy Spirit, from such young hearts. At this time he could not read the Bible with ease, but it was almost continually in his hands. He informed me of his wish to attend Friends' meetings. I consented he should make the trial, and ever after he was a constant attender thereat. He now began to form an acquaintance with some of the members of the Society (his first attendance and preference was entirely independent of my personal intimacy with any of the members of the Society) and he became much attached to some of its ancient heads.

Their week-day meetings were now an object of his desire; and I arranged for his dismissal from school at the proper time. After attending those for worship, for some time, and wishing to sit in those for business, it was proposed and acceded to by the members. I have noticed with surprise that my dear boy returned from these meetings (which sometimes lasted from 11 till 3 or 4 o'clock,) without the least appearance of fatigue, disgust or hunger. The discipline of the Quaker Church was now a matter of deep interest to him. He wished to dress in their manner, and use their language; desiring me to excuse him from the usual forms of address which have obtained currency in the world. I acceded to this, as well as all other of his wishes connected with his profession; believing I had no right to interfere in regulating a mind so manifestly taught by the Spirit of God.

The dear boy requested me to say grace in my heart before meals; mentioning his own wish and intention of giving the Lord thanks always, and desired I would prevail on his uncle and aunt to join us. His conversation was now pious and serious. He began the Bible, and read for some time every evening, intending to read it through.

His sisters were baptized. I left him at liberty to make his choice; he refused to join them, saying, he believed but in one baptism, that of the Spirit. Our town was very sickly in winter, and the many deaths made a deep impression on his mind. He often remarked, solemnly, on the uncertainty of our existence, and the necessity for a due preparation for death. He was in the constant habit of drawing matter for the improvement of the heart and life from many striking, or, to him, interesting occurrences; such as the one just mentioned; the deliverance of his friends or neighbors from danger; the public

punishment of those who had transgressed the law, dwelling earnestly on the hope he felt, from the conduct and confession of one, that God would grant him repentance, and forgive his sins. The great and essential doctrines of religion were made plain to his understanding, and he could give as good a reason for the hope within him, as most of those who had twice his years; adhering uniformly to the faith he had embraced, and zealously defending the Quaker practice and belief; expressing his hope and expectation of being one day a preacher among them himself. Almost every Sabbath it was his custom to take his sisters up stairs, place chairs in order, and hold a meeting; he was much delighted if he could prevail on them to sit still; he would sometimes preach and pray, and then dismiss them in the manner of Friends. It gave him great satisfaction to be able to induce his young acquaintances to attend meeting with him. In this he often succeeded; and after the assembly separated, he occasionally preached to them himself.

I wished the morning and evening prayers of my dear son to be his own in thought and expression. His manner was devout, and his matter that of a mind more exercised regarding the state of the soul after death, and the spirituality and the glory of our heavenly Father's existence, than most would have believed possible in one so young. I had often been told that "Samuel could not live long; that he was not fit for this world." A good old lady, my aunt, to whom he was much attached, said, "I must dedicate him, a second Samuel, to God, from his birth." And now in the midst of all our hopes, spiritual and temporal, for surely a child could scarcely promise more, God saw fit to remove him from us and to take him to himself. How heavy the blow! How irreparable the loss! none can understand but those who have suffered.

I had fondly anticipated a youth, not of levity, folly, and transgression, but full of peace and piety; which instead of trying our hearts by its wanderings, should edify by its purity. I had looked forward to the time, and many of those who knew him indulged the same hope, of his being a teacher and a pillar in the church of our blessed Lord.

This hope I would not have exchanged to have encircled his brow with the first earthly diadem.

He was now nine years old. Eight days of sickness and anguish severed him from our arms forever.

Now I know something of the cross of Christ Jesus; that cross which crucifies me to the world and the world to me, and in the destruction of this our fondest earthly hope, regarding this our first-born and only son, I realized the way in which I was led to follow a Saviour, who, for my sake, "became a man of sorrows and acquainted with grief."

CELIA CLARKE.

Greenwich, (R. I.)

Extracts from a letter dated Jericho, 9th mo. 27th, 1824.

MY DEAR FRIEND,—Thy very acceptable letter of the 29th ultimo came duly to hand.

As to my asserting that I believed the Scriptures were held in too high estimation by the professors of Christianity in general, I readily admit, as I have asserted it in my public communications for more than forty years, but, generally, in opposition to those that held them to be the only rule of faith and practice; and my views have always been in accordance with our primitive Friends on this point. And at divers times, when in conversation with hireling teachers (and at other times), I have given it as my opinion, that so long as they held the Scriptures to be the only rule of faith and practice, and by which they justify wars, hireling ministry, predestination, and what they call the ordinances, viz: water baptism and the passover supper, mere relicts of the Jewish law, so long the Scriptures did such more harm than good, but that the fault was not in the Scriptures, but in their literal and carnal interpretation of them—and that would always be the case until they came to the Spirit that gave them forth, as no other power could break the seal and open them rightly to us. Hence I have observed, in my public communications, and in conversation with the members of different denominations, and others, who held that the Scriptures are the primary and only rule of faith and practice—that, according to the true analogy of reasoning, "that for which a thing is such, the thing itself is more such"—as the Spirit was before the Scriptures, and above them, and without the Spirit they could not have been written or known. And with this simple but conclusive argument, I have convinced divers of the soundness of our doctrine in this respect—that not the Scriptures but the Spirit of Truth, which Jesus commanded his disciples to wait for, as their only rule, that would teach them all things, and guide them into all truth, is the primary and only rule of faith and practice, and is the only means by which our salvation is effected.

I admit that I did assert, and have long done it, that we cannot believe what we do not understand. This the Scripture affirms, Deut. xxix., 29—"The secret things belong unto the Lord our God, but the things that are revealed belong unto us and our children forever, that we may do all the words of this law"—and all that is not revealed is to us the same as a nonentity, and will forever remain so, until it is revealed; and that which is revealed enables us, agreeably to the apostle's exhortation, to give a reason of the hope that is in us, to honest enquirers. I also assert, that we ought to bring all doctrines, whether written or verbal, to the test of the Spirit of Truth in our own minds, as the only sure director, relative to the things of God; otherwise, why is a

manifestation of the Spirit given to every man, if it is not to profit by; and, if the Scriptures are above the Spirit, and a more certain test of doctrines, why is the Spirit given, seeing it is useless? But this doctrine, that the Scriptures are the only rule of faith and practice, is a fundamental error, and is manifested to be so by the Scriptures themselves, and also by our primitive Friends' writings.

It is my belief, that we come into the world in the same state of innocence, and endowed with the same propensities and desires that our first parents were, in their primeval state; and this Jesus Christ has established, and must be conclusive in the minds of all true believers; when he took a little child in his arms and blessed him, and said to them around him, that except they were converted, and became as that little child, they should in no case enter into the kingdom of heaven. Of course, all the desires and propensities of that little child, and of our first parents in their primeval state, must have been good, as they were all the endowments of their Creator, and given to them for a special and useful purpose. But it is the improper and unlawful indulgence of them that is evil.

I readily acknowledge, I have not been able to see or understand, how the cruel persecution and crucifixion of Jesus Christ by the wicked and hard hearted Jews should expiate my sins; and I never have known any thing to effect that for me, but the grace of God, that taught me, agreeably to the apostle's doctrine, to deny all ungodliness and the world's lusts and to live soberly, righteously and godly in this present world; and as I have faithfully abode under its teachings, in full obedience thereto, I have been brought to believe that my sins were forgiven, and I permitted to sit under the Lord's teaching, as saith the prophet: "that the children of the Lord are all taught of the Lord, and in righteousness they are established, and great is the peace of his children." And so long as I feel this peace, there is nothing in this world that makes me afraid, as it respects my eternal condition. But if any of my friends have received any known benefit from any outward sacrifice, I do not envy them their privilege. But, surely, they would not be willing that I should acknowledge as a truth, that which I have no kind of knowledge of. I am willing to admit, that Divine Mercy is no doubt watching over his rational creation for their good, and may secretly work at times for their preservation; but if, in his infinite wisdom and goodness, he sees meet to hide it from us, as most consistent with his wisdom and our good, let us have a care that we do not, in the pride of our hearts, undertake to pry into his secret counsels, lest we offend; but be content with what he is pleased to reveal to us, let it be more or less, and, especially, if he is pleased to speak peace to our minds. And when he graciously condescends to do this, we

shall know it to be a peace that the world cannot give, with all its enjoyments, neither take away, with all its frowns.

I shall now draw to a close, and, with the salutation of gospel love, I subscribe myself thy affectionate and sympathizing friend and brother.

ELIAS HICKS.

RICHARD WATSON ON CREEDS.

The following extracts are taken from the life of Richard Watson, Bishop of Landaff, and contain his opinion on subjects much agitated; it would be well if some of the highly professing orthodox of every persuasion would pattern after his liberal principles. His opinion of catechisms is as follows:

"What are the catechisms of the Romish church, of the English church, of the Scotch church, and of all other churches, but a set of propositions which men of different capacities, educations, and prejudices, have fabricated (sometimes on the anvil of sincerity, oftener on that of ignorance, interest, or hypocrisy) from the divine materials furnished by the Bible? And can any man of enlarged charity believe, that his salvation will ultimately depend on a concurrence in opinion with any of these niceties, which the several sects of Christians have assumed as essentially necessary for a Christian man's belief? Oh no! Christianity is not a speculative business. One good act performed from a principle of obedience to the declared [manifested] will of God, will be of more service to every individual, than all the speculative theology of St. Augustin, or Anastasius Frelinghansen."

The following are his liberal and pertinent views of creeds:

"I certainly dislike the imposition of all creeds formed by human authority; though I do not dislike them, as useful summaries of what their compilers believe to be true, either in natural or revealed religion.

As to natural religion, the creeds of the most distinguished philosophers, from *Plato* and *Cicero* to *Leibnitz* and *Clark*, are extremely various, with respect to the origin of things—the existence and attributes, natural and moral, of the Supreme Being—the natural mortality or immortality of the human soul—the liberty and necessity of human actions—the principle of virtue, and other important points.

And as to revealed religion, though all its doctrines are expressed in one book, yet such a diversity of interpretations has been given to the same passages of Scripture, that not only individuals, but whole churches, have formed to themselves different creeds, and introduced them into their forms of worship. The Greek church admits not into its ritual either the Apostle's creed, or the Athanasian, but merely the Nicene. The Episcopal church in America admits the Nicene

and the Apostle's creed, but rejects the Athanasian. The church of England admits the whole three into its liturgy; and some of the foreign Protestant churches admit none but the Apostle's. These and other creeds which might be mentioned, are all of human fabrication; they oblige conscience, as far as they are conformable to Scripture, and of that conformity every man must judge for himself. This liberty of private judgment is recognized by our church (notwithstanding subscription to the thirty-nine articles) when, in the service for the ordering of priests, it proposes this question:—"Are you determined, out of the said Scriptures, to instruct the people committed to your charge, and to teach them nothing, as required of necessity to eternal salvation, but that which you shall be persuaded may be concluded and proved by the Scriptures?"

The Bishop of Landaff's definition of orthodoxy:

"What is this thing called orthodoxy, which mars the fortunes of honest men, misleads the judgment of princes, and occasionally endangers the stability of thrones? In the true meaning of the term, it is a sacred thing, to which every denomination of Christians lays an arrogant and exclusive claim; but to which no man, no assembly of men, since the apostolic age, can prove a title. It is frequently amongst individuals of the same sect nothing better than self-sufficiency of opinion, and pharisaical pride, by which each man esteems himself more righteous than his neighbors. It may perhaps be useful in cementing what is called the *alliance* between church and state; but if such an alliance obstructs candid discussions, if it invades the right of private judgment, if it generates bigotry in churchmen, or intolerance in statesmen, it not only becomes inconsistent with the general principles of Protestantism, but it impedes the progress of the kingdom of Christ, which we all know is not of this world."

Joseph Wyeth in his answer to the "Snake in the Grass," in treating of that Divine Light, "a manifestation of which is given to every man to profit withal," says:—"This, in short, is the substance of what hath been declared by us, concerning this Divine Light, Christ in men, and which is not more than is witnessed of it in the Holy Scriptures, in the words of which our Friends have frequently given their belief in this, as in other articles; and that with good reason, for the Spirit of God in his church in this age, can well agree to the language of the same Spirit, in, and to the churches in the former ages. And here I may fitly observe, that too nice expressing and minute particularising of articles of faith, has been frequently one ground of heresy and schism, and occasioned great disturbance in the world: and it is no wonder, when

men forsake that teaching grace which brings salvation, they should set up that earthly wisdom,* which in matters of faith, breeds confusion."

EXTRACT.

The observance of the secret admonition of the heart, is an effectual means to cleanse and sanctify us; and the more it is attended to, the more it will be conversant with our souls, for our instruction. In the midst of difficulties, it will be our counsellor; in the midst of troubles it will be our light and our comforter.

It is impossible for us to enjoy the influence of this good Spirit, till we are deeply sensible of our own emptiness and nothingness, and our minds are thereby brought down and laid in the dust. The spirit of Christ is indeed a humbling spirit; the more we have of it, the more we shall be humbled: and it is a sign that either we have it not, or that it is yet overpowered by our corruptions, if our heart be still haughty.

Attend, therefore, to the secret persuasions and dissuasions of the Spirit of God, and beware of quenching or grieving. This wind that blows where it lists, if shut out or resisted, may never breathe upon us again, but leave us to be hardened in our sins. If observed and obeyed, it will, on all occasions, be our monitor and director. When we go out, it will lead us; when we sleep, it will keep us; and when we awake, it will talk with us."

WAR.

"Who has ever told the evils and the curses and the crimes of war? Who can describe the horrors of the carnage of battle? Who can portray the fiendish passions which reign there? Who can tell the amount of the treasures wasted, and of the blood that has flowed, and of the tears that have been shed over the slain? Who can register the crimes which war has originated and sustained? If there is any thing, in which earth, more than in any other, resembles *hell*, it is in its *wars*. And who, with the heart of a man,—of a lover of human happiness—of a hater of carnage and crime—can look but with pity, or repress his *contempt* in looking on all the trappings of war; the tinsel, the nodding plumes, even the animating music designed to cover over the reality of the contemplated murder of *fathers and husbands and sons*."

A. B.

The above holds up a picture of the *horrors*

* Mark the concurrence in opinion between Richard Watson and Joseph Wyeth respecting creeds. The former considers them all of human fabrication; and the latter as being set up under the influence of earthly wisdom, and the occasion of much disturbance in the world. The words "human fabrication," and "earthly wisdom," as they are used by their respective authors, may be considered as synonymous terms.

of war, penned by one, who, I presume, would stand on the defensive if attacked, who perhaps has seen no further. May we, members of the Society of Friends, who profess to have seen into the beauties of a non-resistant life, examine how far *our conduct* is in advance of the feeling depicted in the few last lines, when "looking on all the trappings of war." Are there not among us, many occupying the responsible situation of parents, who are found, at the sound of martial music, throwing aside their various employments and eagerly calling upon the children to come and see and hear? Ah! there is on such occasions often a seed sown, which in after life will spring up, and bear fruit bitter to the taste of the parent.

"The London Times calls attention to the report that 237 tons of bones have been imported from Sebastopol, and asks if they are the bones of men and animals commingled, and now exported by Russia, and imported by English speculators, to manure our fields." J.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, SECOND MONTH 4, 1860.

Friends who have subscription papers for Dr. Ezra Michener's "Retrospect of Quakerism," will please return them immediately to the publisher, T. Ellwood Zell, No. 439 Market Street, Philadelphia. Some of the subscription papers have not been returned, and it is important that the names of all subscribers should be furnished immediately, as the work is now in press.

DIED, In Bendersville, Adams county, Pa., on the 7th of First month, 1860, JOSIAH PENROSE, aged 69 years, 9 months and 10 days. A member of Monallen Monthly Meeting, Adams county, Pa.

—, Suddenly, after a short but severe illness, of disease of the heart, on the 18th ult., at West Branch, Clearfield county, Pa., JEREMIAH C. MOORE, in the 23th year of his age.

—, On the 23d of Eleventh month, 1859, BEULAH JANNEY, in the 76th year of her age. A valuable member of society, and an Elder of Fairfax Monthly Meeting, in Loudoun county, Va.

—, In Worcester, Mass., First month, 16th, 1860, DINAH ROGERS, aged 78 years.

Dinah Rogers was born in Easton, N. Y., First mo. 5th, 1782. In 1798 she married Aaron Rogers, of Danby, Vermont, at which place she resided until Eighth month, 1858, when she removed with her husband to Worcester, Mass., to live with their son. For sixty-two years she has been a member of Danby Monthly Meeting, foremost in the rank of true and devoted spirits, and for many years an Elder, universally esteemed and respected, and particularly so by the young. It would be difficult to find one who has sustained with more dignity and propriety all the relations of social life; a true wife, a loving and devoted

mother, a kind and sympathizing friend, and especially the friend and counsellor of the poor and suffering.

She was widely known and loved, and many who will read this brief tribute to her memory will sympathize with her widowed husband, who has walked hand in hand with her for sixty-two years, and who now seems peacefully waiting to join her in the land of the blest. Her remains were brought to this place for interment, and perhaps the best testimony to the purity and benevolence of her life might be found in the numbers of the poorer class who crowded around the open coffin, returning again and again to look once more upon the countenance of one who had been to them a true friend.

Danby, Vermont.

DIED, At Coleraine, Belmont county, Ohio, on the 5th of Eleventh month, 1859, FRANCES D. FOX, in the 49th year of his age. An exemplary member of Concord Monthly Meeting.

—, On Third-day morning, the 24th inst., SALLIE MAROT, daughter of Charles H. and Hannah S. Marot, aged 17 months and 20 days.

—, On the morning of the 22d inst., CATHARINE MOORE, widow of the late Dr. John Moore, in the 79th year of her age.

For Friends' Intelligencer.

THE AFRICAN COLONIES.

We believe the reading public are not generally aware that the merit of making the first suggestion for colonizing Africa, as the only effectual means of putting an end to the Slave Trade, is due to the members of the New Church, or as they are commonly called, the Swedenborgians. On this account we are induced to present to the readers of Friends' Intelligencer, two extracts published in the New Jerusalem Messenger, which are taken from a MS. history of the New Church, written by John Hough James, of Urbana, Ohio; a work, which, from its character, we should be glad to find published, and accessible to all who take an interest in the records of the various Christian sects.

The recent discoveries of Livingston and other travellers, of a people in a comparatively civilized condition in Central Africa, must lead us to regard the revelations made by Baron Swedenborg as approaching at least to a commencement of their fulfilment. He saw, as in the future, commercial relations existing between the people on the coast of Africa, and the nearly civilized residents of the interior of that vast country. In his "Continuation of the Last Judgment," Swedenborg uses the following language:

"Such being the character of the Africans even in the world, there is at the present day, (1757,) a revelation among them, which commencing in the centre of their continent is communicated around, but does not reach their coasts. They acknowledge our Lord as the God of heaven and earth, and laugh at the monks in those parts they visit, and at the Christians who talk of a threefold Divinity, and of salvation by mere

thinking, saying that there is no man who worships at all, who does not live according to his religion, and that whosoever does not, must become stupid and wicked, because in such case he receives nothing from heaven. Ingenious wickedness, too, they call stupidity, because there is not life, but death in it. I have heard the angels rejoicing over this revelation, because, by means of it, a communication is opened for them with the human rational, hitherto closed up, by the blind which has been drawn over the things of faith."

This disclosure of the remarkable reformer, caused a number of the converts to his faith to assemble twenty two years after its promulgation, that is to say, in the year 1779, at Norkjoping, in Sweden, and their proceedings are thus ably described in the MS. history before referred to.

"The principal business of the Conference at Norkjoping, was to consult upon and devise the most practicable means of forming an association, whose wishes and endeavors might center in one object, that of forming a settlement among those nations, where a certain prospect seemed to open of establishing peaceably, and without opposition, their new system, which might serve as a basis for a new and free community. Charles Berus Wadstrom was present at the meeting, and he states, in his letters to the *New Jerusalem Magazine* of 1790, that 'the more this subject came to be considered, the more these gentlemen were persuaded, that the coasts of Africa would scarcely admit of being peopled by a body of true and sincere Christians, unless the slave trade, so firmly rooted, and the only object of commerce in those fruitful regions, could be abolished.' Before the memorable meeting was dissolved, every one present expressed his warmest and his most cordial assurance, to labor, each in his particular station, and unceasingly to exert his utmost abilities, in concerting and in carrying into execution a plan not only for the abolition of the slave trade, but for the general civilization, founded on true Christian principles, of those uncultivated and hitherto abused nations."

"Soon afterwards, a zealous and well-informed Swedish traveller, U. Nordenskjold, published a plan for colonizing on the coast of Africa, in which he designated Sierra Leone as the proper site for a colony; and by his influence and activity at the court of Sweden, his Swedish Majesty was induced to grant permission to emigrate thither with forty families. This was several years before the society for the abolition of the slave trade was formed in London.

"In 1787, Mr. Wadstrom, with Dr. Sparrman and Chevalier Captain Arrhenius, proceeded on a voyage to the coast of Africa, intending to penetrate to the interior, which, however, they were unable to achieve. Dr. Sparrman and Mr. Nordenskjold afterward founded a congregation at Sierra Leone, and in 1792 it was selected by the

British Government as the place for the residence of the fugitive slaves who had escaped from the Americans, and taken refuge with the British during the Revolutionary War. Twelve hundred of these were then transported thither."

We here have thus placed before us, the first movement made toward the establishment of Sierra Leone. Since that day, our own countrymen have also given encouragement to the foundation of colonies in Africa, perhaps not so much from a wish to suppress that horrible traffic in human beings, which was the principal object desired by the members of the New Church, but as furnishing a place of abode for the liberated negroes. Whatever may have been the designs of the originators of the scheme, *Christian Colonies*, if we may be allowed to grant them so distinguished a name, have been commenced on those once benighted shores, and appear to be in prosperous circumstances. Their exports exceed the exports of the United States at the time of the Declaration of Independence, and their people have evinced a capacity for self-government, and a desire for better education, which must be gratifying to every thoughtful philanthropist. So promising, in fact, is the present aspect of the affairs of the inhabitants of those distant settlements, we cannot escape from a well-grounded hope, that if these emigrants and their descendants do not suffer from the indolence which is so often found to be amongst the besetments of the nations living in warm climates, and if they continue to preserve around them the strengthening influences of civilization, so far as to prevent a relapse into barbarism, that men may be nourished up there capable of becoming the competitors of any civilized people of the earth, in all worthy objects. Such men would present examples worthy of imitation to their barbarous neighbors, who being gradually stimulated to better pursuits than those which, unhappily, at present occupy them, would in time be led to look upon the slave trade with the abhorrence which ought to find a place in the breasts of all rational creatures. Let us therefore be encouraged to anticipate that the emigration to the coasts of Africa may continue and increase, and thereby hasten the appearance of the glorious day when we may say in the prophetic language of the inspired Psalmist, "Ethiopia shall soon stretch out her hands unto God." Then, and not until then, will the African slave trade with all its attendant enormous evils be brought to a conclusion. T.

Baltimore, 1st mo., 1860.

A FABLE.

A young man once picked up a sovereign lying in the road. Ever afterwards, as he walked along, he kept his eyes steadfastly fixed on the ground, in hopes of finding another. And in the course of a long life he did pick up at different

times a good amount of gold and silver. But all these days as he was looking for them he saw not that heaven was bright above him, and nature beautiful around. He never once allowed his eyes to look up from the mud and filth in which he sought the treasure; and when he died a rich old man, he only knew this fair earth of ours as a dirty road to pick up money as you walk along.

THE FALLS OF NIAGARA SURPASSED IN INDIA.

Did any of our readers ever hear of the Gairsoppa Falls, near Honore? If not, they will probably read with some pleasure a description which has just appeared in the Calcutta papers. It is curious that a fall six times the depth of Niagara should remain almost unknown. From the village of Gairsoppa, reached by a river of the same name, the writer was carried for twelve miles up the Malimuneh Pass, and reached the Falls Bungalow about three hours and a half after leaving the top of the Pass. An amphitheatre of woods, and a river about five hundred yards wide, rushing and boiling to a certain point, where it is lost in a perpetual mist and in an unceasing deafening roar, must first be imagined. Leaving the Bungalow on the Madras side of the river, and descending to a position below the river level, you work your way up carefully and tediously over slippery rocks until you reach a point where a rock about twice the size of a man's body juts out over a precipice. Resting flat upon this rock, and looking over it, you see directly before you two out of the four principal falls; these two are called the "Great Fall" and "The Rocket." The one contains a large body of water, the main body of the river, perhaps fifty yards across which falls massively and apparently sluggishly into the chasm below, and the other contains a smaller body of water, which shoots out in successive sprays over successive points of rocks, till it falls into the same chasm. This chasm is at least nine hundred feet in depth—six times the depth of the Niagara Falls, which are about one hundred and fifty feet and perhaps a quarter to half a mile in width. These are the first two falls to be visited. Then move a little below your first position, and you will observe first a turgid boiling body of water of greater volume than the Rocket Fall, rushing and steaming down the same chasm; this is the third fall, the "Roarer." Then, carrying your eye a little further down, you will observe another fall, the loveliest, softest, and most graceful of all, being a broad expanse of shallow water, falling like transparent silver lace over a smooth surface of polished rock into this same chasm; this is "La Dame Blanche."

But do not confine yourself to any one place in order to view these falls; scramble everywhere you can, and get as many views as you can of them, and you will be unable to decide upon which is the most beautiful. And do you want

to have a faint idea of the depth of the chasm into which these glorious waters fall? Take out your watch and drop as large a piece of rock as you can hold, from your viewing place; it will be several seconds before you ever lose sight of the piece of rock, and then even it will not have reached the water at the foot of the chasm—it will only have been lost to human sight; or watch the blue pigeons, wheeling and circling in and out the Great Fall within the chasm, and looking like sparrows in size in the depth beneath you. But you have yet only seen one, and that not perhaps the loveliest, and at least not the most comprehensive, view of the falls. You must proceed two miles up the river above the falls, and cross over at a ferry, where the waters are still and smooth as glass and sluggish as a Hollander, and proceed to the Mysore side of the falls, walking first to a point where you will see them all at a glance, and then descending as near as you can to the foot of these, to be drenched by the spray, deafened by the noise and awe-struck by the grandeur of the scene, and by the presence of the Creator of it, in the perpetual rainbow of many and brilliant hues which spans the foot of the chasm.—*Boston Weekly Transcript.*

THE DUTY OF OWNING BOOKS.

BY H. W. B.

We form judgments of men from little things about their house, of which the owner, perhaps, never thinks. In earlier years, when travelling in the West, where taverns were either scarce, or in some places unknown, and every settler's house was a house of "Entertainment," it was a matter of some importance and some experience to select wisely where you would put up. And we always looked for flowers. If there were no trees for shade, no patch of flowers in the yard, we were suspicious of the place.—But, no matter how rude the cabin, or rough the surroundings, if we saw that the window held a little trough for flowers, and that some vines twined about strings let down from the eaves, we were confident that there was some taste and carefulness in the log cabin. In a new country, where people have to tug for a living, no one will take the trouble to rear flowers, unless the love of them is pretty strong; and this taste, blossoming out of plain and uncultivated people, is, itself, like a clump of harebells growing out of the seams of a rock. We were seldom misled. A patch of flowers came to signify kind people, clean beds and good bread.

But, other signs are more significant in other states of society. Flowers about a rich man's house may signify only that he has a good gardener, or that he has refined neighbors, and does what he sees them do.

But men are not accustomed to buy *books* un-

less they want them. If, on visiting the dwelling of a man of slender means, I find the reason why he has cheap carpets and very plain furniture to be that he may purchase books, he rises at once in my esteem. Books are not made for furniture, but there is nothing else that so beautifully furnishes a house. The plainest row of books that cloth or paper ever covered, is more significant of refinement than the most elaborately carved *etagere* or side-board.

Give me a house furnished with books rather than furniture! Both, if you can, but books at any rate! To spend several days at a friend's house, and hunger for something to read, while you are treading on costly carpets, and sitting upon luxurious chairs, and sleeping upon down, is as if one were bribing your body for the sake of cheating your mind.

Is it not pitiable to see a man growing rich and beginning to augment the comforts of home, and lavishing money on ostentatious upholstery, upon the table, upon everything but what the soul needs?

We know of many and many a rich man's house, where it would not be safe to ask for the commonest English classics. A few garish annuals on the table, a few pictorial monstrosities, together with the stock of religious books of his "persuasion," and that is all! No range of poets, no essayists, no selection of historians, no travels or biographies, no select fictions or curious legendary lore; but then the walls have paper which cost three dollars a roll, and the floors have carpets that cost four dollars a yard! Books are the windows through which the soul looks out. A house without books is like a room without windows. No man has a right to bring up his children without surrounding them with books, if he has the means to buy them. It is a wrong to his family. He cheats them! Children learn to read by being in the presence of books. The love of knowledge comes with reading, and grows upon it. And the love of knowledge, in a young mind, is almost a warrant against the inferior excitement of passions and vices.

Let us pity those poor rich men who live barrenly in great, bookless houses! Let us congratulate the poor that in our day books are so cheap that a man may every year add a hundred volumes to his library for the price of what his tobacco and his beer would cost him. Among the earliest ambitions to be excited in clerks, workmen, journeymen, and, indeed, among all that are struggling up in life from nothing to something, is that of owning, and constantly adding to, a library of good books! A little library, growing larger every year, is an honorable part of a young man's history. It is a man's duty to have books. A library is not a luxury, but one of the necessaries of life.

A good book is a thing as separate and dis-

tinct from all other creations, as a bird is from a flower, or a jewel from a stone. Books are at once our masters and our servants. They have a silent independence, an unchanging voice, a calm declaration of truth, as they will. But they are unobtrusive. They wait for our moods and our leisure. They are never jealous if we neglect them, nor quarrelsome when we are familiar. They wait upon us in youth, in manhood, and in old age, with a vivacity that time never chills, and an instructiveness that repetition never wearies. Men grow old, and children are the only reprints allowed. The same volume is never reproduced. But books come again, in successive editions, with the same life, the same disposition, the same offices of love and goodness. Their joints never stiffen. Their heads never grow gray. All hinges but book-hinges at times grate. But the unrolled pages turn smoothly forever.

CASHMERE GOATS.

An importation of these valuable animals has been made by the Hon. W. H. Stiles, and after a tedious voyage has arrived safely at his place up the river, having been accompanied by a Greek, who is still with them as an attendant, all the way from Smyrna. This is the second importation of the pure breed of Cashmere goats ever made into this country; the first having been made by Mr. Davis, who sold them to Mr. Richard Peters, of Atlanta, from which importation all the crosses and half breeds in this country have sprung. Mr. Stiles has eight of them, and they are no less curious than valuable, something of the size and shape of our native breed. They differ widely in their hair, which grows so luxuriously as to give them the appearance of a sheep with an immense fleece on it. The experiment having been thoroughly tried as to their thriving in our climate, and resulting satisfactorily, there can be no doubt of the value they will be to our country. The uses to which the hair is put are numerous. Camlet and worsted goods and ladies' fabrics, as challies, muslin de laines, gentlemen's clothing for summer wear, hosiery, &c., promising a beauty, strength, durability, luster and permanency of color far superior to the wool of the sheep or the alpaca.

These goats are found in the Himalaya Mountains, and have to be brought about a thousand miles before they reach a shipping port. They are not sheared like the sheep, but the fleece is pulled off twice every year. An ordinary fleece weighs between three and four pounds. The New York price is \$8 50 per pound, making at least \$51 a year for each goat, while there is no cost in feeding them, for they are as frugal and hearty as the common goat.

Their great value in this country is the splendid cross with our common goat, the half-breed

being nearly as valuable every way as the full breed, and their remarkable fecundity soon repays a very heavy interest on the investment, while the expense of keeping them is a mere trifle, as they live on briars and foliage not touched by other animals. There is a great demand for them, and the prices they bring are fabulous—one buck sold as high as \$1,500, and one of Mr. Peters's stock was sent to the Illinois State Fair exhibition, and so pleased the President that he offered the weight of the animal in silver in exchange for him.—*Savannah Republican*, Dec. 25.

For Friends' Intelligencer.

"These are MY Jewels."—ROMAN MATRON.

Once I saw in mental vision, one entrusted with a gem,
Wealth of India could not buy it for a monarch's
diadem,

It was placed within a casket finely fitted for its care;
Human art had never fashioned aught so beautiful
and fair.

She who had received the treasure, grateful seemed,
and overjoyed;

But the outside of the casket soon her every thought
employed.

Though it needed but protection, watchful care from
day to day,

That the impress of the Maker never might be worn
away,

Yet she labored to adorn it; for rich hues to deck it,
sought;

Hung it round with fine embroidery which her busy
fingers wrought.

Toiling thus from morn till even, her meridian life was
passed;

Age came on and found her lonely; she had felt affliction's
blast;

Humbled then, the gem once given, with a throng of
memories came;

Ah! she thought, this precious treasure soon will
bring me joy again.

Trembling then she oped the casket, but no gem with-
in it lay;

Thieves, while she was idly busy, had conveyed it far
away.

Mother! wouldst thou 'scape the anguish of that smit-
ten one? Oh! then

Prize the casket, for *this only*, that it holds a priceless
gem.

Often contemplate its value with a spirit raised in
prayer!

Suffer none to steal it from thee while thou 'rt busied
here and there.

Then when He who charged thee keep it, that no spot
its lustre dim,

Shall "make up" his precious jewels, thou mayest
give it back to him. S.

Philad. 1st mo. 1860.

THE IVY IN THE DUNGEON.

BY CHARLES MACKAY.

The ivy in a dungeon grew,
Unfed by rain, uncheered by dew;
Its pallid leaflets only drank
Cave-moistures foul, and odors dank.

But through the dungeon grating high,
There fell a sunbeam from the sky;
It slept upon the grateful floor
In silent gladness evermore.

The ivy felt a tremor shoot
Through all its fibres to the root;
It felt the light, it saw the ray,
It strove to blossom into day.

It grew, it crept, it pushed, it clomb—
Long had the darkness been its home;
But well it knew, though veiled in night,
The goodness and the joy of light.

Its clinging roots grew deep and strong,
Its stem expanded firm and long,
And in the currents of the air
Its tender branches flourished fair.

It reached the beam, it thrilled, it curled,
It blessed the warmth that cheers the world;
It rose toward the dungeon bars;
It looked upon the sun and stars.

It felt the life of bursting spring,
It heard the happy skylark sing;
It caught the breath of morns and eves,
And wooed the swallow to its leaves.

By rains and dews and sunshines fed,
Over the outer walls it spread;
And in the day-beam waving free;
It grew into a steadfast tree.

Upon that solitary place,
Its verdure threw adorning grace;
The mating birds became its guests,
And sang its praises from their nests.

Wouldst know the moral of the rhyme?
Behold the heavenly light! and climb;
To every dungeon comes a ray
Of God's interminable day.

HOW WATCHES ARE MADE.

N. P. Willis, of the *Home Journal*, who recently visited the watch factory of the American Watch Company, at Waltham, Mass., thus describes the *modus operandi* of watchmaking as carried on at that extensive establishment, by machinery:—

The Watch-Factory is of brick, two stories in height, and enclosing a quadrangular court; and, along the closely-placed inner and outer windows stand the work-benches at which are seated the successions of operatives—each of the one hundred and twenty parts of the watch requiring separate manufacture, and adjustment. What impressed me particularly, as I walked through these long galleries of seated and patient artificers, was the exceeding delicacy and minuteness of it all—the inevitable machinery accomplishing, with such powerful exactness, the almost inevitable wonders of transformation and construction, and human aid seeming only needed to supply the material and measure the work, with movements of hand scarcely perceptible. The successions of minute instruments were like long ranges of little fairies, each weaving its cobweb miracles, under a careful sentinel's superintending eye. It is the novelty of the Waltham Factory that this is so—machinery doing the hundred little dexterities which have hitherto

been done only by the variable hands workmen. With the machinery once regulated, therefore, any number of watches of the same size and pattern are made with invariable exactness—all equally sure to keep time, whereas, formerly, each watch was only a probability by itself.

The minuteness of very essential parts of the watch astonishes the visitor. A small heap of grains was shown to us, looking like iron filings, or grains of pepper from a pepper castor—apparently the mere dust of the machine which turned them out—and these, when examined with a microscope, were seen to be perfect screws, each to be driven to its proper place with a screw driver. It is one of the Waltham statistics, which is worth remembering, that “a single pound of steel costing but fifty cents, is thus manufactured into one hundred thousand screws which are worth eleven hundred dollars.”

The poetic part of a watch, of course, is what the truth in a woman's heart has been so often compared to—the jewel upon which all its movements are pivoted and which knows no wearing away or variation—and to see these precious truth jewels and their adjustment was one of my main points of curiosity. The aid of the microscope was again to be called in, to see these—the precious stones, as we first saw them in the glass phial, resembling grains of brilliant sand. They are rubies, sapphires or chrysolites, inferior only to the diamond in hardness, and to be drilled by the diamond's point into pivoted reliances. The process is thus described in the article to which I am indebted for my statistics:—

“The jewels are first drilled with a diamond, and then opened out with diamond dust, of a soft hair-like iron wire, their perforations having certain microscopic difference. In like manner the pivots of steel that are to run in these jewels, without wearing out in the least, must be exquisitely polished. By this operation their size is slightly reduced. The jewels and pivots, after being thus finished, are classified by means of a gauge, so delicately graduated as to detect a difference of the *ten thousandth part of an inch*. The jewels are classified by means of the pivots, the jewels and pivots of the same number fitting each other exactly. The sizes of the several pivots and jewels in each watch are carefully recorded under its number, so that if any one of either should fail in any part of the world, by sending the number of the watch to Waltham, the part desired may be readily and cheaply replaced with unerring certainty.”

THE BROWNE MANSION HOUSE.

This mansion is situated about half a mile east of Flushing. It is believed to be the oldest house now standing on Long Island, having been erected in 1661, by JOHN BROWNE of the Society of Friends. Besides the antiquity of the

building, it is one of much historical interest. The celebrated GEORGE FOX, the founder of the Society of Friends, has lodged within the walls of this house, which was the place for the Yearly Meeting for the whole body of Friends in the province of New York, previous to 1690. On the opposite side of the street from the house are seen two ancient oaks, under which FOX preached, when in this country, in 1672. Although differing in some of his tenets from the majority of those professing the Christian name, GEORGE FOX had the martyr spirit within, and had he been called to the trial, would, doubtless, have sealed his testimony with his blood. His sufferings in the cause of religious freedom entitle him to the gratitude of mankind. Men of his stamp are the true patriots and genuine nobility of the human race.—*Historical Collections of New York.*

HINTS ABOUT AVOIDING FIRES.

Very many large fires, as well as many severe burns, may be avoided by understanding that air is necessary to produce combustion, and that the exclusion of air is as effectual as an application of water. Indeed in extinguishing fire, water chiefly acts by shutting out air, and any other means of shutting out the air is just as effectual. We have shown this frequently in lectures on heat, by pouring upon the table a quantity of spirits of turpentine, alcohol, or ether, and when set on fire so as to produce a large flame, we have instantly extinguished it, by quickly spreading over it a silk handkerchief or piece of paper, which for the instant shuts out the air.

A week or two since a young lady in Danbury, Ct., upset a camphene lamp, the contents of which spread over her dress and enveloped her in flames, but she seized a blanket from a bed, and immediately wrapped it closely around her, and thus smothered the fire, shut out the air, and escaped without injury. Five years since we were transferring from one vessel to another, two gallons of mixed sulphuric ether and chloroform—both very inflammable substances, which burn with a great flame—when a person in the room carelessly brought a lighted lamp near, and set the whole on fire. We instantly snatched a table-spread from a table near by, and with this entirely covered the flame and extinguished it. We sacrificed the dishes and food upon the table, but saved the house, perhaps the block of buildings, and perhaps our lives as a moment's delay would have enveloped the whole room in flames.

Two years since, a servant girl, contrary to oft-repeated and positive directions, undertook to fill a fluid lamp while burning, and, as was certain to be the case, the can of liquid took fire, (not “exploded,”) and was dropped upon the floor, setting her under garments on fire. She ran for the door, but another domestic happened to catch hold of her outer clothes in such a way

as to draw them closely around her, and thus unwittingly smothered the flames, while a member of the family extinguished the burning lamp, can, and fluid upon the floor by spreading an ironing cloth over them.

Some dozen years since, one of the boys on our farm was at work in the horse and carriage barn, before light one winter morning. When called to breakfast he left the lantern where it was knocked down by one of the horses, and a large mass of straw for bedding was set on fire. When discovered, the whole mass—four or five feet in diameter—was in a flame, that nearly reached to the hay hanging down from a mow above, containing several tons. In this case a horse blanket was at once thrown upon the centre of the flame, and others quickly added, and the fire extinguished without damage, although large volumes of smoke poured forth from the door and other openings, and almost prevented any one from entering.

We have known of instances of rooms being found on fire, where, by closing them up, the fire has been confined and kept in a smothered state, until sufficient help with abundance of water could be procured to at once extinguish the flames. In a great number of instances, extensive conflagrations could have been avoided, had the fire been kept where it originated till efficient aid had arrived. This could have been done by simply closing up the doors and windows, instead of throwing them all wide open as is usually the case.

We have thus given a few instances and we might add many others, where serious injury has been averted by applying a simple preventive, that of shutting out the free access of air which is necessary to feed the flame. Let every person fix it in their minds, and in the minds of every member of their families, old and young, that other means than water may be used to smother fire. Do not teach this by precept only, for in the excitement of a fire mere precepts will be forgotten, but let a few experiments be made before the family, to illustrate the principle.

For example, pour upon the hearth—or better, upon a flat stone or board out of doors—a quantity of alcohol, turpentine, burning fluid, oil, ether, or other inflammable substance, set it on fire, and then extinguish it by spreading a cloth quickly over it. Re-light it and extinguish it with a newspaper, and repeat the experiment with a handkerchief, an apron, a dress, a cloak, a table-cloth, bed-quilt, &c. It would be well to make the experiment with burning shavings, &c. The experiment may be varied by smearing an upright block, barrel or post with oil, alcohol or otherwise, and when on fire extinguish it with a cloth or old garment.

Some simple experiments like these are always interesting; they develop thought, and prepare one for acting coolly and effectually in an emer-

gency. They are like drilling and manœuvring soldiers previous to a battle.—*American Agriculturist.*

SUMMER SOURS.

Physiological research has fully established the fact that acids promote the separation of the bile from the blood, which is then passed from the system, thus preventing fevers, the prevailing diseases of summer. All fevers are "bilious," that is, the bile is in the blood. Whatever is antagonistic to fever is "cooling." It is a common saying that fruits are "cooling," and also berries of every description; it is because the acidity which they contain aids in separating the bile from the blood, that is, aids in purifying the blood. Hence the great yearning for greens and lettuce, and salads in the early spring, these being eaten with vinegar; hence also the taste for something sour, for lemonades, on an attack of fever. But this being the case, it is easy to see, that we nullify the good effects of fruits and berries in proportion as we eat them with sugar, or even sweet milk or cream. If we eat them in their natural state, fresh, ripe, perfect, it is almost impossible to eat too many, or to eat enough to hurt us, especially if we eat them alone, not taking any liquid with them whatever. Hence also is buttermilk or even common sour milk promotive of health in summer time. Sweet milk tends to biliousness in sedentary people, sour milk is antagonistic. The Greeks and Turks are passionately fond of sour milk. The shepherds use rennet, and the milk-dealers alum to make it sour the sooner. Buttermilk acts like watermelons on the system.

Hall's Journal of Health.

PUTTING DOWN THE DUST CHEMICALLY.

A curious experiment is now being tried at Lyons, for laying the dust in public promenades; and has so far been attended with success. A chemist of that city having accidentally spilt some hydrochloric acid on a terrace, found that it hardened the spot on which it had fallen, and maintained it in a state of permanent moisture. This led him to think that by watering the streets with this acid the dust on large Macadamised roads might be laid, or rather prevented from rising. Experiments were first made; the success was complete, and has proved durable. During the hottest part of the day, the ground, although dry and gravelly, has the appearance of being as content and damp as if it had been watered half an hour before. But as evening approaches, the moisture becomes more and more perceptible, every morning the ground is stiffer, and more comfortable to walk on. This may be easily accounted for; the acid decomposing the gravel or stone, from one or several deliquescent

salts, which therefore attract the moisture of the air. The question as to whether roads thus watered are likely to last so long as they ought, can only be decided by time.—*Gabignani*.

ITEMS OF NEWS.

EUROPEAN NEWS.—THE CONGRESS.—A Paris despatch says that it was becoming every day more doubtful whether the Congress would assemble, and the Paris correspondent of the London *Times* says that there were many indications that the chances of the Congress meeting were of the most shadowy kind.

The French journal, the *Opinion Nationale*, which was supposed to speak with some authority, says it believes that if Italy decided for the annexation of the north and centre of the Italian peninsula, England would gladly accept of the combination, whilst France would accept it with still greater eagerness, on condition that Savoy and Nice should be restored to her. The *Opinion* does not anticipate that the Cabinet of Turin would object, and after arguing that neither Austria, Russia or Prussia has the power, right, or will, to interfere, says that it is assured that this combination is seriously entertained by the Governments of London and Paris.

The Paris correspondent of the *Times* says that a company, consisting of eight or ten principal ship-owners at Marseilles, just established, under the name of U. M. Sicard & Co., had purchased from the company of the Maritime Canal of Nicaragua the lands dependent on the canal, which form a part of a concession which the canal company had obtained, and Sicard & Co. propose to turn to account the metallic deposits the lands contain, to cut down timber, and to establish European colonies. They had already sent to Nicaragua from Marseilles two vessels with one hundred and thirty persons, consisting of engineers, chemists, and workmen of different trades. It was also said that the company had besides engaged a number of railway laborers to execute a railroad on the Isthmus of Rivas, which separates Lake Nicaragua from the Pacific.

"The Cunard steamer Africa," says the London *Times*, "on her last passage brought from New York, en route for Italy, 82,000 ounces of silk worms collected in China, whence they were shipped by steamer to San Francisco. The affair has been a private mercantile speculation, and is said to have been very profitable, the worms selling in Italy for 20f. per ounce."

ITALY.—The aspect the Italian question has assumed caused much rejoicing at Venice and Milan.

The news of Count Walewski's resignation had produced a very painful impression on the Pope. He called together the principal members of the Sacred College, and declared to them that he would never fail in the mission which God had entrusted him with, but that, like his predecessor, Pius VII, he would suffer exile, and even martyrdom, before he would do so.

CHINA.—The treaty between the United States and China had been put in force.

A submarine cable had been successfully laid down between Singapore and Batavia.

PROFESSOR ESPY.—James P. Espy, usually denominated "*The Storm King*," died at Cincinnati on the 26th inst.

Some years ago he was a schoolmaster in this city. About that time he began to give gratuitous lectures before the Franklin Institute, of which he was an active member, on the "*Theory of Storms*."

A few, and a very few, of those who heard the lectures, or who heard of them, believed his theory. For many years it was only the theme of ridicule through the country, by editors and legislators, and even men of science. At length, after travelling and lecturing several years in all the principal cities of the Union with little or no success, he went to Europe and made his "theories" known to the scientific men in that quarter of the world. There he was more successful, and particularly in France, where the highest scientific tribunal in the world pronounced in its favor. From this time forward his theory commanded respect, if not confidence. The government of the United States shortly after gave it its countenance; and, with the exception of a short interval, James P. Espy has been connected with one of its departments, collecting facts to prove the soundness or test the correctness of his theory, which he has done beyond all cavil or doubt.—*The Press*.

A SUGGESTION TO PERSONS VISITING THE SOUTH.—The Atlantic, Ga., *Confederacy* says:—We regard every man in our midst an enemy to the institutions of the South who does not boldly declare that he or she believes African slavery to be a social, moral and political blessing. Any person holding other than these sentiments, whether born at the south or the north, is unsound, and should be requested to leave the country.

RESTORATION OF FUGITIVE SLAVES.—The Maryland Senate has passed resolutions requesting the Maryland representatives in Congress to take such steps as are necessary to call upon the government to negotiate a treaty with Great Britain for the restoration of slave property belonging to American citizens that may be found in her provinces.

THE NEGRO BILL IN MISSOURI.—Governor Stewart has refused to sign the bill lately passed by the Missouri legislature for the exclusion of free negroes from that State.

A CHINESE NEWSPAPER.—The Boston Traveller says: "We have received a copy of the Pekin Gazette, the organ of the government, issued daily, and the only paper in the Chinese language now published in that country of four hundred and fourteen millions of people. It is printed on rice paper of a dingy drab color, with a yellowish paper cover. Each page contains twenty-six lines, of seven characters each. In all there are seven pages of four inches each in width, and ten in breadth. Its entire contents would not fill a half column of the Traveller. It is a remarkable fact that this paper was received via Japan and California.

IN THE SOUTH OF FRANCE the weather has been so severe that a sentinel was found dead of cold in his sentry-box at Lyons. Several persons have perished in the snow in the mountains of Dauphine, where they imprudently ventured in pursuit of game. Two boys, eight or ten years of age, died from cold while returning from school.

CIGARS MORE EXPENSIVE THAN BREAD.—Dr. Hawes, of Hartford, Conn., recently preached a strong sermon against the use of tobacco. He exhibited facts and statistics showing its destruction of health and sanity, its demoralizing influence, and its useless expense. It costs the people of the United States over forty million dollars annually—far more than is spent for all purposes of education. New York city uses up daily, \$10,000 in cigars and \$8,500 in bread. He predicted that the valley of the Connecticut would be blasted by it and become as barren as the old tobacco fields of Virginia and Maryland.

THE CALAMITY AT LAWRENCE.—All the wounded are

doing well. The supplies of money and clothing for the aid of the suffering have poured in so copiously from all quarters that the Committee of Relief have given public notice that no more contributions will be needed. The amount contributed in money will probably reach thirty thousand dollars, and the amount of relief in the shape of bedding, clothes, &c., has been very extensive.

The cause of the calamity appears now to be generally attributed to defective iron pillars supporting the floors.

STRENGTH OF IRON PILLARS.—FALL OF THE PEMBERTON MILL.—A correspondent of the Boston Courier makes the following comments on iron columns, which are worthy of the special attention of the public. After alluding to the fall of the Pemberton mill, the writer adds: The hollow iron columns supporting the floor below this heavy machinery *had lost strength*. Though adequate to the support of the floor and machinery above when introduced—and probably to much greater pressure than at any time brought to bear on them—the constant jar of the revolving shafts and wheels and spindles, had produced the same change in them which is known to take place in the wrought iron axles of railway cars after long running.

The same change is produced in cast iron cannon—so that having been fired a certain number of rounds, they are condemned as unsafe, and have been known to burst even with inferior charges. The cohesion is lessened. The fibrous condition is changed to the granular. The continuous vibration caused by the machinery had produced in the upper columns more free than the lower ones to experience it a condition of texture in which the cohesion of parts was less; so that the incidental jolting attendant upon the moving of the heavy mass of machinery caused the first rupture. After this, it is easy to see that the crash of the whole was inevitable. The pressure would be no longer vertical on the adjacent columns, and their capacity to support would be correspondingly less.

AN EARTHQUAKE IN SOUTH CAROLINA.—The Charleston, (S. C.) Mercury of the 20th inst. says: A smart shock of an earthquake was experienced in this city, at five minutes past seven o'clock on Friday evening. The duration of the shock was about fifteen seconds. Buildings were shaken with such force as to rattle the plates on supper tables and in dressers, vibrate pictures on the walls, and such like demonstrations. St. Michael's bell was ringing at the time, and of course no notice was taken of the effect on the belfry. In some families considerable alarm was experienced. No shock of equal severity has been felt here since the shock of the earthquake which buried Guadalupe in 1843 or 1844. We learn, telegraphically, that the shock was noticed at Kingsville, Camden, Augusta and Macon. We shall undoubtedly soon receive intelligence of an earthquake in the West Indies, or some violent eruption of a Mexican volcano.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The market for breadstuffs generally is very dull, but prices have undergone no change. Small sales of superfine at \$5 50 per barrel, and some good Ohio extra at 5 75. There is a steady home consumption demand from our lowest quotation up to \$6 for common and extra brands, and \$6 12½ up to \$7 25 for extra family and fancy lots. Rye Flour and Corn Meal are dull, the former at \$4 50, and the latter at \$3 75.

GRAIN.—There is not much Wheat coming forward, and the demand is limited. Small sales of good and prime Pa. red at 128 a 133 cents per bushel. White

is worth 140 a 150c. No change in Rye, it is worth 92c. Corn is rather quiet. Sales of 1000 bushels yellow at 73½ a 74c, in the cars, and 76c. afloat. Oats are steady; Pennsylvania, in store sold at 45 cents.

Cloverseed of prime quality is less active. Sales of common and prime quality at \$5 a 5 25 per 64 lbs. Timothy and Flaxseed are scarce. The latter at 1 60 and the former \$2 75.

A YOUNG MAN, a member of the Society of Friends, from the country, is desirous of a situation in some kind of business in this city. Apply to
W. W. M., 324 south 5th street.

WANTED a situation as Assistant Teacher in a school of either white or colored children, by a young Woman, a member of the Society of Friends. Inquire at this office.
1st mo. 28, 1860.

WANTED by an experienced Teacher from Massachusetts, a situation for a Select School, in a Friends' neighborhood, where the advanced English studies are required to be taught. Address
L. VINING, Tuckerton, New Jersey.
1st mo. 28th, 1860.—3t.

A NNE CHURCHMAN'S BOARDING AND DAY SCHOOL, No. 908 Franklin street above Poplar.
1st mo., 28, 8t.

BYBERRY BOARDING SCHOOL FOR GIRLS. The Spring Session of this School, taught by Jane Hillborn and Sisters, will commence the 20th of 2d mo., 1860, and continue twenty weeks. The course of instruction embraces all the branches of a liberal English education.

Terms \$60 per Session, one-half payable in advance. For Circulars containing further particulars, address
JANE HILLBORN,
Byberry P. O., Penn.
1st mo. 28, 1860.—2 mo.

EATON ACADEMY, KENNETT SQUARE, CHESTER COUNTY, PA. The Winter Term of the above Institution will expire on the 15th of the 3d mo. next, but, in order to meet the desire of many of the Pupils, and friends and patrons of this Institute, the undersigned have concluded to re-open the School for both sexes, on 2d day the 19th following, and continue it a period of ten weeks, or half a Session, at the present rates, which are \$65 per Term for Tuition, Boarding, &c., and \$16 for Tuition only, one-half payable in advance.

Catalogues, containing further particulars, will be sent to those desiring the same. Apply to
WILLIAM CHANDLER,
Principal and Proprietor,
Or to WILLIAM A. CHANDLER,
Principal Instructor.
1st mo. 28, 1860.

LAKE SCHOOL FOR BOTH SEXES. The 2d semi-term of 20 weeks is to begin 20th of 2d month. The charge, in full, for board and tuition, per term of 20 weeks, is \$45, or at the rate per week of \$2¼.

Circulars with references sent by applying to either subscriber
SIDNEY AVERILL,
ELMENA AVERILL,
West Vienna, Oneida Co., N. Y.,
1st mo. 8, 1860. Proprietors.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, SECOND MONTH 11, 1860.

No. 48.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

A TRUE TOUCH-STONE.

BY HUGH TURFORD.

(Concluded from page 739.)

The fifth branch of the life, nature, and doctrine of Christ, and the last I shall here insist on, is this: "All things whatsoever ye would that men should do unto you, do you even so unto them; for this is the law and the prophets:" and this is that which the righteous Lord God hath required of his people in all ages.

This *doing*, is accounted by many zealous professors of christianity as moral righteousness; and so but a small part, or rather no part of true godliness. But, when rightly considered, all actual righteousness, if it proceeds from a right spirit, is in itself the true righteousness of faith: and that only is moral or of no authority which is performed from or in a carnal mind, in imitation of good men's practices, but out of their life and nature. For, if the tree is to be known by its fruit, fruit manifests the nature of the tree.

If God be, as he certainly is, righteous in all his ways and just in all his works, no people on the face of the earth are more god-like,—none bear his image more exactly, than those whose conversations are upright, honest and just: and nothing can be more just, than to do unto others in all things whatsoever we would that they should do unto us. This is that excellent righteousness which exceeds not only the righteousness of the scribes and pharisees, but the righteousness of most professors of christianity; for hereby we walk in Christ's footsteps,—we fulfil both the law and the prophets.

Moses, in admiration of the justice and equity that the Lord required from the sons and daughters of men under the administration of the law,

uttered these words: "What nation is there so great, who hath statutes and judgments so righteous, as all this law that I set before you!"—And doth the law of the Spirit of life require less righteousness from Christians than that outward law did from the Jews? I tell you nay, but more; because more light and power is given to all true Christians to perform acts of righteousness.

Were the understandings of all who are called Christians enlightened to see themselves as they are,—or had they but hearts willing to prove themselves by this Christian rule,—to measure themselves by this straight line, and to weigh themselves in this equal balance,—the following classes of men and women, with many others, would no more pass for true Christians in God's account, than clipped or counterfeit money when brought to the balance and standard, does in men's accounts, as:

First. All such who in suits of law, by perverting justice or other subtle contrivances, possess themselves of houses, lands or goods to which they have no proper right.

Secondly. All such as by violent robbing or private stealing take that which is not their own.

Thirdly. All those who detain the wages of the hireling, or grind on the necessities of the poor, by beating down the value of their labor till they cannot live thereby.

Fourthly. All such who in trade or dealing use light weights, short measure, or any other kind of deception or fraud.

Fifthly. All them that cast their burdens on other men's shoulders, and go free themselves.

Sixthly. All such as give or take bribes to effect things that are not right.

Seventhly. All those who take wages to serve lord or master, and are not faithful to their trust.

Eighthly. All such as make contracts and perform not the same; or engage themselves by promises, and have no regard to their word.

Ninthly. All those who by evil reports, whisperings, or backbitings, sow the seeds of strife,—create prejudice, or quench charity.

None of these abide in the doctrine of Christ; none of these do as they would be done unto: and though they may bear a Christian name, they are strangers to a Christian life; they live not under the government of Christ; they are

not swayed by the sceptre of righteousness, and therefore are not god-like.

Godliness and christianity have but one image. If we would more fully know the nature of godliness, let us consider the nature of ungodliness. All sober men will grant that the proud, the covetous, the envious, the fraudulent, the extortioner, the swearer, the liar, &c., are ungodly. And well they may; for where such vices prevail, little of the image of God appears. But, if such things make men ungod-like, (ungodly), the contrary, which is humility, meekness, moderation, sobriety, truth, equity and faithfulness, must needs make men godly.

To become ungodly is an easy thing. For if our backs are turned on God, we have nothing in our eye but the world and the vanities thereof, promising such enjoyment that little else is minded. But the great difficulty is to become godly again. Though thousands are employed to make men godly, little fruits do appear. In the eyes of degenerated men, there is no loveliness in the path of self-denial; and hence the inquiry is, by what easier way the proud may become humble,—the wild be made sober,—the covetous become content,—the fraudulent become just,—the intemperate become moderate,—the incontinent become chaste, and the unfaithful become faithful.

Many will say, by hearing good ministers,—reading good books, or conferring with good men. But these things have been tried by many who have found no such change wrought thereby. If advice, exhortation or counsel could effect this great work, we need go no further than the heavenly saying of Christ in the aforesaid fifth, sixth and seventh chapters of Matthew: for if we could hear all the ministers in the world,—if we could read all the good books, and confer with all the good men in the world, we could not have better advice, counsel and exhortation, than are contained in those three chapters.

By hearing good ministers, reading good books, and conferring with good men, we may sometimes be convicted, but not thoroughly converted: for, as virtue hath a spring, so vice hath a root that words will not reach. The strength of sin is the growth of the evil seed in the inward parts of the children of men. And forasmuch as the cause is within, it is impossible it should be removed by things without. As the cause is within, so the cure must be within, by mortifying the body of sin, or bringing down the strength thereof, which is thus effected.

There is no unrighteous thing done, but there is an inward motion before there is an outward action: and by that Light which lighteth every man that cometh into the world (if our eyes are inward) we may see those motions. Now the way to mortify the body or strength of sin is, to

deny and turn from every such motion in the first rising thereof;—for in their first rising they are weak and powerless, and may be easily denied and turned from.

But if we do not suppress vice in the first risings thereof, it will continue to be our master. On the contrary, by every such denial we bring down that which would arise and reign in us and over us;—whether it be pride, covetousness, envy, falsehood, cruelty, or any other vice. The more denials are given to vice the fewer assaults it will make, and the stronger the opposition to it, the weaker the attempt. As yielding gives vice ground to grow from a seed to a body, so denials bring it down from a body to a seed; and though something thereof may remain in us, yet it doth not reign over us, but comes into subjection to the sceptre of righteousness, or the rule and government of a right spirit.

The axe is never laid to the root of the corrupt tree, till a reformation begins within. The life of righteousness stands in the mortification of sin, which is an inward work. The spirit of this world must be brought down, before the spirit of the Lord can be exalted in us. But as a right spirit comes to reign, we have as many motives to acts of righteousness as ever we had to acts of unrighteousness; and as we yield ourselves in obedience thereunto, grace grows in us, and we grow in grace. It is a change in government that changes our natures, and makes us become new creatures.

By this we come to have the blessing, as well as the birthright. For the blessing is not to the exalted mind, but to the poor in spirit,—to the merciful,—to the pure in heart who hunger and thirst, not after riches and honor, but after righteousness,—and all that hunger and thirst after it, will endeavor to satisfy their souls with an increase of it.

Now a talent is not improved by lying hid in a napkin. If we would have more grace, we must exercise the measure we have attained unto;—we must live in the continual practice of right things;—we must keep in a state of lowliness, meekness, temperance, patience, and other virtues;—we must be just in our dealings, as well in the smallest concerns as in those that are more weighty; for a small matter turns the balance; and if that small matter be wanting, things are not just;—we do not even as we would be done by. And this just dealing, as righteousness comes to reign in us, will be no hard thing; for, as we accustom ourselves thereunto, it will be uppermost;—it will be as a diligent handmaid, ready to offer her service. And every act of righteousness performed from the motives of a right spirit, hath its immediate reward, which is not only an answer of peace, but of joy in the Holy Spirit.

The way of life is the way of pleasantness, and all its paths are peace: nothing makes it

seem difficult, but the averseness of our natures, when once corrupted. But as our natures come to be changed, we can from a sensible experience, say with David, "Thy commandment is exceeding broad."

After being awakened unto righteousness, I cannot recommend any to a better way of reforming their lives, than to turn their eyes to the gift of God in themselves; that by his candle they may see the rising of vice and deny it; so that the contrary, which is grace and truth, may rise and reign in them: for that is our help,—that is our strength,—and that is our defence.

Words, whether retained in our memories, or written in our books, are but weak instruments for this work, because the old man must be put off, which is an inward work. And how is a sorry guest put off, or a man that urgeth what we are not willing to grant, but by denying him and turning from him?

If we should enter into any reasonings with the motions of sin, we shall be in danger of being overcome thereby, for that is the nature of sin, not to turn back at a small denial; especially if it be a sin that hath prevailed over us before. But in turning therefrom, we give it a repulse, and if it be not hearkened unto, it goes back.

As the old man is put off, the new man is put on. As vice is denied, virtue is embraced. And this new man makes us new creatures; that which is created after God's image renews in us the image of God; and, bearing that image in holiness and righteousness, our conversations will declare us to be Christians indeed.

But if this old man with his deeds of darkness be not put off, the new man that is created after God's image in righteousness and true holiness, will not be put on; and though we have been awakened unto righteousness, we shall fall asleep again in one form or another,—feeding on words without any sense of power or life. And this second sleep appears to be a dead sleep; because that, although we may hear much said against pride, covetousness, envy, &c., yet we are not touched therewith, but live in the open show thereof.

Did the children of men who are called Christians make it their concern to be Christians indeed, by mortifying in themselves the spirit of this world, which is the origin of all vice,—they would not only be a happy, but a lovely people. For, by mortifying the body of sin, oppression would cease,—all wrongs and injuries would be at an end; love would spring up both to God and man;—grace would grow;—humility, meekness, moderation, and all other virtues would show themselves: we should be another manner of people in our conversations; our words and our works would be just, upright and honest; and we should confide in one another without any scruple or doubt.

What is more lovely, than to be at all times

and on all occasions, just, upright, honest and faithful,—doing to all men in all things whatsoever, even as we would that they should do unto us. Thus, living under the rule and government of a right spirit, qualifies us and makes us capable of performing every Christian duty, and enables us to love the Lord our God with all our hearts, and our neighbors as ourselves; which is the sum of all godliness, and the true character of christianity.

AN ADDRESS TO FRIENDS IN GREAT BRITAIN
AND IRELAND.

By THOMAS SHILLITOE.

Dear Friends,—In the first place, let me put you in mind of the nature and importance of that religious profession we, as a society, are making among men; which I believe will be found to be above that of every other society of professing Christians—to wit, the absolute necessity of our living, acting, and moving, in all our civil as well as religious engagements, under the influence and government of the spirit of Christ Jesus, our Lord and lawgiver: that whether we eat or drink, or whatsoever we do, God the Father may in all things be glorified. (1 Cor. x. 31.)

This, my friends, is the chief conner-stone of our building, our fundamental principle: therefore, let us consider how far the general tenor of our conduct corresponds therewith: how far we are each endeavoring, earnestly, to be found in all things conformable to the example and precepts of the Great and Holy Pattern of all Christian perfection; of Him who has trode the path of temptation and trial before us, but rejected every snare of the enemy. If this should not be the case with us, is there not a danger of our becoming to others, who from our exalted profession may be looking to us for example and encouragement in the way to the heavenly Canaan, like the evil spies unto the children of Israel formerly? or that our examples may prove as lets and hindrances to such, instead of helps, to press through difficulty and discouragement towards the mark for the prize? which is, "Ye shall be holy, for I the Lord your God am holy." (Lev. xix. 2.) "Be ye perfect, even as your Father which is in heaven is perfect." (Matt. v. 48.)

Let us remember, however we may be at peace with ourselves, by thus professing, but not doing the very best in our power to attain this perfect statue of the Christian, we are but branding ourselves in the estimation of the more serious and thinking part of the community, with the odious character of hypocrites! Neither do I believe that we escape, at all times, the like censure from the more unthinking and irreligious part. And, let us remember, the sad effects of thus dissembling will not end here: for if this conduct be

persisted in, we must expect to incur the wo pronounced by our blessed Lord: "Wo unto you, Scribes and Pharisees, hypocrites! for ye shut up the kingdom of heaven against men; for ye neither go in yourselves, neither suffer ye them that are entering to go in." (Matt. xxiii. 13.) For if every one that nameth the name of Christ is to depart from iniquity, is it not obligatory on the part of such as make the high and holy profession we do, to endeavor to attain to such a state of purity of conduct and converse amongst men? 2 Tim. ii. 19.

I believe our first friends were raised up as a people, to bear testimony to the sufficiency of this pure principle of light and life in all mankind, which would direct them the way to the heavenly Canaan, and strengthen them to walk therein. They confirmed the truth of their testimony by the general tenor of their conduct, giving ample proof to by-standers, that through submission to its holy appearance in their hearts and minds, they were mercifully redeemed from the world and its spirit: not only from its pleasures, but also from its treasures; and were enabled to count all things appertaining to this life but as dross and dung, so that they might win Christ. (Phil. iii. 8.) Hereby they became as an ensign to the nations; for the fame of them spread far and wide: they became instrumental in the Divine Hand to gather souls unto God, and had to proclaim the glad tidings of the Church being added unto daily.

But alas! my friends, how is the gold become dim, and the most fine gold changed; how is the love of God, and that humility and self-denial so manifest in them, now by too many amongst us turned into the love of other things, such as gold and silver, and a desire to make an appearance of greatness in the world. That these sorrowful reverses have taken place in too general a way amongst us as a Society, let the reports brought up from Monthly to Quarterly Meetings testify, especially as to growth in the truth and conviction. For it is truly distressing to sit at the Monthly Meetings, when this query is answered, and observe the difficulty and embarrassment the active members feel themselves under, to answer it so as to pass the Quarterly Meeting without remark; especially as respects the first part, of a growth in the truth, which I understand to imply an inquiry, what individual advancement we are making towards the kingdom of heaven. Yet notwithstanding these sifting seasons so frequently occur, (for such I find them to be to myself, and so I doubt not they prove to many others,) they are at times as when a man beholdeth his natural face in a glass, "and goeth his way, and straightway forgetteth what manner of man he was." (Jam. i. 23, 24.) For want of abiding enough under these renewed visitations of the Great Head of the Church, how evident is it, that we soon forget again our

many deformities, hereby adding sin to sin. Is not this too much our situation as a society at the present day? Are not Monthly Meetings and Quarterly Meetings going on from quarter to quarter, and from year to year, satisfying themselves with telling the same dismal tale, "we hope some among us witness a growth in the truth?" Now if the ground of this hope (where meetings venture thus far to express themselves) were called for, I fear it would not be found in the general to be that well-grounded hope which gives victory over the world. At other times, "but little growth in the truth, and some conviction,"—"but little conviction," or "no conviction appears among us!"

Do not these things, my friends, loudly call upon us, as a religious body making a high profession, to be willing, each one for himself, to enter timely into the closet of the heart, and seek for divine help to shut to the door thereof against carnal reasoning, great natural acquirements, and love of the world; which, there is cause to fear, have overpowered the better judgment of many among us? Hereby, as we become willing to stand open to Divine conviction, we may be favored, each one, to see in what manner and how far we may have contributed to this sorrowful declension; and timely amend our ways and our doings; seeing we are yet mercifully followed as a religious society, both immediately by the Great Head of the church, and instrumentally with line upon line line upon line! O, how applicable is the language of the Most High, formerly uttered, to his dealings as respects our society! "How shall I give thee up, Ephraim? how shall I deliver thee, Israel? how shall I make thee as Admah? how shall I set thee as Zeboim? mine heart is turned within me, my repentings are kindled together. I will not execute the fierceness of mine anger. I will not return to destroy Ephraim; for I am God and not man; the Holy One in the midst of thee; and I will not enter into the city." (Hosea xi. 8, 9.)

May we no longer be found walking unworthy of these his multiplied mercies, but be prevailed upon to return to the good old ways; that we also may be found in those paths of holiness of life and conversation, in which our forefathers walked under sore travail of mind, and great suffering of body, and waste of outward substance through persecutions. Oh! let us no longer be found trampling as it were upon their testimony, by slighting the many great and precious privileges of this day of outward ease! We who are uninterruptedly eating the fruit of the vineyards and oliveyards we never planted; but which they were made instrumental to plant for us, thus making the way easy to us, as it now is, to assemble for the purpose of Divine worship, for transacting society concerns, and for the support of our various religious testimonies; lest,

if we still continue to refuse yielding our necks to the same precious yoke of Christ, which they took on them, (and by so doing found it to be all-sufficient to bring down, and keep down, the spirit of the world, that has now gained the ascendancy over too many amongst us,) by this their obedience giving proof, that although in the world they were not of the world, but at enmity with its spirit, its maxims and manners—dead, not only to its pleasures, but so dead to a desire after its pleasures, that when, in order to preserve a conscience void of offence in the sight of their Creator, they were, for faithfulness to His law and testimony, stript of their outward substance, they counted these losses of their earthly treasure to be gain. I say, if we will not cast away from us these things, which have led into captivity again to the world, to its spirit, its manners, and (there is reason to fear) many of its maxims and deceitful ways—our gods of gold and silver, of wood and stone—our sumptuous and richly furnished houses, in some of which is displayed all the elegance the art of the upholsterer can devise, (for it is lamentably the case that little or no trace of true self denial is now to be found in the habitations of many of our members, and even of some who stand in the foremost rank,) lest in the day when the Almighty may see meet, after long forbearing in love and mercy with this favored nation, to rise up and plead with it in judgment, *we should have the largest portion thereof administered unto us as a people*; and the declaration formerly uttered, respecting the children of Israel, be fulfilled also upon the unfaithful members of our religious society—“You have I known of all the families of the earth; therefore I will punish you for all your iniquities.” (Amos iii. 2.)

By unfaithful members, I would not be understood to mean exclusively those among us who have cast off all restraint as to dress and address, and are unfaithful in the other branches of our religious testimony; for these I have long been led to believe are not the greatest enemies that the truth has to contend with in the minds of the Lord's visited children, whether of our own or other religious societies; because in our own society, such as these are not looked up to for example; and as respects the world more at large, such are only known to be of us within the circle of their immediate acquaintance; and by their thus becoming (if I may so speak) *consistently inconsistent* with our profession, there is reason to apprehend they pass along, as to conduct, much unnoticed. But I would wish the term *unfaithful* to be understood to refer more immediately to those, who in their garb and language support the character of a consistent friend, but whose conduct, with respect to their commercial transactions and manner of living, their houses and furniture, does not correspond with their religious profession, but proves that

they are the friends of the world, and not of Christ Jesus. The fruits brought forth by such testify, that within (like the whited sepulchres) they are full of dead men's bones and rottenness; (Matt. xxiii. 27,) and that the spirit of the world is the governing principle in most if not all their actions among men. How many among us are pursuing their worldly concerns as if they counted gain godliness, (and not, as must be the case with true disciples and followers of Christ, godliness with contentment to be the greatest riches, 1 Tim. vi. 5, 6,) proclaiming in the language of conduct, that all is fish that comes to their net, regarding neither quantity nor quality, so there be a prospect of a good profit attached to it! And how have the gifts which the God of this world hath bestowed on these his votaries blinded their eyes; (2 Cor. x. 4,) many of whom, I doubt not, were once favored to see *clearly* the things that belong to peace and salvation. Oh! these professing worldlings, who say they are Jews and are not, but whose fruits testify that they are of the synagogue of Satan, I have been persuaded, have been the greatest enemies to the spreading of our religious principle and enlargement of our borders: these who maintain a uniform, consistent warfare against the “Babylonish garment,” (Joshua vii. 21,) but with all their might grasp at the “wedge of gold,” and aim at making a splendid appearance in their way of living. I believe no character is more odious in the estimation of those termed libertines than those—especially where it is known they are taking an active part in society concerns. For in neighborhoods where meetings are held, it is pretty generally known by those out of the society, who are (what the world calls) our *pillars*; though it can not be doubted that such must at times prove *stumbling blocks* to honest inquirers after Zion, and be instrumental in turning the blind out of the right way of the Lord.

So look to yourselves, my Friends, you to whom these remarks apply, you who have resolved to obtain an impossibility, and be heirs of two kingdoms! Is it any marvel at all, that so little fruit is to be found from the labor that has of late years been bestowed, by the messengers of that same Gospel our first Friends preached, whose feet have been turned into the highways and hedges? For I cannot doubt but that the word preached has been both believed and received by many; but that, on their comparing things with things, the conduct of many amongst us has been found at variance with the doctrine preached, and this even with some whom they considered to be seated as the Aarons and the Hurs by the side of these the Lord's messengers: (Exod. xvii. 10.) And doubtless many have left the meeting-place with sorrowful hearts, and instead of resolving to pursue the path pointed out towards the heavenly Canaan, have

formed this conclusion, that they had better remain as they were, than have the feet of their minds turned into the way, and not persevere, as they clearly saw was the case with many amongst us.

Nor do the sad effects of this dissembling end here; for I think I have frequently been able to trace its sorrowful consequences to many of the dear youth, as being one cause why so few of them in this day of outward ease as to liberty of conscience, are coming forward in the line of true usefulness in the society, and among mankind; or helping the good cause by the religious exercise of their spirits in meetings, and by consistent conduct out of meetings. We may be active in society concerns, and yet strangers to this religious exercise, without which we cannot become helpers in the Lord's cause, and lighte in the world. (Matt. v. 14) I would that I were able to believe that all of us, who stand in the station of Ministers and Elders, had escaped this too general contagion of the love of the world; but with sorrow it must be acknowledged, if we speak the truth, that there is reason to fear the complaint of the Almighty, through one of his servants formerly, may apply to some of this class: "The leaders of this people cause them to err." (Isa. ix. 16.) And such a line of conduct, if persisted in, must in the end prove fatal in its consequences.

Let none be saying I expose things too much; for those to whom these remarks apply have been exposing themselves more already; for our hearers and the world at large are quick-sighted, and although our defects may have been passed over in silence, as respects notice thereof to ourselves, yet they do not pass unobserved, or without being remarked upon as to others: nor is it to be desired they should—the people are not to be expected to take things upon trust, or pin their faith on our sleeves, but to see and know for themselves. The enemy of all good is not idle, but ever alert, and ready with baits suited to answer his purposes; so that when the good hand has been turned towards any, and they have been favored to see and feel the need of a still further separation, in love and affection, from all sublunary things, and the mind has become exercised with desire to experience this, then he has endeavored to counteract the gracious design of Omnipotence by raising mountains of discouragement and difficulty in their way; endeavoring to persuade that the path thus opened to their view is not to be trodden by mortals; and as a confirmation of these his evil suggestions, turning their attention towards such in a more particular manner, who stand in the fore rank, and are making a great profession, but not coming up in a consistent conduct; and hereby, there is a reason to fear, the pure witness in such is often again put to silence.

(To be continued.)

EXTRACT FROM BENEZET'S PREFACE TO THE
PLAIN PATH TO CHRISTIAN PERFECTION.

Amongst the many instances tending to prove the universal operation of divine grace on the human heart, a particular one appeared some years ago, among a number of Indians in the province of Pennsylvania. These people were very earnest for the promotion of piety among themselves, which they apprehended to be the effect of an inward work, whereby the heart became changed from bad to good. When they were solicited to join other Indians in the war against the English, they absolutely refused, whatever might be the consequence to themselves, even if the fighting Indians should make *slaves*, or, as they expressed it *negroes*, of them, rendering this reason for it, that when God made men, he did not intend they should hurt or kill one another.* Upon being further conversed with, respecting their religious prospect, he who had been the principal instrument in raising them to a sense of good, gave in substance, the following account. That being by a particular providence brought under difficulty and sorrow, he was led into a deep consideration of the state of things in the world; when, seeing the folly and wickedness which prevailed amongst men, his sorrows increased. Nevertheless, being impressed with a belief that there was a great power, who had created all things, his mind was turned from beholding this lower world, to look towards him who had created it, and strong desires were begot in his heart for a further knowledge of his Creator. He was then made sensible, that evil not only prevailed in the world, but that he himself partook much of its baneful influence, and he at last found his own heart was bad and hard. Upon this, great dejection and trouble seized his mind, with an inquiry, what would become of his soul? in this situation he cried unto that powerful Being who he was sensible had made the heart of man; and after a long time of sorrow and perseverance in seeking for help, God was pleased to reveal himself to his mind, and to put his goodness in his heart. He found he was, as he expressed it, raised above himself and above the world, and felt that his heart had undergone some great change; the hardness and badness he had so long groaned under, was taken away, it was now become soft and good; he found so much love to prevail in it, to all men, that he thought he could bear with their revilings and

* In this disposition they have continued for about thirty years, notwithstanding the ill treatment they have received from Indians and others; more especially of late that they have been pillaged, their settlements at three towns broken up, and they carried away captives towards Canada. Those Indians who carried them away giving as a reason for this violence, that they were in their way, and a great obstruction to them when going to war. See the Pennsylvania Packet, for December 22, 1781.

abuses without resentment; appearing sensible, that as the hearts of all men were bad and hard, till God made them good, the ill usage he received from them proceeded from the same evil seed under which he himself had so long groaned. This sense of the corruption of human nature, accompanied with a constant application to his Maker, to take away the badness and hardness of the heart, and make it soft and good, was what he called religion; and what upon feeling the power of God to his comfort he was concerned to exhort his brethren to seek the experience of, in themselves. And further said, that under this dispensation he was made sensible the spirit of religion was a spirit of love, which led those who obeyed it into love to all men; but that men not keeping to this spirit of love, an opposite spirit got entrance in their hearts; that it was from hence all those disorders arose which so much prevailed amongst men. He was also sensible there was still an evil spirit laboring to get the mastery in his heart, in opposition to the gospel spirit; but that those who had been visited by a power from God, and were obedient to the degree of light and love he was pleased to favor them with, would be more and more strengthened and established therein. He had also a prospect of the necessity of that baptism of spirit and fire which the scriptures and the experience of the faithful in all ages, testify every true disciple of Christ must undergo; whereby, through mortification, and death to self, the root of sin is destroyed. This he described by the prospect he had of something, like as an outward fire would be to the natural body; which he must pass through in order to attain to that purity of heart he desired. He further observed, that whilst he was anxiously beholding this fire, he saw a very small path close to it, by walking in which, he might go round the fire, and the painful trial be avoided. This he understood to represent the way by which those who were esteemed wise had found means to avoid that probation they ought to have passed through, and yet retained a name amongst men, as though they had been purified by it. Thus this Indian, untaught by books and unlearned in what is called divinity, through the inshining of the light of Christ on his understanding, explained the mystery of godliness in a plain and sensible manner—shewing that true religion remains to be the power of God to salvation, changing and purifying the heart, and bringing it into true contrition and a submissive resignation to the will of God. This has ever been found to be the effect of its operation on all those, who by devoting themselves to God, are become the true followers and disciples of Jesus Christ.

Act as becometh thee in thy present station, and in more exalted ones thy face shall not be ashamed.

CONTEMPLATIONS, MORAL AND DIVINE.

The writings of Matthew Hale, on religious subjects, particularly his "Contemplations, Moral and Divine," manifest a truly humble frame of mind. We shall select a few of these, as testimonies which this great and good man bore to the power and efficacy of religion.

"True religion," says he, "teaches the soul a high veneration for Almighty God; a sincere and upright walking, as in the presence of the invisible, all-seeing God. It makes a man truly love, honor, and obey him, and therefore careful to know what his will is. It renders the heart highly thankful to him, as his Creator, Redeemer, and Benefactor. It makes a man entirely depend on him, seek him for guidance, direction, and protection, and submit to his will with patience and resignation of soul. It gives the law, not only to his words and actions, but to his very thoughts and purposes; so that he dares not entertain any which are unbecoming the presence of that God by whom all our thoughts are legible. It crushes all pride and haughtiness, both in a man's heart and carriage, and gives him a humble state of mind before God and men. It regulates the passions, and brings them into due moderation. It gives a man a right estimate of this present world, and sets his heart and hopes above it; so that he never loves it more than it deserves. It makes the wealth, and the glory of this world, high places, and great preferments, but of little consequence to him; so that he is neither covetous, nor ambitious, nor over-solicitous, concerning the advantages of them. It makes him value the love of God and the peace of his own conscience, above all the wealth and honor in the world, and to be very diligent in preserving them. He performs all his duties to God with sincerity and humility; and, whilst he lives on earth, his conversation, his hope, his treasures, are in heaven; and he endeavours to walk suitably to such a hope."

Of the inward direction and assistance of the Spirit of God to the soul, he writes as follows:

"They who truly fear God, have a secret guidance from a higher wisdom than what is barely human, namely, the Spirit of truth and goodness; which does really, though secretly, prevent and direct them. Any man that sincerely and truly fears Almighty God, and calls and relies upon him for his direction, has it as really as a son has the counsel and direction of his father: and though the voice be not audible, nor discernable by sense, yet it is equally as real as if a man heard a voice, saying, "This is the way, walk in it."

"Though this secret direction of Almighty God is principally seen in matters relating to the good of the soul; yet even in the concerns of this life, a good man fearing God, and begging his direction, will very often, if not at all times,

find it. I can call my own experience to witness, that, even in the temporal affairs of my whole life I have never been disappointed of the best direction, when I have, in humility and sincerity, implored it."

"The observance of the secret admonition of this Spirit of God in the heart, is an effectual means to cleanse and sanctify us; and the more it is attended to, the more it will be conversant with our souls, for our instruction. In the midst of difficulties, it will be our counsellor; in the midst of temptations, it will be our strength, and grace sufficient for us; in the midst of troubles, it will be our light and our comforter."

"It is impossible for us to enjoy the influence of this good Spirit, till we are deeply sensible of our own emptiness and nothingness, and our minds are thereby brought down and laid in the dust. The spirit of Christ is indeed a humbling spirit; the more we have of it, the more we shall be humbled: and it is a sign that either we have it not, or that it is yet overpowered by our corruptions, if our heart be still haughty."

"Attend, therefore, to the secret persuasions and dissuasions of the Spirit of God, and beware of quenching or grieving it. This wind that blows where it lists, if shut out or resisted, may never breathe upon us again, but leave us to be hardened in our sins. If observed and obeyed, it will, on all occasions, be our monitor and director. When we go out, it will lead us; when we sleep, it will keep us; and when we awake, it will talk with us."

FRIENDS' INTELLIGENCER.

PHILADELPHIA, SECOND MONTH 11, 1860.

DIED, at his residence in Green county, Ohio, on the 22d of 1st mo., 1860, JACOB BROWN, in the 85th year of his age.

The deceased was a consistent member of Green Plain Monthly Meeting. For many years Oakland Indulged Meeting has been held at his house, and was a source of much comfort to him. He had an unwavering faith in his Redeemer, and a full assurance of his acceptance with him.

—, On 1st mo. 10th, 1860, at the house of her son-in-law, Reuben Yerkes, JANE SHOEMAKER, widow of John Shoemaker, in her 88th year, a devoted mother and an exemplary member of Plymouth Meeting, Pa.

—, at Waterford, Loudoun Co., Va., on the 23d of the 11th mo., 1859, BEULAH, wife of Moses Janney, in the 76th year of her age.

The deceased was a native of Pennsylvania, but in early life settled at Waterford, Va., and became a member of Fairfax Monthly and Particular Meeting, of which she was a constant attendant. She was faithful in the performance of her duties, and held the station of Elder for many years previous to her death, encouraging all, by her example, to a life of meekness, and devotion to the cause of Truth.

Departed this life, on the 27th ult., at the residence of her son-in-law, Thomas Welsh, in the city of Balti-

more, SARAH W. DODDRELL, widow of James Doddrell, of Deer Creek, in the 70th year of her age.

She was a consistent member of the Society of Friends. Her natural endowments, which were of the best order, had been cultivated by reading and reflection, and much chastened by the sorrows which had attended her life. Yet trusting in Him, in whom she had believed, she had learned to place her confidence where alone true succour can be found, and appreciated this refreshing and all-sustaining influence. She became cheerful under affliction, and was thus a fine example of the meekness and gentleness, which are the highest adornments of every Christian professor. Being also possessed of an unusual store of information connected with the various departments of literature, she was highly valued in the social circle, wherever her lot was cast; and the more so, from the confidence entertained by her friends in the integrity and purity of her character. Her memorial, therefore, is written in their hearts. They believe that, although no "storied urn or animated bust" may perpetuate her remembrance upon earth, yet in the day when the "Lord of Hosts" makes up his "jewels," she will be found amongst the number of those of whom it is declared they "shall be in everlasting remembrance."

Baltimore, 2d mo. 4, 1860.

T.

FASHION AND RUIN *versus* INDUSTRY AND INDEPENDENCE.

BY TIMOTHY FLINT.

I cannot conceive that mere idlers, male or female, can have respect enough for themselves to be comfortable. I have no conception of a beautiful woman or a fine man, in whose eye, in whose port, in whose whole expression, this sentiment does not stand embodied:—"I am called by my Creator to duties: I have employment on the earth; my sterner but more enduring pleasures are in discharging my duties."

Compare the sedate expression of this sentiment in the countenance of man or woman, when it is known to stand as the index of character, and the fact, with the superficial gaudiness of a simple, good-for-nothing belle, who disdains usefulness and employment, whose empire is a ball room, and whose subjects, dandies as silly and as useless as herself. Which, of the two, has more attractions for a man of sense? The one a help mate, a fortune in herself, who can aid to procure one if the husband has it not, who can soothe him under the loss of it, and what is more, aid him to regain it; and the other a painted butterfly, for ornament only during the vernal and sunny months of prosperity, and then not becoming a chrysalis, an inert moth in adversity, but a croaking, repining, ill tempered termagant, who can only recur to the days of her short-lived triumph, to embitter the misery and poverty and hopelessness of a husband, who, like herself, knows not to dig and is ashamed to beg.

We are obliged to avail ourselves of severe language in application to a deep-rooted malady. We want words of power. We need energetic and stern applications. No country ever verged more rapidly toward extravagance and expense.

In a young republic like ours, it is ominous of any thing but good. Men of thought, and virtue and example, are called upon to look to this evil. Ye patrician families, that croak, and complain, and forebode the downfall of the republic, here is the origin of your evils. Instead of training your son to waste his time as an idle young gentlemen at large; instead of inculcating on your daughter that the incessant tinkling of a harpsichord or a scornful or lady like toss of the head, are the chief requisites to make her way in life,—if you can find no better employment for them, teach him the use of the grubbing-hoe, and her to make up garments for your servants. Train your son and daughter to some employment,—to frugality—to hold the high front and to walk the fearless step of independence. When your children have these possessions, you may go down to the grave in peace, as regard their temporal fortunes.

An extract from the Report of the Superintendent of Common Schools of Pennsylvania, for the year ending 6th mo. 6th, 1859.

In some of the rural districts directors persist, regardless of complaints and remonstrance, in keeping the schools open seven and eight hours a day, often with only a short intermission at noon, and the school houses not always properly furnished and ventilated. The practice apparently originates in an unconsciousness of the radical difference between mental and manual labor; and the belief that if, for instance, a robust wood-chopper can swing his axe all day without injury, the brain-work of growing children can be adjusted to a similar standard.

These errors of unlettered ignorance find their counterpart in more enlightened communities in the forcing system of tuition still too often encountered in both public and private schools in our commercial metropolis, and some of our interior cities and large towns. Mistaking knowledge for education, this unfortunate system brings its hydraulic pressure to bear with remorseless cruelty upon the immature intellect of pupils in early youth or dawning womanhood, with a catalogue of text-books and studies that might astonish a university; and is prolific in superficial attainments, or feeble health, broken constitutions and premature graves, that are ignorantly, but not the less falsely and irreverently charged to "a mysterious Providence," instead of inexcusable violations of the physical laws of our being, so obvious and palpable, that he who runs may read. In its immediate application and ultimate results, the policy referred to is an outrage upon humanity, and a crime against society. Teachers deplore it, pupils sink under it, medical authorities denounce it, cemeteries and insane asylums are replenished by it, but

private interests and a misguided public opinion permit, as yet, no adequate reform.

The opinion seems to prevail that because hard-headed lawyers, or energetic merchants, in the maturity of a vigorous manhood, can bend their utmost powers of mind, early and late, to their respective pursuits during term time or the spring sales, the same fierce intensity of prolonged mental application is proper for children and youth, and can safely be exacted of them; and thus the period of life that should be one of genial culture, and the gradual, natural, healthful development of the whole being, becomes one of painful sacrifice and misdirected self-destroying effort.

The popular notions are sadly at fault with regard to the true character and objects of *primary instruction*, the qualifications of the teacher, and the proper methods for developing and training the juvenile mind.

ADDRESS ON THE GRASSES.

BY J. STANTON GOULD.

Delivered before the Cayuga Agricultural Society, 1859.

I come before you to-day to plead the cause of our neglected meadows and pastures. They are not in our State what they once were; their average production is less to-day than it was ten years ago; and if the same negligent, unintelligent and wasteful management is continued, they will yield less, ten years hence, than they do now. I would urge you to stop this fearful deterioration, and to enter at once, and in good earnest, on the opposite path of amelioration; and if I happily succeed in inducing you to grow two blades of grass where but one has grown before, I will ask for no prouder epitaph on my tomb than the record of the achievement.

The word Grasses is very vaguely used in common speech. Many plants, such as the clovers and Lucerne, are familiarly called grasses which are not entitled to the appellation; while many true grasses, such as wheat and Indian corn, are rarely spoken of as such.

Let us, then, in the first place, form a clear conception of what we mean by the word.

Whenever you meet with a plant having a cylindrical, jointed stem, the nodes being solid and the intervening joints hollow, or filled with a pith-like substance; if the leaves are long, narrow, unserrated at the edges, having fine parallel veins running along on each side of a prominent central vein or midrib; if you find the leaves are alternate, one of them originating at each joint, embracing the stem with its base, and forming a sheath which is slit down on the side opposite to the leaf to its origin; and if we also find that its flowers are protected by that peculiar kind of calices called glumes or husks, then you may be certain that you have a *true grass*.

The Almighty has attested the vast importance

of the grasses so clearly as loudly to rebuke our carelessness with respect to them.

While other families of plants, such as the grape, the fig, and the bread fruit tree, are restricted to narrow belts of latitude, the grasses spread over the whole earth. Every where they spring up spontaneously; they unfold their graceful panicles beneath the dull and leaden skies of the Arctic zone; they adorn the temperate zone with their refreshing verdure; while beneath the ardent skies of the torrid zone their culms swell out into almost giant proportions, vying in some of their varieties with the trees of more northern regions.

Providence has not only attested the value of the grasses by the wide dispersion he has given them, but by the great number and variety of the species he has created. There are no less than three thousand distinct varieties known and described by botanists, and we know not how many more exist which have not yet been reduced under the domain of science. Thirty varieties have been counted in a single sod taken from a rich natural pasture. Mr. Flint describes a hundred and twenty-five varieties growing in the State of Massachusetts. In the Natural History of New York, Prof. Torrey describes forty varieties of the genus *poa*, twenty-seven of *agrostes*, six of *alopecurus*, fifteen of the *festucas*, and thirty-four other varieties, amounting in all to one hundred and twenty-two varieties as existing in the State of New York.

Since God makes nothing in vain, and has declared that every thing that he has made is good, we shall not err in inferring that the wide diffusion and the great variety of this family of plants is an indication that he intended them to enter very largely into the sustenance and the enjoyment of his creature, man.

Six tenths of the whole cultivated area of the State of New York is occupied by grass; we are indebted to it for all the meat, and wool, and cheese, and butter, which we produce; its annual value in this State is at least sixty millions of dollars; when therefore we speak of making two blades of grass grow where only one grew before, it means that we shall double our production of meat, wool, cheese and butter; it is equivalent to adding sixty millions of dollars to the annual income of the farmers of the State; it is to give us the means of making a canal every year as long and as large as the Erie canal, leaving a surplus to build two railroads of the capacity of the Hudson River road.

We have not fully measured the importance of making two blades of grass grow where only one grew before when we have stated the direct money value of the increased production; the increased amount of the cereals which would be grown in consequence of the enlarged supply of manure resulting from the doubled growth of grass, would be counted by millions. The effect of grass on

the growth of the cereals is well illustrated by a comparison of the agricultural statistics of France and England. France has fifty-three per cent. of its cultivated area under grain crops, while England has but twenty-five per cent.; but in grass and meadow, the natural food of live stock, England has fifty per cent. and France has only twenty-two per cent. You may be surprised to hear, that notwithstanding the enormous disproportion of area of grain land, England produces 5 1-9 bushels of grain for every individual of her population, while France produces 5 1/2 bushels for every individual of hers. Thus the production of the former is within seven eightieths of a bushel of the latter to each head of her population. How is it that England is so nearly on an equality of production with France, while her cultivated area is very much inferior?

The answer is plain; it is on account of the manure furnished by her grass lands. Every acre of English grain land receives the manure from three acres of grass, while in France the manure from each acre of grass must be diffused over two and a half acres of grain. Let not the eloquent teachings of these plain statistical statements be lost upon us. Let us ponder them carefully when contemplating the splendid rewards which nature offers for a thorough obedience to her laws.

Doubtless you will admit that the doubling or trebling our hay crops is very important and very desirable, but you may very probably say that it is impossible—that any attempt to realize it in practice will be only labor lost.

I do not think so; on the contrary, I am fully persuaded that it can be accomplished, easily and surely, if you will only resolutely make the attempt.

There are many convincing reasons for this opinion:

1st. It cannot be denied that farmers in general bestow much less thought, or care, or study, or science, or labor, on their grass lands, than they do on their grain lands. Not one in ten thousand even know the names of the grasses which are growing in their meadows. Many of them are not even aware that they have any other varieties than timothy, clover and red top; much less do they understand the peculiar properties or the relative values of the different species. Our present meadows and pastures are almost entirely the work of nature, unaided and unimproved by art. Is it unreasonable to expect, that when science, and practical skill and energy, are applied to the culture of grass, to the same extent that they have been to the production of grain and to the breeding and feeding of cattle, that it will result in a great augmentation of our productions?

2d. The average production of the meadows of the State of New York is ninety-six tons of dry hay to the hundred acres. The average pro-

duct of the county of Kings is one hundred and sixty tons of hay to the hundred acres. Why is this county superior to all others in the State for the production of grass? Its soil does not differ at all from that of Queens county, which averages forty-four tons less to the hundred acres; and it is *very inferior* to that of Onondaga county, which gives on an average sixty tons less to the hundred acres. I have carefully examined the meteorological registers of the State, prepared under the direction of the Regents of the University, and I cannot discover any thing in its climate more propitious to the growth of grass than other counties; there remains, therefore, but one conclusion, and that is, that the grass lands are managed with more skill there than elsewhere. Is it any extravagant hypothesis to assume that the farmers of other counties can acquire as much skill as those of Kings, if they choose to exert themselves to acquire it? Can it be a matter of doubt that the farmers of Onondaga can produce as much grass on a superior soil as the farmers of Kings can on an inferior one, if they only resolve that they will do so?

3d. I have examined the Transactions of our State Society, and the agricultural journals of the State, for several years, and find from these that the best farmers are not satisfied with less than two or three tons of hay to the acre, on any soil or in any county. While the average production of the county of St. Lawrence is only eighty-five tons to the one hundred acres, many farmers of that county regularly cut three tons to the acre, although their soils are not intrinsically superior to the average quality of the county. Let the other farmers of that county acquire the same amount of skill and energy, and there is no reason why their production should not rise to the same amount.

4th. Those who have most carefully investigated the subject assure us that at least one third of the plants grown in our meadows are weeds, of no intrinsic value, and which only serve to rob the useful grasses of their proper nutriment; and that one sixth of the remainder are made up of the poorer and least nutritious grasses. Surely it is not impossible to replace these noxious plants by the more valuable grasses; and if we accomplish no more than this, we shall add no less than twenty millions to our annual income.

It seems to me that the consideration of these facts should stimulate us to immediate and active efforts for the improvement of our grass lands, with a full assurance that our enlightened efforts will be crowned with a duplication of our profits.

In the hope of aiding to produce this very desirable result, I beg leave to point out some of the means which science and experience concur in proving to be best adapted for its accomplishment.

The three thousand species of grass of which

we have spoken may be divided into five distinct classes. They are—

1st. *The Jungle Grasses*.—These are chiefly adapted to those equatorial regions that are drenched during one portion of the year with incessant rains, while they are parched with heat during the remainder; some of this class grow fifty or sixty feet high.

2d. *The Aquatic Grasses*.—Which find their congenial homes on the banks of rivers, in brooks and ditches, and in wet places generally. The chief object in studying these grasses is, in general, to learn how to exterminate them; but there are a few of them, such as ribbon grass, (*Phalaris Americana*), which, in certain situations, are well worthy of cultivation, and are much relished by cattle, especially by milch cows.

3d. *The Marine or Sea-Side Grasses*.—These constitute the salt marsh hay, which is of considerable importance on the sea coast of New England, but is little known or valued in New York.

4th. *The Agrarian Grasses*.—Which are furnished with rhizomes or creeping roots, pushing up stems from below in every direction. Quack grass (*triticum repens*) is a most pestiferous example of this class; but it possesses one species of very great value: green grass, wire grass and blue grass are its synonyms, and *poa compressa* its systematic name. This is the heaviest grass known, and is exceedingly nutritive. Horses fed upon it alone will do as well as on timothy and oats together; it is very hardy, and keeps green until the heavy frosts of autumn.

5th. *The True Meadow Grasses*.—It is from this class that those who are determined to improve their meadows and pastures must chiefly make their selections. It is this class which mainly requires their attentive study and their careful and varied experimentation. They will be found to vary very greatly from each other in their habits and their nutritive values. Some of them flourish on dry, sandy, or rocky soils, while they speedily perish in wetness or even moisture; others grow vigorously in wet soils, but die in drier ones. A portion of them will only grow on alkaline soils; and some of these demand an excess of potash, while others only put forth their full luxuriance when there is an excess of lime. Some grasses are adapted to the sun light—others love the shade; some are valuable for hay, but not for pasture, and vice versa. Some kinds are forced into great luxuriance by one kind of manure, which may operate almost like a poison on other varieties. One species abounds in that kind of nutriment which enlarges and strengthens the muscles; another, ill adapted to nourish the muscular tissues, will lay on fat rapidly; another, which is deficient in both these respects, is rich in those elements which

support respiration, and furnish the fuel for the production of animal heat. A variety of grass may be useful if it possesses none of these qualities, if it assists, in combination with the others, to assimilate the nutriment they contain with the tissues of the animal consuming it.

In view of what has been said, it will be clear that in the judicious selection of different varieties of grass, to occupy different localities, and to subserve different purposes, a wide field is afforded for the application of physiological, botanical, geological and meteorological knowledge. Every variety of grass was intended by the Creator to serve some valuable purpose; it is the business of practical agriculture to find out what that is, and to place it in the locality and under the conditions best suited to its most profitable development.

The soil best adapted to the growth of the most valuable grasses is a strong, calcareous soil, resting on a clayey subsoil. On such a soil, we may be sure of an abundant vegetation, resisting drought and heat, and making a fine, durable sod; but we must bear in mind that there is no soil which is incapable of bearing grass, if we only select the variety which is exactly adapted to it.

The best grasses seem to avoid alike the extremes of wetness and dryness; a moist soil is shown by experience to be best adapted to their growth. Thus actual counting has shown that—

In *wet* meadows, out of 30 plants, 4 were useful, 26 bad.

In *dry* meadows, out of 38 plants, 8 were useful, 30 bad.

In *moist* meadows, out of 42 plants, 17 were useful, 25 bad.

By effecting mechanical and chemical alterations in the soil, we may adapt it to almost any kind of grass; but this is generally an expensive and tedious process. Most farmers will, therefore, prefer to suit their grasses to their soils, rather than suit their soils to the grass; this will be true policy in the first instance, but we should keep the amelioration of the soil steadily in view, and gradually and progressively improve it until it is at length adapted for the production of the best grasses.

(To be continued.)

THE MORAL DIGNITY OF THE EDUCATIONAL PROFESSION.

BY WM. E. CHANNING.

One of the surest signs of the regeneration of society will be the elevation of the art of teaching to the highest rank in the community. When a people shall learn that its greatest benefactors and most important members are men devoted to the liberal instruction of all its classes, to the work of raising to life its buried intellect, it will have opened to itself the path of true glory.

There is no office higher than that of a teacher of youth; for there is nothing on earth so precious as the mind, soul, and character of the child. No office should be regarded with greater respect. The first minds in the community should be encouraged to assume it. Parents should do all but impoverish themselves, to induce such to become the guardians and guides of their children. To this good all their show and luxury should be sacrificed.

Here they should be lavish, while they straiten themselves in every thing else. They should wear the cheapest clothes, and live on the plainest food, if they can in no other way secure to their families the best instruction. They should have no anxiety to accumulate property for their children, provided they can place them under influences which will awaken their faculties, inspire them with pure and high principles, and fit them to bear a manly, useful and honorable part in the world. No language can express the cruelty or folly of that economy which, to leave a fortune to a child, starves his intellect and impoverishes his heart.

FAITH TRIUMPHANT OVER SORROW.

Not that Thy boundless love, my God,
Sheds blessing on my way,
And gilds, as with a heavenly beam,
The darkness of earth's day,—
Not now for breath of summer flowers,
For smiles of sunny skies,
The still small voice of gratitude
Shall to Thine ear arise.

I bless Thee for the ministry
Of sorrow's lonely hour,
When darkly o'er my stricken head
I see the storm-clouds lower;
Thy love can still the billows' roar,
And whisper, "Peace; be still!"
While faith doth on Thy promise rest,
And bless the Father's will.

The shadow and the storm must come;
O, grant that faith divine
Which triumphs o'er the might of grief,
And moulds man's will to Thine!
In hours of deepest gloom, mine eye
One blessed ray can see;
A sunlit side that cloud must have,
Which hides Thy face from me.

Chr. Register.

INDEPENDENCE.

How happy is he born or taught,
Who serveth not another's will;
Whose armor is his honest thought,
And simple truth his highest skill;

Whose passions not his masters are;
Whose soul is still prepared for death;
Not tied unto the world, with care
Of public fame, or private breath;

Who God doth late and early pray
More of His grace than goods to lend,
And walks with man, from day to day,
As with a brother and a friend!

This man is freed from servile bands
Of hope to rise, or fear to fall;
Lord of himself, though not of lands,
And having nothing, yet hath all.

Wotton.

For Friends' Intelligencer.

Review of the weather, &c. for FIRST month.

	1859.	1860.
Rain during some portions of the 24 hours,	5 days	4 days.
Rain all or nearly all day,	3 "	1 "
Snow, including very slight falls,	5 "	5 "
Cloudy without storms,	4 "	9 "
Ordinarily clear,	14 "	12 "
	31	31

TEMPERATURES, RAIN, DEATHS, &c.

Mean temperature of the month at Penna. Hospital,	34 deg.	33.11 deg.
Highest do. during month do.	62 "	57 "
Lowest do. do do do.	3 bel. zero	4 "
RAIN during the month,	6.67 inch	3.22 in.
DEATHS, during do., count- ing five current weeks for 1859, and four for 1860,	930	797
The average of the mean tempera- tures of this month for the past 71 years is		31.11 deg.
Highest do. during that entire period, 1857,		44 "
Lowest do. do. do. 1790,		22.37 "

The nearest approach to the extremes last noted, that we have on record since 1700, are:
Highest mean, 1793, 40 deg., and 1858, 39.72 deg.
Lowest " 1840, 24 " and 1856, 24.15

while it will be seen that the mean for the month the present year was only two degrees above the general average for seventy-one years past, notwithstanding the idea so generally entertained that we were passing through "an uncommon spell of weather" for the season.

It may be well to quote Pierce for the same month of 1790:

"The average, or medium temperature of this month was 44 degrees. This is the mildest month of January on record. Fogs prevailed very much in the morning, but a hot sun soon dispersed them, and the mercury often ran up to 70 in the shade at mid day. Boys were often seen swimming in the Delaware and Schuylkill rivers. There were frequent showers, as in April, some of which were accompanied by thunder and lightning. The uncommon mildness of the weather continued until the 7th of February."

In comparing the deaths for the month, after deducting the proportion for the extra week last year, it will show an excess of 53 the present year, while not quite half the quantity of rain has fallen. J. M. E.

Philadelphia, 2d mo. 1, 1860.

THE OKRA PLANT.

The consumption of this plant has materially increased within a few years. Mr. John Buckland, of Monmouth county, (N. J.) now raises seven acres per annum. When the pods are in a fresh state, they are used for soup, and give off a mucilage which enriches the soup materially, while the less soluble portions of the pod are softened together with the seeds, and produce an

admirable pottage. The "gumbo" of the South is made with this plant. The soup is always easy of digestion, and very nutritious. When the plant is suffered to ripen, the seeds are large and hard, and the amount produced is very great; these by being burned produce an imitation of coffee, scarcely inferior to the best Mocha, while the fibrous character of the pod strongly recommends it to paper-makers. It is perfectly evident to those who have examined it, that neither the aloe, beechwood, ordinary straw, or any of the substances now being made use of in place of cotton or linen for paper, can surpass it for this use; and we are surprised that it has not found its way into general consumption.—*Working Farmer.*

DRESS.

The law of health demands that the extremities of our bodies should be kept warm and well protected, while the parts containing our vital economy should be only comfortably clothed and left free to the most natural and easy action, well ventilated or exposed to the ingress and egress of the atmosphere, without any local pressures or means for unnatural warmth. Only think of wearing a thick, heavy girdle of many pounds' weight around the whole zone of the abdominal region—a sort of engirdling poultice, heating and pressing like a girdle of hot lava, day after day and year after year! Is it a wonder that you have so many weaknesses and pains and saddening afflictions upon you? And then your feet treading these cold pavements, this damp earth, these frozen or wet walks, in slippers and silk or cotton stockings! The very part of your bodies of all others you should keep most warm and dry, you expose to every wind and frost, water-pool and snow-storm, in the year; sit through the whole winter with them on cold floors, where every door-crack and floor-crack is breathing in upon them cold, damp breaths from cellars or streets while perhaps your heads are hot in a dry stove air, and your lungs are breathing an atmosphere so hot and close that it has scarcely a breath of life in it, and all the while you say you are comfortably dressed!

And then to make the matter worse, you trail your bedrabbled dress into all the mud and water and tobacco filth on the yard's width you occupy in walking, exhibiting the strangest spectacle of civilized humanity that can well be imagined, a woman claiming good sense, sweeping the streets all about her to make cold and wet her already almost bare feet and ankles!

You go out in all weathers with your heads exposed to the fiercest blasts, all unbonneted; for Webster says a bonnet is a covering for the head; but few are the women's heads we have seen covered this season—and then wonder why you should have such terrible colds, such trouble-

some coughs, such griping pleurisies, such burning fevers, and so many ailments!

Now, I ask again, and you shall be judges, young women, if your modes of Dress do not injure your bodies? Do they answer the ends of Dress? Any one who has given the subject a moment's judicious consideration must see that there has been and still is a fearful departure from the real uses of Dress. The primary object is to clothe and make comfortable the body, so that it may be the peaceful and happy dwelling-place of the spirit in its earthly pilgrimage.

I have referred to a few of the most prominent evils of our present mode of female Dress. Now, let me ask, if our women would dress warmly and securely from wind and wet, yet not in too close confinement, their feet and limbs; if they would shorten their skirts so they would swing clear of wet, mud, filth, and passing obstacles; diminish their number and dimensions, so that their weight would not be burdensome, and suspend them from the shoulders, instead of girding them around the abdominal and spinal regions; would give their chests a free and easy play; would cover their heads, arms, and necks whenever exposed to cold and damp weather or night air, and would always seek to be clothed easily and comfortably, giving always a sufficiently free circulation of air between their dresses and bodies, to carry off the constant exhalations going out from every living body; if they would thus dress, would they not be far more healthy, happy, and useful? * * * * *

Every state of society is manifest in its Dress. The savage is fond of gewgaws, glitter, paint, feathers, colors, mere show, with little or no reference to utility or taste. The barbarian approaches one step nearer the true standard. He exhibits a faint idea of utility and taste; he subdues and blends colors, puts ornaments into use, and varies his Dress a little to suit circumstances. The civilized man shows more taste, less ambition for glowing colors, a greater skill in making, a better idea of fitness and propriety. The enlightened man is more grave in the character of his Dress, wears less ornaments, admits none save where it combines utility and taste, is chaste, subdued, harmonious, classical in everything that pertains to Dress. We can not yet yet lay full claims to an enlightened Dress. Our female Dress is a half barbaric costume—a rude mixture of ornament and utility, in which ornament greatly predominates.—*G. S. Weaver.*

TAKING COLD.

A large number of fatal winter diseases result from taking cold, and often from such slight causes, apparently, as to appear incredible to many. But, although the causes are various, the result is the same, and arises from the violation of a single principle, to wit, cooling off too soon after

exercise. Perhaps this may be more practically instructive if individual instances are named, which, in the opinion of those subsequently seeking advice in the various stages of consumption, were the causes of the great misfortune, premising that when a cold is once taken, marvellously slight causes serve to increase it for the first few days, causes which, under ordinary circumstances, even a moderately healthful system would have easily warded off.

A mother sat sewing for her children to a late hour in the night, and noticing that the fire had gone out, she concluded to retire to bed at once; but thinking that she could "finish" in a few minutes, she forgot the passing time, until an hour more had passed, and she found herself "thoroughly chilled," and a month's illness followed to pay for that one hour.

Many a cold, cough and consumption is excited into action by pulling off the hat or overcoat as to men, and the bonnet and shawl as to women, immediately on entering the house in winter, after a walk. An interval of at least five or ten minutes should be allowed, for however warm or "close" the apartment may appear on first entering, it will seem much less so at the end of five minutes, if the outer garments remain as they were before entering. Any one who judiciously uses this observation, will find a multifold reward in the course of a lifetime.—*Hall's Journal of Health.*

THE FIELD OF BATTLE.

Think only of the common hackneyed expressions which pass so lightly between the lips when speaking of a great battle. We talk exultingly, and with a certain fire, of "a magnificent charge," of "a splendid charge," yet very few will think of the hideous particulars these two airy words stand for. The "splendid charge" is a headlong rush of men on strong horses urged to their fullest speed, riding down and overwhelming an opposing mass of men on foot. The reader's mind goes no further; being content with the information that the enemy's line was "broken" and "gave way." It does not fill in the picture. To do so effectually, we must first think of an ordinary individual run down in the public street by a horseman moving at an easy pace. The result is usually fracture and violent contusion. We may strengthen the tones of the picture by setting this horseman at full gallop and joining to him a company of other flying horsemen. How will it be then with the unhappy pedestrian? So when the "splendid charge" has done its work and passed by, there will be found a sight very much like the scene of a frightful railway accident. There will be found the full complement of backs broken in two; of arms twisted wholly off; of men impaled upon their own bayonets; of legs smashed up like firewood; of heads sliced open like apples;

of other heads crunched into soft jelly by iron hoofs of horses; of faces trampled out of all likeness to anything human. This is what skulks behind a "splendid charge." This is what follows as a matter of course, when "our fellows rode at them in style," and "cut them up famously." Again, how often does the commander, writing home through official despatches, dwell particularly on the gallant conduct of Captain Smith, who finding the enemy were "annoying our right a little," got his gun into position and "held them in check." Both expressions are fair in the drawing-room phrases, to be mentioned cheerfully by ladies' lips. It is, as it were, a few flies buzzing about "our right wing," teasing and fretting "our" men. And yet, properly translated, it signifies this: that stray men of the right wing are now and then leaping with a convulsive start into the air, as a Minie bullet flies with a sharp sting through their hearts; that stray men, suddenly struck, are rolling on the ground, that a man here and there is dropping down quite suddenly with a shriek, his firelock tumbling from his hand; in short that there is a series of violent death-scenes being enacted up and down the long line.

—*All the Year Round.*

ITEMS OF NEWS.

EUROPEAN NEWS.—It is stated in the London journals that the Ministerial Reform measure is ready for Parliament, and will be submitted to the House of Commons at the earliest opportunity.

The Earl of Derby, at a banquet given by the Mayor of Liverpool, expressed the hope that the ensuing session would witness the adoption of a good measure of reform. He believed the conservative party would oppose no factious opposition to it.

Napoleon has addressed a most important free trade manifesto to M. Fould, the Minister of State, from which we extract the following:—"Thus to sum up: Suppression of the duties on wool and cottons; gradual reduction on sugars and coffees; improvement energetically carried out of the routes of communication; reduction of charges on the canals, and consequently a general diminution of the prices of conveyance; loans to agriculture and industry; considerable works of public utility; suppression of prohibitions; treaties of commerce with foreign Powers.

"Such are the general bases of the programme, to which I beg you to direct the attention of your colleagues who will have to prepare, without delay, the projects of law destined to realize it. It will obtain, I am firmly convinced, the patriotic support of the Senate and the Corps Legislatif, both jealously desirous of inaugurating, with me, a new era of peace and of securing its benefits to France. NAPOLEON."

The *Daily News*, reviewing the prospect for the introduction of free trade into France, says that it will very much promote the welfare of the French, increase their knowledge and skill, and increase the power of France. If Louis Napoleon had been required to give Europe a demonstration of his confidence in his own power he could hardly have complied more effectually than by announcing a policy of free trade.

With regard to Napoleon's free-trade programme, he is represented to have said, in reply to certain ob-

servations, "The manufacturers who exist solely because they are protected, have been aware of my intentions for five years, and have had plenty of time to prepare for the change. The system of prohibition has had its day, and I have not the power to raise the dead.

EARTHQUAKES AND ERUPTIONS ON HAWAII.—A severe shock of an earthquake was felt at Lahaina on 21st. of 11mo. One was also experienced on the same day at Honolulu.

The volcano of Mauna Loa continues active, there being considerable action at both ends of the lava stream, where it issues from the volcano and where it empties into the sea.

EARTHQUAKE AT GUATEMALA.—On the night of the 8th inst. a fearful earthquake took place in the city of Guatemala. It commenced about a quarter before nine, and continued for two minutes and thirty-five seconds.

HAYTI.—The government of Hayti is reported as becoming stronger every day. The finances of the country are being reduced to a state of systematic order. A new paper, called *Le Progres*, has been started at Port au Prince. It is liberal but not revolutionary in its sentiments. The erection of a huge quay along the southern part of Port au Prince had been decreed by the President.

THE POOR INDIAN.—Measures are being pressed in the Legislature of Minnesota in order that steps may be taken to remove the Winnebago Indians from their present location. The whites want their land.

EMANCIPATION OF SLAVES IN SIBERIA.—The Kirghises of Siberia have signified to the Russian Minister of the Interior their willingness to emancipate all their slaves at once, and to discontinue forever the practice of holding human beings in bondage.

COLORS PEOPLE AND THE CARS.—In Cincinnati it has been decided that the colored people are entitled to ride in their cars. The case arose from the ejection of a negro woman from the car. The Judge said that "no matter what class or color, so that the person behaves properly, and is not afflicted with an infectious disease, the company, as a common carrier, has no legal right to prevent him or her riding and that this decision was founded upon the law of rail."

AN APPEAL.—The free negroes who have recently left Arkansas to avoid being sold into slavery, have published an appeal for protection. They say Indiana shuts her doors upon them, Illinois denies prairie homes to them, Oregon will not receive them, and Minnesota is debating whether or not she shall admit them. They complain of being forced into a cold climate suddenly from a warm one, and present a sad picture of the distress that they suffer from a hasty legislation.

THE FREE NEGRO BILL IN FLORIDA.—Another prescriptive measure has been defeated in the south. A bill recently passed both houses of the Florida legislature for the expulsion of the free negroes from the State, but the Governor refused to affix his signature, and the measure failed.

OIL IN WESTERN PENNSYLVANIA.—A correspondent of the *Sunbury American*, writing from Warren county, says: "The recent discovery of the oil springs in the western part of Pennsylvania is more important than many are aware of. In a conversation with an intelligent gentleman from Warren, Pa., he informed me that in one of the wells recently dug in that vicinity, the production of oil was about thirty casks, of forty gallons each daily. The well is about seventy feet deep, and is bored through about thirty feet of a

kind of soapstone, after which it penetrates in a sandstone formation, from the crevices of which the oil is forced upwards to the surface. A small engine is used to pump up the liquid, about 25 per cent of which is oil. It is received in a vessel, from the top of which the oil flows, while the water is run off at a point below the oil. In this simple manner the oil is separated from the water, and is worth there forty cents the gallon. At present the crude oil is taken to Buffalo, and by a little refining is there sold at ninety cents per gallon. There are now about thirty wells being dug and in operation in the western part of Warren county.

DEAD LETTERS.—Instead of being sent to Washington within six months, as heretofore, are now returned within half that period of time, thus facilitating the restoration of valuables to their owners, as well as preventing the accumulation of such letters at the various post offices.

TERRIBLE CALAMITY.—A terrible fire occurred between seven and eight o'clock, on the 2d inst., in the double six story tenement house, No. 142 Elm street, New York city. The building was crowded to the sixth story with human beings. There were 22 families in the house, comprising 78 persons altogether. It was supposed at first that nearly half of the inmates had perished in the fire. It is now definitely known that 18 persons lost their lives.

The fire originated in a bakery on the first floor. A little girl was filling a fluid lamp with the wick lighted. The fluid in the can caught fire, and dropping the vessel on the floor, its blazing contents spread in every direction, and communicated with a pile of shavings under the staircase. Instantaneously the store was enveloped in flames, and, almost before an alarm could be given, or the people upstairs warned of their terrible danger, the flames had shot up the stairway and the chances of escape cut off.

The scene of confusion that ensued, the moment the alarm was given, was of the most exciting character. The staircase was burned away, and all chance of escape in that direction cut off. Men, women, and children could be seen by the spectators on the sidewalk, clustered at the windows, screaming for assistance, and wringing their hands in the agony of despair. Many leaped from the windows.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The market for breadstuffs generally is better, and prices, if anything, are rather firmer. Sales of superfine at \$5 62 per barrel. There is a steady home demand from the above quotation up to \$6 25 for common and extra brands, and \$6 50 up to \$7 25 for extra family and fancy lots. Rye Flour and Corn Meal are dull, the former at \$4 25, and the latter at \$3 75.

GRAIN.—There is not much Wheat coming forward, and the demand is better. We quote good and prime Penna. red at 132 a 134 cents per bushel, and white at 140 a 150 cents. No change in Rye. Sales at 92c. Corn is rather scarce. Sales of yellow at 76 a 77c. Oats are dull; Pennsylvania, sold at 43 a 44c., and 42 a 43 cents for Delaware.

CLOVERSEED of prime quality is less active. Sales of common and prime quality at \$4 50 a 5 per 64 lbs. Timothy and Flaxseed are scarce. The latter at 1 58 a 1 60, and the former \$3 25.

THE FALLSINGTON BOARDING SCHOOL affords superior advantages to young ladies who desire, by a thorough course of study, to prepare themselves for the active duties of life.

The number of scholars is limited to twelve, and all are under the immediate care of the Principals.

For circulars address

BEULAH S. & ESTHER LOWER,
Fallsington, Bucks county, Pa.,
or, WILLIAM S. LOWER, 455 N. Seventh St., Pa.
2 mo. 11, 1860. 3 m.

A YOUNG MAN, a member of the Society of Friends, from the country, is desirous of a situation in some kind of business in this city. Apply to
W. W. M., 324 south 5th street.

WANTED a situation as Assistant Teacher in a school of either white or colored children, by a young Woman, a member of the Society of Friends. Inquire at this office.
1st mo. 28, 1860.

WANTED by an experienced Teacher from Massachusetts, a situation for a Select School, in a Friends' neighborhood, where the advanced English studies are required to be taught. Address
L. VINING, Tuckerton, New Jersey.
1st mo. 28th, 1860.—3t.

ANNE CHURCHMAN'S BOARDING AND DAY SCHOOL, No. 908 Franklin street above Poplar.
1st mo., 28, 8t.

BYBERRY BOARDING SCHOOL FOR GIRLS.
The Spring Session of this School, taught by Jane Hillborn and Sisters, will commence the 20th of 2d mo., 1860, and continue twenty weeks. The course of instruction embraces all the branches of a liberal English education.

Terms \$60 per Session, one-half payable in advance. For Circulars containing further particulars, address
JANE HILLBORN,
Byberry P. O., Penn.

1st mo. 28, 1860.—2 mo.

EATON ACADEMY, KENNETT SQUARE, CHESTER COUNTY, PA. The Winter Term of the above Institution will expire on the 15th of the 3d mo. next, but, in order to meet the desire of many of the Pupils, and friends and patrons of this Institute, the undersigned have concluded to re-open the School for both sexes, on 2d day the 19th following, and continue it a period of ten weeks, or half a Session, at the present rates, which are \$65 per Term for Tuition, Boarding, &c., and \$16 for Tuition only, one-half payable in advance.

Catalogues, containing further particulars, will be sent to those desiring the same. Apply to

WILLIAM CHANDLER,
Principal and Proprietor,
Or to WILLIAM A. CHANDLER,
Principal Instructor.

1st mo. 28, 1860.

LAKE SCHOOL FOR BOTH SEXES. The 2d semi-term of 20 weeks is to begin 20th of 2d month. The charge, in full, for board and tuition, per term of 20 weeks, is \$45, or at the rate per week of \$2 $\frac{1}{2}$.

Circulars with references sent by applying to either subscriber

VOL. XVI.

PHILADELPHIA, SECOND MONTH 18, 1860.

No. 49.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

AN ADDRESS TO FRIENDS IN GREAT BRITAIN
AND IRELAND.

By THOMAS SHILLITOE.

I cannot doubt but that a desire to do "a great stroke of business," get great riches, and make a great figure in the world, is as much some men's besetting sin, as ever the love of strong drink has been that of others. But where the temptation is yielded unto, which of these do we conceive to be the greatest sinner? He whose mind and faculties are so besotted with strong drink, that he is thereby rendered unequal to the performance of either his civil or religious duties; or he in whom the same effect is produced by an overcharge of business? for this must be the case; it must disqualify for a faithful discharge of civil as well as religious duties, when the mind and spiritual faculties of any person are so benumbed and overcome, if not "with surfeiting and drunkenness," yet with "cares of this life," (Luke *xxi.* 34,) with the love of his gold and silver, houses and lands; so intent on his mortgages and bonds; his interest and compound interest; trying to make a heaven here below! In this state, his religious performances and offerings are made like the niggard's—grudgingly. If at meeting, scarcely in due time, and with his heart so full of the world, that as he brought it to meeting with him, so there is reason to fear he returns with it again; and before he gets well off the premises, he has a touch about it with some one, it being the thing that lies nearest to his heart! And if the church trust him with any of her concerns to execute, it must give place to every of his temporal engagements, and only have the refuse of his time,—perhaps an evening, after the fatigue

of the day, when the poor mind is more fit for sleep than religious exercise! Is it to be expected that delinquents, who may be visited by such, should be brought to a due sense of their outgoing, and be reclaimed; when the language so fitly applies, of "Physician, heal thyself?" I am aware the former character is deemed the most immoral, but I am not able to bring my mind to believe it the most sinful: for if our minds are but unfitted for a faithful discharge of our civil and religious duties, whether such disqualification proceeds from the love of gold, or strong drink,—I believe the crime is alike in the Divine estimation. I believe I am safe in saying, I have not been wanting, at times in endeavoring to cast a veil of charity over the conduct of some of my friends, who, it is evident, have in this way become Satan's bond-slaves; and at such times, my heart is made sad on their account, under an assurance which cannot be controverted,—that whatsoever our temptations and besetments may be, if we are but in good earnest, willing to resist and overcome them, he that covets great trade, great riches, and to make a figure in the world, as well as he that covets strong drink, will experience a way, a sure and certain way, to be cast up in due time by the Lord, for his escape from this, otherwise, impassable gulf, between him and an eternal resting place with the righteous. For the self-same Divine principle of light and life, which our worthy forefathers believed in, followed, and were actuated by, is still with us as the cloud by day and pillar of fire by night; (Neh. *ix.* 12,) is still experienced by those who wait for it, and found by such as submit to its government, an *all* regulating principle, subduing every inordinate affection and disposition. It says, availingly, from time to time, to such who thus continue subject to its controlling power, hitherto shalt thou go, but no further with safety, in thy worldly concerns and engagements.

But if we will continue to harden our hearts against its holy intimations and restraints, we must expect to wander into the many bye-ways and crooked paths of the enemy, making for ourselves a labyrinth which we may never get clear out of. There is reason to fear this has been the case with many; and I firmly believe restraint to be needful, not only as to the *quantity* of trade or business in which we may engage with safety to ourselves, but also as respects the *nature* and

quality of such our worldly concerns: that it may preserve us not only from an overcharge of business but also from being engaged in such business as either directly or indirectly tends to lead away the mind from the pure, peaceable, self-denying path, and to foster the contrary disposition in ourselves or others.

How remarkably was this manifest in the members of our society in the beginning, until the enemy was permitted to try us with the bait which has not failed to take with some of all classes in society,—riches, worldly prosperity! And in proportion as the mind has been let out, and desire increased after these, it has become indifferent as to consequences,—neither fearing the overcharge of quantity, nor properly regarding the quality, of business. Happy had it been for many, in the present day of sore conflict from the general depression of trade, had they willingly and timely yielded to those Divine intimations! For I believe none ever turned aside from the path of safety totally ignorant thereof: but that in the beginning of their erring and straying, the witness for God followed them, and at times smote them; but if we disregard its invitations and secret monitions, it is then most just, on the part of Almighty God, to leave us to the power and insinuations of Satan, (2 Cor. iv. 4,) the god of this world, who rules in the hearts of the children of disobedience. (Ephes. ii. 2,) But even while thus promoting the cause of the evil one, such may continue to make a fair show in the flesh, as to a profession of religion, and be very tenacious respecting some externals, (as were the Pharisees,—(Matt. xxiii. 23,) things comparable to the mint, anise, and cummin; and in which Satan will not oppose them, so long as they rest herewith satisfied, and continue to rebel against the light, (Job xxiv. 13,) refusing to submit to the heart-cleansing operation of God's word and power, which only can effectually cleanse the inside of the cup and the platter. (Matt. xxiii. 25, 26.)

Happy, I say, had it been for many, had they attended to the pure limitations of truth, who are now plunged with their families into accumulated difficulties, and unlooked-for distress; and respecting whom the declaration of the Apostle has been verified, "They that *will* be rich, fall into temptation and a snare, and into many foolish and hurtful lusts, which drown men in destruction and perdition. For the love of money is the root of all evil; which, while some coveted after, they have erred from the faith, and pierced themselves through with many sorrows." (1 Tim. vi. 9, 10.) And it is to be feared there are many more of this description, who, at times, quake for fear of that which) without divine interposition) seems coming upon them. And is it to be wondered at, that these things should happen among us, when the conduct of many under our name is so opposed to the profession they are making; (Exod. xviii. 21.)

which demands of us that we be found men fearing God and *hating* covetousness. (Prov. xxviii. 16.) How opposite is this disposition of mind to that of the love of the world! For as this disposition is brought about in us, and abode in, the mind as much dreads the very approach of any of Satan's gilded baits, as if surprised by a rattlesnake, or other venomous creature, whose wound is fatal:—because, if we suffer ourselves to be beguiled by him, spiritual death will surely follow. And this has been verified, respecting many, since I first became acquainted with the Society of Friends; many who gave proof that they were the visited children of the Lord our God; who had covenanted with Him, and, for a time, evidently confirmed the same by sacrifice; but for want of continuing to ask wisdom daily, (James i. 5,) to go in and out before the Lord with acceptance; (for I find, if we are favored to possess it, we must daily ask wisdom of Him who still fails not to grant liberally;) and by giving the things of this world the preference,—riches and greatness,—they have been suffered to obtain their heart's desire. But it has been evident, that which they thus coveted did not come alone, but attended with its never-failing companion. (Hab. ii. 9.) For those who covet an evil covetousness must expect to possess leanness of soul also; the sorrowful consequence of which will be unfruitfulness towards God. (Ps. cvi. 15.) Which although it may appear to be very slow in its gradations, yet such may rest assured that it will take place, whatever they have known aforetime of an enlargement of heart towards Him and his cause. For when the door of the heart becomes open towards covetousness, and the love of this world, and there is a stumbling at the cross of Christ, (Gal. vi. 14,) a refusing to become crucified unto the world, and the world unto us, this love of God, once known and felt, in time takes its departure again. O, these spots in our feasts of charity! (for such I fear they have been to many who have been called together by the Lord's messengers.) These wells without water, these clouds without rain!—These stumbling-blocks to others, and to the youth among ourselves. Who have been coveting an evil covetousness, launching out into a great way of business, which truth never justified them in! And even some among us, not satisfied, when a kind Providence has so favored them, as that there has been an ample supply from their present business for basket and store, to satisfy their thirst of more, have infringed upon the rights and privileges of others, adding one fresh business to another. How does such a mode of procedure comport with a people professing (as we do) to be dead to the world, and alive unto Him whose apostle declared: "If any man love the world, the love of the Father is not in him." (1 John ii. 15.) From whence proceeds

this conduct? Let the just witness tell us, my friends! and may it arouse us before it be too late? Let such no longer continue to say, "To-day or to-morrow we will go into such a city, and continue there a year, and buy and sell, and get gain;" (James iv. 13, 14,) whereas they know not what shall be on the morrow: but let them be willing to yield to the restraining influence of God's word and power.

Consider from whence this determination proceeds, which many among us appear to have made; this willingness to sacrifice every thing that should be nearest and dearest to them, in order to add ten thousand to ten thousand, and twenty thousand to twenty thousand, and double and treble it again and again (if possible)—let these things speak for themselves! Can they proceed from any other disposition than the love of the world? Oh! let such consider, if the Apostle's declaration be not true (as to them) that the love of the Father is not in them. For many years, I have esteemed it a reproach to such a society of professing Christians as we are, when any of our members have been summoned from works to rewards, and have left behind them such large sums of money of their own accumulation. Oh! what a cloud has it brought over their very best actions, however conspicuous they may have stood in society. Oh! the sorrowful feelings I have been dipped into at times on the account of such. Language fails me to set them forth: it is painful to me thus to expose myself on this sorrowful subject; (for such I have often experienced it to be;) but I believe that if my efforts be accepted as a peace-offering, that which appears to be the "whole counsel" must be imparted. (Act. xx. 27.*)

Some have replied, when remonstrated with on these subjects, that they are at a loss to define the word "enough;" but this difficulty, I am of the mind, rests with themselves; in the first place, through an unwillingness to have their wants circumscribed by that power which is from above; and in the next, for want of a sincere desire to have this word defined for them by that wisdom which is as competent to direct in this as in any other important step in life. As it is a duty we owe to the body, to make suitable provision for its comfort and convenience, especially for old age, that we may rather be helpful to others than require their help; so, likewise, to put our children in the way to get their living by moderate industry, and provide for such of them as may not be in a capacity to help themselves; when a kind Providence has entrusted

to us so much as may answer these purposes,—if, after this, there remains a disposition to accumulate, then, I believe, we are violating that command of the Divine Master,—"Lay not up for yourselves treasures upon earth," (Matt. vi. 19,) and are giving full proof where our hearts are. Not that I apprehend it would be better for *all* such who have thus attained, to quit their trades and occupations; because some may be more in the way of their duty, in continuing to pursue them honorably; when (besides introducing deserving persons as their successors) they may be the means of helping those who are not able to help themselves (with which description of persons the world abounds,) such as the widows and fatherless; and the infirm, who frequently are obliged to labor under extreme pain and suffering. But there must be no adding to the "enough," lest that enough, which has been mercifully dispensed, be taken away again; for "covet all, lose all," has been the reward of such conduct many times.

I am aware of the trying state of trade and commercial affairs, and the great difficulty many honest minds have had to struggle with, who are obliged to give credit in their trade; thus depending upon others to make good their own payments. Yet I believe that complaints of want of punctuality in fulfilling engagements would not continue among us, were we in earnest to do every thing in our power, that the chief cause, the inordinate pursuit of business, might be removed. What sorrowful instances of notorious and scandalous failure have of late years happened amongst us, for want of the timely exercise of this care! How have the records of our Monthly Meetings been sullied by report after report of this kind; principally through the want of observing the limitations of truth in our trade, and exercising a care that our way of living might in all things be consistent with what we profess. The excellent *advices* that are annually read in our Meetings, I have long been led to fear, are become, to many who hear them, as a stale thing; but this is not the case with the right-minded, who are desirous of receiving help every way.

However, by others' harms, let us take warning. Friends! lessen your temporal concerns; you that have been permitted, so far, to weather the storm that has been long gathering, and at times has blown a heavy gale. And notwithstanding there has been some intermission, something at times which might be termed sunshine, with a hope that the worst was past, and that better times, as to commercial affairs, were hastening, how soon has the expectation of such been disappointed, and how many, that have thus been tempted to venture out on the vast ocean of commerce, have become a total wreck! Has not the next cloud that has gathered still exceeded those which went before, in magnitude and terrific

* I would not be understood as charging such as leave large property behind them, which they *inherited*. And with regard to the disposal of such property by will, were sentiments of the kind here enforced more prevalent, I believe it would be more *distributed*; and that this would be conducive to the solid peace of such as thus dispose of it *in time*.

appearance; sometimes as if ready to burst and carry destruction before it every way? Friends! lessen your trade and business with all the resolution you are capable of mustering, taking especial heed to the good pilot at the helm. Get into a safe port;—to as safe an anchoring place as the nature of your various outward circumstances, in these times, will allow of. Otherwise, it has long been my belief, these instances of want of punctuality, and failure in the discharge of just debts, will more and more increase amongst us. Because, it is my belief, the day of the Lord is coming “upon every one that is proud and lofty, and upon every one that is lifted up; and he shall be brought low; and upon all the cedars of Lebanon, that are high and lifted up; and upon all the oaks of Bashan; and upon all the high mountains, and upon all the hills that are lifted up; and upon every high tower, and upon every fenced wall, and upon all the ships of Tarshish, and upon all pleasant pictures.” (Isaiah ii. 12—16.) Read the remainder of this remarkable chapter, together with the foregoing one. And let none say, “We have long since heard such things—they were long ago proclaimed in our ears by an Emlen and a Scattergood; but what has come of it?” lest our calamity come upon us as a thief in the night, in a day when we look not for it, and at an hour when we are not aware! (1 Thess. v. 2, 3; Matt. xxiv. 44—51; xxv. 13.) Oh! remain no longer unwilling to act the part of wise mariners, you that sail on the wide ocean of trade and commerce, and have its tempestuous billows oftentimes to contend with, and to whom it has appeared as if nothing less than a total wreck could be the result! For when danger like this threatens *him*, he looks well to the helm, reduces his sails, and lightens the vessel by lessening his cargo, rather than risk the loss of the whole. I am aware of the distress the creaturely part must have to endure, before the mind is at all likely to be brought into a willingness to take such steps as these. And I think I can feel much for those of my friends who have families, and have so far extended their manner of living, as that from the depressed state of trade, and the various losses they are assailed with, their income barely covers their expenses, while perhaps their families are increasing. For it is gratifying to our nature to appear to the world to be increasing in substance; but mortifying to retrench, lest it should be suspected that we are going down hill in the world. But this *must be done* by many among us, or I am greatly mistaken in what has long been the feeling of my mind. Friends! you must be content with a half loaf, which is better than no bread at all. Lessen your business and regulate your family expenses accordingly, otherwise you may be brought into the same trying situation many are now in, who once carried their heads very high in the commercial world,

and moved in what are called the more genteel circles, but have now no bread at all that they can strictly call their own.

(To be continued.)

For Friends' Intelligencer.

CHRIST WITHIN.

It may be well occasionally to look forth from the stand point of our profession and review the ground of our principles. That bodies of men holding different religious views have so long existed, leads us to the inference that these wholesome diversities are not likely to be entirely annulled. Our temperaments, education and the circumstances by which we are surrounded are so varied, it is scarcely probable we can arrive at the same conclusion on the most important of all subjects, our spiritual welfare; and it is well early to accustom ourselves to feel that minds equally sincere and conscientious, may, from their highest convictions, be honestly led to embrace views widely differing.

Remembering the many sincere-hearted, self-sacrificing and gifted ones who are now, and have, in former times, been attached to the various Christian sects, we must acknowledge “that God is no respecter of persons, but in every nation, he that feareth him and worketh righteousness, is accepted with him.” From the imperfectness of our finite vision we are incapable of arriving at an impartial judgment; for seeing only a part, we can know but little of the duties required of others, or what is accounted unto them for righteousness, but we can leave each one individually responsible to Him who has placed His law in every heart, taking heed that we give our brother no occasion to stumble through our unfaithfulness.

We must allow others to enjoy the right we claim for ourselves, to follow the Divine light as manifested unto them, and thus show our faith in the efficacy of this noble testimony. It sometimes requires great humility, and an entire abnegation of our pride of opinion to tolerate sentiments differing from our own, but it may, nevertheless, be a profitable discipline to the mind.

While we exercise a vigilance over our own spirits lest any uncharitable assumption prevent the pure flow of love in our hearts, and make us unjust in our estimation of those who differ from us, it is equally important that we be not tossed about by every wind of doctrine, but that “every man be fully persuaded in his own mind.” If we are concerned, in our various allotments, to bear witness to the truth as it is revealed in us, we will not seek to be edified with misty metaphysical abstractions, which the learning of the wisest schoolmen can not unravel, but we shall be constrained to rely only upon the teaching of that still small voice “which speaketh as never man spake.”

The rituals and ceremonials of the outward law can never make the comers thereunto perfect, but there is great danger of our making of them graven images, which may so fill our hearts with idolatry and self-complacency, that we may be turned away from the simplicity of the truth as it is in Jesus.

On the highest authority it is declared, "I will put my law in their inward parts, and write it in their hearts;" "for they shall all know me, from the least of them unto the greatest of them." How satisfying and consoling is the evidence that we are not left without a witness, and the ability to follow its teachings if we are only watchful and obedient to its promptings. H.

2d mo., 1860.

ADDRESS ON THE GRASSES.

BY J. STANTON GOULD.

Delivered before the Cayuga Agricultural Society, 1859.

(Continued from page 764.)

In seeding lands for meadows, we must keep certain principles steadily in view :

1st. *We must sow a variety of seeds.*—Different soils vary very much with regard to the number of plants of a given variety of grass which can be supported on a given area; but every soil has its maximum which cannot be exceeded; no matter how many seeds may be sown, a certain fixed number will flourish, and the rest will die, leaving large spaces of the soil quite bare; if, now, another species of grass seed is sown on these vacant spaces they will grow, and a certain number of them will flourish; there will still, however, be vacant places, and it will be found that six or seven or even more varieties must be sown before the ground is wholly turfed over. Experience has most conclusively demonstrated that any soil will yield a larger and more nutritive crop when sown with six or eight species, than where sown with only one or two species. No farmer could spend his time to better purpose than filling a dozen boxes with the soil that he intends to convert into meadows, and sowing a different kind of grass in each box; he will thus ascertain the adaptation of his land to each kind of grass, and the number of plants which each square foot of it is capable of maintaining.

2d. *We should only sow such grasses as flower at the same period.*—Chemical analyses and practical trials concur in showing that hay is most nutritious and most palatable when cut at the period of flowering; at this time it contains more starch, sugar and albumen, which can be assimilated by animals, than at any other; after this, these substances are converted into woody fiber and other compounds which cannot be acted on by the digestive organs and are therefore wasted. It follows from this, that great loss is sustained by cutting together those grasses which flower

at different periods. If cut when the earlier grasses are in good condition, the later ones are watery and innutritious. If cut when the later grasses are ripe, the valuable constituents of the earlier have passed into woody fiber and other insoluble compounds.

This rule must be exactly reversed for pastures; in these it is desirable to have a constant succession coming to perfection in every month, from spring to fall; the period of flowering for pasture plants should therefore differ as widely as possible.

3d. *The seed sown should be exactly adapted to the soil and climate.*—This rule is too obvious for argument; it is clear that if seeds which will only germinate in sandy soils are sown in wet clays, they will be sickly and useless; and so, on the other hand, we cannot expect those that are adapted to soils where potash abounds, to flourish in soils which are almost wholly calcareous. As we have before remarked, there is some kind of grass just adapted to every soil under the sun, and the active farmer will never rest until he finds the species best calculated for his own land.

4th. *We must stock our meadows with the most nutritive grasses.*—It is really surprising to find how different species of grass vary in their nutritive properties. Mr. Way, the chemist of the Royal Society of England, has given us an analysis of twenty-one varieties of grass, and has thus disclosed to us, as accurately as chemistry can guide us, their relative values for the feeding of animals. It is to be regretted that Mr. Way has not included red top (*agrostis vulgaris*) and wire grass (*poa compressa*) in his list, as these are two of the most important varieties cultivated in this country. Still, his experiments constitute one of the most valuable contributions which chemistry has ever made to agriculture. From these experiments we learn that one hundred pounds of quaking grass (*briza media*) will give 28½ pounds more of dry hay than one hundred pounds of vernal grass (*anthox anthum odoratum*.) That it will require 237 pounds of vernal grass to supply an animal with as much of muscle making matter as is afforded by one hundred pounds of timothy. It will take 319 pounds of soft brome grass to lay as much fat on an animal as one hundred pounds of timothy would do. One hundred pounds of timothy will support the respiratory process as long, and afford as much animal heat, as 260 pounds of vernal grass. I think most of you will be surprised at these statements; very few have been aware of the immense difference which exists among the grasses with respect to their nutritive values; and it is high time for farmers who are awake to their own interests, to bestow more attention to this subject than they have hitherto given to it. I should, however, be untrue to my own convictions if I did not warn you against too credulously receiving the results of pure chemis-

try as an unerring guide in practice, for there are good reasons for believing that, to some extent, they would lead to serious errors in practice.

Chemistry may show that there is a very great amount of nourishment in a given species of grass, yet it may be almost worthless to the farmer. Thus a grass may have any amount of sugar, starch and albumen stored up in its tissues and juices, but if its leaves are armed with sharp spines, as the thistle, or with stinging hairs like the nettle, or from any mechanical cause it is rejected by animals, it will avail nothing. Or it may have some bitter or nauseous secretion mixed with its nutritive matter, or its odor may be repulsive, so that cattle will not eat it. In either of these cases it is of no use to the farmer, even though chemistry stamps it with the very highest value. There may be cases, too, where cattle will eat greedily of a grass which contains substances injurious to their health. Sorghum, according to the results of chemical analysis, is very rich in nutriment, but on soils which abound in the soluble silicates, it becomes coated thickly with a substance like glass. While I am writing this, I read of the death of a number of cattle from eating the sorghum, the sharp angles of the glassy coating having cut through the coats of their stomachs; of course this glass may be too thin to actually cut through the stomach, and yet thick enough to irritate the mucous surfaces to such a degree as to prevent the animals feeding on it from gaining either strength or fat, in which case the nutriment would be of no avail.

These considerations show the necessity of verifying the chemical results by actual trials at the manger, conducted with all possible care and precaution to guard against ambiguities and mistakes. I have searched in vain among the agricultural books and journals of both Europe and America for the record of such experiments. If they exist, I have been unable to find them. Nothing would tend so much to the advancement of sound agricultural science, and to the augmentation of agricultural profits, as a thorough settlement of the exact nutritive values of the different species of grass. I trust the subject may receive the speedy attention of our Agricultural Societies and our wealthy farmers.

5th. *The meadows on a farm should be so arranged as to come successively to maturity.*— There is always a sudden augmentation of the demand for labor, when the season of haying and harvesting comes on, without a corresponding augmentation of the supply. We have seen that the grasses must be cut when in flower, if we would obtain their maximum value. Every day that they are left standing after this, diminishes their nutritive matter. It follows from this that much of the grass on the meadows of large farmers who are restricted to one or two kinds, must suffer great loss from want of labor to cut

it in its maximum condition. To prevent this sad waste, meadows should be so divided that part of them shall come into maturity in June, another part in July, and the remainder in August. Slight additions to the ordinary labor of the farm will thus enable us to secure all our hay at the best possible period.

I trust the five principles which I have just laid down, will all commend themselves to the approval of your enlightened judgments. I do not think there is one amongst you who would think of refusing his assent to any one of them. Yet there is not one of them which is not habitually neglected in the practice of the farmers of this State. I have examined the practice of over two hundred of them, as recorded in the Transactions of the State Society, and in the Agricultural Journals, and all, except about a dozen of them, sow no other seed than timothy and clover. Of the exceptional dozen, one sowed a small field with orchard grass, three of them mixed red top seed with their timothy and clover, and the remainder were accustomed to mix in the seed of Kentucky blue grass. Several of them urge the importance of cutting while in flower, but none of them advise the seeding of meadows with such plants as will enable them to accomplish this object. On the contrary, several of them actually sow clover and Timothy together, notwithstanding they vary so widely in the period of their efflorescence.

None of them seem to be aware of the wide difference which exists among the different species with regard to their nutritive properties, nor is there any allusion to the necessity of diffusing the labors of hay-making over a longer period by stocking different meadows with varieties coming into flower at successive periods of time.

Keeping these principles in view, let us apply them to practice in the actual stocking of meadows and pastures.

1st. *Of Grasses adapted to sandy soils.*— *Lucerne, (Medicago Sativa,)* though a legume, and not a true grass, is admirably adapted to sandy soils resting on porous subsoils. The latter condition is indispensable, as you may infer from the fact that its roots often penetrate fourteen feet into the ground. When in perfection, which it reaches on the third year after sowing, it yields an enormous amount of herbage. In one recorded case eleven acres sufficed to keep eleven horses two hundred and ninety-nine days. In another a field of eight acres kept eight horses three hundred and fifteen days; and in both cases a large number of sheep were pastured on the ground after the last cutting for the horses was taken off the ground. It makes an excellent pasture, but is most profitably used for soiling, being ready to cut about the first of May, and on such land it may be cut every thirty days afterwards. It is remarkably well adapted for

milk cows where the milk is sold in the market, but butter made from it is not as sweet as from some of the other grasses. It is greatly relished by horses and cattle, and its nutritive value as compared with timothy is such that if a ton of the latter be worth \$5.00, a ton of Lucerne will be worth \$3.12½. The only difficulty with Lucerne is to get it started. It must be sowed in drills, and carefully hoed until it is large enough to cover the ground. If this precaution is taken, and a drouth does not occur just as the young plants are starting, it is pretty sure to succeed, and will last twenty-five or thirty years. If, however, it is overrun with weeds in the beginning, or a severe drouth occurs, it grows feebly and soon dies out. Every farmer possessing a soil adapted to the culture, should have at least three or four acres of Lucerne in the vicinity of his stables, for the convenience of soiling.

*Meadow Fox Tail, (Alopecurus Pretensis).—*Grows well in sandy loams which are not too dry, and also in heavier loams. It flowers in May and is much relished by cattle. It shoots rapidly after feeding or mowing, and yields a very abundant aftermath. It requires two hundred and sixteen pounds of this grass to make as much dry hay as one hundred pounds of timothy. If a ton of timothy is worth \$5.00, the meadow fox tail is worth \$2.06.

*Orchard Grass, (Dactylio Glomerata).—*This grass grows well in dry, slaty, as well as sandy soils, and is also remarkably well adapted to shady places. It flowers early in June, and although its flowering stems are not numerous, the leaves grow luxuriantly from two to three feet in length. After being grazed close to the ground, it will give a good bite again in five or six days. It is the earliest grass to start in the spring, and continues to grow vigorously until the frost. The only objection to it is its tendency to grow in tussocks, but this may be prevented by careful harrowing and rolling. It is very rich in muscle-making matter. One hundred and sixty pounds of this grass will make as much dry hay as one hundred pounds of timothy. If timothy grass be worth \$5.00 per ton, orchard grass is worth \$3.59.

*Italian Rye Grass, (Lolium Italicum).—*This grass is much approved throughout Europe, where it seems to flourish in every climate. Its most congenial home is a tenacious, moist, fertile soil, but as it flourishes in the silicious also, I describe it under that division. It has not been as thoroughly tested here as on the other side of the water, but where it has been cultivated it has proved very satisfactory. It bears drouth remarkably well, and is especially adapted to forcing by high manuring or by irrigation. It flowers about the last of June; starting its growth very early in the year it continues to grow through the whole season. It requires one hundred and ninety-seven pounds of this grass to make as

much dry hay as one hundred pounds of timothy grass, which is as well worth five dollars as this grass is worth two dollars and sixty-nine cents.

*Hard Fescue, (Festuca Duriuscula).—*Is well adapted to dry soils, and is much relished, particularly by sheep. It grows from two to two and a half feet high, flowering the last of June. One hundred and thirty-nine pounds of this grass makes as much dry hay as one hundred pounds of timothy grass. It is as cheap per ton at three dollars and thirty-three cents, as timothy is at five dollars. Besides these,

Fall Meadow Oat Grass, (Arrhenatherum Avenaceum).—

Meadow Soft Grass, (Holcus Lanatus), and the red and white clovers are suited for sandy soils.

For calcareous loams, the following varieties seem especially adapted:

*Kentucky Blue Grass, (Poa Pratense).—*In many sections of our country this is a very favorite variety. It is unsurpassed for making sweet butter, which will keep so for a very long time. Flowering about the middle of June, it sends up short culms, but sends up an immense amount of aftermath until the snow comes. It is less injured by frosts than any other variety; indeed, animals frequently paw away the snow and eat it in preference to hay. It turfs remarkably well, but is three years in coming to perfection. It is intolerant of drouth, and in dry seasons it may be easily burned; although it flourishes best in calcareous soils, it will answer well in several others. One hundred and forty-six pounds of this grass gives as much dry hay as one hundred pounds of timothy. A ton of the latter grass being worth five dollars, a ton of blue grass would be worth three dollars and twenty cents. It is better adapted to pastures than to meadows.

To be continued.

For Friends' Intelligencer.

SOME THOUGHTS ON THE PRESENT TIME.

The present aspect of the affairs of this nation are sufficient to awaken every Christian mind to deep reflection in order to ascertain the cause thereof.

The sitting of Congress for several weeks without being able to transact any business, or even to organize because of disagreement;

The mournful tragedy at Harper's Ferry, and the executions that followed;

The abuse and maltreatment of persons traveling or living in the South;

The driving from their homes and families thirty-six or more peaceable men of a neighboring State;

The enacting of laws in several of the States in order to drive out the free people of color or reduce them to bondage;

The stealing and shipping of Africans from their native land, with all the horrors of the middle passage, and reducing them to slavery in this land of boasted liberty and religion;

The examining of the United States mail, and obstructing the freedom of speech and the press,

These are evils which the Christian mind may trace to the undue love of money, which the Scriptures say is the root of all evil.

Now if these things are encouraged and supported they will most assuredly bring desolation, weeping and mourning within our borders, for we cannot expect to escape the judgments due to unrighteousness, or the fate of nations who have gone before us, unless we repent and obey the teaching of the Prince of peace. It is about one hundred years since John Woolman went from house to house, visiting Friends who held slaves, to plead with them to relinquish so unjust a practice, and bore his testimony against it by refusing to partake of slave produce. When he travelled among Friends, and was entertained where they had slaves, he gave or left them money that he might bear his testimony against unpaid toil; and his labor was not lost, for soon after the Society of Friends relinquished the practice, so far as related to direct ownership in man. At that time there were less than half a million of slaves. Now there are nearly four millions. Why this great increase of suffering humanity? why has not the spirit of justice and freedom prevailed? The answer is, because the love of money has been predominant in the minds of the people; sending one to the shores of Africa to bring slaves from thence to supply the market, and another to the States of Maryland or Virginia to rear them for the rice swamps or cotton fields of the South. And why this demand for slaves? It may be answered by referring to the census of 1850. There were at that time 1,815,000 slaves employed in raising cotton, 350,000 in raising tobacco, 150,000 in raising sugar, 125,000 in raising rice, and 60,000 in raising hemp. The aggregate of these is 2,500,000 employed in agricultural pursuits, the produce of whose labor finds a ready sale in our markets. This answers the question why slaves are in demand; and if the saying be true that the receiver is as bad as the thief, which is a principle in common law, it implicates those who buy these articles as supporters of the system.

But we cannot go back to the days of our fathers and raise flax and make our own linnen, that our hands may be clean of our brothers' blood. Nor need we, for there is, as the last census shows, 347,525 slaveholders, and 5,873,893 non-slaveholders in the South; many of the latter class being farmers with small means, who raise their little crop of cotton or rice, as the case may be, and for want of a better, are obliged to sell it in the common market in competition with slave grown produce; thus they labor on

with the monopoly of slave labor bearing them down; consequently they must in most cases remain poor, and their children uneducated; hence the poverty, ignorance, and degradation of the non-slaveholders of the South.

I wish to call the attention of the members of my own Society in particular to this momentous subject, believing if we are faithful and obedient to the light of truth, we will, by divine aid, be instrumental in doing away with those evils, and turning aside the impending ruin that awaits this nation; but if we are selfish and disobey the light, we will most assuredly suffer with the wicked.

If we, as a society, were to employ agents to purchase and manufacture the produce of free labor, we might all be fed and clothed with it; and by so doing elevate the poor free laborer, and carry conviction not only to the heart, but to the pocket of the slaveholder, by diminishing the value of his human chattles.

This would be putting the candle on the candlestick that it might shine on the conviction of the oppressor, and to the joy and rejoicing of the righteous of all nations, many of whom, I trust, would come and do likewise. Thus, I believe, deliverance would come to the slave, and a national calamity be avoided. A FRIEND.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, SECOND MONTH 18, 1860.

DIED on Third day, 1st mo. 31, at Millville, Columbia county, Pa., GEORGE MASTERS, son of Charles W. and Sarah B. Eves, aged about 5 years.

The Seventh Annual Report of the Pennsylvania Training School for Feeble Minded Children, under the superintendence of Dr. Parrish, is before us. It is now located in the new building near Media, of which the Report says:

In selecting a site, care was first taken to find a *healthy* place,—next, one of sufficient elevation to secure perfect drainage, and at the same time command a fine landscape view;—then to build an ample, plain, substantial house, to have it well ventilated and warmed, with good accommodations for bathing, &c. All this has been done. The site may be excelled in some respects, yet but few are equal to it for health and beauty. A grove of ten acres, on the north and west shelters us from the winter winds, and affords a fine summer shade. Good spring water is thrown to the top of the building, and distributed through the different apartments. Hot and cold baths are on each floor, and accessible to the children's dormitories, and an extensive lavatory in the basement, when completed, will serve for ordinary daily ablutions. Attention is

given to secure proper classification according to the grade and necessities of each inmate. Imbecility comes to poor and rich alike, and the institution is for *all* the people who may need its care. The state is the parent of the poor, and she will provide liberally for them. The rich may find such accommodations as they need, and all will be the subjects of kind treatment and training.

We are well secured from a conflagration, the only fire in the house being in the kitchen, which is fire-proof. The warming and ventilation are produced by a current of air which is driven by a fan through an air duct from another building, ninety feet distant, and which is warmed by contact with steam-heated iron coils in the side-cellar.

No expense has been spared to secure every facility for convenience, comfort, and efficiency of management, and the institution is commended to the good-will and generous support of the people and the government of the State.

In allusion to what has been accomplished in the brief history of the Institution, and also to the causes of Idiocy, the report says :

The gloomy have been made happy—the idle, industrious—the profane, ashamed of their profanity—the unloving, affectionate—the speechless, to speak—the unproductive, self-supporting, and in this humble, yet important and compensating work, we are still progressing.

It is not only a labor of development, but of analysis. Society looks upon feeble-mindedness in its sympathetic aspect—but in Institutions like this, the subject is presented for analysis.

Take a family of imbecile children, varying in age from four to twenty years; they are to be grouped in classes, not according to age and sex merely, but according to capacity and character. To find them out, is the first duty, not in their general qualities of mind, and condition of body only, but in their distinct and individual peculiarities. The being is imperfect. The imperfection of the *physical* structure is first apparent. The bones are fragile—the teeth carious—the muscles flabby—the gait unsteady. These are general features. Go still further, and we find that the digestion is imperfect—the appetite various—the taste impaired, and the blood impure. Why all this? is a question of serious import, that is gradually being solved by the experience of public Institutions. All men who have thought much about it, have had their notions and theories. It is not denied that inter-marriages between blood relations does much to produce this evil among us. That scrofula and other diseases of the vital fluid induce an imperfect development, but yet there is one great cause of disturbance and disease that is peculiar in the degree and force of its manifestation to the present age. It is an age of extremes—the head and heart—the intellect and affections, run away

from each other, in the giddy race of life. The harmony of the natural being is lost in the excesses of each extreme of his nature. There is a divergence of the powers of the mind, and the affections of the heart. Each leads on, in its own direction, to a legitimate end. Fanaticism and crime; licentiousness and shame; paralysis, insanity, and idiocy, all these are evidences of the lost balance and harmony, between the two great extremes of nervous life. Leprosy and the plague have laid waste their millions, but the excesses of our day, if not more fatal, are more permanently enervating, than those of the past. The use of spirituous liquors,—how it has at the same time stimulated and stupified the restless brain, till the mind has become obscured, the heart depraved, the blood poisoned and a taint left in the whole economy, to be transmitted to another generation, in some of the varied phases of mental, moral and physical deformity or disease.

Men do not appreciate, as little by little they indulge in sensuality, how much they are doing to mark the race with some sign of violated law—to cast a blemish over the fairest and loveliest associations of Earth. And though the taint may not be exhibited in a direct transmission to immediate offspring, it will show itself somewhere. Many parents who are now weeping over the blight of idiocy, as seen in otherwise fair and lovely children, cannot call to their minds any blameworthy conduct that has marked their own history, and wonder at the inscrutable Providence, by which they are visited. But further back in the line of their parentage, there has been a plague-spot, mental, moral, or physical which has brought forth this pain and sorrow. And not until man has learned to obey the laws of his being, will the traces of earthly evil cease. The moral feelings, the passions, and sensations, the hopes, fears, and doubts, which continually agitate mankind, are disturbing and yet necessary elements in the social compact. But men are led too little, by a deliberate, thoughtful judgment, too much by a hasty, impulsive excitement, and the moral balance is destroyed. Excess in appetite which exhausts physical energy, induces infirmity of the body, and a succession of retro-active movements continues to operate injuriously upon the whole nature, and leads of necessity to deformity of body or mind, or both, either in the parent or offspring.

Such are some of the results of an analysis of this subject. The relations may not be pleasing to any of us, but they are yet true, and replete with instruction and warning. They are potent to every careful observer: their warnings are visible in many of the home sorrows of the people.

Every man may to some extent control the evil in himself and his household, but yet there are certain social customs, defects in the law, which mar the purity of life, and send to successive

generations perpetuity of the sad afflictions which harass mankind. Take idiocy alone—every statistical record upon this subject reveals some truthful cause of it, that is within our reach. Is it the intermarriage of first cousins? Then let the law interfere to prevent it, and while the sufferings already existing as the result of the violation of nature may not be suppressed, the wrong may be arrested at least to some extent. The present Governor of Kentucky, in his late Message to the General Assembly of that State, wisely presents the subject in this light; his appeal is most respectfully recommended for consideration in this Report.

“Closely connected with the question is the prevention of marriage between first cousins. By a single act of the Legislature you can save in the future an immense amount of suffering. You can diminish, according to the opinion of those who have fully investigated this subject, twenty per cent. of the number of imbeciles, insane deaf mutes, and blind children. Render the marriage of cousins illegal, and a great evil is at once eradicated. At least from fifteen to twenty per cent. of all these sufferers are the offspring of cousins. A gentleman of science, of learning, and enlarged experience, who has for a long time paid a great deal of attention to this subject, recently informed me he never yet had seen all the children so related sound in body and mind. There is always among some of them, some defect, mentally or bodily. A large number of the pupils (so say the teachers) in the Deaf and Dumb Asylums are the children of cousins. At Danville there are four sisters, deaf and dumb, the children of cousins; they have two speaking brothers, both in delicate health. There is also, from another family there, a sister and brother, children of cousins. There is another instance of sister and brother there, also deaf and dumb, the children of second cousins, showing that the defect extends beyond even the second degree. In that Institution at Danville, as in other States, I am informed from sixteen to twenty per cent. of the pupils are now, and always have been, the children of cousins. The State, when the parents or friends of these children are not able to provide for them, has to do it; and the instances are numerous where the burden falls on her to provide for and educate them as mutes, insane blind, or imbeciles. She is weakened by so many of her citizens suffering these privations, and a heavy tax is thereby imposed upon her. Is it not her right and her duty to protect herself against the evil and expense, by forbidding such unions, which nature plainly forbids by the natural penalty she uniformly inflicts?”

Is intemperance the cause? If so, the strong arm of the law may be interposed, to close up at least some of the sources of this terrible calamity. While it cannot prevent the earth from bringing forth her fruits and harvests, nor control the ap-

petites of men for strong drink, it can withdraw its support and encouragement from a traffic that is the most wasteful drain upon the wealth of the state, and the surest source of the crimes that fill our prisons, of the pauperism that crowds our almshouses, and of the wretchedness that weeps in our hospitals, of the deafness, blindness, and idiocy that go dumb, sightless and sorrowing through life.

Is bodily disease the cause? Then turn to our social relations, the customs by which they are governed, the false views with which we receive the great fact of life, the duties omitted, the excesses indulged in, the passions excited—acknowledge these as the prolific sources of moral and physical evil, and we have taken the first step toward remedying them. * * * *

The question is often proposed, whether feeble-minded children may not be judiciously trained at home. The answer is No! Childhood in all conditions, needs society—and those who are of natural mental powers, cannot adapt themselves to those of feeble-mind: under the most favorable circumstances, an imbecile child at home has a tendency to solitude or to exclusiveness—it cannot play with other children, and they cannot join in its amusements. It is a lonely being. However loving and tender its associations may be, it lacks suitable companionship. It needs to be with those who are like itself: its instincts lead it to fellowship, with its own grade and stamp of mind, and this association produces friction, and this excitement of the dormant faculties and energies produces growth. There is an unconscious selfculture, resulting from the mere force of association. In this lies the secret of success in institutions for the feeble-minded. The labor may be kind, patient, persistent, long continued, and yet be comparatively fruitless without the force of sympathy of one with another.

Nothing that is human, is so dark and cold as to be without a faint line of light somewhere in its nature, and that is never so feeble that it may not appreciate the same degree of light in another; but keep it always in a sphere uncongenial with itself and you fail to bring it forward and increase its lustre.

It is beautiful to see any children harmonize and form attachments which the moth of years cannot destroy; but it is more beautiful, because more remarkable to see imbeciles taken from home, with all its tender sympathies, but where they seldom find congenial spirits, and placed among children of the same class, whom they have never seen before, and begin at once to form their associations and friendships, and live together in daily concord, with a consciousness, that there is in each, something that the other sees and feels, which binds them instinctively together.

It therefore becomes the *duty* of those to whom

the care of such is committed, to place them in circumstances, where they may find associations, and form friendships, that are within the scope of their capacity, and in which they may have continued enjoyment.

For Friends' Intelligencer.

I have written a few lines, a part of it my own composition, and the other part taken from a paper published in the town of Huntington. I concluded I should like to see it published in the Intelligencer, should the Editors think it worth a place there; if not, they can throw it aside. I am an old man, now in my seventy-eighth year; I often feel grieved when I see our fashionable folks launching out into such extravagances in dress and other things, and I think it is time there was a check put upon them. D. S.

HARD TIMES.

Whence come they? Come they not of our avarice, our greed for gain, our pride, our indolence, the want of attention to business? We have men who spend time and money in drinking saloons and gambling houses. From them we have the cry of hard times. We have men who are hasty to grow rich, who are continually grasping after the world and the riches thereof, who make large ventures in hopes of large gains. A sudden change in the commercial regulations of the country, or in the policy of the banks, puts all their calculations out of joint, they cannot meet their liabilities, and hard times are upon them in spite of all their efforts to ward them off. We have men, and women, too, who love fine clothes and fashionable living; their time is occupied in carefully adjusting their personal adornments; their hair, collar, bonnet, hat, in short every article of dress; and what is supposed to add to personal attraction receives so much attention that little time is left to earn the means to keep up appearances, and the bottom of the purse is reached; their strange and mistaken notions of dignity keep them from manual labor or any other exercise which sounds like earning their bread by the sweat of their brow. These too find hard times upon them, and they know not why.

If our fashionable folks would take the pains to inform themselves, they would find that many of our merchants are involved in debt to the amount of millions of dollars to foreign nations for the materials to make those artificial flowers and other superfluities, which have to be paid for in gold or silver, and if they cannot raise the funds, it will lead to bankruptcy and ruin. Now if our fashionable folks would take up a resolution to do without these things, they would not have so much occasion to cry out against hard times. At every corner in our towns and villages we find persons idling away their time. Labor has no charms for them; in idleness they were

brought up, in idleness they have lived, in idleness they continue. A small light job caught up or pressed upon them occasionally, does not afford sufficient means to support them, and hard times presses her heavy hand upon them. Others we have who give attention to every body's business while their own is neglected. These too cry out hard times. The remedy for hard times is within the reach of every able-bodied man or woman in the land. First keep out of debt, be industrious, be economical, be honest, be virtuous, be peaceable, be sober, keep out of bad company, keep away from grogeries, gambling houses and all their influences, attend to your own business, and prosperity will attend you, and hard times flee away. The man who will not protect himself, will call in vain for help.

Huntington Co., Ind., 1st mo. 28th, 1860.

For Friend's Intelligencer.

BURNING FLUID.

There are few who do not acknowledge life to be a great blessing, and that it is a duty to take proper precautions to preserve it. It is therefore evident that in the promotion of domestic comfort and enjoyment, its sacredness should be deemed paramount to any minor considerations.

It is no marvel that the thoughtless and ignorant in their mistaken ideas of economy should be induced to introduce burning fluid into their dwellings, but it is cause for astonishment that the educated, who ought fully to appreciate its explosive character, should daily run the risk of serious accidents in their own families, and by their example aid in giving countenance to its use among those who have not the intelligence to understand their danger. A steam engine is safe under the direction of a skilful engineer, but that fact can be no argument in favor of introducing one into establishments where the unskilled will direct and attempt to manage it.

Neither is the oft repeated plea that "with care" they are safe, any reason why fluid lamps should ever be brought into a family. The loss of life at Lawrence, which was greatly increased by the breaking of a fluid lamp among the ruins, and the terrible fire on the second inst. at New York, are forcible proofs of the responsibility which any one assumes who gives encouragement to the use of this dangerous material. To these facts are added a paragraph taken from the Delaware County Republican.

"THE HORRORS OF BURNING FLUID.—That indefatigable E. Merriam, says that, in the year 1859, he has recorded 83 deaths and the serious injury of 106 persons, all resulting from the use of burning fluids; while the loss of property by fire from the use of those vile compounds amounts to \$144,000. The whole number of deaths since July 1850, he records as 424; injured, 623. We long ago ordered this stuff out of our house,

advise all our readers to do the same
Use coal oil, tallow candles, pine knots,
ing rather than hazard life, limb, and prop-
erty by the constant use of a dangerous burning
fluid." G.

2d mo., 1860.

REST.

Rest! Thou must not seek for rest
Until thy work is done;
Thou must not lay thy burden down
Till setting of the sun.

Thou must not weary of thy life,
Nor scorn thy lonely lot,
Nor cease to toil because thy work
Thy neighbor prizeth not.

Thou must not let thy heart grow cold,
Nor hush each generous tone,
Nor veil the bright love in thine eye—
Thou must not live alone.

When others toil, thou too must strive,
And answer when they call;
The power to love—God gave to thee,
Thou must employ for all.

Unmoved to gaze upon the strife,
Is not true liberty;
To others thou must minister,
Wouldst thou be truly free.

In the outward world 'tis vain to seek
The Eden thou wouldst win;
That ancient Paradise is gone,
Thine Eden is within.

PLAIN PATHS.

Be thou content to find the narrow way,
Made plain for thee to walk in day by day;
Serve thou thy God with heart and soul and might;
Darkness and doubt are wrong, belief is right;
To him that seeketh, God vouchsafeth light;
But think not that which seemeth right to thee
Must needs be so to all men. Thou canst see
Footprints of light upon the world's highway,
Left there by Him who had not where to lay
His lowly head—the plainest nearest thee;
Duty is plain unto sincerity—
There may be footprints which thou canst not see,
Made plain by heaven's light to other men—
Jesus went MANY WAYS unto Jerusalem.

HAPPINESS.

Oh not to other worlds, poor child of earth,
Alone for comfort and for peace repair;—
Believe it, heavenly bliss must here have birth,
And that must bud below, which blossoms there.
True,—fitter soil, and more delicious air,
And brighter suns above shall impulse give,
But thou meanwhile must inward strength prepare;
That better life e'en now begin to live;—
And look for heavenly aid, since happiness,
Born from above is free for all,—for thee;—
And if thine inmost soul delights to bless,
And commune with the God of purity;
Earth has no bonds the spirit to retain,
And Heaven no bars its entrance to restrain.

Correspondence of the London Daily News.

THE HOLY LAND.

Jerusalem, Dec. 8th, 1859.

It would not require much research into books of travels in Palestine to perceive how universally they designate this city as melancholy, forlorn, silent, or by other epithets denoting that it is located "far from humanity's reach." It would not require much research now to discover that within a couple of years, but especially within a couple of months, it has become, in proportion to its size and population, one of the most stirring cities that can be met with.

The trade within is largely augmented since the influx, ever increasing, of Russian pilgrims; but the life and bustle are to be really found outside the walls, to the north and west, where the country has suddenly changed its aspect, and presents an ant hill amount of industry, where hundreds of men—peasants of the land, with a few Maltese, Ionians and Africans—are employed in raising walls preparatory to the numerous edifices designed by Russians, Armenians, and native merchants; and this, again, tells upon remote distances, where the lime is being burned, and the hills denuded of verdure to supply the kilns. All day long the explosions of blasting rocks resound, as though the walls of a citadel were being besieged, the plugs flying up into the air, each with a stream of fire like a rocket.

Besides those inclosures, the works in progress consist of a wide road being made to the ancient Convent of the Cross, now a Greek clerical seminary, nearly two miles distant from the city, and sundry small forts being erected by the Pasha along the Jaffa road, to be occupied by the Bashi-Bozouk, for insuring the general safety. The first one is close to the north-west corner of the wall; the next, of a larger size, is built just on the spot long endeared to pious minds by being that from which the view of the Holy City is first obtained in that direction—a sad combination of devotional feelings with the riot of uncontrolled soldiery; but more than this (and, in mentioning it, let it not be thought we are pleased with the admixture of what is ludicrous), the Pasha has caused the tower to be painted over with black paint—a stone building painted!—in order to render it more fearful in the eyes of the peasantry; and this because the Bin Bashi of the regulars had assured him that in France, Germany, and England, all the great fortifications are thus colored for the purpose of scaring the enemy. Certainly it is a fearful object, even going a step beyond the vile taste of whitewashing the fine ancient gateways of Jerusalem, built by Suliman the Magnificent, on the recently expected visit of the Sultan in August last. The idea of painting a fort for the purpose of inspiring terror smacks greatly of Chinese taste.

The Pasha rides out every afternoon, to visit this funeral outpost, and to enjoy the animation

of the works around us, especially watching with lynx-eyed jealousy against any approach to progress being made, or buildings that might be undertaken, by Europeans. The advantages he has achieved of late over the Arabs near Gaza by diplomacy, without bloodshed, have been magnified in Constantinople-French newspapers into "a series of glorious victories," and he has mulcted them of about £2,000 in compensation for their previous plundering of the peasants.

When he announced to the sheikhs of villages what he had done, and asked advice as to how he should employ the money, they all, with two exceptions, wished to have the money divided among them, rather than have it spent in useful works for future protection. To which his Excellency rejoined, "For shame! do you not know that I am your father, and know best what is good for you?" So he set to work in constructing these petty towers along the Jaffa road to Jerusalem, far enough from the Arabs. We shall see whether the Bashi-Bazouks will not prove as eminent plunderers as the Bedouins, and whether they will not run away from their detached forts as soon as any of the latter appear, or before. The Pasha has done wonders in seizing and banishing to Cyprus or Constantinople the old belligerent sheikhs of Hebron and the Beled Arkub, and in completely disarming the peasantry. He has not, however, punished the Taaneri, who, near Bethlehem last year, slew one of the best Agas of the Bashi-Bazouk in open fight, with numbers on each side, almost within sight of the Pasha's tents. Neither has he done anything yet to detect and punish the murderers of Miss Creasy; nor does he in any way molest the Jordan Arabs, who have recently been acting as they please about Jericho, and who have all their stores of grain there.

In the late dispute of monks at Bethlehem about replacing a slab of pavement which had become broken in front of the sacred manger, the matter was settled impartially by having Turkish officials to place the stone in presence of Latins and Greeks.

Within the city rents are rising to a frightful extent, viz.: to double, treble, or even more of their rates a year ago. The poor are suffering exceedingly from this cause, and benevolent persons are desirous of seeing houses built for them outside the city—that is, if the Turks will allow it; for, alas, the almshouses designed by Sir M. Montefiore are still arrested by their authority.

Our weather has hitherto remained very pleasant, but the cold has now set in, though as yet with bright sunshine; all classes of people are crying out for rain.

The peasantry, owing to their improvident habits, are now without seed-corn for the season, having scarcely sown any barley last time, and the wheat harvest having been unfortunate. On the former of these accounts, they are compelled to

sell their draught animals for plowing, at very low prices, and on the latter account, they are everywhere beseeching the loan of money, offering interest of six measures of wheat at the next threshing-floors, for the present use of a sovereign—amounting in value to a hundred per cent. for six months.

From the two reasons together, it is feared that, as little will be sown, the next harvest will be very deficient.

I should also mention, that men are wanting too, for many are tempted by the high wages for building employment about Jerusalem to leave their fields, and this will bring evil results to the public in general.

CAUSE OF THE AMERICAN REVOLUTION.

BY WM. TUDOR.

The following authentic anecdote, on the origin of American taxation, may be gratifying to persons who are fond of tracing the current of events up to their primitive sources, and who know how often changes in human affairs are first put in motion by very trifling causes. When President Adams was minister at the court of St. James, he often saw his countryman, Benjamin West, the late president of the Royal Academy. Mr. West always retained a strong and unyielding affection for his native land, which, to borrow a term of his own art, was in fine keeping with his elevated genius. The patronage of the king was nobly bestowed upon him; and it forms a fine trait in the character of both, that when a malicious courtier endeavored to embarrass him, by asking his opinion on the news of some disastrous event to America, in the presence of the King, he replied that he never could rejoice in any misfortune to his native country; for which answer the King immediately gave him his protecting approbation. Mr. West one day asked Mr. Adams if he should like to take a walk with him and see the cause of the American Revolution. The minister having known something of this matter, smiled at the proposal, but told him he should be glad to see the cause of that revolution and to take a walk with his friend West anywhere. The next morning he called, according to agreement, and took Mr. Adams into Hyde Park, to a spot near the serpentine river, where he gave him the following narrative.—“The king came to the throne, a young man, surrounded by flattering courtiers, one of whose frequent topics it was to declaim against the meanness of his palace, which was wholly unworthy a monarch of such a country as England. They said there was not a sovereign in Europe who was lodged so poorly; that his sorry, dingy, old brick palace of St. James looked like a stable, and that he ought to build a palace suited to his kingdom. The king was fond of architecture, and would therefore more readily listen to

suggestions which were in fact all true. This spot that you see here was selected for the site, between this and this point, which were marked out. The king applied to his ministers on the subject; they inquired what sum would be wanted by his majesty, who said he would begin with a million. They stated the expenses of the war, and the poverty of the treasury, but that his majesty's wishes should be taken into consideration. Some time afterwards the king was informed that the wants of the treasury were too urgent to admit of a supply from their present means, but that a revenue might be raised in America to supply all the king's wishes. This suggestion was followed up, and the king was in this way first led to consider, and then to consent to the scheme for taxing the colonies."

HOW TO PRESERVE HEALTH.

DIRECTIONS FOR THE SEDENTARY.

Those who are necessarily compelled to sit much should, if possible, have intervals devoted to exercise; and this exercise should be as prolonged and vigorous as their bodily strength will allow; and if it be so that they cannot spare any considerable and fixed time for exercise, they should frequently arise from their seats and bring the muscles of the chest and abdomen into action by widely extending the arms, by elevating them, by moving them rapidly and forcibly backward and forward, and by throwing the shoulders back, at the same time inhaling as much air as the lungs can possibly contain, and then "breathing out" slowly. Running up a flight of stairs, at the same time holding the breath, is a most excellent and available mode of expanding the lungs, recommended by Dr. Hall, in his late excellent work, "Health and Disease." Another mode of expanding the lungs, suggested by the same writer, and one acceptable to all, is to "blow up" or fill life-preservers, bags, etc., by blowing into them. In the absence of any such things, the lungs might be very well inflated by drawing in the breath full and long, and then blowing into the closed hand. The advantage of these modes is that the lungs are very powerfully distended by the expansion of the air drawn into them, through the agency of heat. This is more particularly true of the running up stairs mode, which we consider a most happy idea. The above directions are so easily followed, even by those who have "no time" to attend to their health, that it seems strange that any one should neglect them when convinced of the vital importance to health of well filled and well developed lungs.

Neglect of these simple and accessible measures, on the part of the sedentary, arises more from indisposition to exertion, than from want of time and opportunity. In such persons this indisposition is almost insuperable; and nothing

can overcome it except a firm, ever-present conviction that health and life are the prizes to be obtained by breaking the fatal spell of indolence. The fact is, where *one* is subjected to unavoidable disease from confinement, there are *hundreds of thousands* who ignorantly or wilfully neglect the means of counteracting the evils to which they are exposed from the nature of their occupation.—*Godey's Lady's Book*.

From the Scientific American.

THE SCIENCE OF SKATING.

We have become in the present practical age, great in small things, from the fabrication of a pin to the construction of a steamship. The humble skate, with which our youth enjoy themselves in the clear, cold days of winter—gliding, with lightning foot, upon lake, pond and river—has not been overlooked in the march of improvement.

The Holland skate, with the runner secured in a shoe upper, appears to be growing in popular favor; and certainly our old-fashioned skates have far too many troublesome straps about them. The runner, which is coming into more general use, is devoid of a groove on the face, and skaters assert that they can "go much faster with it," but cannot turn so rapidly. The old curled-up point is also losing caste, and it is time that this feature (borrowed from a Chinese mandarin's slipper) was entirely abandoned.

We have reason to feel conceited of our skates in these days, when we compare them with those worn by our forefathers, about 700 years ago. An old London historian, describing the winter sports of the youth in that city in the twelfth century, says (about a frozen pond in Moorefields):—"Many young men play upon it—some, striding as wide as they may, do slide swiftly; others make themselves seats of ice as great as a millstone—one sits down; many hand in hand, do draw him, and one, slipping on a sudden, all fall together. Some tie bones to their feet and under their heels, and, shoving themselves with a little picked staff, do slide as swiftly as a bird flyeth in the air, or an arrow out of a cross-bow. Sometimes two run together with poles, and hitting one the other, either one or both doth fall, not without hurt—some break their arms, some their legs, but youth desireth of glory in this sort, exerciseth itself against the time of war." These old-fashioned skate-runners were made of the shank bones of oxen, and were highly polished. They are sometimes dug up now in the vicinity of London, and afford a useful lesson in regard to the progress we have made in making skates. A steel runner of a skate, such as that which now costs only a few cents, could not be then obtained in famous London "for love or money."

All the youth in our land should learn to

skate—every boy and girl within the domains of icedom. In several of the cities and villages on the Hudson river, very many of the ladies are excellent skaters; and we understand that ladies' skating clubs have recently been formed in a great number of places. This movement is a sensible one, and deserves all praise; no winter exercise is more healthful. In Holland, all the lasses appear to skate as naturally as ducks take to water. Hundreds of them may be seen every morning in winter, sweeping on their skates along their frozen canals to market, with baskets upon their heads, which they manage to balance steadily.

ITEMS OF NEWS.

EUROPEAN NEWS.—The Queen's speech was made at the commencement of the Parliamentary session, on the 24th ult., in which she proclaims to the world that England had accepted the joint invitation of the Emperors of Austria and the French to join the Congress for the adjustment of the Italian question—strongly declaring that in such Congress England should “steadfastly maintain the principle that no external force should be employed to impose upon the people of Italy any particular Government or Constitution.” She also announces, “I am in communication with the Emperor of the French with a view to extend the commercial intercourse between the two countries, and thus draw closer the bonds of friendly alliance between them.”

The commercial treaty between France and England continued to attract attention and speculation. The *Constitutionnel* publishes several articles of the treaty, as the following:

On and after the 1st of 6th mo. next, the import duties on cotton wool will be suppressed. English coal and coke will be subjected to the same duty as in Belgium after 10th month next. A duty of seven francs will be substituted for the actual duty on iron from 11th mo. next. Duties on machinery will be diminished. From 1st mo., 1861, the sugar duty will be reduced. From 6th mo., 1861, the prohibition of the importation of threads and hemp will be replaced by a duty not exceeding 30 per cent.; and from 10th month, 1861, all remaining prohibitions will be abolished.

In the House of Lords, Lord Brougham has moved a call for returns respecting Slavery, and intended to bring before the House the whole question. He also called for returns of the amount of cotton imported into England from America. It was announced that the Government would do all in its power to suppress the slave trade. It was also announced that the Government has no information of negotiations between France and Sardinia for the annexation of Savoy to France.

In the House of Commons, Lord John Russel, referring to the cruelties practiced on board American ships, stated that the American Government had empowered George M. Dallas to draw up a convention with England to put an end to those atrocities. The announcement was received with cheers.

FATHERS OF THE HOUSE OF LORDS.—The Earl of Guilford and Lord Lyndhurst are entitled, in point of years, to claim precedence over their brother peers. They have both reached the ripe age of 89. Following close are Viscount Combermere and the Earl of Charlemont, who are respectively 85 and 84. Sixteen peers of Parliament have reached the age of 80, or

have passed it. Lord Brougham is among these Nestors of the State, being in his 81st year. The oldest member of the House of Commons is Sir Charles M. Burrell, the member for New Shoreham, who is in his 85th year. Lord Palmerston is 75; Lord John Russell 67; Mr. Disraeli 54; Richard Cobden 55; and John Bright 48. Lord Campbell is the oldest judge upon the English bench. He is 78 years of age. Sir James Wiles is the youngest, being only 44. The Irish bench is graced by the presence of the oldest and youngest Judge in the United Kingdom—the Right Hon. Thos. Lefroy, Chief Justice of the Queen's Bench, aged 84, and the Right Hon. William Keogh, aged 42.—*The Independent*.

RAILWAY CONNECTION.—There is now, we believe, a complete line of railway connection between Augusta, Maine, and New Orleans, two of the most extreme points in our Confederacy. It is only interrupted by the river at New York, and by the Susquehanna. The trip between the two cities, (Augusta and New Orleans) can be made in about six days, and packages can, with certainty, be forwarded in that time.

MATHEMATICAL CHARACTERISTICS OF DIFFERENT NATIONS.—Professor Pierce, of Harvard University, lectured at the Smithsonian Institute, in Washington, a few evenings since, on the mathematical qualities of the various prominent races of the human family. Among modern nations, he regarded the French as now pre-eminent, though as time passes, and the medley of all the best races which go to make up the population of the United States, shall come to be more thoroughly compounded, he believed the people of America will surpass all others. Professor Pierce deems the imaginative and mathematical faculties of the mind to be closely connected, if not absolutely flowing from the same source.

AREA AND POPULATION OF THE BRITISH PROVINCES.—The two Canadas have an area of 250,000 square miles, with a population of over 2,000,000; New Brunswick 27,700 square miles, with a population of 225,000; Nova Scotia 18,746 square miles, with a population of 300,000; Prince Edward Island is 2,134 square miles, with a population of 62,898, and Newfoundland of 57,000 square miles, with a population of 120,000—total area of 553,446 square miles, and an aggregate population of 3,000,000.

HAYTI.—A New Orleans despatch in the *Charleston Courier* states that fifty wealthy free colored agriculturists, from the interior of Louisiana, are purposing to depart for Hayti.

CITY COUNCILS.—A resolution was adopted on the 2d inst., relative to guards upon the wheels of passenger railway cars, to prevent their running over people.

THE AFRICAN SLAVE TRADE.—A correspondent of the *New York Times*, writing from Fernando Po, says that the slave trade on the African coast is in a very prosperous condition, despite all the efforts of the cruisers for its suppression. The barracoons averaged one to every twenty miles of coast from Cape Palmas to Loando, the owners taking their chance of profit by running the risk of capture, and deeming themselves well paid by realizing one-fourth of their human chattels. The British steamer *Spitfire*, Oct. 20, captured the American slave brig *S. Harris*, after a long chase, and sent her to Sierra Leone. She had 517 negroes on board. The viper had captured another American brig, the *Tavianier*, and had sent her to St. Helena.

COOLIES.—A letter from Havana says there have been three large coolie contracts closed within the

last three weeks, covering 35,000—one for from 5,000 to 6,000, one for 15,000, and one other for 15,000; the last to bring subjects from the Polynesian island tribes.

LAWRENCE VERDICT.—The verdict of the coroner's jury on the late calamity at Lawrence, has been rendered. The proprietors of the mill are exonerated from direct blame, and the responsibility for the accident is placed upon Robert Fuller, who furnished the iron pillars, and C. H. Bigelow, the architect of the mills.

AFRICA.—Silva Porto, a Portuguese trader, has written an account of three journeys that he undertook in Central and Southern Africa. In his third tour, Silva Porto crossed the entire continent in 140 days of actual travel, on a parallel to the north of Livingstone's route. With the exception of three culminating points, his path usually lay through fertile plains, subject to heavy rains and cut up with rivers in many places. This experienced trader entertains a high opinion of the commercial value of Africa. He says: "The greatest misfortune that ever befel Portugal was the withdrawal of her attention from Africa to the Brazils. The ablest Portuguese statesmen now clearly understand this truth; and their exertions will shortly produce in Southern Africa as great a revolution in the commerce of the world as the discovery of the Cape of Good Hope did soon after it was made."

AFRICAN COTTON.—A cargo of African cotton is reported to have been received at Boston, and is said to be equal to the best Mississippi, in length and fineness of staple.

AMERICAN SLAVER.—The slaver bark Orion, of New York, was taken to St. Helena in 12th month last, by a British war steamer, and delivered over to the U. S. steamer Mystic.

When captured the bark had 1023 slaves aboard, of whom 152 died before reaching St. Helena.

The captain of the Orion was imprisoned by order of the American consul.

THE ICE-BOAT so much talked of for winter navigation on the Upper Mississippi, was put into successful operation at Prairie du Chien, Wisconsin, on the 11th instant, and made a trial trip to Lafayette, thirty-two miles, in two hours and ten minutes, returning in two hours, and carrying twenty passengers.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The market for breadstuffs generally is quiet, and prices, if anything, are rather firmer. Sales of superfine at 5 62, and extra at \$6. There is a steady home demand from the above quotation up to \$6 25 for common and extra brands, and \$6 25 up to \$7 25 for extra family and fancy lots. Rye Flour and Corn Meal are dull, the former at \$4 12 a \$4 25, and the latter at \$3 75.

GRAIN.—There is not much Wheat coming forward, and the demand is better. We quote good and prime Penna. red at 135 a 136 cents per bushel, and white at 140 a 150 cents. Rye—sales of Pennsylvania at 92c., and Delaware at 88 c. Corn is dull and lower. Sales of yellow at 75 a 76c. Oats are dull; Pennsylvania sold at 44½ cts., and 43c. for Delaware. Sales of Barley Malt at 90 cts., and choice Barley at 88c.

CLOVERSEED of prime quality is more active. Sales of common and prime quality at 4 62 a 5 12½ per 64 lbs. Timothy and Flaxseed are scarce. The latter at 1 58 a 1 60, and the former \$3 25.

ANNE CHURCHMAN'S BOARDING AND DAY SCHOOL, No. 908 Franklin street above Poplar.
1st mo., 28, 8t.

THE FALLSINGTON BOARDING SCHOOL affords superior advantages to young ladies who desire, by a thorough course of study, to prepare themselves for the active duties of life.

The number of scholars is limited to twelve, and all are under the immediate care of the Principals.

For circulars address

BEULAH S. & ESTHER LOWER,
Fallsington, Bucks county, Pa.,
or, WILLIAM S. LOWER, 455 N. Seventh St., Pa.
2 mo. 11, 1860. 3 m.

A YOUNG MAN, a member of the Society of Friends, from the country, is desirous of a situation in some kind of business in this city. Apply to
W. W. M., 324 south 5th street.

WANTED a situation as Assistant Teacher in a school of either white or colored children, by a young Woman, a member of the Society of Friends. Inquire at this office.
1st mo. 28, 1860.

WANTED by an experienced Teacher from Massachusetts, a situation for a Select School, in a Friends' neighborhood, where the advanced English studies are required to be taught. Address
L. VINING, Tuckerton, New Jersey.
1st mo. 28th, 1860.—3t.

BYBERRY BOARDING SCHOOL FOR GIRLS. The Spring Session of this School, taught by Jane Hillborn and Sisters, will commence the 20th of 2d mo., 1860, and continue twenty weeks. The course of instruction embraces all the branches of a liberal English education.

Terms \$60 per Session, one-half payable in advance. For Circulars containing further particulars, address
JANE HILLBORN,
Byberry P. O., Penn.

1st mo. 28, 1860.—2 mo.

EATON ACADEMY, KENNETT SQUARE, CHESTER COUNTY, PA. The Winter Term of the above Institution will expire on the 15th of the 3d mo. next, but, in order to meet the desire of many of the Pupils, and friends and patrons of this Institute, the undersigned have concluded to re-open the School for both sexes, on 2d day the 19th following, and continue it a period of ten weeks, or half a Session, at the present rates, which are \$65 per Term for Tuition, Boarding, &c., and \$16 for Tuition only, one-half payable in advance.

Catalogues, containing further particulars, will be sent to those desiring the same. Apply to

WILLIAM CHANDLER,
Principal and Proprietor,
Or to WILLIAM A. CHANDLER,
Principal Instructor.

1st mo. 28, 1860.

LAKE SCHOOL FOR BOTH SEXES. The 2d semi-term of 20 weeks is to begin 20th of 2d month. The charge, in full, for board and tuition, per term of 20 weeks, is \$45, or at the rate per week of \$2½.

Circulars with references sent by applying to either subscriber

SIDNEY AVERILL,
ELMINA AVERILL,
West Vienna, Oneida Co., N. Y.,
Proprietors.

1st mo. 8, 1860.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, SECOND MONTH 25, 1860.

No. 50.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,

No. 324 South Fifth Street,

PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

AN ADDRESS TO FRIENDS IN GREAT BRITAIN AND IRELAND.

By THOMAS SHILLITOE.

(Concluded from page 172.)

I am now under the necessity of claiming your attention, my dear *Sisters!* in order that you may do your part, in facilitating the escape of your husbands and parents from the troubled waters and sunk rocks of commercial difficulty, which the keen eye of human policy is so often unable to discover; for with you, generally, rests the management of the household affairs: it is also principally for the supply of these, that the laboring oar is kept tugging. You must be willing, mothers and children, to examine closely the mode and circumstances of your expenditure, with a mind made up to relieve, as far as in you lies, the head of the family, who may have both wind and tide to contend with. Lower your topsails, and tighten every rope where it is needful. Search your houses, search your tables, search your garments; and where any expense can be spared, without lessening your real comforts, seek for holy help to rid the vessel of it. I am well aware it will require holy help to take such steps; but this, I am assured, will not be wanting, if sought after in a proper disposition of mind. And we shall find, that those things which have been sacrificed, being calculated only to gratify the vain mind in ourselves and others, and pamper a depraved appetite, had not the effect of adding real comfort to our hearts. Regard not, "the world's dread laugh," but set your intimates and neighbors this salutary example. Show them the way to live well at little expense: an example I believe we are called upon, as a religious society, in a peculiar manner to be holding up, especially in the present state of the nation. And how-

ever this may prove a sore conflict to the fleshly part, by letting us down in the eyes of the world, yet in the end we shall appear more honorable than some among us of late years have; who have gone on, pushing business to keep up an appearance which their circumstances did not justify; clothing and feeding themselves and their children with that which they were not able to pay for. And, Friends! you that are of ability of body, learn to wait more upon yourselves, and bring your children to do the like. I find I am never better waited on, than when I wait upon myself. Teach your children industry, and a *well-regulated* economy: I fear there is too much need, in the present day, to press this wholesome practice. For, next to a truly pious example, you cannot bestow upon your children a better portion. This appears to have been much the case with our first Friends; and it had been better for many of our youth, had their parents trod more in the footsteps of these.

There is yet another precious advantage results from bringing up children in habits of well-regulated industry and economy: little business will then be found sufficient to bring up a family reputably, when our wants are confined to real comforts and conveniences, which truth allows as far as ever our circumstances will warrant them. It is those things which have nothing to recommend them but show, and an appearance of what the world calls gentility, that are opposed by the truth in each of our minds, did we but attend to it more faithfully. For want of this attention, how many have become *slaves to appearances!* And where this well-regulated industry and economy are wanting, and idleness and fulness of bread prevail, how little is to be observed, in the conduct of such, of reverential thankfulness for the bounties they are receiving from heaven!

When we are content to move in this humble sphere, we are prepared the better to meet such reverses as may come upon us. Let none among us say in his heart, "I am out of the reach of reverses;" because *none* are out of the reach of reverses. For, however variously our outward substance may be secured, all sublunary things are unstable as the waters; and various as may be our resources, every supply may be cut off: the Philistines may be permitted to stop up all the wells which we have dug for ourselves and our children. (Gen. xxvi. 15.) The most High may permit his little army to enter into our vine-

yards and olive-yards, and strip us of all, without power on our part to prevent the devastation. For what the palmer-worm leaves, the canker-worm may eat; and what the canker-worm leaves the caterpillar may so destroy, that not the least vestige of our once greenness and greatness may remain. (Joel i. 4.) This has been the case with many within my memory. The crafty have been so taken in their own craftiness, and the lofty so brought down from their seats, and men of low degree exalted, that he who was the servant has become the master of his once master, and even his master's children have served his children! (Job v. 13.) What has been may be again. For thus has the All-wise Disposer, to whom belong the cattle of a thousand hills, and every visible thing, (for nothing is mine or thine, any longer than He sees meet we should possess it,) evinced his sovereignty and power to humble his creature, man: convincing him thus of the great uncertainty of all visible things! (Ps. l. 10.) And may these turnings and overturnings which we hear of, (and some more keenly feel the smart of,) in commercial concerns, and in families, prove the means of stimulating us to leave the things that are behind, (all of which are perishing,) and press forward to those which are before, which are eternal!

I am afraid, my dear sisters, to close this subject without adding another hint, as essential to our being the better able to keep our family expenditure within its proper bounds; having myself experienced its salutary effects, when I had a numerous family around me. It is, to determine to purchase with ready money the various articles consumed for family use; and that we resolve to perform this, however mortifying it may prove, by depriving us of many things the natural disposition may crave, in ourselves and children. I believe great advantage will be found to result from such a practice, both to parents and children; more particularly to such as, at times, feel themselves straitened to carry on their business reputably. For when these difficulties are felt by an honest mind, it becomes obligatory on such, (if they get through them,) closely to inspect the manner of their expenditure; and this will afford an opportunity of timely checking any unnecessary expense that may have crept into the family. But when things for family consumption are mostly, if not all, had upon credit, this opens a wide door, both for parents and children, to greater indifference, both as respects expediency and cost, than Truth at all justifies; and the children of such parents are in danger of being brought up, ignorant of the real use or value of property. When numbering my blessings, I esteem this as not one of the least that my heavenly Father has bestowed upon me, that He kept me in a little way of business, and a care to keep my family expenses within proper bounds, and taught me the lesson of contentment

with little things: because, now I am advanced in life, I am satisfied I escape manifold perplexities, which would have been at this time my attendants, had I sought after greater things as to this world. The purchasing goods for family consumption on credit, often proves a serious inconvenience to those on whom such are depending for supplies, especially if they are not beforehand in the world: for it too frequently proves, that such purchasers are not very ready to make payment in due time; and when this is the case, are they doing as they would be done by?

I have long viewed it as a mean practice to consume, in any way, the property of another person before I have paid for it, (except under some peculiar circumstances;) for general usage does not justify me, or any other person, (to say no more,) in wrong practices, especially to a people making the high profession we do. For we are not to view things as the world does; but through a more pure medium, with the eyes of truth and uprightness. I want us more frequently to recur to that which we are making profession of, and as frequently compare our practice therewith; bringing all our deeds to that light by which, in a future day, they will be judged: for I cannot refrain from expressing a jealousy, that too many amongst us are swerving into this dangerous track of the world. One of the diadems with which our first Friends were decked,—one of the many jewels that shone in their character, and adorned their profession, was the care they manifested to have nothing but what they could well pay for; so that, should reverses come from the many perils they were, in various ways, liable to, none might be losers by *them*. This, in due time, with an uniform, consistent, upright conduct, in other respects, procured for them that confidence in the minds of all ranks, and that respect which they so long maintained. I am not able to close this subject without intreating such, to whom these remarks may apply, not to set light by them. Look seriously at the subject, and make a stand, and hold up your testimony by example, against *this baneful practice*: for so I doubt not it has been to thousands, and the inlet to those embarrassments that have at last overtaken them. If we are willing to be found thus standing in our proper allotment, we may prove, in degree, instrumental in the Divine Hand, to check that torrent of evil which so sorrowfully pervades all classes. For the practice has overspread the nation, of supporting an expensive manner of living upon credit, which, if not timely checked, there is reason to fear may contribute, amongst other evil practices, to work its ruin. We have stood high, as a religious society, in the esteem of others, for nearly a century and a half, in regard to honesty, integrity, and an exemplary conduct. Can we with truth say, we believe we have been rising higher in this respect of latter years? I fear this has not

been the case, but that the many sorrowful failures, the multiplied instances of want of punctuality, that have, of late years, occurred among us, with various departures, in other respects, from our well-known principles, have given a severe shock to that confidence in us, which once had place in the public mind.

The door has of late been set open, much wider than was the experience of our first friends, for the members of our society to associate with those of other religious professions, in the management of the various institutions for benevolent purposes that are on foot. Let us be careful that this does not lead us *to assimilate ourselves to the world*. The world hated our first friends, because they maintained a faithful protest against its spirit, its maxims and manners; but, in proportion as we put away from us the weapons of the Christian's warfare, and join in league with the world, a wider door of admittance *into all companies, and all societies*, will be opened to us. Thus, we have indeed occasion to look well to our steppings and our standing; remembering that so far as we join ourselves *to the world*, in any respect, we shall be condemned with the world. "If ye were of the world, (said our blessed Lord to his immediate followers,) the world would love its own: but because ye are not of the world, but I have chosen you out of the world, therefore the world hateth you." (John xv. 19.)

In order that we may not further forfeit the confidence of the public, but regain that which we may have lost, let me again repeat the caution, that by others' harms we may take warning; and by our future conduct give proof of our belief in this incontrovertible truth, that "a man's life, (or the true enjoyment of it,) consisteth not in the abundance of the things which he possesseth." (Luke xii. 15.) Let us learn that essential lesson of contentment with little things as to this world; remembering that He, whom we profess to take for our leader, declared respecting Himself, although Lord of the whole world, "the foxes have holes, and the birds of the air have nests; but the Son of Man hath not where to lay his head?" (Matt. viii. 20,) so void was he of any earthly inheritance! It was the exhortation of the prophet to Baruch, the son of Neriah, "Seekest thou great things for thyself? seek them not; for behold I will bring evil upon all flesh, saith the Lord: but thy life will I give unto thee for a prey in all places whither thou goest." (Jer. xiv. 5.) Whilst then we are engaged to circulate more generally among mankind at large, publications explanatory of our religious principles, and religious tracts, may we give proof, in the first place, of their happy effect upon our own minds. For example will do more than precept; actions will speak louder than words: so shall we, each one, become a preacher of righteousness, that cannot fail to

reach to the pure witness in the minds of others. Thus may we become as saviours on Mount Zion; for saviours shall come up on Mount Zion, to judge the Mount of Esau; and the kingdom shall be the Lord's." (Obad. v. 21.)

And let us all retire to our tents; for, if I am not mistaken, such are the signs of the times, that they loudly call upon us so to do, and there closely to keep. The Lord is this tent, unto which the true Israel of God must flee to be safe; and as there is thus an abiding in Him, who is the munition of rocks, should the potshards of the earth begin to smite one against another, (Isa. xiv. 9,) such will be preserved from smiting with them, in word or deed, and escape that danger which will, more or less, follow those who are found so meddling; and that perturbation of mind, that instability of confidence, and want of support, under the varied probations that may, in unerring wisdom, be permitted to overtake; which ever was, and will be, the case of those who make flesh their arm. (Jer. xvii. 5—8.)

I cannot forbear to express a fear, that there are among us who are not sound in the faith, as it respects an entire reliance on the all-superintending care of Divine Goodness, in times of danger and difficulty, but who *are* making flesh their arm; and when, at times, their minds are awakened to behold the approach of danger, as respects national affairs, are placing their confidence in (what they esteem) the wise conducting of a well-disciplined army, and a large store of weapons of defence; all of which may effect the very destruction of those who are thus relying upon them instead of the living God for preservation. Such is the great uncertainty of all human events! It must, with reverence, be acknowledged, by every serious observer, that the Divine protection has long been over us as a nation; and, for the sake of the few righteous amongst the different professors of the Christian name, is still, I believe, mercifully continued. But how soon, or how suddenly, this may be withdrawn from us as a nation, because of our multiplied transgressions, is altogether unknown to us; but should this once be permitted, and the chain of the evil power be loosened for a time, this arm of flesh, which there is reason to fear many are depending upon for support in such perilous times, will become but as tow in the furnace! Happy will it be, in that day, for those who have made the Lord alone their refuge, and placed their dependance on that Omnipotent and Omnipresent Being, who will prove, in such seasons, a covert from the heat; shelter from storm; and as the shadow of a great rock in a weary land, (Isa. xxv. 4;) a day and time when the minds of all may be clad with dismay as with a garment, for fear of what is coming upon this part of the Lord's footstool! And, friends, let us dare not to meddle with political matters;

but renewedly seek for holy help to starve that disposition, so prevalent in us, to be meddling therewith. Endeavor to keep that ear closed, which will be itching to hear the news of the day, and what is going forward in the political circles. We shall find there is safety in so doing: it is the only way for us to experience our minds to be preserved tranquil, amidst all the commotions, all the turnings, and overturnings, that may be permitted to take place, when the measure of iniquity may be filled up. I have found that if we suffer our minds to be agitated with political matters, our dependance becomes diverted, by little and little, from the true centre and place of safety; where perfect peace is experienced, though the world, and all around us, may speak trouble. Such as have this dependance, will know it to be a truth, fulfilled in their own individual experience, that "They that trust in the Lord shall be as Mount Zion, which cannot be removed, but abideth for ever:" (Ps. cxxv. 1, 2,) and that "as the mountains are round about Jerusalem, so the Lord is round about His people from henceforth, even for ever." Now friends, be willing to take up this cross (for I have found it to be one of the many crosses I have had to take up,) and avoid reading political publications; and, as much as possible, *newspapers*; and I am persuaded, if a willingness be manifest on our part so to do, sufficient help will be afforded, from time to time, to withstand this and every other temptation of the great adversary of our peace. I am well aware, that men in trade, and sometimes those who are free from its incumbrances, have occasion to resort to those channels of general information; but when this is my case, I find it safest for me, after I have received information on the subject in question, to put the paper then away from me. I am aware that it requires firmness so to act, there being something in our nature so anxious to know what is going forward in the world. But, my friends, nature must be overcome by grace; which I never found to be wanting, if rightly sought after.

I must now conclude with expressing the earnest solicitude I feel, that we may each of us be found willing to unite with that all-sufficient help, which I believe yet waits our acceptance; and suffer it so to operate in and upon us, that we may become again a people wholly separated, in heart and mind, love and affection, from every thing that has a tendency to dim our brightness, to prevent us from being as lights in the world; and become again clothed with those beautiful garments which so adorned our worthy ancestors, humility, self-denial, and an entire dedication of heart and mind to the work and service of our God: a disposition truly characteristic of the disciples of him who declared: "My kingdom is not of this world;" and thus may the enemy no longer be permitted to rob

and spoil us,—but the language go forth respecting us: "Happy art thou, O Israel: who is like unto thee, O people saved by the Lord." (Deut. xxxiii. 29.)

Hitchen, 1st of 11th mo. 1820.

ON DAILY FAULTS AND THE TOLERATION OF OURSELVES.

You understand that many of our faults are voluntary in different degrees, though they may not be committed with a deliberate purpose of failing in our allegiance to God. One friend sometimes reproaches another for a fault not expressly intended to be offensive, and yet committed with the knowledge that it would be so. In the same way, God lays this sort of faults to our charge. They are voluntary, for although not done with an express intention, they are still committed freely and against a certain interior light of conscience, which should have caused us to hesitate and wait.

Of these offences, pious souls are often guilty; as to those of deliberate purpose, it would be strange indeed if a soul consecrated to God should fall into such.

Little faults become great, and even monstrous in our eyes, in proportion as the pure light of God increases in us; just as the sun in rising reveals the true dimensions of objects which were dimly and confusedly discovered during the night. Be sure that, with the increase of the inward light, the imperfections which you have hitherto seen, will be beheld as far greater and more deadly in their foundations, than you now conceive them, and that you will witness, in addition the development of a crowd of others, of the existence of which you have not now the slightest suspicion. You will there find the weaknesses necessary to deprive you of all confidence in your own strength; but this discovery, far from discouraging, will serve to destroy your self-reliance, and to raze to the ground the edifice of pride. Nothing marks so decidedly the solid progress of a soul, as that it is enabled to view its own depravity without being disturbed or discouraged.

It is an important precept to abstain from doing a wrong thing whenever we perceive it in time, and when we do not, to bear the humiliation of the fault courageously.

If a fault is perceived before it is committed, we must see to it that we do not resist and quench the Spirit of God, advising us of it inwardly. The Spirit is easily offended, and very jealous; He desires to be listened to and obeyed; He retires if He be displeased; the slightest resistance to Him is a wrong, for everything must yield to Him, the moment He is perceived. Faults of haste and frailty are nothing in comparison with those where we shut our ears to the voice of the Holy Spirit beginning to speak in the depths of the heart.

 2001

Restlessness and an injured self-love will never mend those faults which are not perceived until after they are committed; on the contrary, such feelings are simply the impatience of wounded pride at beholding what confounds it. We must quietly humble ourselves in peace; I say *in peace*, for it is no humiliation to do it in a vexed and spiteful way. We must condemn our faults, mourn over them, repent of them, without seeking the slightest shadow of consolation in any excuse, and behold ourselves covered with confusion in the presence of God; and all this without being bitter against ourselves or discouraged; but peacefully reaping the profit of our humiliation. Thus from the serpent itself we draw the antidote to his venom.

It often happens that what we offer to God is not what he most desires to have of us; that we are frequently the most unwilling to give, and the most fearful He will ask. He desires the sacrifice of the *Isaac*, the well-beloved son; all the rest is as nothing in his eyes, and he permits it to be offered in a painful unprofitable manner, because He has no blessings for a divided soul. He will have everything, and until then there is no rest. *Who hath hardened himself against Him and hath prospered? (Job ix. 4.)* Would you prosper, and secure the blessing of God upon your labors? Reserve nothing, cut to the quick and burn, spare nothing, and the God of peace will be with you. What consolation, what liberty, what strength, what enlargedness of the heart, what increase of grace, will follow when there remains nothing between God and the soul, and when the last sacrifices have been offered up without hesitation!

We must neither be astonished nor disheartened. We are not more wicked than we were; we are really less so; but while our evil diminishes, our light increases, and we are struck with horror at its extent. But let us remember, for our consolation, that the perception of our disease is the first step to a cure; when we have no sense of our need, we have no curative principle within; it is a state of blindness, presumption and insensibility, in which we are delivered over to our own counsel, and commit ourselves to the current, the fatal rapidity of which we do not realize, until we are called to struggle against it.

We must not be discouraged either by experience of our weakness, or by dislike of the constant activity which may be inseparable from our condition in life. Discouragement is not a fruit of humility, but of pride; nothing can be worse. Suppose we have stumbled, or even fallen, let us rise and run again; all our falls are useful, if they strip us of a disastrous confidence in ourselves, while they do not take away a humble and salutary trust in God.

Carefully purify your conscience, then, from daily faults; suffer no sin to dwell in your heart;

small as it may seem, it obscures the light of grace, weighs down the soul, and hinders that constant communion with Jesus Christ which it should be your pleasure to cultivate; you will become lukewarm, forget God, and find yourself growing in attachment to the creature. A pure soul, on the other hand, which is humiliated, and rises promptly after its smallest faults, is always fervent and always upright.

God never makes us sensible of our weakness except to give us of His strength; we must not be disturbed by what is involuntary. The great point is, never to act in opposition to the inward light, and to be willing to go as far as God would have us.—*Fenelon*.

“—The best way to avoid being disturbed by an unpleasant thing, is to resolve that it shall not disturb you; but should your nerves be sensitive and unable to stand the trial, hasten by the annoyance and don't see it. A stinging remark loses all its point when we are not conscious that we are aimed at.”

A PLEA FOR THE POOR: OR A WORD OF REMEMBRANCE AND CAUTION TO THE RICH.

BY JOHN WOOLMAN.

Wealth, desired for its own sake, obstructs the increase of virtue; and large possessions in the hands of selfish men have a bad tendency; for, by their means, too small a number of people are employed in things useful; and therefore some of them are necessitated to labor too hard, while others would want business to earn their bread, were not employments invented, which, having no real usefulness, serve only to please the vain mind.

Rents set on lands, are often so high, that persons who have but small substance are straitened in taking farms; and while tenants are healthy, and prosperous in business, they often find occasion to labor harder than was intended by our gracious Creator.

Oxen and horses are often seen at work, when through heat, and too much labor, their eyes, and the emotions of their bodies, manifest that they are oppressed. Their loads in wagons are frequently so heavy, that when weary with hauling them far, their drivers find occasion, in going up hills, or through mire, to raise their spirits by whipping, to get forward.—Many poor people are so thronged in their business, that it is difficult for them to provide shelter suitable for their cattle and other animals, against the storms. These things are common, when in health; but through sickness and inability to labor; through loss of creatures, and miscarriage in business, many are so straitened; so much of their increase goes to pay rent or interest, that they have not wherewith to buy what their case requires.

Hence, one poor woman, in attending on her children, providing for her family, and helping the sick, does as much business as would, for the time, be suitable employment for two or three; and honest persons are often straitened, to give their children suitable learning.

The money which the wealthy receive from the poor, who do more than a proper share of business in raising it, is frequently paid to other poor people, for doing business which is foreign to the true use of things.

Men who have large possessions, and live in the spirit of charity; who carefully inspect the circumstances of those who occupy their estates, and, regardless of the customs of the times, regulate their demands agreeably to universal love; these, by being righteous on principle, do good to the poor, without placing it to an act of bounty. Their example, in avoiding superfluities, tends to incite others to moderation; their goodness, in not exacting what the laws or customs would support them in, tends to open the channel to moderate labor in useful affairs, and to discourage those branches of business which have not their foundation in true wisdom.

To be busied in that which is but vanity, and serves only to please the unstable mind, tends to an alliance with those who promote that vanity, and is a snare in which many poor tradesmen are entangled.

To be employed in things connected with virtue, is more agreeable with the character and inclinations of an honest man.

While industrious, frugal people are borne down with poverty, and oppressed with too much labor in useful things; the way to apply money, without promoting pride and vanity, remains open to such who truly sympathize with them in their various difficulties.

CONSISTENCY.—A father never gains the affections of his children by refusing to decide their disputes, or settle them; but he loses a vast deal of their respect, if he evades or shuns the subject. And those opinions expressed before the younger members of the family should be held consistently. It will not do to state one thing in theory, and allow your children to see you reverse it in practice daily and hourly: by such a method one thing is ensured—contempt; and contempt is alike fatal to love, respect, or imitation.

FOUR GOOD HABITS.—There were four good habits a wise man recommended in his counsels, and which he considered to be essentially necessary for the management of temporal concerns; and these were, punctuality, accuracy, steadiness, and dispatch. Without the first of these, time is wasted; without the second, mistakes the most hurtful to our own credit and interest and that of others may be committed; without the third,

nothing can be well done; and without the fourth, opportunities of great advantages are lost, which it is impossible to recall.—*Life Illustrated.*

FREE-LABOR GOODS.

It hath been held from old time that the receiver is as bad as the thief. The proverb, so to call it, though not found either in Scripture or in Shakespeare, those great artesian fountains of the Anglo-Saxon vernacular, is nevertheless so orthodox as to be accepted by the public, and insisted on by the bench. One branch of the family of philanthropists has applied it with impetuous vehemence to the use of goods the product of Human Slavery, averring that as the slave was stolen, those who consume the product of his labor are receivers of stolen goods, and equally guilty with his master. The Society of Friends in this country have borne an equally decided testimony against the sin of slaveholding, but in language less impetuous, and, judging by its results, with infinitely more advantage to the bondman. They began early among themselves, first to emancipate, then to plead with each other to do likewise, then to incorporate an avoidance of Slaveholding among the articles of their religious faith, and closed the peaceful warfare by emancipating the whole Society from any connection with this sum of all villainies. More than this, they sought out many slaves who had been emancipated by Friends, and paid them for the time they had been unjustly held in bondage. In every way within their power they cut loose from the sin, and this pioneer testimony against it has continued to be maintained down to the present day. This mighty revolution in the opinions and conduct of a wide-spread religious organization, was effected without the use of harsh or bitter language. Religious suasion, preaching, pleading, exhortation alone, were the agencies relied on to produce conviction. How potent they were, under Divine guidance, to purge them of a sin in which all other sects were steeped, may be seen by looking round among the members of the Society. Not one of them is now the holder of a slave.

While the difficult task of cutting loose from Slavery was being accomplished, efforts were made to carry it to its utmost limit by avoiding the use of goods, the product of Slave-Labor. Abstinence of this kind was recommended by tracts extensively circulated among their members, by preaching in their congregations, and by epistles from one Yearly Meeting to another. Free-Labor Associations were formed among them, to establish depositories of Free-Labor goods, many of which are now in active operation. One of these Associations in Ohio has recently issued an address to the members of that Yearly Meeting, renewedly urging them to abstain from the use or purchase of slave-grown products. It is couched in the decorous language peculiar to

the Society, and instead of stinging invective, all is gentle persuasiveness, strengthened by the highest arguments that a religious conviction could suggest. They tell us that the motive of the slaveholder to perpetuate the bondage of the slaves is to realize a profit from their labor, and that if this be sinful, we, by purchasing the products of their toil, are making his sin our own. The consciences of some who have misgivings as to the innocency of using such products, are sometimes quieted by the idea that their abstinence would have no weight in the scale of Anti-Slavery effort, and that Slavery is invulnerable to all such attacks. They ask their brethren if they have no testimony to bear against Slavery but to condemn it in the abstract, and to refuse to hold slaves—if there is no power in example, no efficacy in the plain, simple, consistent testimony borne by abstaining from its fruits? They allege that such abstinence, by lessening the demand for slave products, would improve the comfort of the slave. The testimony is unanimous that when the prices of cotton and sugar rule high, the condition of the slaves is far worse. They are then driven to the utmost extent their strength will permit; the mills are worked day and night; the domestic slave-trade becomes brisker, and families are much oftener separated. Increased demand for either staple causes increased prices, both being the result of increased consumption. Evidence of this state of things was given in a slaveholders' Convention, held in Louisiana some years ago, in which the question was gravely argued whether it would not be better, that is, more profitable, when the price of cotton or sugar reached a certain figure then named, to "use up," that is, work to death, their slaves in seven years, and buy a new set when they were thus killed off, than to protract their existence a few years longer by decent treatment. The value of human sinews was on this occasion calculated to a nicety. Dollars and cents being taken as the basis, the beginning and the end, it was voted that it would pay best to use them up in seven years.

The business of collecting Free-Labor goods for sale as such, began in Philadelphia under the auspices of Lydia White, in 1845. The movement was subsequently consolidated into "The Free Produce Association of Friends," composed of persons residing in Pennsylvania, New Jersey, and Delaware, by whom a fund of several thousand dollars was subscribed, part being absolute donations, and part as loans without interest, but all to share, pro rata, any losses that might be made. This Association was not incorporated, and much difficulty was experienced in managing a business requiring so much personal attention, by the agency of committees composed of those who had daily engagements of their own. Individual care and oversight being seen to be indispensable, one of the members was induced

to undertake the whole charge. He invested capital of his own, and was permitted to use, without interest, the sum already contributed. But the difficulties to be surmounted were soon found to be numerous and perplexing. The task of seeking supplies of raw cotton, with its attendant expenses, had been assumed by the Association; but to procure its manufacture into a variety of fabrics to meet the wants of families, involving careful bargaining and superintendence, the solicitation of manufacturers, with the inducement of extra pay, and a multitude of *et cæteras*, was found to be exceedingly laborious, and to require continual additions of capital.

As the supply of Free-Labor groceries was included in the plan, and as Free-Labor sugar and molasses were in those days but seldom offered in the Philadelphia market, great care and industry were required to procure them. The proprietor was even compelled to visit the Free Islands in the West Indies, and make arrangements on the spot for supplies. Of latter years, these articles have been more freely imported into this country. To secure a steady and ample supply of refined sugars, was also a great desideratum. But this could be accomplished only by purchasing a large and inconvenient quantity at a time, so as to make it an object for the refiner to keep the Free-Labor article separate in all its stages of manufacture. Rice was also an indispensable article to have on hand. At first it was obtained by Free-Labor cultivation in Virginia and North Carolina, but so many difficulties attended the process of cleaning, that East India rice was substituted. Many other articles in the same line demanded special attention to insure their being the product of Free-Labor. Indeed the trials and perplexities encountered in accomplishing the ends of this undertaking, would fill a small volume. Nothing short of the most conscientious perseverance could bear up against the delays, the difficulties and the losses which were continually experienced.

After encountering these perplexities for years, especially the difficulty of getting the cotton manufactured in different mills in this country, and even in England, it was resolved to have a mill devoted exclusively to the production of Free-Labor goods. No sooner was this determined on, than friends to the great enterprise were raised up in Philadelphia and its vicinity, who courageously supplied the money to put it in operation. It has been nearly five years constantly engaged in producing yarns from No. 30 down, shirting, sheeting, drillings, flannel drills, printing-cloths, ginghams, furniture check, Summer stuffs in great variety, cambrics, paper muslins, cheese swathings, denims, ticking, table damasks on Jacquard looms, some of which are of elaborate and exquisitely finished patterns, cotton and wool, Kentucky jeans, satinets, cashmerets, and cotton-warp flannels. In addi-

tion to this great variety of fabrics, yarns are made for wicking, knitting, hosiery, and for warps, with cotton laps. The raw cotton is the growth of Texas, the product of that noble leaven of German Freedom which has there entered into possession. Some also is produced by small planters in other States, who neither own nor hire slaves. Every pound used is the product of Free-Labor, known and warranted to be such, raised by one body of conscientious planters for the use of another body of conscientious consumers. Though cotton can be had from Africa and Hayti, free from the stain of Slavery, yet the policy has been adopted of giving preference to that of American origin.

There are grave reasons for this preference. It causes no sectional separation of the friends of Free Labor from those interested in Slavery. The example of Free Labor properly encouraged in the midst of Slavery, as it might be a united effort of its friends, would demonstrate the superior advantage of paid over servile labor, and lead the now blinded slaveholders to think, to imitate, and to emancipate. The special encouragement of non-slaveholding planters, by securing them a market, would stimulate them to greater production, greater profits, and increased ability to educate their children. The Southern mind would undergo a gradual change, as it became convinced of the superior cheapness and certainty of Free Labor. Laws permitting them to emancipate and hire their slaves would be enacted, and the sanguinary crusade against free negroes be stayed. The right movement in the South would be one of brotherly co-operation, free from every semblance of antagonism or outside pressure.

The varied products of the Free Labor mill referred to approximate a full supply of goods for ordinary family wear. The customers for these fabrics are found in all the Free and several of the Slave States. In the latter, they are principally members of the Society of Friends; but in the North, East, and West, the goods are sought after by men and women of all denominations, with whom it is a conscientious obligation to cut loose from Slavery by every means within their reach. This demand extends to every article in the general market which is wholly the product of Free Labor, and is steadily increasing. The consumption would be vastly greater if the business were managed by an incorporated company composed of a larger number of friends of the cause with ampler capital. It is contemplated by George W. Taylor, who has charge of the Free Labor Store in Philadelphia, to attempt the organization of such a company, and to hand over the whole stock and business to its management.

This pioneer establishment for the sale of Free Labor goods has been in operation twelve years. It was not begun as a speculation out of which to make money; but with views of the loftiest and

holiest character. Had it been a speculation merely it would have been long since abandoned. Some of its goods cannot be sold so cheaply as those produced by Slaves, yet the conscientious consumers continue to purchase. So, on the other hand, it originated in no antagonism, no hostility to the South. Political considerations of any kind had no part in its establishment. Its origin may be traced to a desire to act in obedience to the intimations of that higher law which commands us that we should do unto others as we would that others should do unto us. It cannot be doubted that the new front which Slavery has presented to the Northern mind within a year or two will give to its general operations a fresh and powerful momentum.—*N. Y. Tribune.*

FRIENDS' INTELLIGENCER.

PHILADELPHIA, SECOND MONTH 25, 1860.

The views expressed in an essay entitled "Education," in regard to the manner of teaching, and the branches taught in schools, are now so generally acknowledged and acted upon, that an essay on the subject, which from its length would take up a considerable portion of our paper, seems to us unnecessary.

With regard to the subject of teaching music in our public schools, we think Friends have little to do with it. If we cannot bring the public schools to our standard, their unfitness for the education of our children should stimulate us to have schools of our own in every neighborhood where there is a sufficient number of Friends to support them. We hope the time is not far distant when a system of *free education* will be established throughout the Society. This would not only have a tendency to equalize all classes amongst us, but would be a means of preserving our principles and testimonies.

NEEDLE WOMEN.—Some weeks since a pathetic appeal for sewing girls, written by one of their number, appeared in the *New York Sun*, and renewed a feeling of sympathy for this much oppressed class. Though we are measurably aware of the injustice and servitude under which these silent sufferers labor, occasionally it is so forcibly presented to the mind that humanity shudders at the picture, and we ask, is there no redress for these great wrongs.

Hundreds and thousands in our own, as well

as other cities, are striving to earn an honest livelihood by the use of the needle, and in this way, not only endeavor to maintain themselves, but a husband, sick or out of employment, and a family of helpless little children. In some instances this meagre support might be obtained with comparative facility were they allowed a living profit for their labor.

The great number of industrious, virtuous poor who have no alternative but to starve, beg or submit to these impositions, affords unprincipled manufacturers an opportunity to enrich themselves at the expense of the needy—thus taking unholy advantage of their necessities. That one mammoth establishment may amass wealth, multitudes of poor, yet deserving women, suffer privations and oppressions almost incredible to one ignorant of the manner in which these things are conducted.

Sewing machines, which were intended to relieve the operatives of drudgery, instead of abating the labors of the needle-women, are too frequently used as instruments of oppression to increase the cupidity of the manufacturers. Basting articles of clothing to be finished by these machines has of late become a fertile branch of occupation, but while an increase of work is thus furnished, the compensation seems materially to have diminished, until it is almost surprising any one will consent to toil for such a pittance. While we hope there are many honorable exceptions to this too general system of extortion, we fear scarcely any trade is exempt from such impositions.

The striped or plaid cotton shirts which are so extensively furnished for the California market, are basted and made ready to finish on the machine at the low rate of thirty-five cents per dozen. Every seam in these garments is to be carefully basted, and six button-holes neatly worked in each, for two cents and eleven-twelfths a piece. Only a few days since, a woman, whose husband is out of employment, and who is endeavoring to support herself, her husband and five little children in this life-wearing manner, assured us she industriously sewed from early morn till 10 o'clock at night, and could only make three of these shirts; earning, consequently, eight and three quarters cents a day. To obtain the work she walked nearly three miles.

For basting flannel shirts the general price is

twenty-five cents, or thirty cents per dozen,—two and one twelfth, or two and a half cents a piece. It is called "basting," but the seams must be carefully run together, tape basted over, the neck bound, and button-holes worked, and if not neatly done they are reprimanded, and discharged if the negligence is repeated. But we forbear to dwell longer on this heartless, it may sometimes be thoughtless, oppression.

"Speak no ill" has been published in a former volume of the *Intelligencer*.

Communications of Y. T. have been received, and will appear in future numbers.

MARRIED, at Milton, Wayne county, Indiana, on the 26th of 1st mo., 1860, URIAH WOOLMAN, Jr., of Westfield, Ohio, to ANNIE, daughter of Daniel and Cecelia Whitely, of Fayette county, Ind.

—, According to the order of Friends, at the house of Francis Boggs, on the 9th inst., JOHN A. RULON to MARY A. BOGGS, both of Camden Co.

—, At Westfield, Ohio, 1st instant, JAMES C. MOORE, of Fall Creek, Indiana, to PHEBE, daughter of Uriah and Mary B. Woolman, of Preble Co., Ohio.

—, With the approbation of Middletown Monthly Meeting of Friends, at the residence of T. Blakey Walton, in Falls township, Bucks county, Pa., on the 16th inst., JOHN WATSON, of Solebury, to PHEBE ANN WALTON, of Falls.

—, With the approbation of Falls Monthly Meeting of Friends, at the residence of the bride's father, on the 16th inst., DAVID SIMPSON, of Solebury, to TACIE, daughter of William Satterthwait, of Falls, all of Bucks county, Pa.

DIED, at her residence in Bristol Township, Bucks county, Pa., on the night of the 27th of 1st mo., 1860, REBECCA E., wife of John G. Burton, aged 72 years, a member of Falls Monthly Meeting.

—, At her residence in Byberry, on the 17th inst., BEULAH WALMSLEY, aged about 83 years, a member of Byberry Monthly Meeting.

—, On the 10th inst, after a few days' illness, LYDIA B. STILES, daughter of Joseph A. BURROUGHS, of Camden county, N. J., in the 27th year of her age.

This dear young woman evidenced that she was quickened by the spirit of the Father, and the song of triumph was her portion. She remarked that although her journey was brief, yet no doubt it would terminate in the right time, and she was favored to hand forth good counsel and advice to those around her. Oh! that her removal may incite us who remain to struggle for the blessing, and, like her, to know that the Bethlehem star illuminates our way.

—, On the evening of the 31st ult., at Sterling, Whiteside county, Illinois, AQUILA M. KIRK, aged about 66 years.

And on the evening of the 14th instant, SARAH, his wife, aged 65 years. Both had suffered long and severely, and passed away calmly and peacefully.

From All the Year Round.

SUBTERRANEAN SWITZERLAND.*

Formerly, books, records, human authorities (as they were called,) transmitted occasional truths, but more frequently error after error, to successive generations. Strange assertions appeared to be truths, because the venerable but credulous Pliny, or such as Pliny, had delivered them, *ex cathedrâ*, to mankind. Now, we choose to see and judge for ourselves. Even history, which emphatically might be termed a science of record, is obeying the universal rule. If we do not supersede, we, at least, strive to authenticate history by the evidence of our eyes. And how do we effect this? Precisely by the same method that the geologist makes use of, when he is so wise—or, as poor Cowper thought, so sinful—as to

“Drill and bore
The solid earth, and from the strata there
Extract a register.”

To the earth, man instinctively turns for the archives of the past—to the earth—the great keeper of the dead—the preserver of extinct forms and vanished dynasties. We rifle tombs; we drive pits into buried cities; we plunge into railway cuttings; and so lay bare, and extract, the life of other days, as it is made manifest in its domestic implements, its handiworks, and ornaments, its modes of sepulture, and scrolls of epitaph. For many a year we have been burrowing thus: so that, since the day when, in 1711, *Herculaneum* gave up to view her first secrets, subterranean research has become an art that is already advancing to a respectable maturity. But the immense stride forward that it has made in our day, is owing to the multitude of objects and observations that have been so discovered and accumulated as to admit of chronology being founded, not on conjectural eras, but on the objects themselves, which, wheresoever found, illustrate and determine those eras. The old natural geology loosely judged of periods by the mere substances in which certain fossils were found. It babbled of the green-sand fossils, the fossils of the coal, the fossils of the chalk, etc. But this method of classification was found to be misleading and imperfect. “It is well known,” as Sir R. I. Murchison in his *Siluria* observes, “that a mass of sediment which in one tract is calcareous, often becomes sandy and argillaceous in another; and thus, in such cases, very close examination of the fossils can alone decide the exact line of demarcation.” To this I add, from my own observation, that, in Switzerland, where there is no chalk, the peculiar fossils belonging to the cretaceous period are found in clay. Safely and rightly, then, each period of ascending organization is decided by

the fossil which is unalterable, and not by the local matter around it, which is susceptible of very great and surprising transformation. So it is with human geology. Recent works on ancient pottery take the line of judging of the age of a vase by form and manner of embellishment, not by the locality in which the vase is found. The Etrurian tomb, in which certain urns are discovered, does not prove that the urns are Etrurian; the forms of them, and the pigments, and the figures on them, may determine that they are of Greek, or haply of Egyptian origin, and that they have come from afar.

The same analytical argument that has been found satisfactory in respect to earth-buried objects, is now being applied to certain relics of antiquity discovered in water. The discovery has taken place in some of the lakes of Switzerland; and it is found that these relics are indubitably of a period far anterior to the Roman conquest. Traces of lake dwellings, even of lake villages, have been discovered; that is, of cabins that have rested on piles, advancing, Dutch fashion, far into the water. The most remarkable of these discoveries was made in 1856, in the Lake of Moosseedorf, six miles from Berne. This lake, having been partially drained for agricultural purposes, gave to view the broken remains of stakes projecting a little above the mud that formed the bed of the lake. A further search revealed that many more stakes were hidden; being covered by a kind of under-water peat, in which have been found upwards of a thousand articles of a simple, and evidently very remote manufacture.

Taking for granted that a nation in its infancy uses, for its immediate purposes, only the substances which it finds ready to its hand, we cannot but assign to articles composed merely of stone, wood, or clay, a high antiquity. Reversing old fables, we discover that the golden age was not the age of gold, but of wood and stone. Of course, these primitive substances, worked by human hands, have the priority over articles wrought from metal. We find that the articles from the Lake of Moosseedorf bear the stamp of primitive antiquity. They consist of fragments of rude pottery, made by the hand, evidently without a turning-wheel, domestic implements in stone and stag's-horn, without any trace of metal. The stone—a kind of serpentine, extremely hard—is fashioned into hatchets bearing the form of a wedge, and into instruments resembling chisels, hammers and knives. Not one of the hatchets has been pierced—as in our day—so as to admit of a handle being inserted into it; on the contrary, the stone hatchet-head itself has been inserted into a handle, generally of stag's-horn, in some few cases of wood.

Passing some time at Lausanne, I was made aware of these discoveries in, and near to, the

* This article has been in type several weeks, waiting space for insertion.

Lake of Moosseedorf; and obtained a note of introduction to Professor Troyon, head of the Museum at Lausanne, who had transferred from the natural Museum of the Peat-moss, a quantity of the sub-lacustrine articles to a well-ordered museum of his own.

The professor, a most intelligent gentleman, with a benevolent countenance, began his lecture, (for such, unaffected as it was, his discourse might be called), by opening a cupboard and displaying a variety of human skulls. These were all the skulls of Helvetians, or of Celts prior to Helvetians, or of some unnamed people older than the Celts. These, like many other articles in this private Museum, had been chiefly discovered or dug up from ancient tumuli by the professor himself. He made me observe how small were the earliest skulls—unintellectual, but not cruel like some of later savage nations, in which the great proportion of brain lay behind the ear; and so led me on to the higher developments of the skulls of the civilized, that occupied the upper shelves of the closet. We next proceeded to survey the contents of the first glass case, which were supposed to be coeval with the small-skulled generation. These were the horn and stone industrial implements, that had recently been discovered in the Moosseedorf and other lakes in Switzerland; yet, even here, I should say that the ingenuity displayed in the structure of these peculiar instruments betokened a people already somewhat advanced out of the first state of barbarism. The odd thing that strikes an observer first, is the small, toylike character of every thing. Hatchet, indeed! One of these Lake-people hatchets lies on the quarter-sheet of foolscap on which I am writing, with room to spare. It is a pretty baby-hatchet, a piece of serpentine, not two inches long) very well-sharpened, however,) inserted with wonderful firmness into a detached portion of stag's-horn. I asked the professor, "Could any one have ever cut down a tree with that small thing?" The professor replied that by marks found on the old buried timber, it appeared probable that the ancient Lakers charred and nearly burnt through the trunks of the trees before they felled them with their miniature stone-hatchets. My attention was next turned to a dandy poniard, entirely of stag's-horn. A sharp-pointed and polished piece of horn, about four inches long, is inserted into an unpolished piece of antler, somewhat longer. The professor suggested that the handle of this poniard was worn almost smooth by use. I said, "Could the owner have killed so many men as that implies?" "No!" returned the professor, with a smile; "but the dagger may have served many uses—as a defence from wild beasts, to kill animals in the chase, and, perhaps, now and then, to despatch an enemy." Next, I admired a variety of small instruments that would have gone into a lady's

étui—needles of bone, not perforated, and even a bodkin, properly perforated, a specimen almost unique: small chisels of beautifully polished serpentine, some of which looked quite gemlike in their green half-transparent lustre. These were supposed to be for cutting leather for moc-casins or other garments. Then I noticed teeth of the red deer fastened into handles of rough horn. These, it is supposed, were used for polishing down the protuberant seams of barbarian dresses.

Very curious, indeed, were certain minute saws, not more than three inches long, like reductions of Queen Elizabeth's pocket-comb, with the teeth broken off. These flint saws, and one or two scooplike articles that looked as if meant to scrape off the hair from deer-hides, also of flint, give rise, as Professor Troyon observed, to curious speculations. Flint of any kind is very rare in Switzerland, and flint of the particular kind from which the ancient Lakers had wrought their saws and knives, is not found in Switzerland.

The induction is, that the Lake-people were already sufficiently advanced in civilization to have made the first step towards commerce by import, or barter. The especial silex of the Lakers might have come from some neighboring portion of Gaul; but, in truth, it resembled more the kind of flint that is found on our own British coasts. To have fashioned a flint knife, such as was shown me, four inches long, the improving savages of the Lacustrine period must have had a very large flint-stone, such as Great Britain peculiarly produces. Waiving a too precise settlement of this curious question, we, at least, are sure that the flint found at Moosseedorf was not a native production of Switzerland. There were also small arrow-heads prettily and neatly wrought from a fine kind of silex.

Under a glass and framed like a picture, I observed something that looked like coarse, dark netting, the reticulations of which were jointed by rude knots. This, the professor told me, was a specimen of the supposed garments of the ancient people; of which the material was flax, and the mode of putting together, knitting, or rather knotting: the art of weaving not yet being practised by the Lakers. Some of the mysterious-looking needles in horn might have served for the manufacture of this primitive sort of shirting.

(To be concluded.)

An exchange gives the following as the origin of the use of the thistle as the national emblem of Scotland: When the Danes from England invaded Scotland, they availed themselves of the pitch darkness of night to attack the Scottish forces unawares. In approaching the Scottish camp unobserved, and marching barefooted to prevent their tramp being heard, one of the Danes trod

upon a large prickly thistle, and the sharp cry of pain which he instinctively uttered suddenly apprised the Scots of their danger, who immediately ran to their arms and defeated the foe with great slaughter. The thistle was thenceforward adopted as the national insignia of Scotland.

LINES,

Written on Reading several Pamphlets published by Clergymen against the Abolition of the Gallows.

BY JOHN G. WHITTIER.

The suns of eighteen centuries have shone
Since the Redeemer walked with man, and made
The fisher's boat, the cavern's floor of stone,
And mountain moss, a pillow for his head;
And He, who wandered with the peasant Jew,
And broke with publicans the bread of shame,
And drank, with blessing in His Father's name,
The water which Samaria's outcast drew,
Hath now His temples upon every shore,
Altar and shrine and priest,—and incense dim
Evermore rising, with low prayer and hymn,
From lips which press the temple's marble floor,
Or kiss the gilded sign of the dread Cross He bore!

Yet as of old, when meekly "doing good,"
He fed a blind and selfish multitude,
And even the poor companions of His lot
With their dim earthly vision knew Him not,
How ill are His high teachings understood!
Where He hath spoken Liberty, the priest
At His own altar binds the chain anew;
Where He hath bidden to Life's equal feast,
The starving many wait upon the few;
Where He hath spoken Peace, His name hath been
The loudest war-cry of contending men;
Priests, pale with vigils, in His name have blessed
The unsheathed sword, and laid the spear in rest,
Wet the war-banner with their sacred wine,
And crossed its blazen with the holy sign;
Yea, in His name who bade the erring live,
And daily taught His lesson—to forgive!—
Twisted the cord and edged the murderous steel;
And, with His words of mercy on their lips,
Hung gloating o'er the pincer's burning grips,
And the grim horror of the straining wheel;
Fed the slow flame which gnawed the victim's limb,
Who saw before his searing eye-ball swim
The image of their Christ, in cruel zeal,
Through the black torment-smoke, held mockingly to him!

The blood which mingled with the desert sand,
And beaded with its red and ghastly dew
The vines and olives of the Holy Land—
The shrieking curses of the hunted Jew—
The white sown bones of heretics where'er
They sank beneath the Crusade's holy spear—
Goa's dark dungeons—Malta's sea-washed cell,
Where with the hymns the ghostly fathers sung
Mingled the groans by subtle torture wrung,
Heaven's anthem blending with the shriek of Hell!—
The midnight of Bartholomew—the stake
Of Smithfield, and that thrice accursed flame
Which Calvin kindled by Geneva's lake—
New England's scaffold, and the priestly sneer
Which mocked its victims in that hour of fear,
When guilt itself a human tear might claim—
Bear witness, O Thou wronged and merciful One!
That Earth's most hateful crimes have in thy name
been done!

Thank God! that I have lived to see the time
When the great truth begins at last to find
An utterance from the deep heart of mankind,
Earnest and clear, that ALL REVENGE IS CRIME!
That Man is holier than a creed,—that all
Restraint upon him must consult his good,
Hope's sunshine linger on his prison wall,
And Love look in upon his solitude.
The beautiful lesson which our Saviour taught
Through long, dark centuries, its way has wrought
Into the common mind and popular thought;
And words, to which by Galilee's lake shore
The humble fishers listened with hushed oar,
Have found an echo in the general heart,
And of the public faith become a living part.
Who shall arrest this tendency?—Bring back
The cells of Venice and the bigot's rack?
Harden the softening human heart again,
To cold indifference to a brother's pain?
Ye most unhappy men!—who, turn'd away
From the mild sunshine of the Gospel day,
Grope in the shadows of Man's twilight time,
What mean ye, that with ghowl-like zest ye brood
O'er those foul altars streaming with warm blood,
Permitted in another age and clime?
Why cite that law with which the bigot Jew
Rebuked the Pagan's mercy, when he knew
No evil in the Just One?—Wherefore turn
To the dark cruel past?—Can we not learn
From the pure Teacher's life, how mildly free
Is the great Gospel of Humanity?
The Flamen's knife is bloodless, and no more
Mexico's altars soak with human gore,
No more the ghastly sacrifices smoke
Through the green arches of the Druid's oak;
And ye of milder faith, with your high claim
Of prophet-utterance in the Holiest name,
Will ye become the Druids of our time?
And, consecrators of Law's darkest crime,
Urge to its loathsome work the Hangman's hand,
Beware—lest human nature, roused at last,
From its peeled shoulder your incumbrance cast,
And, sick to loathing of your cry for blood,
Rank ye with those who led their victims round
The Celt's red altar and the Indian's mound,
Abhorred of Earth and Heaven—a pagan brother-
hood!

ADDRESS ON THE GRASSES.

BY J. STANTON GOULD.

(Continued from page 775.)

Timothy, (Phelum Pratense)—Grows well on a variety of soils, and is deservedly a universal favorite, although I am very sure it has been cultivated too exclusively for profit. Of the twenty-one varieties analysed by M. Way, this is decidedly the most valuable. One hundred pounds of the grass make 42½ pounds of dry hay; they also contain 4.9-10th pounds of muscle making matter, 1½ pounds of fat making matter, and 22.9-10th pounds of respiration supporting matter. From its superior qualities I have used it as a standard with which to compare the other varieties. The only objection to it is that it yields very little aftermath. It is very superior as a butter-making grass, ranking in this respect with blue grass, red top and white clover.

Annual Spear Grass, (Poa Annua.)—This is one of the most commonly diffused grasses of

our country. It is by no means confined to calcareous soils, but is often found in clay meadows where no other grass except the crested dog's tail will grow. It flowers early in June, and is an early as well as a sweet feed. It will grow very well all through the summer, if the rains are frequent, but if it is very dry, it parches up and withers. Two hundred and five pounds of it will make as much dry hay as one hundred pounds of timothy, and is as well worth two dollars and thirty-nine cents per ton as timothy is worth five dollars. Besides these, the following grasses flourish well on calcareous soils. *Sweet Scented Vernal Grass*, (*Anthoxanthum odoratum*,). *Upright Broom Grass*, (*Bromus Erectus*,) and the white and red clovers. The latter, especially, are more at home in these soils than any others.

A very large number of grasses seem adapted for our most *Tenaceous Clays*, among which we may enumerate—

Perennial Rye Grass, (*Lolium Perenne*)—Which enjoys as wide a popularity in England as timothy does in this country. It comes into flower during the latter part of June. It flourishes on a great variety of soils, but does not stand drouth well. It turfs better than the Italian variety; it is one of the earliest grasses known. It makes a good hay if cut when in flower, but if cut after this period it is no better than straw—its nutritive matters being transformed into indigestible woody fibre. One hundred and sixty eight pounds of it make as much dry hay as one hundred pounds of timothy, and is worth three dollars per ton when timothy is worth five dollars.

Crested Dog's Tail, (*Cynosurus Cristatus*)—Is not much relished by animals, on account of its hard, wiry stems. It is used in the manufacture of straw plait. Flowers in July, and is chiefly mentioned here because it will grow on poorer land than any other known grass. One hundred and nineteen pounds of it make as much dry hay as one hundred pounds of timothy, and is worth \$4.20 when timothy is worth \$5.00. It must be recollected that this comparison of values is deduced from Mr. Way's tables, but I am persuaded it would prove delusive in practice, in consequence of its hard, wiry character and unpleasant taste, which makes it almost useless to the feeder.

Red Top, (*Agrostes Vulgaris*)—Is one of our most valuable grasses, especially for feeding working oxen. Flowering in July, it loves moist places, and varies in its character with the soil it grows on very remarkably. On moist, rich soils it grows large, and its flowers are of a deeper purple. On light soils it seldom exceeds one foot in height, and is then popularly known as fine top. We have no analysis of this grass, and are therefore unable to compare it accurately with others, but it is well known in practice

to be very nutritive, and to be well relished by cattle.

Wire Grass, (*Poa Compressa*.)—We have no analysis of this grass, neither is it known by the majority of American farmers. Flowering in August, it is heavier in proportion to its bulk than any other grass. It is exceedingly nutritive. Working horses can be kept as well on this grass alone, as they can on timothy and oats together. It can be cut profitably until August, and yields no aftermath. It is exceedingly hardy, and is well suited to clay lands, especially those which are mixed with coarse gravel. We think its more general diffusion would be very advantageous to the interests of the farmer. Its seeds cannot be obtained at the seed stores, but can be readily saved in localities where it grows indigenously.

Oat Grass, (*Avena Elatior*)—Thrives admirably on clays; flowers in June, and is sometimes four and a half feet high at the time of flowering. It is very early, and although chiefly used as a pasture grass, it makes good hay. We possess no analysis.

Fearing to weary you with further special descriptions of other species of grass, I close this branch of my subject by recommending the following mixtures for a beginning in the path of improved grass husbandry. As you gain in experience, you will increase the varieties and graduate them more closely to different modifications of soils.

For light, sandy land and mowing in June—Orchard grass, red clover, annual spear grass, meadow fox tail.

For clayey or calcareous loams and mowing in July—Timothy, red top, crested dog's tail, tall tescue, hard fescue, Italian rye grass, and oat grass.

For clayey lands and mowing in August—Wire grass, (*Poa Compressa*,) and fowl meadow, (*Poa Serotina*.)

Having now selected the mixtures of seeds for our different soils, the question that presents itself is, how shall we best insure their germination and growth? That is a very serious and important question, as I have no doubt you can all feelingly bear witness. Many of you, unless you have been much more fortunate than your brethren of other countries, have been obliged to seed your meadows over three or four times before the seeds would take, and even then, you have been obliged to wait several years before the sod becomes thick and the meadow profitable.

To avoid this difficulty, you must bring your soil as nearly as possible into the condition in which you find that of our richest and best meadows. On examining these, you will invariably find that the roots of the grass are surrounded by a fine, dark mould, the fertility of the meadow being always proportioned to the fineness, depth, and darkness of the mould.

It is supposed by many intelligent farmers, that this mould is produced by the gradual decay of the roots, stems, and leaves of the plants. This, no doubt, contributes in some degree to its formation, but its agency, is however, very trivial. Were the plants growing on the ground suffered to decay on it for a century, they would not form a coating of an inch in thickness, while we sometimes find an inch of mould accumulated in four or five years. The theory of decay fails, therefore, to explain the facts.

You have often seen a smoothly-raked garden bed covered over in the morning with little hillocks of earth. The common earth worm swallows the earth through which it moves, and after extracting whatever of nutriment is contained in it, throws out the remainder, mixed with the mucus of its digestive organs on the surface of the ground. This is the origin of the little mounds upon our garden beds. Prof. Johnson tells us that a bowling green, forty-five yards by thirty-two yards, was watered with a solution of corrosive sublimate, after which four hundred and thirty-four pounds of dead worms were taken from it. This is at the rate of one thousand four hundred and sixty-six pounds of worms to the acre. With this illustration of the immense numbers of worms at work, and remembering that they are casting up these mounds in the meadows every night during the summer, you will see that we have here an adequate cause for the production of all the mould we find in them, and we have no doubt that this is the true cause of its presence. Worms are not only useful in forming mould, but the galleries which they form in their ceaseless journeys through the soil and subsoil, admit the air, and thus set on foot that train of chemical transformations which are essential to the growth of the grass, and which without their assistance could never be effected.

From all this it is plain that if we would succeed in our sowing, we must artificially prepare a seed bed as nearly resembling this worm mould as possible, and we must encourage the continued travelling of the worms through the soil. To accomplish this, the ground must be carefully plowed as nearly as possible to the time at which the seed to be sown ripens. When the ground is somewhat dried, it should be gone over three or four times with a cultivator, with intervals of three or four days to allow the weeds in the soil to start up. The ground should then be harrowed with a fine-toothed harrow, until it is thoroughly pulverized. When it is very tenacious, it should be rolled between each harrowing in order to break down the lumps. When the surface has been reduced to a fine powder, it may be suffered to lie until the appearance of the sky pretty clearly indicates rain; then the mixture of seeds should be evenly sown and covered with a bush harrow, (not a toothed harrow.) It will

be said that the preparation of the soil is troublesome and expensive. So it is, but you cannot make seeds take well on stiff soils without it. I have been told by farmers that they have succeeded in making their new seeding look as green the first fall as an old meadow, with one-tenth of the labor that I have prescribed. So they have, but when I have examined the greenness I have found three-fourths of it to consist of worthless weeds. The problem is not how to make the newly seeded land speedily green, but how to fill it speedily with *useful* grass.

Before the seeds have germinated, the ground should be covered with a thin coating of rotten manure, when, in a short time, the young grass will make its appearance. Before the frost sets in, the ground should be covered with straw, which will prevent the radiation of heat from the earth, and will protect that tearing of the rootlets from the roots which ensues from the alternate freezing and thawing of the ground, and which is well known to be exceedingly destructive to our best grasses. Such being the effect of the straw covering, it will be found to repay with usurious interest the cost and trouble of the laying on.

There is another cause for the failure of grass seeds to germinate, which is not generally understood, and to which I ought to call your attention, and this is the burying of the seeds too deeply in the earth. Carefully repeated experiments, made with every precaution against error, show that grass seeds should not be covered with more than an eighth of an inch of earth. A much smaller proportion of the seeds germinate at one-fourth of an inch deep, and they are nearly all destroyed at the depth of one inch. These facts show the impropriety of harrowing in grass seeds in the usual manner, since most of the seeds will in this way be buried beyond the possibility of germination.

Another cause of the failure of grass seeds is the damaged condition in which they are received from the seedsman.* To guard against such imposition, they should be thoroughly tested before purchasing, in the following manner: Take two or three thicknesses of cloth, wet them, but not enough to make them drip when held edge-wise, place them in a saucer and strew the seeds over them, cover them with the same thickness of cloth similarly wetted, and keep them moist and in a warm place. The upper cloth may be raised each day to observe the appearance of the seeds. The good seeds will be found to retain their color, and gradually swell, while the poor seeds will be found to change their color, grow mouldy and gradually decay.†

(To be continued.)

* Prof. Buckman found 7,600 weed seeds in a pint of clover, 12,600 weed seeds in a pint of broad clover. In cow grass 39,440.

† Mr. Flint's method.

THE PHILOSOPHY OF RAIN.

To understand the philosophy of this beautiful and often sublime phenomenon, so often witnessed since the creation of the world, and essential to the very existence of plants and animals, a few facts derived from observation and a long train of experiments must be remembered. 1. Were the atmosphere everywhere, at all times, at an uniform temperature, we should never have rain, or hail, or snow. The water absorbed by it in evaporation from the sea and the earth's surface would descend in an imperceptible vapor, or cease to be absorbed by the air when it was once fully saturated. 2. The absorbing power of the atmosphere, and consequently its capability to retain humidity, is proportionably greater in warm than in cold air. 3. The air near the surface of the earth is warmer than it is in the region of the clouds. The higher we ascend from the earth, the colder do we find the atmosphere. Hence the perpetual snow on very high mountains in the hottest climate. Now, when from continued evaporation the air is highly saturated with vapor—though it be invisible and the sky cloudless—if its temperature is suddenly reduced by cold currents descending from above, or rushing from a higher to a lower latitude, its capacity to retain moisture is diminished, clouds are formed, and the result is rain. Air condenses as it cools, and, like a sponge filled with water and compressed, pours out the water which its diminished capacity cannot hold. How singular, yet how simple, the philosophy of rain? What but Omniscience could have devised such an admirable arrangement for watering the earth?—*Scientific Journal*.

ENERGY.

It is astonishing how much may be accomplished in self-culture by the energetic and the persevering, who are careful to avail themselves of opportunities, and use up the fragments of spare time which the idle permit to run to waste. Thus Ferguson learned astronomy from the heavens while wrapped in a sheepskin on the highland hills. Thus Stone learned mathematics while working as a journeyman gardener; thus Drew studied the highest philosophy in the intervals of cobbling shoes; thus Miller taught himself geology while working as a day-laborer in a quarry. By bringing their mind to bear upon knowledge in its various aspects, and carefully using up the very odds and ends of their time, men such as these, in the very humblest circumstances, reached the highest culture, and acquired honorable distinction among their fellow-men. It was one of the characteristic expressions of Chatterton, that God had sent his creatures into the world with arms long enough to reach anything, if they choose to be at the trouble.

ITEMS OF NEWS.

EUROPEAN NEWS.—By the steamer Arabia, which arrived at New York at 7.30 A. M., on the 18th instant, and the Borussia, which arrived here at 8 P. M. the same day, we have foreign intelligence to the 4th inst. The proceedings in Parliament were not of striking importance. In France, the annexation of Savoy and the Emperor's Commercial Treaty continued to attract much public attention. It is now stated as appearing certain that the annexation of Central Italy to Sardinia will be left to popular suffrage, and that there will be "No foreign intervention, but Italy for Italians." This, it is said, is the policy of France and England. A collision had taken place at Ancona between the Papal chas-seurs and artillerymen on the one side, and the Swiss and gendarmes on the other. The Mazzini party is said to be active at Rome, and measures have been taken to prevent any manifestation. The discontent in Hungary was on the increase, and it was reported that Kossuth had disappeared from London, giving rise to the impression that he had gone to Hungary with revolutionary designs.—*N. Y. Tribune*.

RAILWAY ACROSS THE ANDES.—At the last meeting of the Geographical Society of London, held on the 23d ult., an unusually large number of members attended, to hear a paper read upon the practicability of making a railway across the Andes. It appears that the South American States are so fully alive to the advantages they will derive from the execution of this project that the Argentine Republic has offered a free grant of land, five miles in breadth, on each side of the railway.

ANTIQUARIAN RESEARCHES.—Antiquarian discoveries of the highest interest have lately been made in the Great Desert beyond the River Jordan, by an English gentleman, C. C. Graham, Esq., who read a paper on the subject to the Royal Asiatic Society, in 1st month last. Far to the east of the district of the Hauran, and in a region unvisited by any European traveller, he found five ancient towns all as perfect as if the inhabitants had just left them—the houses retaining the massive stone doors which are a characteristic of the architecture of that region. One of the cities is remarkable for a large building like a castle, built of white stone, beautifully cut. Further eastward, other places were found where "every stone was covered with inscriptions" in an unknown character, bearing some apparent likeness to the Greek alphabet, but probably referable (in the opinion of C. C. Graham), to the ancient Hamyaritic alphabet, formerly in use in Southern Arabia. Copies and impressions of several inscriptions are presented, and will, no doubt, engage the attention of Orientalists.

OUR INTERCOURSE WITH CHINA.—The new treaty with China was to become operative on and after the 24th of 11th mo. last. Mr. Ward, in announcing the fact, also states that two new ports—Swatow, in the province of Fuhkin, and Faiwan, in the island of Formosa—would afford an entry to American trade on the 1st day of 1st mo., 1860. The other ports now open for our commerce are Canton, Amoy, Fuchau, Ningpo and Shanghai. These are to be added as the necessities of trade shall demand, or as the treaties with other powers shall give an equal right. The privilege of residence at, or journeys to and from, any of these places is guaranteed to American merchants and their families, as well as transient traders. The treaty of Wanghia—that of 1844—is understood to be yet in force, relative to the tariff of duties on articles of export or import, unless future treaties with other powers shall reduce the rates, it being expressly understood that our citizens shall never be called upon for

a higher duty than is paid by the most favored nation.

LONG RAILROADS.—The longest railway line in England is the London and Northwestern, 910 miles; the Northeastern is 746. Eight railroads have their termination in London, and their gross receipts are close upon a million dollars per week. The total railway receipts in Great Britain are two and a half million per week. The total investments in these roads is about \$1,953,413,757.

SALT.—A vein of brine, which yields ninety per cent. of salt, has been discovered in Saginaw, Mich. The brine flows with a very strong current, and it is supposed that a very large supply of saline will be yielded.

SCHOOLS IN FRANCE.—It is stated that the whole of France, a nation of thirty-six millions of inhabitants, only appropriates as much money to common schools as does the city of New York alone—something like six millions of francs.

POPULOUS.—The little Island of Barbadoes, it may not be generally known, is the most densely populated country in the world; with an area of one hundred and sixty-six square miles, it contains 125,864 inhabitants.

Too MUCH STUDY.—The subject of overtaking children in school has been considerably discussed in Salem, Mass. As a consequence, the committee of the classical and high schools have reduced the number of daily recitations from four to three. Thus far, the change has worked beneficially to the school.

FREE NEGROES IN TENNESSEE.—A bill has been introduced in the Tennessee Legislature to prevent free negroes travelling on the railroads in that State. The bill provides that the President who shall permit a free negro to travel on any road within the jurisdiction of the State under his supervision, shall pay a fine of \$500; any conductor permitting a violation of the act shall pay a fine of \$250; provided such free negro is not under control and care of a free white citizen of Tennessee, who vouches for the character of said free negro in a penal bond of \$1000.

FREE NEGROES IN KENTUCKY.—The Lexington *Observer* says that a movement for the expulsion of free negroes has been made in the Kentucky Legislature, but the Judiciary Committee of the Senate have reported that any attempt to carry into execution a plan for the removal of the negroes, who were free at the adoption of the present Constitution (there is a provision in that instrument providing for the removal from the State of all who may hereafter become free), would be an interference with vested rights, and clearly unconstitutional.

IMPORTATIONS OF AFRICAN "APPRENTICES."—The Havana correspondent of the New Orleans Delta writes: I learn that it has been arranged to import into Cuba, in the least time practicable, from 25,000 to 75,000 free Africans, under contracts for twelve years' service. If this business is once commenced by introduction under contracts which, it is said, have been authorized by competent authority, it will be continued as long as sugar cane is one of the staples of Cuba.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The market for breadstuffs is quite firm. Sales of superfine at 5 75, and extra at \$6 12. There is a steady home demand from the above quotation up to \$6 50 for common and extra brands, and \$6 62 up to \$7 25 for extra family and fancy lots.

Rye Flour and Corn Meal are dull, the former is offered at \$4 12, and the latter at \$3 62.

GRAIN.—There is not much Wheat coming forward, and the demand is active. We quote good and prime Penna. red at 135 a 136 cents in store, and white at 145 a 150 cents. Rye—sales of Pennsylvania at 93c. Corn is dull. Sales of yellow at 76c. Oats are dull; Pennsylvania sold at 44½ cts., and 43c. for Delaware. Sales of Barley Malt at 90 a 95 cents., and choice Barley at from 80 to 85 cents.

CLOVERSEED is in limited demand. Small sales of fair and prime at 4 50 a 5. Timothy is worth \$3 25, and Flaxseed at 1 58 a 1 60 per bushel.

ANNE CHURCHMAN'S BOARDING AND DAY SCHOOL, No. 908 Franklin street above Poplar. 1st mo., 28, 8t.

THE FALLSINGTON BOARDING SCHOOL affords superior advantages to young ladies who desire, by a thorough course of study, to prepare themselves for the active duties of life.

The number of scholars is limited to twelve, and all are under the immediate care of the Principals.

For circulars address

BEULAH S. & ESTHER LOWER,
Fallsington, Bucks county, Pa.,
or, WILLIAM S. LOWER, 455 N. Seventh St., Pa.
2 mo. 11, 1860. 3 m.

BYBERRY BOARDING SCHOOL FOR GIRLS. The Spring Session of this School, taught by Jane Hillborn and Sisters, will commence the 20th of 2d mo., 1860, and continue twenty weeks. The course of instruction embraces all the branches of a liberal English education.

Terms \$60 per Session, one-half payable in advance. For Circulars containing further particulars, address

JANE HILLBORN,
Byberry P. O., Penn.

1st mo. 28, 1860.—2 mo.

EATON ACADEMY, KENNETT SQUARE, CHESTER COUNTY, PA. The Winter Term of the above Institution will expire on the 15th of the 3d mo. next, but, in order to meet the desire of many of the Pupils, and friends and patrons of this Institute, the undersigned have concluded to re-open the School for both sexes, on 2d day the 19th following, and continue it a period of ten weeks, or half a Session, at the present rates, which are \$65 per Term for Tuition, Boarding, &c., and \$16 for Tuition only, one-half payable in advance.

Catalogues, containing further particulars, will be sent to those desiring the same. Apply to

WILLIAM CHANDLER,
Principal and Proprietor,
Or to WILLIAM A. CHANDLER,
Principal Instructor.

1st mo. 28, 1860.

LAKE SCHOOL FOR BOTH SEXES. The 2d semi-term of 20 weeks is to begin 20th of 2d month. The charge, in full, for board and tuition, per term of 20 weeks, is \$45, or at the rate per week of \$2¼.

Circulars with references sent by applying to either subscriber

ELMINA AVERILL,
West Vienna, Oneida Co., N. Y.,
Proprietors.

1st mo. 8, 1860.

FRIENDS' INTELLIGENCER.

VOL. XVI.

PHILADELPHIA, THIRD MONTH 3, 1860.

No. 51.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

From Janney's History of Friends.

WILLIAM BAYLY.

William Bayly was born in the borough of Southampton; but the date of his birth is not stated. In a paper of his, entitled, "A short relation or testimony of the working of the light of Christ," he informs us, that while he was yet a child, his soul thirsted for the water of life, and at ten years of age he was drawn to seek for retirement, in order to wait upon God; but when he was about fifteen years old, not heeding the true guide, he entered the army in time of war, and served nearly two years as a soldier.

Through the example of wicked companions, and the corrupting influence of a military life, his heart became hardened, until he even "took delight in swearing and drunkenness." Yet oft-times when he had withdrawn from his companions, he was brought into awful condemnation by the witness for God in his own soul, being seized with horror, and tormented with visions of death and perdition.

The army being disbanded, he was discharged, and, about the same time, he "was so smitten by God's witness, the light in his conscience," that he began to leave off his wicked practices, and profane company became burdensome to him. He now began to hunger for spiritual food, and in order to obtain it, he resorted to the priests, who, he supposed could, by their learning, open the mysteries of the heavenly kingdom. He found, however, that they fed him upon husks, being destitute of that true bread which comes down from heaven, and, while he was famishing, the cry of his soul was: "Give me food, or else I perish."

"In those days," he says, "my soul was awakened by the witness of God, feeling the burden of sin, and was often afraid of death and misery

without end; but knew not how to get out from under the power of sin and death, nor to escape the wrath to come, being ignorant of him that saveth from it, which is Christ, the power of God, that lighteth every man, that cometh into the world, which condemns sin in the flesh." Finding he could derive no help from the priests, he left them, and sought for retirement and quietude at home, which was a great cross to his wife and nearest relatives. But although he had from a sense of duty, withdrawn from attendance on the mercenary teachers of religion, he was induced by motives of expediency, and through the persuasion of others, to frequent their meetings again, for which he was brought into condemnation and deep distress by the Searcher of hearts.

Being in want of employment, he made two voyages to France, and became deeply interested in the study and practice of navigation, by which he was so much fascinated, that his attention was, for a time, withdrawn from the pursuit of spiritual good, "the spirit of the world came in upon him like a flood, and gross darkness covered his soul." Yet he was so far restrained by the witness for God,—the light in his conscience, that he durst not return to his former course of wickedness. Although he was preserved from gross immorality, yet the love of the world had a strong hold in his heart, and the love of righteousness had greatly declined.

While in this condition, he indulged many vain imaginations of honor and renown; but suddenly his mind was arrested by a divine visitation,—a cloud came over his prospects of worldly glory, and a season of calm reflection ensued, during which he saw that he wearied himself for things that would perish with the using, and that "like a fool he might leave them in the midst of his days." Being now like one awakened from sleep, and hungering for food, he began to look around for that which would satisfy the longings of his soul. He went among the Anabaptists, hoping to find rest and peace; for he often felt the love of God extended to him, and thence concluded that he was one of the elect, for he did not then know that there is "a seed in man to which the promises and the blessings belong, and the elect is before the foundation of the world." The promise of election was to Christ the true seed, and to all those who, through obedience, become united to him in the

covenant of life. William Bayly entered into communion with the Anabaptists, and received the rite of water baptism. He observes: "Before I was dipped in water they called me not brother, but suddenly after, they did; yet I was the same every way as before." He did not find the peace and joy he expected, and he longed for that spiritual food which alone can satisfy the soul.

Having heard a book read concerning the sufferings of the people called Quakers, his heart was touched with tenderness and pity towards them, and he was led to believe they suffered innocently for conscience sake.

Afterwards he heard one of their ministers, who preached the word of life, and he rejoiced in hearing it, being convinced that it was the very truth. He became satisfied that there is no other way to know God, but by walking in the light which comes from Christ the Saviour, and leads all who follow it out of the evil that is in the world. He who "was glorified with the Father before the world was," is the substance of all the types, figures, shadows, and ordinances—"He redeems man by his blood—the life—out of the earth, into which man was driven by transgression," and brings him again into union and communion with God.

As the mind of William Bayly was turned to the true light, many passages of Scripture were revived and opened to him, by which he was confirmed in the doctrines of Friends. A change was then begun in him, and "he was made to weep and lament, seeing all the religion in the world to be but a fading leaf, without the pure life and power of God, which alone can save from sin and bring into unity with him." While in this troubled condition, he was followed day and night by many Anabaptists, endeavoring to persuade him out of it; looking upon him as deluded, some resorted to prayers, some to flatteries, and others to railing words, telling him that he was fallen from grace, and was become under the law, making the blood of Christ of none effect. Their efforts were not without success, for he knew not then "the blood to be the life, and that the light is the life of men." Though he was convinced in his conscience, yet his understanding being darkened by listening to their counsels, he was drawn away from a reliance upon "the law written in the heart—the sure word of prophecy," to which he should have been faithful.

In order to obtain relief from trouble, he was persuaded to join again with them more zealously than before, and having become a minister, he "encouraged others to follow their strong imaginations from the letter of Scripture, looking for a Saviour without us, though the Scripture saith, "Christ in you the hope of glory," and "Know ye not that Christ is in you, except ye be reprobrates?"

He found, however, that all his efforts to obtain peace of mind by outward observances were in vain; he was brought under severe condemnation for his dereliction of duty, and finally he withdrew from fellowship with the Anabaptists, and joined in membership with Friends.

He was convinced by the ministry of George Fox, in the year 1655, being then a resident of Pool, a seaport in Dorsetshire. Believing it his duty to testify publicly to the spiritual truths he had embraced, he went to the parish house of worship for that purpose, but was hauled out with violence. He suffered imprisonment for conscience sake, at Southampton, in the year 1657, and at Hartford he was some years a prisoner, being committed in 1663. It does not appear at what date he settled in the city of London; but in the year 1662, while quietly standing in the street, near the Bull and Mouth meeting-house, he was taken by soldiers and carried before Richard Brown, alderman, who treated him with violence, and then committed him to Newgate prison. Again in 1670, being found preaching in Grace church street meeting, he was taken before the mayor and committed to prison. He was a patient sufferer for the cause of truth, and a powerful minister of the gospel.

JOHN GASPARD LAVATER AND THE POOR WIDOW.

It was a practice with Lavater to read every morning several chapters from the Bible, and select from them one particular passage for frequent and special meditation during the day. One morning, after reading the fifth and sixth chapters of the Gospel of Matthew, he exclaimed, "What a treasure of morality—how difficult to make a choice of any particular portion of it." After a few moments' consideration he threw himself upon his knees, and prayed for divine guidance.

When he joined his wife at dinner, she asked him what passage of Scripture he had chosen for the day. "Give to him that asketh thee, and from him that would borrow of thee turn not thou away," was the reply. "And how is this to be understood?" said the wife. "Give to him that asketh thee and to him that would borrow of thee turn not thou away," rejoined Lavater, "are the words of Him to whom belongs all and everything that I possess. I am the steward, not the proprietor. The proprietor desires me to give him who asks of me, and not refuse him who would borrow of me: or, in other words, if I have two coats, I must give one to him that has none, and if I have food, I must share with him that is an hungered and in want. This I must do without being asked; how much more, then, when asked?"

"This," continues Lavater in his diary, "appeared to me so evidently and incontrovertibly

the meaning of the verses in question, that I spoke with more than usual warmth; my wife made no further reply than that she would take these matters to heart.

I had scarcely left my dining room a few moments before an aged widow desired to speak with me, and she was shown into my study. "Forgive me, dear sir," she said, "excuse the liberty I am about to take. I am truly ashamed, but my rent is due to-morrow, and I am short of six dollars. I have been confined to bed by sickness, and my poor child is nearly starving: every penny that I could save I had laid aside to meet this demand, but six dollars are yet wanting, and to-morrow is term day."

Here she opened a parcel which she held in her hand, and said: "This is a book with a silver clasp, which my late husband gave me the day we were married. It is all I can spare of the few articles I possess, and sore it is to part with it. I am aware it is not enough, nor do I see how I can repay, but, dear sir, if you can, do assist me.

"I am very sorry, my good woman, that I cannot help you," said I; and putting my hand into my pocket, I accidentally felt my purse, which contained about two dollars; these, I said, cannot extricate her from the difficulty, for she requires six; besides, if even they could, I have need of this money for some other purposes. Turning to the widow, I said, "have you no friends, no relatives, who could give you this trifle?" "No, not a soul. I am ashamed to go from house to house, I would rather work day and night. My excuse for being here is that people speak much of your goodness. If, however, you cannot assist me, you will at least forgive me the intrusion; and God, who has never yet forsaken me, will not turn me away in my sixty-sixth year!"

At this moment the door of my apartment opened and my wife entered. I was ashamed and vexed, gladly would I have sent her off, for conscience whispered, "Give to him that asketh of thee, and from him that would borrow of thee turn thou not away." She came up to me and said with much sweetness, "This is a good woman, she has certainly been ill of late; assist her if you can." Shame and compassion struggled in my darkened soul. "I have two dollars," I said in a whisper, "and she requires six. I'll give her a trifle in hand and let her go." Laying her hand on my arm and smiling in my face, my wife said aloud what conscience had whispered before, "Give to him that asketh of thee, and from him that would borrow of thee, turn not thou away." I blushed and replied with some little vexation—"Would you give your ring for that purpose?" "With pleasure," answered my wife, pulling off her ring. The good widow was either too simple or too modest to notice what was going on, and was preparing to

retire, when my wife requested her to wait in the lobby. When we were alone, I asked my wife, "Are you in earnest about the ring?" "Certainly, can you doubt it?" said she; "do you think I would trifle with charity? Remember what you said to me a year ago. O, my dear friend, let us not make a show of the gospel. You are in general so kind, so sympathizing, how is it that you now find it so difficult to assist this poor woman? Why did you not without hesitation, give her what you had in your pocket? And did you not know that there were six dollars in your desk, and that the quarter will be paid to us in less than eight days?"

She then added with much feeling, "Take no thought for your life, what ye shall eat or what ye shall drink, nor yet for your body what ye shall put on. Behold the fowls of the air; they sow not, neither do they reap or gather into barns, yet your heavenly Father feedeth them." I kissed my wife, while tears ran down my cheeks.

"Thanks, a thousand thanks for this humiliation!"

I turned to the desk, took from it the six dollars, and opened the door to call the poor widow. At first she seemed not to understand what I meant, and thought I was offering her a small contribution, for which she thanked me and pressed my hand. Perceiving that I had given her the whole sum, she scarcely could find words to express her feeling.

She cried, "Dear sir, I cannot reply; all I possess is this poor book, and it is old."

"Keep your book," I said, "and the money too, and thank God, and not me; for verily I deserve no thanks, after having so long resisted you entreaties. Go in peace, and forgive an erring brother."

I returned to my wife with downcast looks, but she smiled and said, "Do not take it so much to heart, my friend, you yielded at my suggestion; but promise me so long as I wear a golden ring on my finger, and you know that I possess several besides, you will never allow yourself to say to any poor person, I cannot help you." She kissed me and left the apartment.

When I found myself alone I sat down and wrote this account in my diary, in order to humble my deceitful heart; this heart which no longer than yesterday dictated the words, "Of all characters in the world, there is none I more anxiously desire to avoid than a hypocrite;" yet to preach the whole moral law and fulfil only part of it is hypocrisy. I read over once more the chapter I had read in the morning with so little benefit, and felt more and more ashamed and convinced that there was no peace except where precept and practice are in accordance.

How peacefully and happily I might have ended this day, had I acted up conscientiously to the blessed doctrine I preach.

For Friends' Intelligencer.

THE BEAUTIES OF FROST.

Every season has its peculiar beauty. Spring, with its profusion of leaves and flowers, is redolent of fragrance and bloom, giving promise of future luxury and plenty. Summer, with its golden harvests and ripening fruits; its shaded walks and cool arbors inviting to repose. Autumn, with its rich vintage and luxurious fruits and ripened grain, and the unparalleled gorgeousness of its forests, are all well calculated to inspire the feeling mind with hope, and joy, and thankfulness. But winter, stern though it be, has beauties peculiarly its own, and totally unlike the other seasons.

In all the other seasons, the water in the atmosphere descends in grateful showers, giving health and strength to vegetation, and producing abundant harvests of grains and fruits. In winter it often descends congealed in minute crystals of exquisite formation, and beautifully white. If we look at them with a microscope, we see they are systematically arranged and formed according to some definite law. Crystals of ice when beginning to form, either in air or in water, appear to be needle-shaped, and increase at first most at their extremities and in a straight line. Branching crystals thus form from the edges of these, and shoot out in other directions, but always at a certain angle of about 60° or 120° , but never at right angles. In small spaces of water, when beginning to freeze, these crystals may be seen shooting across the surface very rapidly; other crystals cross in other directions, until by addition to other sides the surface is covered with ice. The same thing takes place in large bodies of water when the surface is unruffled, we can there see where the crystals first began to form, and the direction in which they proceeded.

The same law governs the formations of snow. The additions of particles of water takes place at the extremities of the forming crystals, increasing their length, and thus commencing at the sides with the same angle. Should the air be heavily laden with moisture, and no wind stirring, they sometimes descend in large flakes, and when examined, particularly with a microscope, present a very beautiful appearance. When a wind is blowing at the time, the crystals cannot increase to much size, and the snow falls in fine particles.

Many curious phenomena occur at times from the effect of congelation. When the atmosphere in the region of the clouds is above the freezing point, and water is precipitated in rain, and the atmosphere on the surface of the earth is below the freezing point, congelation takes place as it falls. Then everything exposed to the falling water is covered with a coating of ice. Should the rain continue long enough, the ice forms on

every sprig and branch of the trees, and in this way, sometimes, large branches of trees are broken off by the accumulated weight, and trees are sometimes torn up by the roots. When we consider that ice is nearly as heavy as water, and that even the smallest twig sometimes has a covering of ice an inch thick, we need not be surprised at the effect produced. Should the rain fall rather faster than it can congeal, it forms icicles; these suspended from all horizontal places, such as fence rails, &c., present a curious appearance. The beauty of this appearance is much heightened, should the sun rise clearly, and the rays of light strike the icicles nearly horizontally. The many thousand surfaces then reflect the light, resembling the most brilliant gems, and present a splendor no artist can copy. The inhabitant of Southern climes, where congelation is unknown, can have no conception of the beauty and magnificence of such a scene.

Another curious and beautiful phenomenon occasionally takes place. It was exhibited on a grand scale, in the northern part of this county, the morning of the 2d day of this month. The evening previous to the first day of the month, it commenced raining moderately, with the wind from the Northeast, and the weather had been quite moderate for some days. The wind, however, soon changed round to the North, became cold, and it snowed moderately during the night. By morning there was three or four inches of fine and dry snow, and the wind continued from the same quarter very cold, but without any more snow, but cloudy all day. Just at sunset it cleared off without wind, and the clouds during the day prevented the absorption of heat from the sun's rays, and at night the clear sky admitted of free radiation, so that the temperature of the air fell rapidly. My thermometer indicated 10° below zero at 9 o'clock at night, and at sunrise on the morning of the 2d it stood at $13\frac{1}{2}^\circ$ below, others showed 16° below that morning. The Potomac river, more than one-fourth of a mile wide, with a rapid current and considerable fall, borders this county on the North, and while its waters were being reduced to the freezing point, it of course gave off considerable heat, carrying vapor with it. This vapor, often filling the immediate valley of the river, extended up the vallies opening upon the river. Here coming in contact with bodies colder than itself it adhered to everything like hoar frost of a morning. The great quantity of vapor that rose during the night from the river before it froze over, caused the frost to thicken so much on the limbs and branches of the trees as to be from half an inch to an inch in thickness. This gave everything a feathery appearance, and as the vapor assumed the appearance of a fog, the sun could not shine out so as to melt it until near the middle of the day. The shining of the sun on this frost gave it an exceedingly beautiful

appearance, and presented a phenomenon not often witnessed on so large a scale.

Few persons in this latitude but have seen the frost on panes of glass in our windows, of a cold morning. This formation is governed by the same laws that govern the freezing of water and the formation of snow. It will be seen that the crystals run in straight lines, and where there is divergence, it is at the same angle. When there is a slight moisture in the room, so that the frost does not cover the entire pane of glass, there is often exceeding beauty in these tracings. Like all the other operations of nature, the more closely they are observed, the more beautiful they appear; and this will be found to be the case when these are examined with a good microscope.

YARDLEY TAYLOR.

Loudoun County, Va., 1st mo., 1860.

THE POWER OF MONEY.

The greatest things which have been done for the world have not been accomplished by rich men, or by subscription lists; but by men of small pecuniary means. Christianity was propagated over half the world by men of the poorest class; and the greatest thinkers, discoverers, inventors, and artists have been men of moderate wealth, many of them little raised above the condition of manual laborers in point of worldly circumstances. And it will always be so. Riches are oftener an impediment than a stimulus to action, and in many cases they are quite as much a misfortune as a blessing. The youth who inherits wealth is apt to have life made too easy for him, and he soon grows sated with it because he has nothing left to desire.—*Delaware Republican.*

TEMPTATIONS OF THE YOUNG.

BY J. S. BUCKMINSTER.

It is true that every age and employment has its snares; but the feet of the young are most easily entrapped. Issuing forth as you do, in the morning of life, into the wide field of existence, where the flowers are all open, it is no wonder that you pluck some that are poisonous. Tasting every golden fruit that hangs over the garden of life, it is no wonder that you should find some of the most tempting, hollow and mouldy. But the peculiar characteristic of your age, my young friends, is impetuosity and presumptuousness. You are without caution, because without experience. You are precipitate, because you have enjoyed so long the protection of others, that you have yet to learn to protect yourselves. You grasp at every pleasure because it is new, and every society charms with a freshness which you will be surprised to find gradually wearing away. Young as you are, there seems to be little for you to know of yourselves, therefore you are contriving to know little, and the world will not let

you know more till it has disappointed you oftener.

Entering then into life, you will find every rank and occupation environed with its peculiar temptation, and without some other and higher principle than that which influences a merely worldly man, you are not a moment secure. You are poor, and you think pleasure and fashion and ambition will disdain to spread their snares for so ignoble a prey. It is true they may. But take care that dishonesty does not dazzle you with an exhibition of sudden gains. Take care that want does not disturb your imagination by temptations to fraud. Distress may drive you to indolence and despair, and these united may drown you in intemperance. Even robbery and murder have sometimes stalked in at the breach which poverty or calamity has left unguarded. You are rich, and you think that pride and a just sense of reputation will preserve you from the vices of the vulgar. It is true, they may; yet you may be ruined in the progress of luxury, and lost to society, and, at last, to God, while sleeping in the lap of the most flattering and enervating abundance.

A resource against temptation is *prayer*. Escaping then, from your tempter, fly to God. Cultivate the habit of devotion. It shall be a wall of fire around you and your glory in the midst of you. To this practice the uncorrupted sensations of the heart impel you, and invitations are as numerous as they are merciful to encourage you. When danger has threatened your life, you have called upon God. When disease has wasted your health, and you have felt the tomb opening under your feet, you have called upon God. When you have apprehended heavy misfortunes, or engaged in hazardous enterprises, you have perhaps resorted to God to ask his blessing. But what are all these dangers, to the danger which your virtue may be called to encounter on your first entrance into life? In habitual prayer you will find a safeguard. You will find every good resolution fortified by it, and every seduction losing its power, when seen in the new light which a short communion with Heaven affords. In prayer you will find that a state of mind is generated which will shed a holy influence over the whole character; and those temptations to which you were just yielding, will vanish with all their allurements, when the day-star of devotion rises in your heart.

THE FOLLY OF BOASTING.

A gourd wound itself round a lofty palm, and in a few weeks climbed to its very top.

"How old mayest thou be?" asked the new-comer.

"About a hundred years."

"About a hundred years, and no taller!"

Only look : I have grown as tall as you in fewer days than you count years !”

“I know that well,” replied the palm, “every summer of my life a gourd has climbed up around me, as proud as thou art, and as short lived as thou wilt be.”

Extracts from the Introductory Lecture to the Class of the Female Medical College of Pennsylvania, 10 mo. 19th 1859.

BY ANN PRESTON, M. D.

Ladies.—As I meet you to day, and on behalf of the Faculty of this Institution, welcome you to the course of study before you, it seems a fitting occasion to scan briefly the position and prospects of the cause in which we are engaged.

While, to a large portion of thinking and observing men, the medical education of woman appears to be the natural result of the progress of society, there are others who still regard it as some abnormal social phenomenon ; some abrupt and fantastic freak of unbridled liberty, unfitted to stand the test of time and experience.

Those who are familiar with the history of civilized countries for the last few hundred years, must have been struck with the great changes which have occurred in the occupations, modes of living, habits of thought and general education of the people. A few generations ago, human muscles were the principal power which lifted the weights and turned the wheels of industry ; now machinery takes the place of hands, and steam and air are subsidized as effective forces which lift the heaviest burdens from human shoulders.

A little while since, our fathers built their houses down in low, perchance, uninhabited valleys and hollows, that they might be near the indispensable springs of water ; now, we can select sites of healthfulness and beauty on the hills, and wielding that power over external nature which knowledge gives, force the obedient waters to come up to us.

Fifty years back, the horseman or slow stage carried the most urgent messages ; now, we have tamed the forked lightning, and made it the gentle carrier, which swift as thought transmits for us intelligence from city to city.

A few generations ago, the masses, even in England, were considered to possess no Political Rights, and it was deemed the sober dictate of reason and experience “that those who think should govern those who toil” ; now, these same masses are the conscious sources and dispensers of political power ; enforcing law upon sovereigns and governing the governors.

A few centuries since, the common people, sunk in ignorance, believed that to priests and rulers only was education necessary ; now, in the regular march of events, we have the grand fact of the Common School, and general recognition

that knowledge and truth are the appropriate food of the human mind, adapted to all classes and all occupations.

The position and employments of woman have been subject to the same rule of change. In barbarous ages and nations, the drudgery of life has fallen largely on her. Among the American Indians, we are assured it is the province of the wife to carry home the venison or other game the husband has shot, while he, unincumbered, proudly stalks to their dwelling. * * *

There was a time within the memory of many now living, when, in some places, a stout resistance was made to the employment of women as Teachers ; but they vindicated their competency to instruct and govern schools, the opposition slackened, and since they have formed so large a portion of our public instructors we are assured by competent authority that the rate of compensation for School Teachers generally instead of diminishing, has increased both positively and relatively as compared with other employments, and that, as a class, they occupy a higher social position than in earlier times.

So too, American women are rapidly engaging in the various industrial pursuits requiring skill rather than strength—shop-keeping, book-keeping, attending post offices and telegraph offices, taking photographs, &c. &c. Designing and Painting are to some of them now remunerative employments, and rising to the highest departments of science and art, we have women who in Astronomy and Sculpture possess a world-wide reputation.

Coincident with this extension of the range of woman's employments, and partly as its cause, there has been a corresponding advance in the standard of her education. It has been only a short time since to “read, write and cipher to the rule of three” was deemed quite enough of solid learning for an ordinary woman ; and if impelled by an irresistible thirst, she drank stolen waters from the fountains of knowledge, she was ridiculed by the vulgar as a “blue stocking,” and sometimes was made to blush at the disclosure of the springs at which, in secret, she regaled.

Now, we have writers and comparative scholars among the workers, and the new world has seen a periodical ably edited and conducted by Factory girls : now, we have schools of Design, and high schools, and colleges for women ; while one by one, the *laws* framed for an earlier and different state of society, which imposed grievances and disabilities on account of sex, are being wiped from our statute—books disappearing before the irresistible march of modern civilization.

The same steady onward movement, without violence or abrupt transition, naturally, unavoidably has carried woman into the Study and Practice of Medicine.

They who continually tell us that her only proper place is in the parlor, under the protecting

care of man, prove that they know but little of the actual condition of woman at the present day, to a majority of whom, even in America, exertion in some form is a pressing necessity as a means of procuring the comforts of life.

Still less do such understand the higher necessities of woman's spiritual nature, or realize that the exercise of the moral and intellectual faculties, in the direction indicated by the powers and convictions of each individual, is the appointed means of satisfying a mighty inward want, and of inducing harmony and true repose in the whole being.

Neither do they more fully appreciate the advanced position of the world, nor perceive that society, learning that human capabilities are the measure of human spheres, is demanding of woman to take her true and natural place by the side of man in the ranks of medicine, and that all efforts to baffle this result are opposed to the ordinances of Nature and Providence, and futile as endeavors to beat back the careering winds, or to stop the surges of the sea.

All who are familiar with the modern movement for the medical education of woman, must have remarked the ready favor with which enlightened men generally, outside of the profession, have received it, and the interest it has excited as a great movement for humanity. That it has been carried into effect in America, results from the favoring circumstances of our free growth; but from across the ocean, through periodicals and private advices, come abundant evidences that this is not a mere American movement—that noble minds and hearts in Europe are giving us their sympathy and aid.

It is true that difficulties and embarrassments of various kinds have attended the inauguration of this work, as they have ever attended the early stages of all movements fraught with power to advance and bless society: nor need we be greatly surprised, that some professional opposition should be elicited. No large body of men have ever yet been found, who welcomed, at first, what they deemed encroachments upon the customs and interests of their order.

The medical profession in this country abounds in high-minded and discerning men, who appreciate the propriety and need of this movement, and foresee its inevitable success; men who have given it their aid, or who are ready to do so; but this magnanimity and clear-sightedness, could hardly be expected from all: and while we regret the indiscriminating opposition lately made by a body of medical men in Pennsylvania, to this whole movement, we will not, I trust, permit it in the least to embitter our spirits; aware that while it indicates the importance our enterprise has assumed in their estimation, it is regarded largely among physicians, as well as others, as an impotent effort, unworthy members of a generous and enlightened profession.

The facilities afforded women for *practical* instruction in medicine, have greatly increased within the last two years. In New York, there is now a thriving "Woman's Infirmary," with doctors Elizabeth and Emily Blackwell at its head, which is constantly open to the inspection of medical women, and, in the same city, a "Preparatory School of Medicine," taught by able physicians, all connected with public institutions, for a year past has given separate instruction to a class of ladies. These ladies are admitted to the clinical teachings of two of the largest Dispensaries in the city;—Dispensaries which, together, furnish upwards of sixty thousand cases of disease annually. Six of the students and graduates of this school, during the past season, have availed themselves of the extensive facilities of observing disease and its treatment afforded by these institutions.

You will learn hereafter of the generous reception which some of our graduates have met from the physicians where they have become located, of the success attending the practice of a number, and of the increasing demand which comes from various quarters of the Union, for the services of competent medical women, as well as of the fuller facilities for practical training opening in this city. * * * * *

In England, the women have organized a "Ladies' National Association for the diffusion of Sanitary Knowledge," which is "hailed with much satisfaction" by that able Medical Journal "The British and Foreign Medico-Chirurgical Review;" and these ladies have issued a series of penny-tracts to enlighten the people on subjects connected with health; and, with slight exceptions, the same authority "cordially approves the manner, matter and method of these tracts."

In enlightened countries, sanitary regulations are now recognized as an important and legitimate province of legislation, and many sources of disease have been removed. The airs of Heaven have been made to sweep through infected and unhealthy dwellings, bearing healing upon their wings; the waters of the Earth have been turned into foul places, to wash away impurities; fire has still been brought to the aid of these ancient "elements," to burn up and dry up sources of disease—proving that the Promethean fable of its Heavenly origin was not *all* fabulous; swamps and stagnant pools have been drained and dried; food, rest, sleep and sunlight, exercise and clothing are beginning to be treated as medical agencies; the reactions of mental conditions upon bodily vigor are becoming better understood; so that, much, very much, as we have yet to learn, imperfect and unhealthful as are still our habits and regulations, an embargo has been laid upon many devastating diseases, and the results of vital statistics show that the average duration of human life throughout the civilized world is fast increasing.

The oldest system of general registration of births and deaths in any of the countries of Europe, does not extend backward beyond eighty years; but we are told that the mean duration of life during that time has been prolonged more than twenty-five per cent.

In many cities, however, records have been kept for a longer period; and we learn that in London, where in the latter part of the seventeenth century one in every twenty of the inhabitants died annually, now, only one dies in forty; and in the highly refined city of Geneva, Switzerland, where careful registers of births, marriages and deaths have been kept since 1549, there has been a constant extension of the average duration of life, until it is more than five times greater at than the beginning of that period;—the probabilities of life for all born *then* being only eight years, while the probabilities are *now* more than forty-five years. See *Wynne's Vital Statistics*.

Ladies; as I close this rapid review of a few of the salient points of the studies in which you engage and the cause with which you identify yourselves, permit me to give you the assurance of my sympathy with you personally, in the labors before you. I know something of the anxiety and fear, as well as the aspiration and hope with which some of you come here to-day. I know that, to some, the way seems long and the range of study formidable, but I am happy in believing that before a woman of fair capacity and a brave steady spirit, one by one, the difficulties will be overcome.

Although we shall all frequently feel how very little we know compared with what remains to be known, and although a discouraging array of apparently unconnected ideas may seem thrown upon your at first, yet as you patiently persevere, content to learn one thing at a time, you will find that the attainment of each point of knowledge will make easier the acquisition of the next, and you will gradually perceive relations, which will simplify and illumine your whole range of study.

Believing that the natural tendency of medical studies upon a pure and healthful mind is to refine, and elevate, and cause it to realize that we live amid holy things, and bringing, as we believe you do, a reverent spirit to the work before you, we trust to find in you such illustrations of virtue and excellence as will disarm prejudice, and teach the unbeliever the perfect compatibility of medical studies with the noblest and sweetest development of the womanly character.

Ladies, with you, I am thankful to-day that it is our privilege to engage in a work so satisfying and so beneficent—that to woman's longing spirit also, the beautiful volume of Nature is more fully opening, and the serene pursuits of science are made available.

As you pursue those studies which disclose order amid apparent confusion, stability in the midst of mutation, and law in every depart-

ment of nature, may your own hearts be attuned to such according harmony that you will realize the presence of God to be the Heavenly Law of the Soul! May you indeed gain the highest end of all study and all effort—that of enriching and ennobling the Spiritual Nature, and bringing out more clearly the Divine Image there.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, THIRD MONTH 3, 1860.

OPPRESSION.—In our columns of to-day we give place to a letter giving an account of the coolie trade as now carried on. The sufferings of these poor creatures, are such as we cannot realize even from this heart-rending description, and yet there is every reason to believe that this account is but a type of the misery which is brought about by this and the African Slave Trade. Whilst these crimes exist, it is in vain that we content ourselves with a tacit hearing of these recitals. They appeal to every heart, and demand of each one of us an honest expression of our utter abhorrence of such iniquity. The voluntary emigration of the Chinese to Australia, California, and to Siam, where they earn their wages and dispose of their money as they please, is of an entirely different character, from the false pretences and kidnapping which are employed in getting them on board vessels bound for Cuba, the Chincha Islands, and French Colonies.

—
The article on "Dancing" contains correct sentiments, and though probably appropriate to the occasion for which it was written, is not entirely suitable for our paper.

—
MARRIED, In Rush, on the 27th of 12th month, 1859, with the approbation of Rochester Monthly Meeting, AARON P. BAKER to MATILDA J. MOSHER, both of Monroe county, N. Y.

—
DIED, On Second day, the 13th inst., SARAH BALLENGER, aged 23 years, member of Woodbury meeting, N. J., and daughter of Isaac and Susan Ballenger.

—, On Seventh day, the 18th inst., HANNAH MOORE, wife of SAMUEL MOORE, at an advanced age. a member of Woodstown meeting, N. J.

—, On Third day, the 21st inst., HANNAH BOWER, aged 83 years, wife of Elijah Bower, and member of Mullica Hill meeting, N. J.

—, Of consumption, near Waynesville, Warren county, Ohio, on the 7th of the Second month, 1860, ELMA R. MILLS, wife of JOSIAH B. MILLS, and daughter of Aaron Mullin, in the 26th year of her age.

From the China Correspondent of The Journal of Commerce.

EIGHT HUNDRED AND FIFTY MEN SACRIFICED.

The coolie-trade has lost none of its activity or horrors. The slave-trade itself on the coast of Africa is not more atrocious; while all the horrors of the "middle passage" belong to a coolie ship as well as to an African slaver, and at the same time that middle "passage" embraces the China Sea, the Indian Ocean, and the Atlantic, instead of the Atlantic only. The great centers of the traffic are Amoy, a port about 200 miles north of Hong Kong, and Macao, the old Portuguese town, 25 miles distant, on the Canton River, where barracoons are erected, and dealers have their residence, who make their arrangements with pirates and others to secure coolies by promises, however false, if they can, or by violence, if that is necessary. Fair promises are made in abundance, tempting to these poor starving people, but promises made only to be broken, by which great numbers are decoyed, and then forced into these barracoons, and thus detained, unable to communicate with their friends, or the authorities, while others are seized while asleep in their junks by night, or quietly occupied in their fields or gardens, or other humble avocations, and with hands and feet tied, are hurried off to the barracoons, where they are imprisoned till the ship is ready, to which they are carried by night, or stealthily by day, notwithstanding all their entreaties and protestations, and despite all their feeble resistance. A case recently occurred of which a friend has furnished me some particulars in addition to those given in a paper here, by an individual concerned in the traffic, and on board the ship at the time of the disaster. It is a tale of horror never exceeded by anything in the records of the ocean. The *Flora Temple*, as I am ashamed to confess, was an American vessel, but chartered by English residents here, who are fully responsible for all which followed.

The *Flora Temple* was as fine a merchant-ship as ever entered the sea of China, as is asserted by competent judges. Lying off Macao, all arrangements were made to secure a full cargo of coolies by the means I have mentioned. They were cheated, inveigled, or stolen, and either taken directly to the ship or else confined in the barracoons in Macao till the ship was ready to sail for Havana—the crew numbering fifty, and the coolies *eight hundred and fifty*. Leaving Macao Oct. 8, (Saturday), the deceived and stolen coolies soon learned their cruel destiny, and as all injured and betrayed men would do, resolved to attempt to avert it, however desperate the chances. They had no arms, and therefore had to struggle with every disadvantage in the effort of recovering their liberty. A party collected on the deck on Tuesday morning, before the shores of their own loved country had

forever disappeared from their eyes, and rushing upon the guard, a single individual, a fight ensued, in which the guard was killed. In the mean time, the captain, Johnson, hearing the noise, hurried upon deck with his revolver, and his brother and an Englishman interested in the kidnapping with him, both also armed with revolvers, who discharged half-a-dozen rounds into the coolies, who were thus driven back, and defeated in their attempt to recover their liberty. How many were killed and wounded, it is for the interest of the kidnappers not to tell, and the *dead* also tell no tales. Nor can they tell the cruel treatment they received before they were driven to this desperate act—treatment, as they well knew, which was only a foretaste of what awaited them. Nor do the officers of the ship or the Englishman on board, who was trading in stolen human flesh, inform the world of the course they took toward these miserable, deceived, and helpless men, when they were overpowered and defeated in their most justifiable attempt to assert their liberty. But a friend informs me that they were driven below deck, and confined there like felons, almost without light and air, and were, crowded together so large a number in so narrow a space, the greater part must inevitably have perished in the long middle passage. Think of 850 human beings, all full grown men, pressed into this contracted, rayless, airless dungeon, in which they were to be deported from China to Havana, all the long way over the China Sea, the Indian Ocean, and the Atlantic!

On the following Friday, Oct. 14, while sailing over the China Sea, at 7½ o'clock in the evening, the vessel struck upon a reef which is not laid down in the charts, a gale of wind in the mean time blowing, and the sea running high. Every effort was made to save the ship by the officers and crew; the poor coolies, battered down beneath the decks, being allowed no chance to aid in saving the ship or themselves. Although the yards were "braced around," and the ship "hove aback," she struck first slightly, and then soon after several times with a tremendous crash, the breakers running alongside very high. Pieces of her timbers and planking floated up on her port side, and after some more heavy thumps she remained apparently immovable. The water rapidly increased in the hold till it reached the "between-decks," where the 850 coolies were confined. While this was going on, indeed almost immediately after the ship first struck, the officers and crew very naturally became afraid of the coolies for the treatment they had received, and the Captain ordered the boats to be lowered, not to save the coolies in whole or in part, but to preserve himself and crew. These boats, even under favorable circumstances, were not more than sufficient for the officers and crew, showing that no provision had been made for the poor coolies in case of disaster. The boats passed

safely through the breakers, leaving the ship almost without motion, all her masts standing, her back broken and the sea making a clear breach over her starboard quarter. When the boats left the ship, and steered away, without making one effort to save the 850 coolies, or allowing them to do anything to save themselves, with their last look toward the ship, they saw that the coolies had escaped from their prison through doors which the concussion had made for them, and stood clustering together, helpless and despairing, upon the decks, and gazing upon the abyss which was opening its jaws to receive them. My friend assures me that he knows these poor creatures were completely imprisoned all the night these terrible occurrences were going on, the hatches being "battered down," and made as secure as a jail-door under lock and bars.

The ship was 300 miles from land when it struck, and after fourteen days of toil and struggle, one of the boats only succeeded in reaching Towron in Cochin-China; the three other boats were never heard of. Here the French fleet was lying; and the Admiral at once invited the Captain and his boat's crew on board one of his ships, and besides at request, sent one of his vessels to the fatal scene of the disaster, where some of the wreck was to be seen; but not a *single coolie*! Every one of the *eight hundred and fifty* had perished! Whether the coolie traffic is any better than the African slave-trade in its palmy days, every one may decide. Nor is this a solitary case; hundreds could be adduced of equal horror and barbarity, if not ending in the same catastrophe.

SUBTERRANEAN SWITZERLAND.

(Continued from page 795.)

For food the Lakers had, as the remains of various seeds and fruit-stones demonstrated, the wood-raspberry, the wild plum ("prunus spinosa," which we unlearned schoolboys used to call bullas,) small crab-apples, of which a dried and venerable specimen was shown me, and wheat corn, sundry masses of which, apparently carbonized by fire, demonstrated that agriculture was an art not unknown.

Fragments of bones of various animals, which were discovered in quantities under the peat, and had either been used in the fashioning of instruments, or were the remains of antique repasts, proved that this primitive people already possessed the greater part of the domestic animals of our day. The professor showed me bones enough, in this department, to have served as the basis of a Cuvierian lecture on osteology. The Lakers had certainly gathered round them the ox, the pig, the goat, the cat, and many different sized kinds of dogs; nor had the horse been wanting, though, as the professor conjectured, chiefly used, by a sublime anticipation of Paris-

ian gastronomy, as an article of food. With these were mingled quantities of bones of the elk and stag, the urus, bear, wild boar, fox, beaver, tortoise, and various kinds of birds. Strange to say, the bones that one would most have expected a Lake-people to have left behind them—fish-bones—were entirely absent; for which absence, however, their chemical decomposition by some unknown agent might by possibility account.

Of what materials the habitations of the primitive Lakers were constructed, the professor now gave me ocular demonstration. First, I was shown what kind of stakes or piles their lake-cabins were elevated upon; the stakes themselves I did not see, only casts of them; for, when these very ancient piles were first taken out of the peat they had looked fresh and solid as those human bodies which have occasionally been found in airless stone coffins, bodies which for a moment have mocked the view with a phantasma of fresh life, and, almost immediately after, fallen to dust. So with the stakes of the old Lakers. Once exposed to the air they crumbled; and their external skin was found to be only a feeble covering to rottenness. Professor Troyon then cleverly devised a mode of perpetuating these fleeting forms, by injections of plaster, from which moulds and casts were obtained. These casts, short and fragmentary, looked very like the ends of not very large hop-poles. The marks of the stone chisels were still plainly discernible on the stakes, and they were sharpened to a point. The cabins that had been raised on these piles had left more enduring fragments. Most interesting were the morsels of old wall, which consisted of unbaked clay, bearing the impressions of woody twigs, whereby it was evident that the primitive cabins had been formed of boughs of trees, plastered over and between with clay. From the fragments being calculable segments of a circle, two facts were ascertained, namely, that the cabins had been circular, and the circumference of them about fourteen feet. Some of these fragmentary piles and dwellings that were found in the Lake of Constance were above a hundred yards from the shore; and that they always had been so, and had not been thrown further off from the mainland by any rising or agitation of the waters, was proved by pieces of earthen pots that lay at the bottom on the stirless depths, so near together, just as they had broken and fallen ages before, that much pottery had been re-constructed from such fragments. I observe, in passing, that the fragments of pottery are of rough manufacture, and, in their dark, burnt-looking substance contain morsels of shining quartz, or mica, unassimilated to the prevailing texture. I possess some fragments, that, by carrying out the segments of the circle, appear to have been of great size, (singular exception to the general littleness of the relics,) as big, indeed, as Roman wine-vases. Another thing to be observed, is, the way these

pots were evidently supported. They had pointed ends, and near them are found circular open rings of pottery, whose use was evidently to support the pointed ends of the vases, which were incapable of standing by themselves. The ring of burnt clay was the mortise, the pegtop-like termination was the tenon of the vase. In connection with this, the professor told me that Admiral Elliot, who had visited the museum, recognized this primitive form of support as still used by the Hindoos and other Indian people.

This brings me to the probable origin of these ancient predecessors of the Swiss. They were a wave of that great tide which set in towards Europe from the East, choosing chiefly the inland seas, and ascending rivers, as their roadways, or rather waterways, to new regions, where they should replenish the tenantless earth. Naturally such tribes, accustomed to water, chose water whereon to found their first settlements. Moreover, the long narrow causeways of wood, that led from the shore to their habitations, became a protection to them from wild beasts, or wilder human enemies. Also the waters supplied them with ready food, and were as Nature's own clearings amidst the shaggy mountains and impenetrable forests, the mere fringe of which they with difficulty cut away for household purposes. Advanced into the free lake, the settlers could look around them and breathe the air of heaven. Herodotus has described similar lacustrine dwellings belonging to the Pæonians, who had settled on Lake Prasias, in Turkey.

When I asked the professor, "Why the implements of this ancient race were so baby-like and small?" he replied, "Probably because they themselves were small, and, like the Orientals, had very small hands and feet. However," he continued, "this is not conjecture, but fact. Look here at the next case in my museum, where you perceive ornaments of a more advanced period, though still belonging to the Lake people. Look at these bracelets of horn, so deep in circumference but so small in diameter; you would think that even a child's hand could not enter them; yet here are the human bones still in them." This was true. The professor, finding the bracelets on the skeleton of a full-grown person, had fixed the bones of the wrist within the bracelets by pouring cement around them. "Look, also," resumed the professor, "at that bronze sword, still later in date, found at a time when the Age of Wood and Stone became the Age of Bronze; observe that the handle is only co-extensive with three of my fingers, though my hand, like myself, is not very big. I met, some time ago, a Peruvian lady, who was the last descendant of Montezuma, and hers was the only hand and wrist I have ever known slip easily into that bracelet.

That these Lake relics are, in very truth, of a most remote antiquity, was proved in various

ways by Professor Troyon. He said, "A discovery that was made in the valley of the Orbe may give an idea of this antiquity. The Lake of Neufchâtel, it is well-known, is always, because of the increase of the peat bogs and the delta of alluvial matter formed by the rivers Thiele and Buron, retreating further back from the Lake of Neufchâtel. In the time of the Romans, the actual site of Yverdon was under water. There was even a time when all the valley was covered by the lake. Then Mount Chamblon was an island, and, at the foot of this mount, were Lake-villages of the ancient people, whose relics, which are all of the Age of Stone, are now found many feet below the surface of the bog. By accurate calculation of the time that the lake now takes in its retreatings, we find that the destruction of these lake-dwellings must have occurred, at latest, in the fifteenth century before the Christian era.

"But here is another proof of this," continued the professor. "Look at these fir-poles which were found in the Lake of Geneva, the supports of ancient villages of a later date, though still of a period long previous to the Roman conquest. You see that they are the real wood, while I only possess casts of the primitive poles; and that they are not only much longer than the ancient stakes, but curiously worn to a gradual slenderness, and to a point, by the gentle but constant action of the waves upon their upper surfaces. Why is this difference? Because, these poles, when discovered, still projected two or three feet above the mud of the lake, while the others were covered by the mud itself. Now it is calculated that a thousand years, at least, must have elapsed before the fir-poles could be brought, by the slow action of tideless water, to the level of the bed of the lake."

I own that these reasons did not quite convince me of the deduction at which the professor wished to arrive, namely: that the first, and not altogether savage, inhabitants of Switzerland, dated from two thousand years before Christ. Many circumstances—draining, for instance—might, I thought, have expedited the retiring of the waters, or the wearing away of the piles. Nevertheless, with all the caution of scepticism, it is impossible not to allow that the Lake-relics proceed from an age long anterior to the Christian era, and very far more remote than the Roman conquest. Even supposing the objects now discovered, to be coeval with the time when Herodotus mentions the Pæonian Lakers, they remount to the seventy-fourth Olympiad, answering to four hundred and eighty-four years before Christ—an antiquity to be respected by us poor mortals, who grow old in seventy whirls of our little planet.

(To be concluded.)

To delay justice is injustice.—*Penn.*

THE NEW PLANET.

Two or three months ago we announced the discovery by M. Le Verrier, the discoverer of Neptune, of perturbations in the orbit of Mercury, which led him to believe that there must be planetary bodies between Mercury and the sun. We give his reasonings somewhat in detail, as this discovery was even more remarkable than that of the outmost planet of our system. We then stated what he then believed, that this might be a ring of bodies too small even for telescopic observation, and, at any rate, that probabilities were not in favor of the actual confirmation, for many years, of the brilliant deduction of the great astronomer.

But while M. Le Verrier, was communicating his discovery to the public, a doctor of medicine in one of the departments of France (Eure-et-Loir) was actually observing one of these planets. M. Lescarbault, the doctor of Orgeres, while yet a student in Paris, had so strong a mania for astronomical observations that he saved out of his yearly allowance of \$300, \$150 for a telescope. This he installed in a turning dome, in great part the work of his own hands, and, oddly enough, he recorded his observations on white-wood planks with a pencil. When a plank was full, a few strokes of the plane made it as good as new. So a plank an inch or two in thickness became equivalent to a whole ream of paper, but these new palimpsests retained nothing of the old writing. Indeed, the astronomic physician used almost as primitive a book as that by which the Norway lumbermen are paid off. The book-keeper, after comparing accounts with the workman, sends him to the cashier for his wages, chalking the amount on his back, and when the cashier has paid him, he takes his receipt himself by brushing off the chalk-marks.

It was on a white-wood plank, which fortunately had not been planed off, that M. Le Verrier found the first observation of a planet, with an estimated diameter of about one quarter that of Mercury, and much more important in weight, if not in bulk, than any of the 57 planets which inhabit the void between Mars and Jupiter. M. Lescarbault's planet requires about three weeks for its revolution about the sun, while the period of Mercury is about three months. It is only one-seventh of the distance of Mercury from the center of the sun, and it is very doubtful whether it can be seen except when it passes across the disc of the sun.

This observation was made before the publication of M. Le Verrier's calculations, and its importance was revealed to the obscure physician by an article in the *Cosmos*, which encouraged him to publish it. M. Le Verrier went immediately to Orgeres, and the modest doctor was infinitely surprised one morning to find the astrono-

mer-in-chief of the National Observatory his guest. The original plank was carried off in triumph by the National astronomer, and publicly exhibited at the next meeting of the Academy of Sciences.

This is probably only the first of a new series. Its action on Mercury can only account for its perturbations in part. Probably there are not less than a dozen in the comparatively limited space between the sun and Mercury, only about 30,000,000 of miles. Theoretical astronomy has achieved a new triumph. Our solar system has been explored with pen and telescope from its center to its circumference.

LOOKING BACK.

Shut the door and come away,
Faces that we here have known,
Step and voice, are gone to-day,—
Leave the dear old house alone.

Leave it in the tender light
Of the early evening hours,
To the voices of the night,
Murmuring as once did ours.

This was home: I cannot go.
When I once have passed this door
And the open gate—I know
I can call it so no more.

Up the wide and shady path
Other steps than ours shall come;
Other circles round the hearth,
Gather here and call it home.

Speaking in familiar tone,
Household names by us unheard;
While each name that we have known
Grows a strange forgotten word.

Then as now will morning come,
Glancing through the ashen tree,
Lighting up my vacant room,
Where so oft it wakened me.

When the glowing sunsets stream
Through this window to the west,
Who will linger here and dream,
Past that glory walk the blest?

On the doorstep as before,
When the summer nights are bright,
We shall come and stand no more,
Watching with a calm delight,

Rival beauties in the sky,
Rising moon and tapering spire;
One in brightness sailing by,
One forever pointing higher.

Gone are books and pictures all,
Gone are all familiar things,
From the echoing room and hall
Where my lightest footstep rings.

Rushing sounds are in my ears,
All around me is so still;
Mingled voices of the years,
Come and charm me as you will.

THE MEANING OF SORROW.

We love this outward world,
Its fair sky overhead,—
Its morning's soft, gray mist unfurled,
Its sunsets rich and red.

But there's a world within,
That higher glory bath;
A life the immortal soul must win,—
The life of joy and faith.

For this, the Father's love
Doth shade the world of sense,
The bounding play of health remove,
And dim the sparkling glance.

That, though the earth grows dull,
And earthly pleasures few,
The spirit gains its wisdom full
To suffer and to do.

Holy its world within,—
Unknown to sound or sight,—
The world of victory o'er sin,
Of faith, and love, and light.

THE STRENGTH OF THE LONELY.

Though lonely be thy path, fear, not, for He
Who marks the sparrow fall, is guarding thee;
And not a star shines o'er thy head by night,
But He hath known that it will reach thy sight.

And not a grief can darken or surprise,
Swell in thine heart, or dim with tears thine eyes,
But it is sent in mercy and in love,
To bid thy helplessness seek strength above.

ADDRESS ON THE GRASSES.

BY J. STANTON GOULD.

(Continued from page 798.)

Having now got our young grass successfully started, the next object is to provide for its future welfare, and our first inquiry with this view must be to ascertain whether there is any stagnant water on the soil. It is settled beyond all cavil by the united testimony of both science and experience, that the true meadow grasses, (such as are included in our fifth class,) will not flourish in the presence of stagnant water. Sow as many seeds and put on as much manure as you will, they will be all lost. Nothing but the aquatic grasses will flourish on soils where water stands. Whenever, then, these aquatic grasses are seen, there is but one thing to do, and that is to underdrain. It is not necessary to drain meadows as thoroughly as plow lands, for nearly all the grasses require *moist* soils, but if you would have a profitable meadow or pasture, you must free it from stagnant waters.

Good husbandry not only requires that the grass should be well started, but that provision should be made for its future growth and increase, yet this necessity is overlooked by nineteen twentieths of our farmers. There are hundreds of thousands of acres of meadows in the

State which have never had any manure applied to them for a century, nor been the subjects of any ameliorating process whatever; their annual burthen of grass has been removed, and this has been the only care their owners have bestowed upon them. This ought not so to be. Depend upon it, there is a Nemesis that watches over agriculture as well as over human conduct, and every fraud which the farmer practices on his lands will assuredly be visited on his pocket.

The necessity for the application of nourishing manures, is clearly shown by the amount of matter removed from the soil by every successive crop. Each ton of hay of average quality, removes one hundred and fifty pounds of mineral matter, and twenty-five pounds of nitrogen, equivalent to 46½ pounds of ammonia from the soil. The mineral matter is composed of forty-three pounds of potash, twenty-five pounds of lime, eight and a half pounds of phosphoric acid, beside many other ingredients.

This simple statement of the losses sustained by the soil, ought to be a warning to every farmer to desist from the wasteful and heedless management which they have hitherto practised; and to adopt a system in future, more in accordance with the teachings of nature as interpreted by science. They may do so with the full assurance that it will increase both the quantity and quality of their crops, and also augment their pecuniary returns.

Grass lands laid down in the fall, in the manner I have just described, will generally give a fair crop of hay on the ensuing summer; but the second summer is the most trying year for the young meadow. Many of the young plants are found to have died out, and their places are supplied by noxious weeds, while the good plants that are alive look feeble and sickly. This is caused by the solid packing of the earth around the roots of the grass. They can hardly penetrate into the hard soil, nor can the atmosphere readily find access to them. The worms have not yet been attracted in sufficient numbers to make a proper mould, or to fill the soil with air galleries, nor have succeeding crops yielded their debris to the soil. In this condition the food which the plant cannot find below, must be supplied to it from above. Early in the second spring, if we cannot obtain a supply of well rotted barn yard manure, we may mix together two parts of Peruvian guano, one part of plaster, and one part of ashes, and apply it to the new meadow at the rate of four hundred pounds to the acre, which will be found to invigorate the grasses and repress the growth of weeds, and what is of almost equal importance, it will increase the activity of the worms.

The meadow will now be fairly started, and if the matters removed by the crop are faithfully restored, it will constantly increase in fertility, and return a yearly improving dividend on the

capital invested in its formation. Since the matters taken from the soil by the crops must be returned to it in some way, it becomes a very interesting question to the farmer how this return can be made in the most economical and effectual manner.

The answer to this question will be very different in different localities; in some, one kind of manure will be cheap and easy to be procured, which in another would be quite too costly to use with profit or advantage. We will, therefore, speak of several, some one of which will be applicable to every locality.

Among the manures suited to the improvement of grass lands, bone dust occupies a very conspicuous place; it is mainly composed of phosphate of lime and gelatine, the latter of which is rich in nitrogen, and therefore furnishes in itself some of the most important components of grass, and must, therefore, minister directly to its growth. Mr. J. Dixon, in a paper published in the *Journal of the Royal Society of Agriculture*, gives some very striking and intelligible examples of its value, some of which I select for your consideration. In the year 1840, he covered his grass lands at a cost of \$20 an acre. Within two years after it had been boned, the character of the herbage was entirely changed for the better, and the land which had previously rented for \$7 50 an acre, now lets for \$15, and yields a far better profit to the tenant than it did before at \$7 50.

In 1841, Mr. Williamson manured his grass with bone dust at a cost of \$12 an acre; his soil and subsoil were both of a very tenacious character. After it had been boned two years, the sedges and weeds which constituted nearly all the herbage, were replaced by a luxuriant growth of the true meadow grass. Previous to the boning, forty cows had been kept on the land, and were at times almost starved; now fifty-two were kept, and a large number of sheep in addition.

From twelve to fifteen cwt. had been found to be about as large a dressing as can be profitably applied to an acre at one time. If some means were adopted to preserve the bones which are daily wasted in our families, together with the refuse of comb, knife-handle and button factories, for the benefit of our grass lands, it would add some millions of dollars to our Nation's wealth.

Lime has been extensively used as a manure for grass lands with great benefit, both in Europe and America. It seems to be of special use on those dry pastures and meadows which are liable to burn in hot weather. It diminishes the tenacity of clay lands, and sets free its latent ammonia for the benefit of the growing crop. It corrects the acidity of our soils, and represses the growth of sorrel, besides which, it ministers directly to the composition of all the grasses. I have before me a large number of statements at-

testing its efficacy as a manure, but will content myself with mentioning but one of them. In this case two hundred and eighty acres, used as a pasture for hire, yielded an average rental for ten years of \$630. It was then limed, and has since rented for \$1,000 a year, so greatly has the produce been increased, both in quantity and quality.

It may be very beneficially used in connection with common salt, by dissolving eight hundred pounds of salt in the water used for slacking 1½ tons of lime; it should be slacked in small heaps; it will be ready for use in a week, and will be found a most valuable application to grass lands.

(To be continued.)

STEPHEN GIRARD'S APPRECIATION OF INDUSTRY.

An old retired Morocco manufacturer states that when the East India trade centred here in Philadelphia, and they first began to import the East India goatskins in small quantities as an experiment, with their assorted cargoes, and when the business was in its infancy, it was then encouraged and fostered by Girard, as the following incident related by him of his own life will show: "I was," says he, "a poor man at that time, buying a few hundred skins at a time, paying cash as I bought them, and wheeling them home on my barrow; and, after manufacturing, wheeling them around town, selling them to my customers. At that time I worked early and late, working like a horse in a mill. When at the break of day I would be washing my skins in the Cohocksink Creek, on the Frankford road, I would often see Stephen Girard riding out for his morning's ride. He used often to stop on the old bridge and gaze at me working for a while, and then continue on. As I said, I used to buy my skins a few hundred at a time, and do my own portering. I went into town for my usual supply one day, for my few hundred of skins from the shipping merchant, when I was surprised by his making an offer to let me have twenty bales, or ten thousand skins. I looked at the man as if he was crazed; I told him I only wanted a few hundred, as usual, and there is your money, when he still frightened me by repeating his offer, and telling me he knew what I wanted mentioning a very low price, and also on a liberal credit, and as he seemed very anxious to sell, I wanted to know the reason why; I thought he could not be in his senses; I could never pay him. Never you mind, by good fellow, about that, it will all come right in good time; only say the word that you will take them, and up to your place they go, wheel-barrow and all—just give me your notes for the amount. I thought to myself he was a clever chap, and as he said he knew what I wanted better than I did myself, and if he was willing to risk his money (amounting to two thousand dollars,) why should I complain, so I told him to send them along. This was the turn in

life with me, it was the opportunity to make the most of. The skins were finally manufactured in good time, and so were the liabilities met, and when I got entirely through with it, and was completely and firmly on my feet, with a snug capital made from the profits, I asked my merchant friend how he came to credit me with such a large amount of stock; it was a great risk on your part to run. He then gave me the key to the enigma. It seems that when Stephen Girard in his rides used to observe me working morning after morning, incessantly, with my pants rolled up to my knees, working like a Trojan, inquired from my friend if he could not sell me some skins, if he did, he would take all my paper without recourse, and that, says the old manufacturer, is one of the good hidden deeds of old Stephen Girard, the millionaire merchant of Philadelphia."

ITEMS OF NEWS.

EUROPEAN NEWS.—A recent steamer brings the intelligence that England has made four propositions to France and Austria relative to the settlement of the Italian difficulties, viz: 1st. Neither Power to interfere, without the consent of the five Great Powers. 2d. The French troops to be withdrawn. 3d. Venetia to be left to Austria. 4th. The Central Italy States to be left again to express their desires.

France had agreed to all but the fourth proposition.

Austria had not replied, but it was understood that that Government objected to two of the propositions.

Lord John Russel expressed confidence in an amicable settlement of the question.

The Great Ship Company, on the recommendation of the Committee on Investigations, resolved to borrow £50,000 to get the steamer Great Eastern ready for sea without delay. The estimated cost to prepare her for America was £30,000.

The Emperor of Austria has received a portion of the Hungarian deputation and promised them satisfaction.

The provisions of the late treaty between England and France have been explained in a great measure.

It was anticipated that the duties will be materially reduced on wine, brandy, timber, currants, raisins, &c., and the duties on paper, butter, tallow, and other articles abolished. The duties on tea and sugar will remain unchanged for another year.

The treaty was favorably received in most quarters.

It is supposed that England will resume her mediation between Spain and Morocco. The Ministerial troubles in Naples still continued, as the King adhered to his intention of ordering his army to cross the frontiers. A revolutionary movement had occurred at Accra, near Naples.

The steamship Hungarian, which left Queenstown for Portland on the 9th instant, ran ashore on the west side of Cape Sable, and was totally wrecked. All her crew and passengers, it is supposed, are lost.

CUBA AND THE SLAVE TRADE.—A Havana correspondent says:

"No less than four vessels, that were notoriously bound for the coast of Africa to return with cargoes of Bozales, have left this harbor within the last ten days. One of them is a steamer. She was brought here twelve or fifteen months ago, perhaps longer, from Montreal, sold to certain Spanish houses, and until recently has been employed as a coasting steam-

er. She was called the Colon, but I think it probable she has been re-baptized, and has now another name. A day or two before she left this harbor she was repainted entirely black, so as, I suppose, to deceive the cruisers on the coast of Africa (who, of course, are in possession of a description of her) as to her character. She did not clear at all at the custom house here, and went to sea in the night, or, at least, she was observed in this harbor in the evening, and next morning was *non est inventus*.

"It is utterly impossible that the authorities of this island were not aware that this steamer was fitting out in the harbor for a voyage to the coast of Africa, and it was in their power to have detained her.

"The other three vessels referred to, it was equally notorious, were fitted out for the coast of Africa, to return with cargoes of Bozales, and they, too, might, had such been the desire of the authorities, have been detained."

THE CROW.—In an article on winter birds, we have this defence in the *Atlantic Monthly*.

"He consumes in the course of the year vast quantities of grubs, worms, and noxious vermin; he is a valuable scavenger, and clears the land of offensive masses of deceased animal substances; he hunts the grain fields, and pulls out and devours the underground caterpillars, whenever he perceives the signs of their operations, as evinced by the wilted stalks; he destroys mice, young rats, lizards, and the serpent; lastly, he is a volunteer sentinel about the farm, and drives the hawk from its enclosure, thus preventing greater mischief than that of which he himself is guilty. It is chiefly during seed time and harvest that the depredations of the crow are committed, during the remainder of the year we witness only his services, and so highly are these services appreciated by those who have written of birds that I cannot name an ornithologist who does not plead in this behalf."

AMERICAN GROWN TEA.—A gentleman in the agricultural division of the Interior Department states that he has tested some tea made from the leaves of the plants grown in the agricultural garden on Missouri avenue, in Washington. He says the flavor is far superior to any he has ever tried, having a rich, oily taste, which is really delightful. The tea, to be properly tested, must be drank without milk.

FACTORY CHILDREN IN ST. PETERSBURG.—The Journal de St. Petersburg states that the special commission, appointed to draw up regulations for the manufactories and industrial establishments of St. Petersburg, has recently called to its aid several noted political economists, and these gentlemen have proposed to the commission twelve years of age, instead of ten, shall be the earliest period at which children shall be allowed to work in factories. From that age to fourteen, they are not allowed to work above six hours per day, and between fourteen and sixteen, twelve hours at the utmost. It is also proposed to keep the males and females separate, and that all factory children shall be made to go to school.

TELEGRAPHIC PROJECT.—The overland route for telegraphic communication with America has been proposed in France—making use of the existing lines from London to Dresden, and from thence entering the Russian Empire, and passing through Moscow and Kasan; then crossing the Ural Mountains to Yakoutsk, and on to the Behring Strait, crossing this, and passing through Russia America to Canada and the United States.

THE ATLANTIC AND PACIFIC TELEGRAPH.—The Senate committee having the subject in charge have reported unanimously in favor of the Atlantic and Pacific Telegraph bill, as amended by Mr. Gwin. The bill

authorizes the Postmaster General to contract with certain parties for building for the use of the Government a line of telegraph from some point on the Mississippi river to San Francisco, with connecting branches to various prominent points. The contract is limited to ten years, and the bonus offered by the Government is fifty thousand dollars per annum for that period, together with the free use of any unappropriated public land that may be required, and the privilege of buying at \$1.25 per acre, such portions of said land as may be necessary for the purpose of the company. In return for these very liberal grants, the company will be expected to accord to the United States at all times, a priority in the use of their line. It is stipulated that the work shall be completed within two years, from the 31st of 7th month.

GREAT TELEGRAPHIC FEAT—FROM NOVA SCOTIA TO THE MISSISSIPPI IN A FEW SECONDS.—The extraordinary operation of sending dispatches direct from Halifax, Nova Scotia, to Milwaukee and Prairie du Chien; via Quebec, Kingston, Ogdensburg, Detroit and Chicago, was to-day performed, the lines working over three thousand miles with ease. Dispatches were received at Milwaukee and other points, and answered in a few seconds, promptly and with accuracy. This is working over a line nearly twice the length of the Atlantic cable, and demonstrates the fact that, with good lines and skillful operators, a line of almost any length can be worked as well as a short one. The operators here inform us that it would have worked, without doubt, equally as well over one or two thousand miles of additional wire.—*Milwaukee Sentinel.*

POST OFFICE BILL.—The Post Office bill, having received the signature of the President, has become a law. The bill, as passed, appropriates \$4,296,000 to supply the deficiency, and \$4,000,000 for the support of the department for the year ending 6th mo. next, and the further sum of \$2,400,000 was appropriated for the payment of the salaries of officers, clerks, &c., and for the transportation of the mails, &c.

CANALS IN FRANCE.—It is stated that the Emperor Napoleon has made an appropriation of five millions of dollars for the improvement of the canals of the South of France, from Marseilles to Bordeaux. They are to be widened to twenty-six yards, and deepened to sixteen and a half feet. When completed, the passage to the Mediterranean, now made through the Straits of Gibraltar, and which takes two months, will be accomplished by this route in ten days.

CAMELS.—Benjamin M. Woolsey, of Selma, Alabama writes to the Savannah Republican an account of his experience with the camel. He thinks that upon paved streets, as in New York or New Orleans, they would last longer and do better than the mule, and would not be subject to broken knees and diseases of the foot; and that the curvature of the spine, the superior weight and strength of the camel, evidently fit him for the car or dray. He can carry on his back as much as can be packed in a two horse wagon.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—The market for breadstuffs is quite firm. Sales of superfine at 5 75, and extra at \$6 25. There is a steady home demand from the above quotation up to \$6 50 for common and extra brands, and \$6 50 up to \$7 25 for extra family and fancy lots. Rye Flour and Corn Meal are dull, the former is offered at \$4 25, and the latter at \$3 62.

GRAIN.—There is not much Wheat coming forward, and the demand is active. We quote good and prime Penna. red at 140 cents in store, and white at 155 a 157 cents. Rye—sales of Pennsylvania at 92 cts.

Corn is dull. Sales of yellow at 75 a 76½c. Oats are dull; Pennsylvania sold at 44 a 44½c., and Delaware at 43c. Barley Malt is selling at 95 cts per bus.

CLOVERSEED comes forward more freely. Sales of fair and prime at 4 25 a 5. Timothy is worth \$3 25, and Flaxseed at 1 58 a 1 60 per bushel.

One who has had some experience in teaching wishes either to assist in a boarding school, or to take charge of one, where the usual branches of an English education are taught. A Friends' school preferred. Inquire at this office.

3d mo. 3.

ANNE CHURCHMAN'S BOARDING AND DAY SCHOOL, No. 908 Franklin street above Poplar. 1st mo., 28, 8t.

THE FALLSINGTON BOARDING SCHOOL affords superior advantages to young ladies who desire, by a thorough course of study, to prepare themselves for the active duties of life.

The number of scholars is limited to twelve, and all are under the immediate care of the Principals.

For circulars address

BEULAH S. & ESTHER LOWER,
Fallsington, Bucks county, Pa.,
or, **WILLIAM S. LOWER,** 455 N. Seventh St., Pa.
2 mo. 11, 1860. 3 m.

BYBERRY BOARDING SCHOOL FOR GIRLS. The Spring Session of this School, taught by Jane Hillborn and others, will commence the 20th of 2d mo., 1860, and continue twenty weeks. The course of instruction embraces all the branches of a liberal English education.

Terms \$60 per Session, one-half payable in advance. For Circulars containing further particulars, address

JANE HILLBORN,
Byberry P. O., Penn.

1st mo. 28, 1860.—2 mo.

EATON ACADEMY, KENNETT SQUARE, CHESTER COUNTY, PA. The Winter Term of the above Institution will expire on the 15th of the 3d mo. next, but, in order to meet the desire of many of the Pupils, and friends and patrons of this Institute, the undersigned have concluded to re-open the School for both sexes, on 2d day the 19th following, and continue it a period of ten weeks, or half a Session, at the present rates, which are \$65 per Term for Tuition, Boarding, &c., and \$16 for Tuition only, one-half payable in advance.

Catalogues, containing further particulars, will be sent to those desiring the same. Apply to

WILLIAM CHANDLER,
Principal and Proprietor,
Or to **WILLIAM A. CHANDLER,**
Principal Instructor.

1st mo. 28, 1860.

LAKE SCHOOL FOR BOTH SEXES. The 2d semi-term of 20 weeks is to begin 20th of 2d month. The charge, in full, for board and tuition, per term of 20 weeks, is \$45, or at the rate per week of \$2½.

Circulars with references sent by applying to either subscriber

SIDNEY AVERILL,
ELMINA AVERILL,

PHILADELPHIA, THIRD MONTH 10, 1860.

No. 52.

EDITED BY AN ASSOCIATION OF FRIENDS.

PUBLISHED BY WM. W. MOORE,
No. 324 South Fifth Street,
PHILADELPHIA,

Every Seventh day at Two Dollars per annum, *payable in advance*. Three copies sent to one address for Five Dollars.

Communications must be addressed to the Publisher free of expense, to whom all payments are to be made.

The postage on this paper, paid in advance at the office where it is received, in this State, is only 13 cents per annum; if out of the State, to any part of the United States, 26 cents.

From Janney's History of Friends.

JOHN BANKS.

In Cumberland, the meetings of Friends continued to increase, and among those added to their number in the year 1654 was John Banks, who has left on record some account of his religious experience.

He was born at Sunderland, in the county of Cumberland, in the year 1638, and in early life removed with his parents to the neighborhood of Pardshaw. Through the judicious care and counsel of his pious mother, he was preserved from the corrupting influence of bad examples, and being sent to school early, he became a diligent and exemplary student. At fourteen years of age his father put him to teach school at Desington, and the following year he taught at Mosser Chapel, near Pardshaw, where he read the Scriptures and the homilies of the Church of England to those who attended the chapel on First days. He also joined with them in singing psalms and public prayer. "For this service," he says, "my wages from the people was to be twelve pence a year from every house of those who came to hear me, and a fleece of wool, and my table free; besides twelve pence a quarter for every scholar I had, being twenty-four." Among those who attended the chapel was John Fletcher, a good scholar, but a drunkard. He took John Banks aside and told him he read very well for a youth, but did not pray in proper form, offering at the same time to teach him. His instructions for praying were sent in a letter, which, coming to John while at the chapel, he went out to read. No sooner had he read it, than his mind became convinced, through the immediate operation of divine grace, that a qualification for gospel ministry and acceptable prayer

can only come by "the revelation of Jesus Christ;" and the language arose in his heart, in relation to the written instructions he had just been reading, "Thou hast this prayer from man, and are taught it by man, and he one of the worst of many." Under the solemn feelings then experienced, he determined never more to pray in that formal manner; and an impression at the same time attended his mind, saying, "Go to the meeting of the people in scorn called Quakers, for they are the people of God." Being at Pardshaw meeting the next First-day, "the Lord's power," he says, "so seized upon me in the meeting, that I was made to cry out in the bitterness of my soul, in the true sight and sense of my sins, which appeared exceeding sinful; and the same evening, as I was going to an evening meeting of God's people, scornfully called Quakers, by the way I was smitten to the ground with the weight of God's judgment for sin and iniquity, which fell heavy upon me, and I was taken up by two Friends. Oh, the godly sorrow that took hold of me that night in the meeting, so that I thought in myself every one's condition was better than mine! A Friend, who was touched with a sense of my condition, and greatly pitied me, was made willing to read a paper in the meeting, which was so suitable to my condition that it helped me a little, and gave some ease to my spirit."

He was then about sixteen years of age, and at the end of the year when he was to receive compensation for reading at the chapel, he could not accept it, nor did he ever again read prayers to the congregation. For some years he continued under deep religious exercise, which so affected him, both in body and mind, that he had to relinquish his school. He then engaged in husbandry, and assisted his father in business, being doubtless convinced that useful industry promotes physical health and serenity of mind. "At length," he says, "I overcame the wicked one, through a diligent waiting in the light and keeping close to the power of God—waiting upon him in silence among his people, in which exercise my soul delighted." Oh, the comfort and divine consolation we were made partakers of in those days! and in the inward sense and feeling of the Lord's power and presence with us, we enjoyed one another, and were near and dear one unto another. But it was through various trials and deep exercises, with fear and trembling, that

thus we were made partakers. Blessed and happy are they who know what the truth hath cost them, and hold it in righteousness!" . . . "My prosperity in the truth I always found was by being faithful to the Lord in what he manifested, though but in small things, unfaithfulness in which is the cause of loss and hurt to many in their growth in the truth."

About six years after his conviction, being in the year 1660, he appeared in the gospel ministry. "The Lord," he says, "opened my mouth with a testimony in the fresh spring of life, that I was to give forth to his children and people." "Oh! then a great combat I had through reasoning that I was but a child, and others were more fit and able to speak than I. But the Lord by his power brought me into willingness, and with fear and trembling I spoke in our blessed meetings."

At one time, as he was sitting in silence at a meeting on Pardshaw Crag, his mind was deeply exercised under an apprehension of religious duty to go to the parish house of worship at Cocker-mouth. Although much in the cross to his own will, he yielded, and went. When he entered the house, the minister was preaching; who cried out, "There is one come into the church like a madman, with his hat on his head. Churchwardens, put him out." They immediately thrust him out; but after awhile he went in again, and waited till the service was ended. Then he said to the priest, "If thou be a minister of Christ, stand to prove thy practice, and if it be the same as the apostles and ministers of Christ, in doctrine and practice, I will own thee; but if not, I am sent of God this day to testify against thee." The priest immediately departed, and a great uproar ensued, some of the people being disposed to maltreat John Banks, and others endeavoring to protect him. At length he was hauled out of the house, but found an opportunity in the yard to address the congregation, opening to them the truths of the gospel of Christ, after which he came away in the enjoyment of "sweet peace and spiritual comfort."

It was not long before he experienced the common lot of nearly all the Friends of that day; being taken in a religious meeting held on a common at a place called Howhill, in Cumberland, he and three other friends were committed to prison at Carlisle. Being unwilling to pay the prison fees demanded by the jailer, they were kept in the common jail for several days and nights without food, drink, or bedding, and their friends were denied the privilege of supplying their wants. The jailor, finding that he could not effect his purpose by this means, removed them into a room in his own house, where several Friends were imprisoned for the non-payment of tithes. After about two weeks' confinement they were tried at the quarter sessions, and set at liberty; but a considerable amount was taken

from them by distraint of their goods for the payment of fines.

John Banks was a devoted and efficient minister of the gospel, whose labors and sufferings will again claim our notice.

ROBERT LEIGHTON.

The annexed account of a meek and humble Christian, is an instructive evidence that the church militant is composed of the good, in all denominations. His forbearance toward those who differed from him in his religious views, shows the largeness and gentleness of his spirit.

Robert Leighton, was born in the year 1611; whether in Edinburgh, or in London, is not very certainly known, neither is it now a matter of much importance.

His father, Dr. Alexander Leighton, was noted as a zealous Presbyterian, and under this administration of religion his son was educated.

Of the boyish days of Leighton we have but scanty records, except from his affectionately attached sister, who says of him, "that his singular teachableness and piety, from his tenderest age, endeared him greatly to his parents, who used to speak with admiration of his extraordinary exemption from childish faults and follies."

At college his conduct appears to have been so uniformly good as to have attracted the notice of his superiors, who congratulated his father on having such a son. He was, however, guilty of one satirical poem on the warden of his college, in which there is said to have been "much good-tempered playfulness of fancy." After taking his degree, he passed some years on the Continent, part of the time at Douay, where, while highly deprecating the superstition and errors of the Church of Rome, he was struck by beholding men, even under that administration of religion, whose lives were on the strictest models of primitive piety; and he never would denounce with fire and faggot every individual who chanced to be within the pale of the Church of Rome; indeed violent denunciation in every form, except against sin, his soul abhorred.

It was whilst at Douay that he became in degree shaken in his attachment to the Presbyterian Church.

He appears, both at that time, and in after life, to have had a very decided feeling, as to the gain it had been to him thus early to have seen so much of men and manners, in different lands, and under various circumstances; but we will give his opinion in his own words:—"There is," says he, "a very peculiar advantage in travel, not to be understood but by the trial of it."

In 1641, he entered on his duties as a Presbyterian minister in a small parish in Midlothian. Whilst holding this office, he appears

to have done his work with exemplary devotedness and fidelity; but he did not mingle in the convocation enough to satisfy his fellow-presbyters, who were fond of discussing "The Covenant," forcing it even upon conscientious objections.

It is said of Leighton that his aim was not to win proselytes to a party, but converts to Jesus Christ. When attacked by some of the zealous party on not preaching up "the times," he meekly replied, "If all of you preach up 'the times' you may surely allow one poor brother to preach up Jesus Christ and eternity."

He retained his post as pastor in the parish of Newlottle, until 1653, when he resigned it; and a few years later he gave up his connection altogether with the Presbyterian Church, and became a member of the Episcopal Church. This change he appears to have made on conscientious grounds: never probably was there a man in whose mind worldly ambition had less place. It was not long, however, before the bishopric of Dunblane was offered to him. Slowly, and with evident reluctance, did he accept the proffered promotion; but we will give his own words:—"This word will I add, that, as there has been nothing of my choice in the thing, so I undergo it, if it must be, as a mortification, and that greater than a cell or hair-cloth; and whether any will believe this or not, I am not careful."

The exclusive and narrow spirit of many of his spiritual colleagues Leighton highly disapproved: he says,—“I have met with many cunning plotters, but with few truly honest undertakers. Many have I seen who were wise and great as to this world; but of such as were willing to be weak that others may be strong, and whose only aim it is to promote the prosperity of Zion, have I not found one in ten thousand.”

So troubled was he at the persecuting spirit in the diocese, that he resolved to present himself before the king, and offer to resign his post unless things were changed. The result was, that Charles would not hear of his resignation, but pledged himself to enact the sheathing of the secular sword, against which Leighton had so faithfully protested. The law which would goad Dissenters into confinement, goals, and corporal punishments, was, by the intercession of Leighton, annulled.

So little did the bishop expect this concession on the part of the king, that, before going, he wrote a farewell charge to his clergy, in which he says:—"My last advice to you is that you continue in the study of peace and holiness, and grow and abound in love to your great Lord and Master, and to the souls for whom he died. If in anything, whether in word or deed, I have given you offence, and unnecessarily pained a

single individual amongst you, I do earnestly and humbly crave forgiveness."

Leighton continued in Dunblane until the year 1669, when he was translated to Glasgow, where he continued until age and infirmities made him desire rest. He says of himself,—“*Senectute fractus, portam exoptans.*”

The disregard of worldly emolument was a striking feature of his character. The sum expended on his personal requirings was wonderfully small, but his liberality to others seemed scarcely to know any bounds. It has been said of him, that, except a bare allowance for his own wants, all he received he gave to the poor.

On being called to a bishopric, he objected to be addressed as "My Lord." It has been said of him,—“The only priority he sought was in labor, the only ascendancy he coveted was in self-denial and holiness, and in these respects he had few competitors for pre-eminence.”

Without holding any exaggerated view as regards the doctrine of perfection, he would often lament the low practice of those who ought to have been more earnestly pressing towards the mark. "So much talk," he says, "and so little action, religion turned almost to a tune and air of words, self and pride, and passion domineering, while we speak of 'being in Christ and clothed with him,' and believe it because we speak it so often, and so confidently. Well I know," he says in writing to his friend, "you are not willing to be thus deceived, and having some glances of the beauty of holiness, aim no lower than perfection, which, in the end, we hope to attain; in the meanwhile, the smallest advances toward which are more worth than crowns or sceptres."

As regards natural things, Leighton was not a fearful and timid Christian; indeed he evinced great disregard of personal danger.

On one occasion, having, with his brother Sir Ellis Leighton and some others, embarked in a boat on the Thames, they were, from the unskillful management of the boat, or some other cause, apparently in danger of going to the bottom. The rest of the party were in great alarm, but Leighton never for a moment lost his accustomed serenity. To some of his friends, who afterwards expressed their astonishment at his calmness in the midst of danger, he only replied, "Why, what harm would it have been if we had all been safely landed on the other side?"

On one occasion, during the civil wars, he was anxious to visit his brother, and while on his way to the camp where his brother then was, he found himself benighted in the midst of a thicket, and, having lost the path, he sought in vain for an outlet. Almost spent with fatigue and hunger, he began to think his situation desperate, and dismounting, he spread his cloak on the ground, and knelt down to pray. With implicit devotion he resigned his soul to God, entreating however, that if it were not the divine

will for him then to conclude his days, some way of deliverance might be opened. Then, remounting his horse, he threw the reins on its neck, and the animal left to itself, or rather to the conduct of an over-ruling Providence, made straight into the high road, threading all the mazes of the wood with unerring certainty.

Of the habits and employments of Leighton after he resigned the arch-bishopric but few particulars remain; he appears to have lived chiefly with his beloved sister Lightmaker.

"The dressing and undressing of his soul,"—as he used to call his devotional exercises,—was now, he thought, the business to which his few remaining days should be consecrated.

After disburdening himself of all episcopal dignities, he became a simple parish minister. In the peasant's cottage it is said of him, "his tongue dropped manna." Prayer and praise were the clothing of his spirit. "It is not," he would say, "the want of religious houses, but of spiritual hearts that glues the wings of our affections and hinders the more frequent practice of this leading precept of the divine law, fervently to lift up our souls unto God, and to have our conversation in heaven." His favorite motto was, "*Necesse est non ut multum legamus sed ut multum oremus.*" This he accounted "the vessel with which living water can be drawn from the well of divine mysteries." Pointing to his books one day, he said to his nephew, "One devout thought is worth them all."

Leighton's kindness and forbearance were very uncommon. It is said that he had a manservant who by his thoughtlessness often tried his master's equanimity, and that one day this man, having a fancy for the amusement of fishing, locked the door of the house, carried off the key, and left his master imprisoned. He was too much engrossed with his sport to think of returning until evening, when the only reproach he received from the meek bishop for this gross misbehavior was, "John when you next go a fishing, remember to leave the key in the door."

Of his forbearance toward those who differed from him in the administration of religion we have undoubted proof. It has been said that if he ever did meddle with them it was in so gentle a manner as at once to show the meekness and the largeness of his spirit. "I prefer," he would say, "an erroneous honest man to the most orthodox knave in the world, and I would rather convince a man he has a soul to be saved, and induce him to live up to the belief, than to bring him over to my opinion in whatsoever thing beside. Would to God that men were as holy as they might be under the worst of forms now amongst us!" On being told of some one who had changed his religious persuasion, all he said was, "Is he more meek, more dead to the world? If so, he has made a happy change."

He was not fond of giving his opinion on

speculative points in religion, and when one day pressed to say what he thought of the millenium, and as to the saints reigning with Christ, he tried to avoid the question, and merely replied, "If we suffer with Him we shall also reign with Him."

"He well knew," writes his nephew, "when it was expedient to be silent, and when it behoved him to speak, and he was of opinion that 'the silence of a good man will sometimes convey a more effectual lesson than his discourse.'" Accordingly he was averse to long or obscure preaching; "for it is better," said he, "to send the people home still hungry than surfeited." There is much meaning in a prayer which he often used, "Deliver me, O Lord, from the errors of wise men, yea, of good men."

He was by nature endowed with warm affection; of this we find proof in a letter to his brother-in-law, Lightmaker, after the death of a child.

"I am glad of your health," he writes, "and of the recovery of your little ones; but indeed it was a sharp stroke of a pen that told me your pretty Johnny was dead, and I felt it truly more than, to my remembrance, I did the death of any child in my life-time. Sweet thing! and is he so quickly laid to sleep? Happy he! Though we shall no more have the pleasure of his lisping and laughing, he shall have no more pain of crying, nor of being sick, nor of dying: he has wholly escaped the troubles of childhood, and the riper and deeper griefs of riper years; this poor life being all along a linked chain of many sorrows and many deaths.

"Tell my dear sister she is now so much more akin to the other world, and this will quickly be past to us all for ever. John is but gone an hour or two sooner to bed, as children are used to do, and we are undressing to follow. And the more we put off the love of this present world, and all things superfluous behind, we shall have the less to do when we lie down. It shall refresh me to hear from you at your leisure.

"Your affectionate brother,

R. LEIGHTON."

Leighton was a great admirer of rural scenery, and in his rides on the Sussex Downs often would he descant, with devout fervor, on the marvellous and beautiful works of the Almighty Architect.

It has been said of him, that to the things of time he died daily. He would talk of death in no melancholy tone, but as one whose heart was fixed on the blissful realities of the yet unseen world of which, through the mercy of God, in Christ Jesus, he had long had an assured hope. In bodily illness he was remarkably cheerful; but it may, for the encouragement of the weak believers be recorded, that he did not presume upon absolute assurance of final salvation. Conversing one day in his usual strain of holy

animation on the blessedness of being fixed *as a pillar* in the heavenly Jerusalem, *to go no more out*, (Rev. i. 11, 12) he was interrupted by a relation exclaiming, "Oh! but you have assurance." "No, truly," he replied; "only a good hope, and a desire to see what they are doing on the other side."

Burnet says of him, "He seemed to have the lowest thoughts of himself possible, and to desire that all other persons should think as meanly of him as he did of himself, and he bore all sorts of ill-usage and reproach like a man that took pleasure in it."

Of this great and good man little now remains to be said, except of his dismissal from the things of time to that higher and holier world, upon the unseen things of which his hopes had long been fixed.

Burnet, who had not seen him for a considerable time, one day greeted him on appearing so vigorous. Leighton replied, that, "for all that he was very near his end; his work was almost done."

The very next day he was attacked with a cold, which ended in pleurisy. He sank rapidly, soon becoming speechless and apparently unconscious, and after about twelve hours' panting for breath he died without a struggle, in the arms of his faithful friend Burnet.

We have no last words in the way of "dying sayings" to record; but his life had been one long and continued preparation for this hour, and testimonies to the certainty and fulness of his hope in Christ were not needed. He knew in whom he had believed, and the works and spirit of his whole course on earth had given abounding evidence of his faith. Who would not say, in contemplating the end of such a man, "*Let me die the death of the righteous, and may my last end be like his?*"

Leighton had long had a fear of having the solemnity of a dying hour interrupted, and his mind distracted, by witnessing the sorrow of those he loved. He had also a singular desire that his death might take place at an inn; in such a place he thought a believer might properly finish his pilgrimage, the whole world being to him "but as a large and noisy inn, and he a wayfarer tarrying only for a time."

In both these respects his desire was granted: his death took place at the Bell Inn, Warwick-lane, and of his particular friends Burnet alone was with him.

His remains were taken to Norsted Reynes, which had, since he resigned the episcopal office, generally been his home.

His funeral was most simple, with—as it has been said—no other pomp to hallow his obsequies than "the unbought attendance and expressive tears of the surrounding neighborhood."

Burnet who was the long tried and faithful friend of Leighton, says of him:—"He had the

greatest elevation of soul,—the largest compass of knowledge,—the most mortified and most heavenly disposition, that I ever yet saw in mortal. I can with great truth say that, in a free and frequent conversation with him for above two-and-twenty years, I never knew him say an idle word that had not a direct tendency to edification; and I never once saw him in any other temper but that in which I wish to be at the last moment of my life. From that pattern which I saw in him, and that conversation which I had with him, I know how much I have to answer to God."

One of Leighton's biographers, in speaking of his style, says:—"That which adds so peculiar a zest to his compositions is the quality usually denominated unction."

A MEMOIR CONCERNING JEREMIAH C. MOORE,
A Notice of whose death appeared in the Intelligencer of the 4th ult.

He was the youngest son of Andrew and Elizabeth Moore, and was born at West Branch, Clearfield county, Pa., the 8th of the 6th mo., 1832. Being ready to learn, he early obtained a knowledge of letters, so as to be able to read in his fifth year. Not having the advantage of regular school education, he improved the short intervals of relaxation from business to enlarge his store of useful knowledge. Being of a serious and contemplative disposition of mind, he chose the sedate and grave conversation of those of riper years to the too often light and volatile company of the young; yet, cheerful and lively when mingling with congenial spirits, and being chaste in his manners, he took pleasure only in such conversation as instilled useful and virtuous principles. He took particular interest in often perusing the sacred pages of Scripture, and was a firm believer in the solemn truths therein contained, manifesting his faith by his works. He was a regular attender of our religious meetings, having very creditably fulfilled the station of Clerk to his own Monthly Meeting for a considerable period, and only relinquished it when infirmity of body rendered him no longer able to attend to the service. Having a desire for literary improvement, his books seemed the greatest source of enjoyment when not actively employed in business, spending the intervals in retirement or with his parents. First-days, except meeting hours, he spent mostly at home. Being the youngest of a family of six children, and the only one remaining unmarried, the care of his parents, now in the decline of life, seemed more particularly to devolve upon him, and enlisted the energies of his body and mind in contributing to their comfort, being willing to lead a life of self denial that he might be better enabled to fulfil the high duties that devolved upon him; hence his early removal by death has left a void in the

family circle not easily to be supplied nor soon forgotten. Early in the spring of last year his health began to decline, but not so as to excite any particular apprehension of danger. He complained mostly of weakness with swelling in his limbs, which was attributed to rheumatism; such remedies were used as seemed likely to remove the complaint, and he was enabled to go about for most of the summer, and he performed some short journeys to neighboring meetings; but exercise, though advised by his physician, seemed to fatigue and exhaust him. Active endeavors were used to restore him, without avail, and his disease assuming a more alarming form, additional advice was called, and his case pronounced nearly hopeless, being organic disease of the heart and lungs. His strength failed fast during the last few weeks of his illness, with great oppression in respiration, particularly through the night, being unable to lie down but very little, and suffering much from exhaustion; yet at intervals he conversed cheerfully. Seeing those around him much affected, he desired them not to grieve, that he was willing to die, and had been some time preparing for such an event if it was the will of Providence, saying he desired the prayers of all his friends. Seeing his dear mother much affected, he desired her to give him up; she replied, she had given him up to the disposal of his Heavenly Father; he seemed satisfied, giving many evidences that his mind was at peace, and appearing to await calmly the final close.

After a sore conflict, his physical powers seemed much exhausted, and lying more composed, he conversed with those around his couch, appearing in a happy, resigned state of mind, earnestly engaged at times in mental prayer. Many weighty expressions dropped from his lips, during his illness, which gave abundant evidence of a mind filled with heavenly love.

After lying quiet for some hours, he calmly breathed his last, without a struggle, like one falling asleep, aged 27 years, 7 months and 10 days.

For Friend's Intelligencer.

THE CICADIA SEPTENDECIM, OR AMERICAN
LOCUST.

This singular insect will again make its appearance the coming spring. Why the name of locust was given to it is hard to tell, as it does not belong to that family of insects. Its true designation is Cicadia, of which the cricket and such other singing insects are examples. The true locust of the eastern hemisphere is of the grasshopper family, and are voracious feeders; and often commit dreadful depredations in the northern part of Africa, and sometimes in southern Europe. The flying grasshopper of the

West, that sometimes visits Minnesota and Utah if not the same insect, is of the same species and character.

The Cicadia Septendecim, as its last name indicates, is of 17 years duration, and this is its greatest singularity: When first hatched from the egg it is said to have the same form and appearance as when it issues from the ground preparatory to its taking wing. As it lives so long a time beneath the surface of the ground, it has been considered entirely harmless, but later investigation induces the belief that it often does injury there unperceived. As these insects do not appear to take nourishment while in the winged state, the inference is strong that they subsist on that which they receive before emerging from the ground.

Some naturalists who have given special attention to their habits, assert that they have found them adhering to the roots of trees, and, apparently, drawing sustenance from them, and, from this fact, suspect that when trees have assumed a sickly appearance, they are the cause of it. They have been known to arise in very large numbers from beneath apple trees in orchards, where no doubt the eggs were deposited in the young and tender shoots of the trees by the parent insect 17 years before. This fact is evidence that they do not move laterally in the earth, but descend perpendicularly, or nearly so, as they only ascend from the ground as far out as the branches extend. If the tree has been cut down within the 17 years, they will ascend where it stood, and in this case they must have lived on the roots of other vegetables growing in its place.

They usually make their appearance above ground from the 20th to the 25th of the 5th month—seldom earlier than the first, or later than the last date. They have been seen near the surface some days before appearing, and, apparently waiting for the proper time to come forth. Their holes are about half an inch in diameter, and perpendicular, unless they meet with some obstruction, in which case they vary their course to get round it. When they first appear above ground, they are about three-fourths of an inch in length and have six legs, the two hinder ones flat and larger than the others; they have rudimentary wings, and the sexes may readily be distinguished. They usually come up in the night, so that they may be enabled to climb up some distance before their outer skin becomes dry and stiff. They ascend the trunk of a tree or shrub to a height of from one to six feet or more, and as the skin begins to dry and harden, they firmly fix themselves by their claws, when the skin begins to split open in the back, and the insect presses itself out through the opening, drawing its legs and feet out, even to the minutest part, leaving even the form of the eyes. The skin often adheres to the place

where it was fixed for months. The insect now increases rapidly in size, and in a few hours the wings, which in the shell were nicely folded up, now expand, and with the body are nearly two inches in length. The color at first is yellowish white, but soon turns brown, and nearly black on the upper part of the body. The wings are provided with veins and nerves united by a thin and strong film; the nerves disposed in such a way as to form the letter W, which superstition formerly interpreted to portend war. They are now able to fly, and are quite a strong and vigorous insect. On their first reaching the surface of the ground they are preyed upon by hogs, and after taking wing all insect eating birds feast upon them; they are said to be so fat and oily that soap may be made of them.

The male insect soon commences his musical note. He is furnished with two concave drums, situated immediately under and behind the wings; these are covered with a thin parchment-like covering, with numerous small folds, which are acted upon by small cord-like threads or filaments within, that give a vibrating motion to the surface, and produce a quick, rattling kind of sound that may be heard a considerable distance, and when they are numerous may be heard nearly a mile. Each one continues his music for perhaps half a minute, when just before closing he increases the sound and then lets it gradually die away, and after a little time renews it again in a similar manner.

The female never sings; she is provided with an ovipositer for puncturing small branches of trees in which she deposits her eggs. This ovipositer is placed in the lower and hinder part of the abdomen, and is enclosed in a sheath. It is about the thickness of a small knitting needle, about half an inch long, and somewhat curved; it is flattened at the end and lance-shaped, and at the extremity is composed of two pieces with sharp notches like saw teeth on the edges. By giving these a vibratory motion, the insect is able to penetrate small twigs to their centre, and deposits four or five eggs in each incision; then by moving about half an inch forward, she performs a like operation, and deposits again; often depositing several times in a line if the twig is favorable, if not she removes to where it is, as she never attempts to work except on smooth places. Small twigs are often so cut up as to kill them, and are sometimes broken off by the wind. They thus sometimes seriously injure young fruit trees, and the best way in that case is to cut off the head or branches below the injured part, and let them form new heads. This is, perhaps, all the injury the insect does in the winged state. They do not continue more than six weeks, and, probably, do not live more than four; but by a few days inequality in the time of their appearing, they are seen a little more than five weeks.

The eggs thus deposited hatch after a few weeks, and it is said the young insect has the same form as when they first issue from the ground. It is a remarkable circumstance that they should live in the ground nearly 17 years and come out so nearly together.

We see by the newspapers that they are met with almost every year in some part of our widely extended country. Here we have two sets of them, and they appear every 8 and every 9 years alternately. It is said that they have appeared here in 1792, in 1800, and in 1809. I myself remember them in 1817, in 1826, in 1834, in 1843, and 1851. When last here they extended from the eastern base of the Allegheny mountains, above Cumberland, to within a few miles of Alexandria, in Virginia. How far they extended north and south I am not advised. This Spring they will not extend much into the valley of Virginia, very little west of the Blue Ridge, but will reach eastward about as far as Staten Island, New York.

YARDLEY TAYLOR.

Loudoun county, Va.

THE WOOD THRUSH.

BY JOHN J. AUDUBON.

This bird is my greatest favorite of the feathered tribes of the woods. To it I owe much. How often has it revived my drooping spirits, when I have listened to its wild notes in the forest, after passing a restless night in my slender shed, so feebly secured against the violence of the storm, as to show me the futility of my best efforts to rekindle my little fire, whose uncertain and vacillating light had gradually died away under the destructive weight of the dense torrents of rain, that seemed to involve the heavens and the earth in one mass of fearful murkiness:—how often, after such a sight, when, far from my dear home, and deprived of the presence of those nearest to my heart, wearied, hungry, drenched, I have been obliged to wait with the patience of a martyr for the return of day, silently counting over the years of my youth, doubting, perhaps, if ever again I should return to my home and embrace my family;—how often, as the first glimpses of morning gleamed doubtfully amongst the dusky masses of the forest trees, has there come upon my ear, thrilling along the sensitive cords, which connect that organ with the heart, the delightful music of this harbinger of day!—and how fervently, on such occasions, have I blessed the Being who formed the wood thrush, and placed it in those solitary forests, as if to console me amidst my privations, to cheer my depressed mind, and to make me feel, as I did, that man never should despair, whatever may be his situation, as he can never be certain that aid and deliverance are not close at hand.

The wood thrush seldom commits a mistake

after such a storm; for no sooner are its sweet notes heard, than the heavens gradually clear, the bright refracted light rises in gladdening rays from beneath the distant horizon, the effulgent beams increase in their intensity, and the great orb of day at length bursts on the sight. The gray vapor that floats along the ground is quickly dissipated, the world smiles at the happy change, and the woods are soon heard to echo the joyous thanks of their many songsters. At that moment all fears vanish, giving place to an inspiring hope. The hunter prepares to leave his camp. He listens to the wood thrush, while he thinks of the course which he ought to pursue; and, as the bird approaches to peep at him, and learn somewhat of his intentions, he raises his mind toward the Supreme Disposer of events. Seldom, indeed, have I heard the song of this thrush, without feeling all that tranquillity of mind, to which the secluded situation in which it delights is so favorable. The thickest and darkest woods always appear to please it best. The borders of murmuring streamlets, overshadowed by the dense foliage of the lofty trees growing on the gentle declivities, midst which the sunbeams seldom penetrate, are its favorite resorts. There it is, that the musical powers of this hermit of the woods must be heard to be fully appreciated and enjoyed.

FRIENDS' INTELLIGENCER.

PHILADELPHIA, THIRD MONTH 10, 1860.

MARRIED, In West Chester, Second month 27, 1860 by Friends' ceremony, EDWARD H. HALL and SARAH E. CRANSTON, all of that borough.

—, On the 11th of the Second month, 1860, at the residence of George Gawthrop, Avondale, Chester Co., Pa., according to the order of the Society of Friends, WILLING C. GRIEST, of Monallen, Adams Co., Pa., to PHILENA H. BROOMELL, of Chester Co., Pa.

DIED, On Second day, the 27th ult., SYBIL IREDEL, at an advanced age,—a member of Mullica Hill Monthly Meeting, N. J.

—, On Sixth day, the 2d inst., SAMUEL WHITE, in the 79th year of his age,—a member of Woodstown Meeting, N. J.

—, At the residence of her husband, Moorestown, N. J., after a few days' illness, LYDIA B. STYLES, wife of Joseph B. Styles, in the 27th year of her age,—a member of Chester Monthly Meeting.

In the notice of the death of this young friend in our paper of Second month 25th, the name of her husband, as well as the meeting to which she belonged, was unintentionally (*on our part*) omitted.

WE think a little earnest—a small tasting—is all that can be had of Christ in this life, (which is true compared with the inheritance,) but yet know it is more,—it is the kingdom of God within us.

Notes on Nursing: What it is: and What it is not. By FLORENCE NIGHTINGALE; New York, D. Appleton & Co.

We have been so favorably impressed with the views contained in this little work, that we take an early opportunity to direct the attention of our readers to the excellent matter it contains, and to express our conviction that the introduction of a copy of this book into every household might tend greatly to the comfort of the inmates, and the preservation of health in very many instances. Where it may not suit individuals to purchase it, we would encourage them to use their influence to have it placed in the nearest library, so that every one may read it and profit by its valuable suggestions. From the chapters on Ventilation and Warming and Health of Houses, we give a few extracts:—EDS.

The very first canon of nursing, the first and the last thing upon which a nurse's attention must be fixed, the first essential to a patient, without which all the rest you can do for him is as nothing, with which I had almost said you may leave all the rest alone, is this: TO KEEP THE AIR HE BREATHES AS PURE AS THE EXTERNAL AIR, WITHOUT CHILLING HIM. Yet what is so little attended to? Even where it is thought of at all, the most extraordinary misconceptions reign about it. Even in admitting air into the patient's room or ward, few people ever think where the air comes from. It may come from a corridor into which other wards are ventilated, from a hall, always unaired, always full of the fumes of gas, dinner, of various kinds of mustiness; from an underground kitchen, sink, wash-house, water-closet, or even, as I myself have had sorrowful experience, from open sewers loaded with filth; and with this the patient's room or ward is aired as it is called—poisoned, it should rather be said. Always air from the air without, and that, too, through those windows through which the air comes freshest. From a closed court, especially if the wind do not blow that way, air may come as stagnant as any from a hall or corridor.

Again, a thing I have often seen both in private houses and institutions. A room remains uninhabited; the fireplace is carefully fastened up with a board; the windows are never opened; probably the shutters are always kept shut; perhaps some kind of stores are kept in the room; no breath of fresh air can by possibility enter into that room, nor any ray of sun. The air is as stagnant, musty, and corrupt as it can by possibility be made. It is quite ripe to breed small-pox, scarlet-fever, diphtheria, or anything else you please.

Yet the nursery, ward, or sick room adjoining

will positively be aired (?) by having the door opened into that room. Or children will be put into that room, without previous preparation, to sleep.

With a proper supply of windows, and a proper supply of fuel in open fire places, fresh air is comparatively easy to secure when your patient or patients are in bed. Never be afraid of open windows then. People don't catch cold in bed. This is a popular fallacy. With proper bed-clothes and hot bottles, if necessary, you can always keep a patient warm in bed, and well ventilate him at the same time.

But a careless nurse, be her rank and education what it may, will stop up every cranny and keep a hot-house heat when her patient is in bed,—and, if he is able to get up, leave him comparatively unprotected. The time when people take cold (and there are many ways of taking cold, besides a cold in the nose,) is when they first get up after the two-fold exhaustion of dressing and of having had the skin relaxed by many hours, perhaps days, in bed, and thereby rendered more incapable of re-action. Then the same temperature which refreshes the patient in bed may destroy the patient just risen. And common sense will point out, that, while purity of air is essential, a temperature must be secured which shall not chill the patient. Otherwise the best that can be expected will be a feverish re-action.

To have the air within as pure as the air without, it is not necessary, as often appears to be thought, to make it as cold.

In the afternoon again, without care, the patient whose vital powers have then risen, often finds the room as close and oppressive as he found it cold in the morning. Yet the nurse will be terrified if a window is opened.

A careful nurse will keep a constant watch over her sick, especially weak, protracted and collapsed cases, to guard against the effects of the loss of vital heat by the patient himself. In certain diseased states much less heat is produced than in health; and there is a constant tendency to the decline and ultimate extinction of the vital powers by the call made upon them to sustain the heat of the body. Cases where this occurs should be watched with the greatest care from hour to hour, I had almost said from minute to minute. The feet and legs should be examined by the hand from time to time, and whenever a tendency to chilling is discovered, hot bottles, hot bricks, or warm flannels, with some warm drink, should be made use of until the temperature is restored. The fire should be, if necessary, replenished. Patients are frequently lost in the latter stages of disease from want of attention to such simple precautions. The nurse may be trusting to the patient's diet, or to his medicine, or to the occasional dose of stimulant which she is directed to give him, while the patient is all

the while sinking from want of a little external warmth. Such cases happen at all times, even during the height of summer. This fatal chill is most apt to occur towards early morning at the period of the lowest temperature of the twenty-four hours, and at the time when the effect of the preceding day's diet is exhausted.

Generally speaking, you may expect that weak patients will suffer cold much more in the morning than in the evening. The vital powers are much lower. If they are feverish at night, with burning hands and feet, they are almost sure to be chilly and shivering in the morning. But nurses are very fond of heating the foot-warmer at night, and of neglecting it in the morning, when they are busy. I should reverse the matter.

All these things require common sense and care. Yet perhaps in no one single thing is so little common sense shown, in all ranks, as in nursing.

The extraordinary confusion between cold and ventilation, even in the minds of well educated people, illustrates this. To make a room cold is by no means necessarily to ventilate it. Nor is it at all necessary, in order to ventilate a room, to chill it. Yet, if a nurse finds a room close, she will let out the fire, thereby making it closer, or she will open the door into a cold room, without a fire, or an open window in it, by way of improving the ventilation. The safest atmosphere of all for a patient is a good fire and an open window, excepting in extremes of temperature. (Yet no nurse can ever be made to understand this.) To ventilate a small room without draughts of course requires more care than to ventilate a large one.

Another extraordinary fallacy is the dread of night air. What air can we breathe at night but night air? The choice is between pure night air from without and foul night air from within. Most people prefer the latter. An unaccountable choice. What will they say if it is proved to be true that fully one-half of all the disease we suffer from is occasioned by people sleeping with their windows shut? An open window most nights in the year can never hurt any one. This is not to say that light is not necessary for recovery. In great cities, night air is often the best and purest air to be had in the twenty-four hours. I could better understand in towns shutting the windows during the day than during the night, for the sake of the sick. The absence of smoke, the quiet, all tend to making night the best time for airing the patients. One of our highest medical authorities on Consumption and Climate has told me that the air in London is never so good as after ten o'clock at night.

In laying down the principle that the first object of the nurse must be to keep the air breathed by her patient as pure as the air without, it must not be forgotten that everything in the

room which can give off effluvia, besides the patient, evaporates itself into his air. And it follows that there ought to be nothing in the room, excepting him, which can give off effluvia or moisture. Out of all damp towels, &c., which become dry in the room, the damp, of course, goes into the patient's air. Yet this "of course" seems as little thought of, as if it were an obsolete fiction. How very seldom you see a nurse who acknowledges by her practice that nothing at all ought to be aired in the patient's room, that nothing at all ought to be cooked at the patient's fire! Indeed, the arrangements often make this rule impossible to observe.

Let no one depend upon fumigations, "disinfectants," and the like, for purifying the air. The offensive thing, not its smell, must be removed. A celebrated medical lecturer began one day, "Fumigations, gentlemen, are of essential importance. They make such an abominable smell that they compel you to open the window." I wish all the disinfecting fluids invented made such an "abominable smell" that they forced you to admit fresh air. That would be a useful invention.

Three, out of many "negligences and ignorances" in managing the health of houses generally, I will here mention as specimens—1. That the female head in charge of any building does not think it necessary to visit every hole and corner of it every day. How can she expect those who are under her to be more careful to maintain her house in a healthy condition than she who is in charge of it?—2. That it is not considered essential to air, to sun, and to clean rooms while uninhabited; which is simply ignoring the first elementary notion of sanitary things, and laying the ground ready for all kinds of diseases.—3. That the window, and one window, is considered enough to air a room. Have you never observed that any room without a fire-place is always close? And, if you have a fire-place, would you cram it up not only with a chimney-board, but perhaps with a great wisp of brown paper, in the throat of the chimney—to prevent the soot from coming down, you say? If your chimney is foul, sweep it; but don't expect that you can ever air a room with only one aperture; don't suppose that to shut up a room is the way to keep it clean. It is the best way to foul the room and all that is in it. Don't imagine that if you, who are in charge, don't look to all these things yourself, those under you will be more careful than you are. It appears as if the part of a mistress now, is to complain of her servants, and to accept their excuses—not to show them how there need be neither complaints made nor excuses.

But again, to look to all these things yourself does not mean to do them yourself. "I always open the windows," the head in charge often says. If you do it, it is by so much the better, certainly, than if it were not done at all. But

can you not insure that it is done when not done by yourself? Can you insure that it is not undone when your back is turned? This is what being "in charge" means. And a very important meaning it is, too. The former only implies that just what you can do with your own hands is done. The latter, that what ought to be done is always done.

And now, you think these things trifles, or at least exaggerated. But what you "think" or what I "think" matters little. Let us see what God thinks of them. God always justifies His ways. While we are thinking, He has been teaching. I have known cases of hospital pyæmia quite as severe in handsome private houses as in any of the worst hospitals, and from the same cause, viz., foul air. Yet nobody learnt the lesson. Nobody learnt *anything* at all from it. They went on *thinking*—thinking that the sufferer had scratched his thumb, or that it was singular that "all the servants" had "whitlows," or that something was "much about this year; there is always sickness in our house." This is a favorite mode of thought—leading not to inquire what is the uniform cause of these general "whitlows," but to stifle all inquiry. In what sense is "sickness" being "always there," a justification of its being "there" at all?

SUBTERRANEAN SWITZERLAND.

(Concluded from page 811.)

Pursuing our investigations, we find that, dark as it may appear in its origin, the end of this Lacustrine dynasty has a sad light cast upon its cause. The villages, the inhabitants, all evidently perished by a sudden catastrophe; and that catastrophe was fire.

To understand this, reconstruct, by the architecture of fancy, the primitive villages of the Swiss Lakers. Take your stand on some rock of vantage, whence you can see all that is not water or snowy summit, covered with black-looking crowded pine forests that teem with the red-deer—once numerous in Switzerland, now extinct. Throw out your narrow wooden causeways a hundred yards forward into the shallow waters nearest the shore, drive whole quincunxes of fir-poles into the bed of the lake, top them with rudely fashioned planks, and upon the artificial peninsula now elevated above the waters, transport a bit of rivery Orientalism: dwelling-places for man, gardens, if you wish, or patches of ripened grain (for the catastrophe must have happened at harvest time), such as, even at this day, may be seen floating on the half-quaggy, inundating rivers and channel-pools of China. Penetrate into those circular Red Indian-like wigwams that stand like bee-hives on the stationary rafts, and see the rude pots upon the earthen shelves, the traps in the floor for catching or preserving fish, the little barbarian

children, tethered by the foot with a cord to a projecting stake, lest they fall into the water, (both these peculiarities are mentioned by Herodotus in his account of the Pæonians), and behold the industrious natives themselves, the pigmy race, with their small, but constructive and not cruel heads, and their long, flexible, Hindoo-like hands. Enter their manufactories for their ingenious tools and petty ornaments; and, when you have set the whole nation busy at their several employments, suddenly crush the whole of your scene and drama by the irruption of some wild band of warlike Gauls, who annihilate our poor aborigines, and their fragile dwellings, by casting fire-balls into the Lake villages, and killing or carrying away the inhabitants.

No other combination of circumstances can account for the appearances which the remains of the Lake villages present. The carbonized corn, the pieces of wood half burnt, the marks of fire everywhere, all testify to the destruction of these villages by fire. Then, again, it is apparent that all industry stopped suddenly. The workman was at his polishing, the housewife was grinding corn by hand between two flat stones, but, by a fate worse than that denounced upon Jerusalem—"the one taken and the other left"—of our poor Lake people none were left. The late explorers of these mysteries came, at Moosseedorf, upon a marvellous heap of objects of industry, which, by their state and number, crowded over a considerable area, proved that the discoverers were standing on the site of the village manufactory of industrial implements. Professor Troyon showed me many proofs that it was so—pieces of serpentine, half-fashioned and thrown away because they had been broken in the cutting, and rendered unfit for use; split stag's-horn also rejected; and, more affecting still, instruments that were not thrown away because of defect, but were dropped unfinished because of a sudden catastrophe: axes that lay beside the handles, into which time was not given to insert them; poniards yet unsharpened; needles or hair-pins yet unpointed.

He who visits Pompeii is not so much affected by the architecture he finds there, as by the signs of human life that realize the sudden destruction of the city. The woman's crouching form, impressed upon the lava that had filled a cellar, interests the heart more than hundreds of tessellated pavements. The remains fetched up from the subaqueous Pompeiis of Switzerland also produce this touching and human effect. They are more than books or oldest parchments wherein to read how race after race of men do verily pass away, according to old Homer's deathless simile, like leaves on trees. Science, too, on such evidences of abrupt conclusions to things, is wonderfully impelled to speculate on the wherefore of these stern closings-up of human periods. It is as if some power had grown tired

of a particular creation. Strong relation here to the geology of nature, in which the mintage of preceding eras is found suddenly to cease; the medals, indeed, laid up in the stupendous repositories of a past creation, but the dye that stamped them broken forever, and cast away as a thing of no account. No otherwise is it with the geology of man, with human relics subterrene or subaqueous. In the midst of their full life they were suddenly and utterly destroyed; if not by a volcano or an earthquake that ingulfs or overwhelms them, by man's own rage. The excavations of Wroxeter display a people suddenly crushed by some other people. The conquered are gone: the conquerors themselves have passed away. Similarly, the Swiss lakes are now giving up their records of hasty catastrophes, and nations blotted out forever. But why so sudden? Why so complete these destructions? Here, the doombook is silent and decipherless.

I can only glance at later eras to be read in the contents of Professor Troyon's museum. Arranged with infinite knowledge, this complete collection rises from the age of stone and wood to that of bronze (which composite material, though imperfectly mixed, does, singularly enough, precede any demonstration of simple iron), and so on to periods, still remote, but which, like the Eocene and Pliocene of geology, are assimilated to our own time by form and material; periods in which the luxury of the precious metals, and the beauty of gems, far from being unknown, were displayed in works of human fancy, then young and vigorous, which modern art but feebly imitates.

There is, however, one group of relics of the ante-Roman period, evidences of an event that probably occurred two centuries before Christ, which I cannot pass over in silence, since these evidences contrast most strikingly with any revelations that we obtain of the harmless, childish, and in all respects—except the poniards—peaceful people of the Lakes.

The time had grown warlike: as the bronze spear-heads and swords demonstrate. The human beings had grown larger: I could almost insinuate my hand into the inflexible bronze circle without a clasp, which was called a woman's bracelet, while a woman's bronze girdle, with clasp, gave no wasp-like idea of the women's waists of the period. Society had left the lakes, as too tame, in order to dwell in the hills and forests: living, to construct bloody altars; dying, to be burnt and potted in tumuli. The relics I was now surveying came from a tumulus opened some years ago, under the direction of Professor Troyon, of course, in a forest, on a hill. The hill and forest are about five miles inland from Lausanne. The relics are three earthen pots, which are filled with a calcined-looking stuff; then, sundry small bones of animals; then a number of warlike implements,

and a still greater number of female ornaments, consisting of glass-bead necklaces and bracelets, that have an Egyptian character, and a very curious appendage, like a little bronze cage with a round white stone loose in it—a child's rattle, in fact.

These objects were found in the following order: Lowest were the earthen pots that held all which had once been a hero, or heroes. Above these, came a vast assemblage of bones, supposed to be those of the warrior's favorite animals, which were slain in order that they might accompany him into Hades. At the summit of the tumulus—crowning the terrible interest—were four skeletons of females, supposed to be the warrior's four wives, also sent after him to Hades.

Concentrating the interest, I take the professor's account of the uppermost skeleton. It was that of a young female in an attitude of supplication and wild agony. The knees were bent, as if she had implored for life; the arms were cast on high, as if in frantic deprecation of her fate. She had evidently been tossed upon the top of the pile, and her limbs yet retained the very posture in which she died. Then earth and stones had been thrown hastily over the corpse, to crush out the remains of life, if any remains of life there were. A large stone had shattered one of her feet; another lay across her arm, the bone of which it had broken.

"Was she stoned to death?" I asked. "No," replied the professor: "she was probably slaughtered at a stone altar, which was close to the tumulus, and in which the customary blood-basins of the heathens are still to be seen *in situ*—for, the altar, as we had others of the same kind, we did not remove from its place. Besides, it was the wish of the owner of the wood that the relic should remain on his property."

"Did you preserve the skeleton?"
 "I could not. It fell into a thousand pieces in being removed from the pile. But here is the young creature's skull; and you see by the teeth (magnificent are they not?) that the poor thing was young."

I was struck by the preservation of the small and perfect teeth; and moreover by the fact that the skull was beautifully and intellectually formed.

"Ay!" said the professor, "it was an affecting sight to see that skeleton uncovered, telling its own poor history of two thousand years ago! Several ladies, who were present at the exhumation, (the whole search into the tumulus took four days; and, as it excited great interest, was attended by many people), shed tears as they looked at the remains."

I felt how possible it was, even for a man, to have wept at such a drama; and the thought occurred to me, "Eras do not always rise to better things! The poor gentle savages on their artifi-

cial islets would not have done the deed which the nation of the forest, capable as it was of higher arts, arms and manufactures, so fanatically perpetrated. Was there ever a priest upon the tethered rafts of the Lakers? We find no trace of him! But here was evidently a grand sacrificator, and an unexceptionable altar. Blessed be the faith which has overturned every sacrificial altar save that of the loving heart!"

Here, according to all the laws of climax, I should end; but I cannot help throwing out one hint in parting to the antiquarian explorers of my own country:—

"Look well into the British lakes."

For Friends' Intelligencer.

Review of the weather, &c. for SECOND month.

	1859.	1860.
Rain during some portions of the		
24 hours,	6 days	4 days.
Rain all or nearly all day,	2 "	2 "
Snow,	6 "	7 "
Cloudy without storms,	4 "	3 "
Ordinarily clear,	10 "	13 "
	28	29

TEMPERATURES, RAIN, DEATHS, &c.

Mean temperature of the month at Penna. Hospital,	37 deg.	32.72 deg.
Highest do. during month do.	60 "	69 "
Lowest do. do. do. do.	19 "	1 "
RAIN during the month,	3.66 inch	2.75 in.
DEATHS, during do., counting four current weeks for each year,	769	853
DEATHS IN NEW YORK during do. for 1860,		1969
Average of the mean temperatures of the second month for the past 71 years,		30.18 deg.
Highest do. during that entire period, 1857,		41.03 "
Lowest do. do. do. 1815, '36, '38		24 "

WINTER TEMPERATURES.

Mean temperature of three winter months of 1859, 1860,	32.88 deg.
Do. 1858, 1859,	36.14 "
Average for the past seventy years,	31.09 "
Highest mean temperature of three winter months during the past 79 years, 1827, '20, and 1850, '51,	38.33 "
Lowest do., 1814, '15, and 1835, '36,	26.66 "

In comparing the month under review with the corresponding one of *last* year, it will be seen that, although that of 1859 was over four degrees warmer than that of 1860, the extremes of the latter have been much greater, while its mean rises more than two and a half degrees above the average for the past seventy-one years.

It is seldom the mean temperatures of the three winter months are so nearly alike as they have been the present season, viz:

Twelfth month, 1859,	32.80 deg.
First " 1860,	33.11 "
Second " 1860,	32.72 "

Not a degree variation between any two of them. In referring to our manuscript tables, we find that by taking periods of twenty-five years each, com-

mencing with the winter of 1790-91, the average temperature has been gradually increasing, viz.:

	Deg.
From 1790-91 to 1814-15 inclusive, av. of means,	29.65
" 1814-15 to 1839-40 do. do.	30.34
" 1839-40 to 1859-60 (twenty years) do. do.	33.85

It may also be noticed that there has been an increase of deaths in Philadelphia the present year.

J. M. E.

P. S. Should this meet the eye of any one who either takes a record himself of the thermometer at 9, 12 and 3 o'clock respectively, or knows of any other person who does, or any other hours near those named, a favor would be conferred by dropping a line to

J. M. ELLIS,

Southeast corner of Ninth and Spring Garden sts. Philada., Third mo. 2, 1860.

FRIEND SORROW.

Do not cheat thy heart and tell her
 "Grief will pass away;
 Hope for fairer times in future,
 And forget to-day."
 Tell her, if you will, that sorrow
 Need not come in vain;
 Tell her that the lesson taught her
 Far outweighs the pain.

Cheat her not with the old comfort,
 "Soon she will forget;"
 Bitter truth, alas!—but matter
 Rather for regret.
 Bid her not "Seek other pleasures,
 Turn to other things,"
 But rather nurse her caged sorrow
 Till the captive sings.

Rather bid her go forth bravely
 And the stranger greet:
 Not as foe, with spear and buckler,
 But as dear friends meet.
 Bid her with a strong clasp hold her
 By the dusky wings,
 And listen for the murmured blessing
 Sorrow always brings.

ADELAIDE ANNE PROCTOR.

THE LITTLE SUNBEAM.

A tiny sunbeam stole,
 On a summer's day,
 Through a little crevice,
 To where a sick man lay.

It played upon the wall.
 And upon his table;
 With a smile he watched it
 As long as he was able.

Much he loved the sunbeam,
 Little dancing light;
 It told of sunny hours,
 Of skies and meadows bright.

Kind words are like sunbeams,
 Stealing into hearts;
 Scatter them most freely
 Ere light of life departs. A. H. Y.

THE water that flows from a spring does not congeal in winter. And those sentiments of friendship which flow from the heart cannot be frozen in adversity.

ADDRESS ON THE GRASSES.

BY J. STANTON GOULD.

(Continued from page 814.)

Near towns where street manure can be obtained, the following compost will be found very useful. Three tons of manure, three tons of earth and two cwt. of common salt should be well mixed together; it should be well wetted two or three times, and the heap turned over after each wetting.

In places where the sweepings of woolen factories, or shoddy, can be cheaply procured, it may be made into an excellent compost, by mixing one ton of shoddy, three tons of earth, one cwt. bone ashes, and one cwt. of salt; these ingredients should be watered two or five times.

Where soot can be obtained readily, it may be composted by mixing thirty-two bushels of soot, three tons of earth, one cwt. of bone ash, one cwt. common salt, one half cwt. of sulphate of magnesia, which should be turned over two or three times.

A very valuable compost is made by mixing two and a half cwt. of Peruvian guano, one ton of earth, one cwt. of salt, one half cwt. of sulphate of magnesia.

Those who live in the vicinity of peat bogs may spread alternate layers of peat and quicklime, and after the heap is well dried turn it over and wet it with liquid manure. Grass lands treated with this mixture in the Fall, will be greatly improved the following summer.

For sandy or loamy land four parts of guano should be mixed with three parts of plaster and three hundred and fifty pounds of the mixture evenly spread over an acre.

For clays, equal parts of guano and ashes may be mixed together, and four hundred pounds of the mixture applied to the grass. Fifty pounds of salt to the acre would be an improvement.

Ashes and plaster are too well known as fertilizers to make it necessary for me to allude to them. And though I have not spoken of barnyard manure, I consider it the best of any application for grass lands.

You have observed that I have recommended common earth as an ingredient in all the composts that I have described. The object of this is,

1st. As an absorbent of the gaseous and liquid matters which are disengaged from the other manures. And,

2d. That the silica they contain may be rendered soluble.

Grasses cannot grow without silica; an external coating of this substance performs the same office for them that the bony skeleton does for animals. Although silica abounds in all soils, it must be made soluble before it can be of any use to the grass, and this soluble silica is deficient in nearly all soils. Its augmentation in the composts is, therefore, a very important advantage.

Before leaving this branch of our subject, we must warn the farmer against the system of one-sided manuring which unnecessarily augments one or two of the elements of vegetable nutrition, while all the others are neglected. The grasses contain silica, phosphoric acid, sulphuric acid, carbonic acid, lime, magnesia, peroxide of iron, potash, soda, chloride of potassium, chloride of sodium, carbon and nitrogen. Now we may supply any amount we please of any two or three of these ingredients without improving the grass; nay, we may provide abundance of them all; so long as the soil is deficient in any one of these ingredients, we cannot expect good crops. Suppose phosphorus is the missing ingredient, the grass will be feeble, and the crop unremunerative. If bone dust, which abounds in phosphorus, is now applied, the grass will increase as if by enchantment; and such will be the result on the supply of any missing ingredient. Illustrations of this erroneous one-sided manuring meet us on every hand, in all of the agricultural journals.

J. R. Bywater manured his land with the washings of his manure heaps, and the urine from his tanks; the effect of this for two years was astonishing, but a continuance of the practice caused a growth of coarse, woody varieties, which banished all the finer and more nutritious kinds. A return to barn yard manure which contained the missing elements, checked the growth of the coarser, and restored the finer grasses. Another gentleman applied bone dust at the rate of a ton to an acre to a very poor meadow; the next year, to use his own expression he had a forest of grass, three tons to each of two mowings, making six tons in all. Delighted with his success, he put on another ton of bone dust to the acre, but the year after he had only a common crop. The six tons of hay taken from it the previous year had exhausted the soil of several of its constituents not contained in bones, and therefore no addition of these could restore the elements of fertility demanded by the grass.

I must speak of one more means for the improvement of our grass lands, before I close, and that is, irrigation.

My attention was first turned to this source of fertility by a visit to the farm of Leonard D. Clift, of Carmel, in Putnam county, where its good effects were very conspicuous, but it has been very well known in the east as a valuable means of fertilization ever since the Bible was written, and it has been practised to a great extent in Europe for more than a century, and is now being somewhat introduced into our own country.

L. Clift has about forty acres under irrigation, which, before they were irrigated, were more difficult to keep in grass than any other portions of the farm; he now takes heavy crops of grass for hay from it, besides an immense amount of pasture, without the application of any

other manure than the simple water that flows over it. He also gets two hundred loads of manure for his uplands, annually, from the scrapings of the bottom of his pond.

Geo. W. Coffin, of Duches county, has irrigated five acres with the same results, and indeed every experiment which has been made within my knowledge has been attended with the most satisfactory results.

Irrigation is proved to have the effect of diminishing the number of poor grasses and increasing the number of the better ones. In one very carefully conducted experiment, there were before irrigation, on a given area, seventeen grass plants of twelve different varieties; after two years' irrigation there were twenty-two plants of ten varieties; after three years' irrigation there were twenty-seven plants embracing nine varieties. The seventeen grass plants before irrigation, contained eleven good varieties and six poor varieties. The twenty-seven plants of the third years' irrigation were composed of twenty-six good varieties and one poor variety. Before irrigation, there were, in addition to the seventeen grass plants, fourteen plants which were not grasses but weeds; three years' irrigation reduced the weedy plants to five. Three years' irrigation, therefore, increased the number of plants on a given area sixty-three per cent. The innutritious grasses were reduced from six to one, and the weeds from fourteen to five.

Slow moving streams are richer than the more rapid ones, and those running through alluvial are better than those running through primitive soils. It has been found that flat lands are not benefitted by irrigation unless they are underdrained. Where this has not been effected, the land ought to slope one inch in six. There are thousands of streams in the State which are wasting their treasures of fertility at the tide waters, which if skilfully distributed over our grass lands, would incalculably increase their fertility and add correspondingly to the wealth of the State.

I had marked several additional topics for exposition, such as the proper time for cutting hay, the proper length of stubble, the best modes of cutting and curing hay, and other collateral matters, but I have already trespassed too long upon your patience, and therefore close at once, in the humble hope that I have contributed in some slight degree to hasten that good time coming when two blades of grass shall grow where only one has grown before.

IN sickness we perceive our former faults and wrong doings. In sickness the mind reflects and surveys itself with judgment, and regrets its former course. Pliny said sickness was the period of philosophical reflection, and it would be well for us if we would, on recovering, perform what we promised when sick.

RINGS OF SATURN.

Prof. Lovering, in his astronomical lectures before the Lowell Institute, gives the following account of the important discoveries and investigations of the rings of Saturn, by American astronomers :

"Between 1847 and 1856, the rings of Saturn were a subject of special consideration with the astronomers of the Cambridge Observatory. On the night of the 11th of November, 1850, Mr. G. P. Bond noticed the filling up of light inside of the inner edge of the inner ring, and above and below the ring a dark band which he thought was the shadow of the ring. Further observation by himself and Mr. C. W. Tuttle, led to the suggestion by the latter that these phenomena were owing to the existence of an interior dusky ring, and that theory was confirmed by subsequent observation. This ring occupies about one-third of the distance between the planet and the ring formerly considered the interior. With some it is a question whether this is not divided into two rings. These rings have a different appearance when seen from different points.

It has been a question, of what these rings have been composed, and how they are sustained. Formerly it was believed they were a solid mass, but in 1851, Mr. George P. Bond advanced the theory that they were composed of a liquid substance. This hypothesis explains the different forms of the rings at different times, and if strengthened by the demonstrations of Prof. Pierce, that the rings cannot be solid, they are supposed to be kept in their place by the attraction of the satellites. Saturn has rings, because it alone of the planets has a sufficient number of satellites to keep the rings in their place."

ITEMS OF NEWS.

EUROPEAN NEWS.—By the steamer Africa, we have dates to the 18th ult. The statement that Lord Elgin was to be sent to China again was contradicted in the House of Commons by Lord John Russell, who also stated that a correspondence was going on with a view to admitting British vessels to the coasting trade between the eastern United States and California. The proposed annexation of Savoy to France had been noticed in the House of Lords, and in response to an inquiry addressed to him by Sir Robert Peel, Lord John Russell stated that Sardinia had informed England that there was no engagement or intention to cede Savoy to France. Also, that England had informed the Swiss Government that, in case of the annexation, England was not prepared to abandon the neutrality of Switzerland, guaranteed by all the Great Powers, and was determined not to do so. It was the opinion of her Majesty's Government that if there was to be any annexation, Savoy should be annexed to Switzerland. The commercial treaty with France had been criticised in the House of Commons, and the Conservatives showed considerable hostility to it. The French Government has concluded, in the matter of the annexation of Savoy, to defer it to the decision of the Great Powers of Europe. It is stated

that a commercial treaty similar to the one between France and England is about to be negotiated between France and Prussia. The Austrian Emperor was still making use of the most vigorous efforts to stifle the liberal sentiment of his people. Large numbers of political prisoners from Venetia were being sent to Slavonia and elsewhere. It is stated that the Emperor of China is disposed to make every reasonable concession for the satisfaction of England and to avert further hostilities.

The Correspondent of the Tribune remarks:—

Three questions now exclusively engross the attention of the public, the Free-Trade Budget of Mr. Gladstone in England, the annexation of Savoy and Nice, which it seems is insisted upon by the Emperor Napoleon, and the Central Italian question, which affects the relations of the Pope to Sardinia and France. As to the Budget, it is a bold and honest endeavor to carry out the principle of Free Trade to its utmost limits, without regard to political consequences. It strikes a heavy blow at the licensed victuallers especially, and the practical monopoly of the great brewing firms, all of them hitherto staunch supporters of Lord Palmerston and the Whigs, and their defection may really endanger the Cabinet.

THE BUDGET.—In the city of London the budget is decidedly popular, if we may judge by the language held by the majority of the city articles in the daily press, devoted to the monetary and commercial features of that great congress of capitalists and merchants. We find the same feeling in most of the great towns of England and Scotland, and the popularity of the scheme increases the more it is discussed and analyzed. It will, in all probability, absorb the Commons next week, and so important is its success regarded that Louis Napoleon has postponed the commencement of the proceedings of his legislative body until its fate is known, and Lord John Russell, actuated by the same feeling, has delayed the introduction of the reform bill until the beginning of March. The fate of the Ministry is bound up with its success or failure. There is a general feeling prevalent that the measure will pass the House of Commons by a large majority, and in this belief we coincide. Nothing so important has occurred in the way of a revision of taxation since Sir Robert Peel was at the head of the Government of this country, and it is such a thorough development of his policy that all free-traders and Liberals are united in its support.

FLORENCE NIGHTINGALE.—A great change for the worse has taken place in the health of Florence Nightingale than was even lately announced, when great fears were entertained.

GENEROSITY OF THE IRISH GIRLS.—Dr. Cahill, in a letter to the Dublin Telegraph, speaks of the generosity of Irish servant girls here, in sending money to their relatives in the old country. He has visited the different offices in New York for the transmission of money to Ireland, and from the statistics thus obtained estimates that, during the year 1859, the Irish servant maids now working in New York city, and Brooklyn, have sent home to their parents, brothers, and sisters, the enormous sum of one million three hundred and fifty thousand dollars.

OLD NEWSPAPERS.—Two of the oldest newspapers in Germany, the Gazette of Leipsic and Rostock, celebrated on New Year day, the former its two-hundredth, and the latter its one hundred and fiftieth birthday. As a souvenir of the occasion, the Leipsic Gazette presented to its subscribers *fac similes* of its publication on the first of 1st mo., 1860, and 1760, respectively.

THE STEAMER HUNGARIAN.—A dispatch from the Hungarian agent to Montreal, dated Barrington, S. C., gives a list of the passengers booked in England, by the agents of the Grand Trunk Railroads, numbering thirty-eight, all of whom were from the Canadas, excepting one from Milwaukee. Capt. Shannon, of Africa, thinks that she had about 140 passengers.

CALIFORNIA.—The Pacific Railroad Convention has been in session at San Francisco since the 6th. It is composed of about seventy members, representing California and Oregon, and Washington Territory, and the object is to concentrate public sentiment upon the important project of a connection by railroad with the Atlantic States. It was resolved to send memorials to Congress on the subject, and legislative action on the part of California and Oregon is recommended. A resolution was unanimously adopted urging the California Legislature to offer a bonus of six thousand dollars to any company that shall first complete an overland telegraph line to the United States, and four thousand dollars to any completing a second line by a different route, provided that both lines shall be finished within eighteen months.

THE PHILADELPHIA MARKETS.

FLOUR AND MEAL.—There is no quotable change to notice in the Flour market. With limited receipts, a fair home consumption demand and moderate stocks, holders are firm. Flour for export is held at \$5 75, a 5 87 for superfine; \$6 a 6 12½ for extra. The sales to the retailers and bakers range from \$5 75 up to \$6 75 for common and extra family, and \$6 87½ a 7 12½ for fancy. Rye Flour is steady at \$4 25, and Corn Meal at \$3 50 per barrel, but there is nothing doing in either. Barley is scarce. Barley malt ranges from 95 cents to \$1 05, cash and on time.

GRAIN.—There is not much Wheat coming forward, and it is in good demand for milling. Small sales of good red at 1 40 a 1 42, and white at 1 55 a 1 60. Rye is selling on arrival at 92 cents. Corn is more abundant. Sales of 8000 bushels yellow at 73 a 74½ cents. Oats are steady. Sales of Pennsylvania at 41 a 44½ cents, and Southern at 42½ a 43 cents.

There is a fair amount of Cloverseed offering. Sales of 360 bushels good and prime quality at \$4 37½ a 4 74, and 100 bags re-cleaned, at \$5 per 64 lbs. Timothy—Sales of 150 bushels at \$3 62½. Flaxseed at \$1 60 per bushel.

ANNE CHURCHMAN'S BOARDING AND DAY SCHOOL, No. 908 Franklin street above Poplar. 1st mo., 28, 8t.

SARON FEMALE SEMINARY.—This Seminary is located in a pleasant and healthy situation, one mile from the village of Darby, in Delaware county, Penna., and six miles from Philadelphia; between which places there is an hourly communication by passenger railway in winter, and half hourly in summer. It was for many years in successful operation under the charge of John and Rachael T. Jackson, by whom it was founded, but having been closed since the decease of the former, will be re-opened for the reception of pupils on the 21st of 5th month, 1860, and continue in session for twenty weeks, when a vacation will occur until the 19th of the 11th month, at which time the second term of the school year will commence.

COURSE OF TUITION.—The course of tuition embraces all the elementary and higher branches of a liberal English education, and also the Latin, French, and German languages, and drawing. Those who wish to qualify themselves for teachers will receive particular attention in such branches as they may de-

sire to pursue. The pupils will also be instructed in needle work. Superior facilities for the acquirement of the French language will be afforded, in daily conversation with a native French teacher, resident at the school.

Circulars containing a full description of the school building, terms, and other details of the institution, will be furnished on application to the subscribers, Darby P. O., Delaware county, Penna.
